## Foreword

Dear Guests,

Welcome to the 5<sup>th</sup> International Conference of New Horizons in Education-2014 in Paris, France. "The International Conference of New Horizons in Education (INTE)" is an international educational activity for academics, teachers and educators. It promotes development and dissemination of theoretical knowledge, conceptual research, and professional knowledge through conference activities, workshops, discussions and conference proceeding book. The International Conference of New Horizons in Education-2014 aims to diffuse knowledge and research findings among academicians and lead to professional development and scholarly practices in educational sciences.

For this conference, we have gathered in Paris to share and construct knowledge, to promote dialogue across academic differences, to further and deepen connections within our scholarly community, and to be in fellowship with friends and colleagues old and new. This year, INTE-2014 has received about 1300 applications. The Conference Organizing Committee has accepted approximately 900 abstracts and the conference features over 750 presentations, including 620 oral, 86 poster, and 42 video presentations in 8 conference halls and with more than 165 sessions, representing the breadth and depth of education research today.

This year we have participants from more 60 different countries representing five continents, with different races, gender, ethnic backgrounds and cultures.

We would like to wish you a pleasant stay in Paris and a successful conference. We hope that we will meet again at the International Conference of New Horizons in Education, 2015 in Barcelona, Spain next year.

Thank you for your contribution for the success of International Conference on New Horizons in Education 2014.

Assoc. Prof. Dr. Ahmet ESKİCUMALI  
*Coordinator*

Prof. Dr. Aytekin İŞMAN  
*General Coordinator*

## **INTE 2014 Organizing Committee**

### **General Coordinator**

Prof. Dr. Aytekin İŞMAN, Sakarya University, Turkey

### **Coordinators**

Prof. Dr. Colleen SEXTON, Governor State University, USA

Prof. Dr. Teresa FRANKLIN, Ohio University, USA

Prof. Dr. Carlos De Sousa REIS, Instituto Politecnico da Guard, Portugal

Assoc. Prof. Dr. Ahmet ESKİCUMALI, Sakarya University, Turkey

### **Assistant Coordinator**

Assist. Prof. Dr. İrfan ŞİMŞEK, Istanbul University, Turkey

### **Conference Secretary**

Dr. Kerim KARABACAK, Sakarya University, Turkey

Dr. Burak ŞİŞMAN, Istanbul University, Turkey

## INTE 2014 Editorial Board

Aaron DAVENPORT, Grand View College, United States	Francine Shuchat SHAW, New York University, United States

*<sup>a</sup>Investigation of Learning Disabilities Laboratory of Speech and Hearing Sciences Department of São Paulo State University "Júlio de Mesquita Filho" - UNESP - Marília - São Paulo - Brasil. Avenue Hygino Muzzi Filho, 737, Postal Code: 17.525-000, Marília-Sao Paulo-Brazil.*

---

## Abstract

This study aimed to verify the effectiveness of Reading comprehension intervention program for teachers from 3rd grade's students. 4 teachers of 3rd grade from public school were divided: GI - two teachers submitted to intervention program and GII - two teachers not submitted to intervention program. Reading Comprehension Assessment Protocol was applied in all students of these teachers in pre and post-intervention. The results revealed a difference between the performance of the situations of pre and post-testing for GI. The intervention program was effectiveness for teachers to teach narrative and expository texts comprehension for students.

## 1. INTRODUCTION

To the process of reading occur some skills are considered essential, as: language, attention to understand and interpret written language, auditory memory, visual memory, identifying words, contextual and structural analysis of language, logic synthesis, vocabulary, comprehension and fluency in reading. Thus, reading involves a variety of processes that begins on the visual identification of the letters and to the understanding of the content of the text message (Andrade and Dias, 2006).

Several factors contribute to the comprehension of texts, all of which are necessary, but insufficient to, in isolation, determine the comprehension. It is widely acknowledged the role played by linguistic factors, such as the ability of decoding, vocabulary and syntactic knowledge (Cain, Okkhil and Elbro, 2003); by cognitive factors such as working memory, monitoring, and the ability to establish inferences (Andrade and Dias, 2006); and by social factors, involving the circumstances under which the reading occurs (social context, objectives, motivations and expectations of the reader), but also the previous knowledge of the reader and your social and cultural experiences (Baleghizade and Babapour, 2011). However, educators and professionals who work with students know the difficulties that many of them present in the skill of reading comprehension.

Cain, Oakhill, Barnes and Bryant (2001) argued that the most important measures of the performance of reading are related to how much and how the student understand a text and identifying processes and processing underlying to the comprehension. This is done in different levels, from the most superficial, even that which allows to use creatively the information removed from the text and to answer questions whose answers are not literally written or identify problems occurring during the reading and looking for ways to solve them (self-regulation).

Differences of the performance in reading tests observed in students showed that the development of cognitive processes and of language interferes in the comprehension.

Massignani, Oliveira, Kubo and Botomé (2012) cited the importance of developing the behavior of reading comprehension in students through the use of any resource or strategy, as the dramatization of stories. Their results indicated that the use of this resource contributed to improving of the reading comprehension. This results are in agree with Ferreira and Dias (2004) which concluded how the use of reading strategies can assist in overcoming difficulties in comprehension of text, especially when allows the active participation of the reader with the text, contributing to the integration of the information contained therein and the construction of inferences.

Considering the results obtained by the different research presented, this study intends to apply an informative intervention program, with the possibility that the students will progress in the reading comprehension after its realization, because this ability is a process essential for the achievement of learning the different curriculum subjects.

## **2. OBJECTIVES**

-Verify the effectiveness of an intervention informative program to the reading comprehension to third grade teachers of elementary level.

## **3.MATERIAL AND METHOD**

This research was conducted after approval by the Research Ethics Committee of the Faculty of Philosophy and Science – FFC/UNESP-Marília, São Paulo, under the Protocol 0720/2013 approved in 5/29/2013.

### **3.1 Pre-assessment of the 3th of elementary level in reading comprehension**

Participated this study 45 students of the third grade of elementary level, of two municipal public schools in the city of Marília-SP, of both genders between the ages of seven years to eight years and eleven months.

A pre-assessment was conducted using the Protocol of evaluation of reading comprehension-PROCOMLE (Cunha and Capellini, 2014). The evaluation was applied through a narrative and expositive text, being respectively N1 and E1. These texts contain each of them eight multiple-choice comprehension questions, four related to microstructure of text (two literals and two of the inferences) and four related to the macrostructure of the text (two literals and two of the inferences).

### **3.2 Application of Informative intervention program for reading comprehension for teachers of the elementary level**

At this phase it was applied a informative intervention program for reading comprehension for students of the third year of elementary school I.

The guidelines and strategies of intervention provided were about the processes involved in reading comprehension both of narrative texts and expositive texts.

Informative Program guidelines were held in two sessions of four hours each, being two hours for the theoretical part and two hours with workshops, in which were worked for activities practices to the teacher.

Participated of the study two teachers of the students participating in the phase 1 of this study. These teachers were divided into:

Research Group (GI): composed of two teachers of the third grade that was submitted to informative intervention program,

The control group (GII): composed of two teachers of the third grade that has not been submitted to the intervention program.

The teachers of the GII group did not receive any sort of guidance on the specific and directed work with reading comprehension, while the teachers of GI group received guidelines of interventive program informative about the cognitive and metacognitive processes of reading comprehension and reading comprehension strategies with specific and targeted activities.

### 3.3 Verification of the educational effectiveness of the Informative Intervention Program to the reading comprehension to the students of the third grade of elementary level.

In order to verify the educational effectiveness of the program developed in this study, after the implementation of the program, all the students of the phase 1 of this study were subject to reapplication of the evaluation Protocol of reading comprehension-PROCOMLE (Cunha and Capellini, 2014), after eight weeks between the first and second evaluation. In the post assessment was used a second narrative text and a second expository text of the Protocol, being respectively N2 and E2, each with eight multiple-choice comprehension questions, four related to microstructure of text (two literals and two of inferences) and four related to the macrostructure of the text (two literals and two of inferences), constant in the original assessment procedure.

## 4. RESULTS

The results of the pre and the post assessment were statistically analyzed with the purpose of comparing the results intergroups in situation of pre and post implementation of the informative program in order to verify the educational effectiveness of the program. For this analysis, we used the program SPSS (Statistical Package for Social Sciences), in its version 21.0. Was applied the test of Wilcoxon, aiming to check possible differences between the moments of implementation of the evaluation of the understanding reader in study groups, submitted and not subjected to the intervention program.

Table 1 presents the values of average, standard deviation and the values of p regarding the performance of the GI in situation of pre and post intervention in narrative texts N1 and N2 and expository texts E1 and E2.

**Table 1.** Distribution of values of average, standard deviation and p value regarding the performance of the GI in the pre and post intervention situation.

Texts	n	average	standard deviation	p value
N1 Lmi Pre	20	0,60	0,88	0,627
N2 Lmi Post	20	0,70	0,80	
N1 Lma Pre	20	1,30	0,80	0,001*
N2 Lma Post	20	0,30	0,47	
N1 Imi Pre	20	1,25	0,72	0,083
N2 Imi Post	20	0,95	0,61	
N1 Ima Pre	20	1,05	0,89	0,018*
N2 Ima Post	20	0,30	0,66	
TN Pre	20	4,20	2,57	0,009*
TN Post	20	2,25	1,80	
E1 Lmi Pre	20	1,10	0,79	0,059
E2 Lmi Post	20	0,70	0,73	
E1 Lma Pre	20	0,85	0,81	0,802
E2 Lma Post	20	0,90	0,79

E2 Imi Post	20	0,95	0,83	
E1 Ima Pre	20	1,10	0,91	0,448
E2 Ima Post	20	1,25	0,72	
TE Pre	20	4,00	2,43	0,282

Texts	n	average	standard deviation	p value
TE Post	20	3,55	1,76	

**Legend:** **N1:** narrative text 1; **N2:** narrative text 2; **E1:** expositive text 1; **E2:** expositive text 2; **Lmi:** literals questions of microstructure; **Lma:** literals questions of macrostructure; **Imi:** questions of inferences of microstructure; **Ima:** questions of inference de macrostructure; **Pre:** pre-assessment; **Post:** post-assessment.

The data in the Table 1 reveal that the GI's students, whose teacher was subjected to intervention with the informative program showed statistically significant differences in the comparison between the literals questions of macrostructure with lower average for the text applied on post-assessment, N2 indicating a smaller number of incorrect answers, suggesting superior performance on questions of the post-assessment. The same occurred for the questions of inferences of macrostructure, indicating superior performance also in the post-assessment. On comparison between the pre-and post-assessment to the total number of questions of narrative texts, the lower average also occurred in the post-assessment pointing to superior performance after the intervention activities.

Table 2 presents the values of average, standard deviation and p value regarding the performance of the GII in evaluation Protocol of reading comprehension-PROCOMLE (Cunha and Capellini, 2014) in situation of pre and post intervention.

**Table 2.** Distribution of values of average, standard deviation and p value regarding the performance of the GII in the pre and post intervention situation.

Texts	n	average	standard deviation	p value
N1 Lmi Pre	25	0,64	0,70	> 0,999
N2 Lmi Post	25	0,64	0,64

E2 Imi Post	25	1,12	0,73	
E1 Ima Pre	25	1,08	0,64	0,830
E2 Ima Post	25	1,04	0,84	
TE Pre	25	3,96	1,93	0,646
TE Post	25	3,72	2,34	

**Legend:** **N1:** narrative text 1; **N2:** narrative text 2; **E1:** expositive text 1; **E2:** expositive text 2; **Lmi:** literals questions of microstructure; **Lma:** literals questions of macrostructure; **Imi:** questions of inferences of microstructure; **Ima:** questions of inference de macrostructure; **Pre:** pre-assessment; **Post:** post-assessment.

The data in the Table 2 show that the GII's students, whose teacher was not subjected to intervention with the informative program showed statistically significant differences only in the comparison between the literals questions of macrostructure with lower average at post-assessment, indicating superior performance in this type of question in the narrative text N2.

## 5. DISCUSSION

Our results showed the positive effects of explicit information strategies for comprehension narrative texts, because students presented significant differences between pre and post assessment for the literal and inferences questions and of macrostructure, indicating superior performance to the central ideas and in the association with previous knowledge, agreeing with studies of Rabren, Darch and Eaves (1999) who demonstrated that students performance was better when the pedagogical approach used textually explicit material.

Specific strategies for reading comprehension have also been investigated in a study of Ferreira and Dias (2004) performed in order to check and compare the training effect of strategies of note-taking and Mental image on the reading comprehension of students of 8 to 14 years old (3rd and 4th grades) with reading comprehension difficulties of public and private schools. Their results indicated that the group with little difficulty in comprehension progressed more about inferences questions than the group with great difficulty of comprehension. Children from public schools were the most benefited. Both strategies have enabled the emergence of answers to literals and inferences questions, agreeing with our results that demonstrated positive effects on these types of questions on work with narrative texts.

The positive effects of specific practices for the teaching of reading comprehension have also been demonstrated in study of Lai, McNaughton, Amituanai-Toloo, Turner and Hsiao (2009) whose results showed systematic improvement in performance to the students who received these specific practices and the maintenance of this improvement from one year to the next over the three years of study.

The positive results have also been observed in study of Block, Parris, Reed, Whiteley and Cleveland (2009), which indicated the positive effects of instructional approaches, noting that when readers with difficulty received 20 minutes of instruction with reading practices in the classroom with the teacher's monitoring produced significantly higher scores in reading comprehension.

In a study of Baleghizade and Babapour (2011) conducted with the objective to investigate the effect of summary written in reading comprehension, found that this kind of strategy improved the reading comprehension and retention of the main ideas. Our findings corroborate these results, because between the activities developed for the comprehension of narrative texts had also written summary of the main ideas so that the diagrams were filled. This strategy therefore proved effective also in our study since students presented superior performance in the macrostructure questions on post-assessment.

Diakidoy, Mouskounti and Ioannides (2011) conducted study to compare the effects of a contested text in performance comprehension and learning of expositive texts. 61 students of a psychology university course participated of the study. The participants were randomly divided into 2 groups: one for reading a text of refutation and another expositive text pattern on the scientific concept of energy. The results indicated that compared with expositive text, the text of contestation facilitated learning and an overall increase of inference generation bridges and elaborativas, but not the memory for the text. Comprehension performance indicated the performance in learning, especially for students with prior knowledge low and inaccurate. The results contributed to the understanding of the effect of the contested text, indicating its association with increased generation of inference and the construction of a more elaborate and coherent textual representation.

Study of Sampaio, Assis and Baptista (2010) also proved the effects of explicit teaching procedures on reading comprehension. The students were exposed to teaching conditional relations, equivalence tests, teaching by

thread of responses, production tests of sentences, and connectivity tests and reading comprehension tests. The results indicated that these procedures were significant in performance in reading comprehension.

The intervention program developed with the expositive texts of this study was based on studies of Sánchez (1992, 2002, 2012) that discuss the work in thematic progression of text, extraction of global significance (application of macro roles selection, generalization and integration), recognition and use of basic organizational forms. The results obtained by this study did not corroborate those obtained by Sánchez, which studies have shown that students who received the training program presented superior performance after the intervention activities, because our students did not present significant differences between pre and post assessment for the expositive texts.

Our results do not corroborate also study of Miranda, Villaescusa and Vidal-Abarca (1997) that showed that explicit instructions about identification of main ideas by means of the application of the generalization macro roles brought benefits in performance comprehension of the students of the study, because they did not significant differences between pre and post assessment for the expositive texts.

Study of Kinniburgh and Shaw Jr. (2009) performed with the goal of teaching strategies for reading comprehension of expositive texts for students of the third to sixth grade, which would have to identify the type of question whether explicit or implicit, framed them in two categories: "memory for events" and "inferences", showed that by incorporating strategies for reading comprehension, students have become more skilled in reading of scientific texts. Your reading and comprehension of theoretical texts improved its results in the tests in science and reading. Our results however showed that the way the strategies were provided were not efficient, because no significant differences between the pre and post assessment demonstrating that students did not understand the relationship between questions and answers.

Study developed by Wilawan (2011) in order to investigate the effects of a procedure which incorporated lexical cohesion and macro roles to promote the comprehension of the main idea of the text read, revealed in its results a significant improvement in comprehension the main idea in the experimental and control groups on the post-test. However, no significant differences were found between the groups. The findings suggested that the statement of the main idea requires a simultaneous integration of various techniques of reading. Our results for the expositive texts indicated that in some variables there was a decrease in the averages indicating some improvement in post-assessment although not statistically significant differences have occurred.

Our results indicated that the strategies used in informative program for teachers concerning the comprehension of narrative texts were more effective than those used for the expositive texts, because for the first statistically significant differences occurred while for the latter, these differences did not occur. In this way, it is necessary that the strategies used for the expositive texts (types of strategies) and the way in which they were used (frequency and duration of follow-up monitoring guidelines, of the guidelines and how they have been applied, for example) are revised to that subsequent studies should be reconsidered in order that greater effectiveness of its results. However, the results recorded for the narrative texts, we find also in our study, the use of explicit and specific strategies for reading comprehension had significant effects on this ability to students participants in this study.

## 6. CONCLUSION

From the results found in this study it can be concluded that:

- The profile of the 3rd grade in reading comprehension before the implementation of the informative program developed for this study was similar, meaning that not presented significant differences for both performance narrative texts as for the expositive.
- The intervention program developed for this study was effective for the comprehension narrative texts because to the narrative texts statistically significant differences occurred while these differences did not occur for the expositive texts.

# Realization of digital Oscilloscope with FPGA for education

Berkant Başa<sup>a\*</sup>, Murat İskefiyeli<sup>b</sup>

<sup>a</sup>*Sakarya University, Faculty of Computer and Information Sciences, Department of Computer Engineering, 54187, Sakarya TURKEY*

---

## Abstract

In this study, it is aimed to implement a digital oscilloscope by FPGA architectures to correspond the requirements of laboratories in the educational institutions in an economic way. It is shown that non-professional oscilloscopes can be implemented with low-cost, educational purposed FPGAs. It is also able to measure high frequency signal by high speed FPGAs. Terasic DE0 kit is used as hardware and Quartus II is used as software in this application. The sine signal which is a widely known signal used to measure is generated by the signal generator. The graphical view of the sampled signal in the FPGA is shown on a 640x480 pixelated VGA monitor.

## Introduction and Purpose

The aim of the realization of digital oscilloscope with FPGA (Field Programmable Gate Arrays) structures is to get a digital oscilloscope in an economic way. The principal reason of this phenomenon is the extraordinary evolution of the Digital Electronics [1]. Every time the manufacturers of Digital chips manage to realize smaller chips, with major number of transistors, capable of working every time to more speed and to minor cost. The basic functioning of the digital oscilloscope we can see it in the Figure 1. It has an ADC (Analog to Digital Converter) for conditioning signal. The ADC is in charge of sampling the signal and of the quantification of this value.

E-mail address: basaberkant@gmail.com

This part of the oscilloscope is especially critical, since depending on the sampling rate and the precision level of the converter (levels of quantification), it will define the principal characteristics of the oscilloscope [5]. Once sampled the values are stored in a digital memory for later processing and visualization. The Digital oscilloscope, by the advantage of the digital logic, can realize complex calculations on the information stored in the memory. This one is a great advantage of the digital oscilloscopes opposite to the analogical ones the Major Productivity. The design is simpler and rapid on our chip that the design with devices of different manufacturers and with characteristics that surely are not exactly the wished ones[6].

Figure.1: Schematic digital oscilloscope

## Altera DE0 Board

The Altera DE0 board is a well-known kit of Terasic Technologies and it is shown in Figure 2. It depicts the layout of the board and indicates the location of the connectors and key components. The DE0 board has many features that allow the user to implement a wide range of designed circuits, from simple circuits to various multimedia projects. To provide the maximum flexibility for the user, all connections are made through the Cyclone III FPGA device. Thus, the user can configure the FPGA to implement any system design [3].

The concept of the DEO Control Panel is illustrated in Figure 3. The "Control Codes" that perform the control functions is implemented in the FPGA board. It communicates with the Control Panel window, which is active on the host computer, via the USB Blaster link. The graphical interface is used to issue commands to the control codes. It handles all requests and performs data transfers between the computer and the DEO board [3].

The DEO Control Panel can be used to light up the LEDs, change the values displayed on 7-segment, monitor buttons/switches status, read/write the SDRAM and Flash Memory, read data from a PS/2 keyboard, output color pattern to LCD monitor via VGA connector, and read SD-CARD specification information. The feature of reading/writing a word or an entire file from/to the Flash Memory allows the user to develop multimedia application (Flash Picture Viewer) without worrying about how to build a Memory Programmer [3].

## FPGA and VHDL

Modern field-programmable gate arrays (FPGAs) contain hundreds of thousands of lookup tables (LUTs), hundreds of embedded memories, and hundreds of multipliers connected through a programmable interconnect fabric. Obviously it is intractable to program the FPGA at the granularity of these individual elements. However, with modern synthesis and layout tools, it is possible to describe a design simply by writing logical expressions, a level higher than gates, and letting the tools do the rest [2].

Register transfer level (RTL) design is a popular discipline for describing these logical expressions. It allows the designer to express the design by describing the logic between each pair of register stages. This allows her to carefully control register-to-register logic depth while freeing her from selecting the actual gates and their mapping to the FPGA. Very High-Speed Integrated Circuit Hardware Description Language (VHDL) is one popular programming language that supports RTL hardware descriptions [4].

VHDL enjoys widespread popularity among designers in the industry, along with its close cousin, Verilog. Indeed, almost all modern CAD tools that perform simulation, synthesis, and layout support both. Verilog differs from VHDL primarily in the syntax it uses (VHDL is derived from Ada; Verilog, from C), but both languages are IEEE standards and are periodically reviewed to reflect changing industry realities and expectations.

## Digital Oscilloscope with FPGA

An oscilloscope is an instrument of visualization of signals as seismic, beatings of the heart, electromagnetic waves etc. when it has been provided with a suitable transducer. The measurements that an oscilloscope has to do have to be very precise and it is here where the system of acquisition has been generated by a memory of double port synthesized and optimized by Altera DE0 for its FPGAs. The FPGA is programmed to measure the digital a module that manages the reading and writing of the same one. The writing fulfills consecutively from the address 0 up to 640 when the control of the trigger indicates it to us. This does that for our VGA it is so simple to read all the information that it contains whenever we draw one of 480 vertical lines that has the screen.

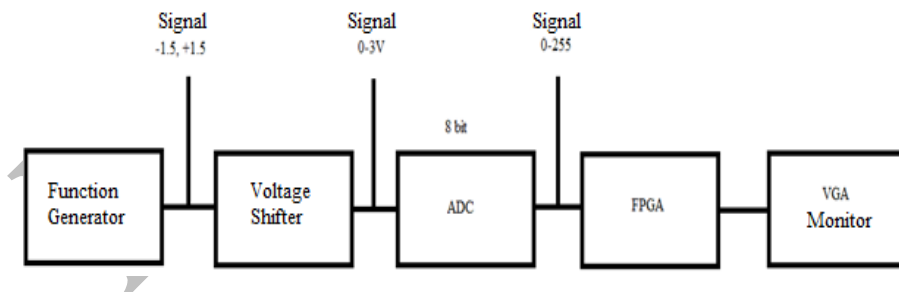

Figure.4: The Block diagram of the system

The oscilloscope module is the part of the system which deals with the analog signal and converts it in to a digital form that is then stored in to a memory [7]. In the project, the reference voltage of ADC is 3.3 V. So, the maximum voltage that measures is 3.3 V. The values that bigger than the reference voltage must be converted by transformer or divided by resistance. For testing in the project it is used a function generator and adjusted its values as below.

Signal type	: Sine wave
Amplitude	: 1.5 Volt

INTE 2014

Frequency : 50 Hz

Figure.5: Sine wave

Figure.6: Shifted Sine wave

The sine wave has a negative and a positive pole in one cycle. So the maximum value is +1,5 V and the minimum value is -1.5 V. To measure both negative and positive values a DC signal adder is designed and the sine wave scope is altered from (-1.5 V, +1.5 V) to (0 V, +3 V) values. The new sine wave can be seen in the Figure 6. [8].

In the Figure 7 the non-inverting adder circuit can be seen. In the circuit, if the  $R_a=R_b$  and  $R_f=R_i$  then the output voltage will be  $V_{out}=V_a+V_b$

Figure.7: Non-inverting voltage adder

Figure.8: ADC0804

The output of the voltage adder circuit is connected to the ADC's input and the ADC converts this analog value to the digital value. The ADC has a resolution of 8 bits and converts the 0-3 V to the digital state of 0-255. According to the design -1.5 V corresponds to 0 and +1.5 V corresponds to 255.

The measured voltage can be calculated by the formula of

$$V = (\text{ADC\_Output\_Value} * 3 / 256) - 1.5$$

The VGA monitor with the resolution of 640x480 screens the image of obtained sinusoidal wave. Number of pixels on horizontal axis is 640 and number of pixels on vertical axis is 480. According to the design every horizontal pixel represents 1 msec and also every vertical pixel represents 10 mV [8].

The VGA monitor connector on the ALTERA DE0 board consists of five signals, RED(4 bits), GREEN(4 bits), BLUE(4 bits), HORIZ\_SYNC, and VERT\_SYNC. The timing relationships among this signal are shown in Figures 9 and 10. The generation of signals needed for the raster on the VGA monitor begins with dividing the frequency of the 50 MHz clock on the ALTERA DE0 board down to a 25 MHz pixel clock which is further divided down to the horizontal and vertical sync frequencies [9].

This means your design will contain a horizontal counter and a vertical counter. The horizontal and vertical sync pulses of appropriate lengths are then produced from the two counters. A video display consists of 640 pixels in the horizontal direction and 480 lines of pixels in the vertical direction. The monitor starts each refresh cycle by updating the pixel in the top left-hand corner of the screen, which can be treated as the origin (0,0) of an X-Y plane.

After the first pixel is refreshed, the monitor refreshes the remaining pixels in the row. When the monitor receives a pulse on the **HORIZ\_SYNC** pin, it refreshes the next row of pixels. The time required for the sweep, the horizontal sweep period, is nominally 31.77  $\mu$ s [9].

Figure.9: Horizontal Refresh Cycle.

Figure.10: Vertical Refresh Cycle.

This process is repeated until the monitor reaches the bottom of the screen. When the monitor reaches the bottom of the screen, a 64  $\mu$ s pulse applied to the **VERT\_SYNC** pin, causing the monitor to begin refreshing pixels at the top of the screen (i.e., at [0,0]). As shown in Figure 8, the VERT\_SYNC pulse must be repeated every 16.6 ms (vertical sweep period). A complete screen of information is being traced by the electron beam every 16.6 ms for a frame rate of 60 Hz [9].

In this context, we use the non-inverted voltage bus, ADC, DE0 Kit and VGA 640x480 monitor the process of implementation through the elements we have reflected on the screen. The sinusoidal waveform obtained through the following image we have achieved is shown in Figure 11 [8].

Figure.11: VGA 640x480 output sine wave

Above on the screen that is reflected, in the range of 3V that means between +1.5V and -1.5V, non-inverting voltage integrator term is used to acquiring a sinusoidal wave on the screen. In the view on the screen that is showed are the main dots of sinusoidal wave's (view on the screen that is reflected is between +150pix and -150pix). During the process of FPGA DE0, the function is on the basis of pixel and every detail of view that is the reflected on the screen is calculated over pixels. It is impossible to see by pixel's this view on the screen because FPGA's are functioning very fast and this is the reason why the view is not reflected clearly on the screen [8].

## Conclusion

In this project is worked by FPGA DE0 kit to verify the quantitative oscilloscope. The kits (or materials) that are used for purpose of educating and for non-professional to performe the oscilloscopes are quite low coasted. During this project work, there was a signal of sine wave that was attained from generator. An improving kit that we have ADC has no module. Therefore the module was connected from the outside by the ADC. The sine (sinus) wave include both positive and negative pole. Because of this reason by inverting and shifting term, the exit of functional generator is shifted to the positive pole. The exit of the ADC is connected to the DE0 kit and is written by VHDL.

Then the code that was written is synthesized and loaded to the FPGA and the enter signal of DE0 that is connected to the VGA's port, is watched on the monitor.

In the project, even the sine signal is tested as the input signal, it is arranged for all the signal terms to be readable. Moreover, all these readable values are saved in memory module where exist in the DE0's kit (or material) memory card. Therefore, all values are backed up.

Instead of using external ADC module, it can be used new version kits of internal ADC modules. By this way, not just low frequency signals but also on high frequency signals can be followed.

# Reception of critical educational science and the contemporary educational crisis

Adnan Tufekčić<sup>a</sup>

<sup>a</sup> Department of Pedagogy and psychology, Faculty of Philosophy, University of Tuzla,  
Tuzla, Bosnia and Herzegovina

---

## Abstract

The basic starting point in the research of the educational reality within the critical educational science was represented by criticism of the ideology and comprehension of the influence of social processes on education. The purpose and principal objective of education from the critical educational science point of view is striving towards maturity and self-determination leading to emancipation and solidarity development. Contemporary society is marked by large educational crisis determined by postulates of so called „neoliberal pedagogy” where, very frequently, education becomes its opposite. Due to that, the question arises of whether we could and should analyse the existing contemporary educational crisis through the reception of the critical educational science.

## 1.Introduction

Critical educational science appeared in the second half (the sixties) of the 20<sup>th</sup> century. Its emergence represents the tendency of one part of pedagogues to structure the educational science on the basic starting points and fundamental characteristics of the critical theory of society. The most significant representatives of this direction within educational science are Klaus Mollenhauer, Herwig Blankertz, Wolfgang Klafki, Hermann Giesecke and Wolfgang Lempert. Therefore, resting upon the most important thesis of the critical theory of society, the representatives of critical educational science believe that the critique of ideology is the basic starting point in understanding educational reality and therefore the fundamental task of educational science. This starting point and the fundamental task attempt to explain the social context of education or in other words the influence of social processes and ideologies on upbringing and education by which “the educational practice enlightens on itself by which, for example, teachers are helped to realize usually unnoticed dependence of the educational system of the governing social structures” (Gudjons, 1994, 37). This was the way of accomplishing one deviation from empirical / behavioral educational science as well as from spiritual scientific pedagogy that have not critically illuminated social circumstances in which educational reality takes place, nor the social demands that are being placed on upbringing and education.

The fundamental question of critical educational science, therefore, are upbringing and education whose objective and purpose are striving towards emancipation, which leads to maturity, self-determination and development of solidarity. Emancipation and solidarity as the purposes of education lead to the liberation of children and young people from different kinds of subordinations, in other words, being free for maturity and self-determination (König and Zedler, 2001) “Emancipation means freeing the subject - in this case young people in this society - from conditions that limit their rationality, and the related social activity” (Mollenhauer, 1973, 11, according to König and Zedler, 2001, 137). The task of all educational reflections, from the viewpoint of critical educational science, is the research and design of pedagogical activities with the aim of clarifying the issues of self-determination, democratization and emancipation. Emancipation and solidarity as the purposes of education lead to liberation of young people from different forms of subordinations, in other words being free for maturity and self-determination.

Although the critical educational science in the late seventies of the 20<sup>th</sup> century loses its critical-theoretical “edge” in dissecting the existing social and pedagogical relations, the question arises whether we can and should analyze the existing contemporary educational crisis, and therefore the position of children and young people in contemporary social and educational reality from the perspective of critical educational science that in the last few decades has been neglected in considerations and structuring the system of upbringing and education. This question specifically refers to the structuring and reforming educational systems in the so called “transitional societies”. Therefore, the next part will try to show some of the most important guidelines of the contemporary educational crisis and its influence on the lives of children and young people in the current social reality and on the basics of the most important start points of critical educational science.

## 2. Some characteristics of the contemporary educational crisis

The modern age is full of various contradictions, problems and risks and according to the words of Ulrich Beck it can be characterized as "risky society" (Beck, 1992). A large number of today's reflections of education as a human activity is focused on finding answers to these problems. That points to the fact that education is facing some really high expectations. Almost imperative, education is referred to as the main growth driver, as the field of solving the greatest misfortunes of mankind. We are looking for new solutions, new methods and new concepts of education that will be particularly successful. No area of human activity is so affected by the reforms as education is. However, in all this, the question that arises is what is with the crisis of education itself, that is, in what kind of condition it is in the rapidly changing society full of risks and uncertainties. This question in itself implies the following questions: 1) If education can "cure" or alleviate and solve many social problems, does this mean, then, that they are created by the education? 2) If there are social problems that are caused by education, can we expect education to solve them? 3) If education cannot solve all social problems, how much can it help in restoring and connecting numerous broken social relationships, and social connections and networks? The efforts in this paper are not focused on trying to give answers to these questions. Highlighting them is the way to show the problem of crisis in education which is expected, as it is pointed out, to alleviate social crisis. This crisis of education is often blurred by various neo-liberal concepts of education in which, under the constant illusion of emphasizing the free development of the individual, the fundamental universal guidelines of education are ignored. Consider the following words: "Zealous advocates of reform must be talking about the individual and his responsibilities, but they are deep in their hearts determinists, deeply convinced that the structures determine everything. They therefore prefer to deal with structural reforms, not finding anything so disgusting as structural conservatism" (Liessman, 2009, 142). Therefore, the question of human's/individual's position in the current crisis of education is more emphasized.

A man treats the world that surrounds him through the system of knowledge and values. He is a being who has not been given "ready-made things" because man is a being to whom things are "assigned". This means that he is a being that by his birth is still not the thing that he should be. This, to use the Nietzsche language, "loose animal" needs to go through the development process after his birth and cross the path from biological individual to personality. This development path, in which special human characteristics are being developed, is based on potential and tendencies that a man has, is named the process of upbringing/education. In upbringing / education as "the shortest way to man's ascent to humanity" (Slatina, 2000, 365), a *conditio sine qua non* is being hidden when it comes to human development path and his becoming a human being. It is unimaginable and impossible to find some form of human society in any historical period, nor any human individual, which in its basis of existence does not contain procedures and ways of conquering and transferring knowledge, in the broadest sense of the word, necessary for their survival, changing and transforming. That is why upbringing and education always carry "social" and "individual" in themselves, not as opposites or exclusivities but as two guidelines which overlap and reinforce. On the level of "social" we are talking about the influence of older on younger, introducing young people into the social world and conquered system of social knowledge and values, and on the level of "individual" we are talking about upbringing that enables this influence and introduction. "Among all the characteristics by which a person is very different from other beings, a special place certainly belongs to upbringing. It is exactly the thing that makes him the only truly social being - being that its essence, culture and purpose of its existence, cannot satisfy by the very birth, but only by life and education in the community" (Polić, 1997, 150).

We face, therefore, many problems that are directly or indirectly connected with upbringing and education. "Today's world is not only image of new discoveries and progress but (also) the kind of performance of violence and drama of man's moral action and life. Despite the modern scientific and technological progress of mankind, our time registers a series of assaults and attacks on human life (alcoholism, drug addiction, various forms of euthanasia, genetic manipulation, selfish organ transplantation, torture, executions, murder, terrorism, wars, crimes, genocide) ... It is obvious that the moral progress of mankind today has not kept pace with his intellectual progress" (Slatina, 2005, 11). In addition to these problems in today's global information age, the special attention has been directed towards intercultural education which aims at a common and peaceful life of people who come from different cultures with all the diversity which in their totality constitute the uniqueness of the world. In efforts to respond to these problems and challenges and in order to find so called „pedagogical solutions“, we often reach for a frequent term which sometimes becomes a purpose in itself and it is "reform of the educational system" (Tufekčić, 2009, 266). The phenomenon of upbringing is inextricably linked to the phenomenon of education and its characteristic is to be always in reform because upbringing and educations are also by themselves reform and change. The misfortune is often in the fact that every time the reform is being accessed, it comes to such occurrences that we believe that everything that is left behind is underdeveloped and that we are the ones that will build a "contemporary, modern, efficient" system of upbringing and education. Such opinions often rise to the level of major "scientific" and "professional" achievements and are declared the "best" solutions. Basically, this occurs mainly because most of the focus of attention is always on the form, and the essence remains "intact". This is very noticeable in the reform stunts of the so called transitional societies such as the Bosnian society, in which among other things it happens that one child-centeredness is formulated in the terms such as "child / student in the center of attention" or "school is child's friend" appears as one of the best solutions for the organization of school work. As much as these ideas appear as new, I offer personal observation that they are consumed and outdated ideas because in essence they are really "production" of limited manpower to "modern times", in other words, of neoliberal capital. In addition to numerous reforms, we continue to face the great misfortunes in the modern world (wars, human suffering, hunger and illiteracy in the XXI century), which are mainly "creation" of those who are educated and who have a huge number of scientific information which do not preserve but in various

ways destroy the man (Tufekčić, 2009).

It is necessary to impose such a simple but also extremely complex question: why is it so? In an attempt to answer this question it is evident that in the development of some pedagogical areas and their application in pedagogical work, especially the one that is related to school and teaching, there was neglect or some sort of (unusual) distancing from the fundamental anthropological guidelines of upbringing and education. This problem clarifies Slatina (2001, 66) through the analysis of school due to the upbringing and education as human and as a social necessity: "In our teaching practice dominates the cognitive school model. A school that is only a means of supplying the society with usable workers rests on the wrong anthropological assumptions." In the foundations of modern educational crisis lies precisely this problem. Moreover, we find an interesting observation by Pastuović (1999, 23-24) that "the educational crisis is not only educational but also upbringing. It is interesting that the upbringing crisis is detected later than educational, although, according to the latest analysis, it is more dangerous for the sustainable development than educational. The upbringing crisis is more complex and less transparent than educational. This can be seen from the list of some of the major causes of the school's inefficiency in upbringing." The next question is: What is the position of children and young people in recent educational crisis?

A possible answer to this question is that the children and young people are usually left to themselves. It happens often that behind the terms like "democratic education", "school as child's friend", "child in the center of attention" etc. we have hidden adults' indifference for essential needs and problems of children and young people. In other words, children and young people are liberated from those activities and "efforts" that they should experience and live through from the aspect of developing their own personalities while on the other side we set before them certain forms of behavior and actions that belong to the world of adults. "Intensive institutional colonization of childhood can lead to its extinction" (Postman, 1994, according to Nenadić, 2010, 274).

So, big aspirations about "free education" in the result lead to neglect of a child and his surrender to himself and strengthening the preset images on upbringing by the adults. At the same time, neoliberal colors of happiness (hedonism) and child-centeredness in these pictures of adults lead to such (non)educational results that are reflected in the inability of developing the picture of childhood in children or in other words not being able to develop self-perception and image of life (Tufekčić, 2013, 77). "In summary, for modern childhood we can argue that the adoption of culture in children has significantly changed: secondary experiences are growing, the ways of behaviour focused on consumption and previously interpreted forms of interpretation. But according to new theories about the activities and findings, the own activity represents a material surface of cognitive activity and the image of the world and reality is related to the active dealing with reality" (Folling-Albers, 1989, according to Gudjons, 1995, 96).

In schools, it is evident that under the pretext of developing "free and creative people" we leave children without the optimal development of their life forces and specific human characteristics. This happens through permanent development of "culture of idleness and consumption" and "management culture" in schools from one side and developing "ideology of success" on the other side. Failure to develop all necessary competences in children and young people in processes of formal education is in a weird and dangerous way compensated with a false image of success. Besides that the questioning about what consequences this phenomenon has on the social position of children and young people necessarily occurs. While in a way we "enchant them with school success" we do not think about the level on which children and young people develop personal skills important for free and self-conscious life in the 21<sup>st</sup> century. In the process of education of children and young people we deprive them of these competencies and in return we develop "overprotective" relationship towards them which we want to show as "child care". In addition, the children and young people are often found in the open space between family and school which transfer responsibility on each other for the situations in which children and young people try to point out that they are in the state of neglect and mistreatment, while at the same time that lack of interest for the development of children and young people as free, self-actualized personalities, personalities that are ready for critical reflection of the realities of life, they explain by the fact that they want to provide children with "free" and "unrestricted" development. Let us recall the words of Hannah Arendt pronounced in the mid 20<sup>th</sup> century: "It appears that the child freed from the adult authority is not liberated but subject to even worse and indeed tyrannical authority, the tyranny of the majority... The reaction of children to this pressure is either conformity or juvenile delinquency, or, quite often, a mixture of both" (Arendt, 1954). Let us add to this the fact that the results of pedagogical research in the field of family upbringing showed that overprotected children ultimately show similar personality characteristics as well as the so called abandoned children.

Furthermore, the deep ideological education institutions, rather strong negative aspects of the hidden curriculum (conformism, subordination, the inability of conscious rejection of the state of humiliation, developing passive traits of will and character, etc.) and who are faithful picture of contemporary social processes, especially in transitional societies, do not allow emancipation, maturity and self-determination of an individual and develop noncritical acceptance of the ideology of consumer society where everything turns into commodities and where "sociability is not based on solidarity but on conflict" (Močnik, 1999). "Simply put, instead of parents (*and schools* – a remark A.T.) teaching children to the socially acceptable behavior, they try to as much as possible and as quickly as possible fulfill the wishes of their children. That transformation of one of the key processes in the society is related to the transition from working society to the society of consumption, and the processes of individualization and subjection" (Nikodem, 2010, 174).

Efforts of the so called neoliberal pedagogy that are really too beautiful to be true are directed towards subordination of the children to unnecessary forms of rule of man over man or a group of people over another group of people. That is why, the position of children and young people, their quality of life in the processes of education in today's times and social realities

certainly seek actualization of programs of critical educational science, because “the attempt of established critique of existing pedagogical relations is undoubtedly justified” (König and Zedler, 2001, 137). This critique of existing pedagogical relations based on the ground postulates of critical educational science involve constant reference to the problem of identifying the contemporary upbringing / education and indoctrination. Therefore, a critical approach to modern upbringing – educational opportunities involves constant differentiation of these two processes that are formally very similar but fundamentally are opposed to each other and are mutually exclusive. In a looser interpretation, here will be given some explanations between differentiating upbringing/education and indoctrination which are discussed by Slatina (2000, 373), in the following tabular overview:

Table 1. Differentiation between upbringing/education and indoctrination

<b>Upbringing/education</b>	<b>Indoctrination</b>
<i>Preparing people to accomplish their own possibilities</i>	<i>Getting people used to use their possibilities in limits</i>
<i>Forming an open spirit</i>	<i>Forming closed and rigid conscience</i>
<i>Development of feeling and need for freedom and personal dignity</i>	<i>Getting people used to loyalty and obedience</i>
<i>Teaching people that they can think anything, work, believe and evaluate</i>	<i>Guiding people to think, to work, to evaluate in a specific way</i>
<i>Developing the ability of independent and free thinking</i>	<i>Making people dependent</i>
<i>Offering ideas</i>	<i>Forcing ideology</i>
<i>Pointing to the possibility of choice, to the alternative</i>	<i>Removing all alternatives, offering only “one solution”</i>
<i>Offering information, facts, views on which there is general agreement</i>	<i>Extortion of a general consent for your own, personal opinion</i>
<i>Offering the truth as tuition and lesson</i>	<i>Offering your own message as truth</i>
<i>Practicing others to set hypotheses in order to check them</i>	<i>Guiding others to believe in totally suspicious things</i>
<i>Using checked data</i>	<i>Misuse of all data</i>
<i>Reasonable and progressing action on the behavior of others</i>	<i>Unreasonable judgment</i>
<i>Entering the relationship of mutual learning</i>	<i>Teaching by the principle „magister dixit“</i>
<i>Learning to know, to do, to live, to be</i>	<i>Learning to have, to own, to rule</i>
<i>Building the authority of truth</i>	<i>Imposing irrational identity</i>
<i>Mistaking because of ignorance</i>	<i>Conscious and deliberate spreading of delusion</i>
<i>Efforts to expand the knowledge of others</i>	<i>Desire to narrow down the rational possibilities of others</i>
<i>The existence of a solid target (forming a complete person)</i>	<i>Accomplishing partial goal</i>

In a number of mentioned educational reforms a lot more attention is focused on developing new and more successful methods and techniques of learning and teaching, in other words on more successful adoption of educational contents rather than on shedding the light on the differentiation between upbringing/education and indoctrination. This has led to the fact that education in various ways is becoming more in the service of requests that in themselves carry less internal logic to education and more market logic, the logic of manipulation and the logic of “human resource management”. Therefore, it is necessary to reaffirm theoretical - methodological traditions of critical theory of society and the so called conflicting views on education in contemporary reflections on education in order to fully comprehend the place and role of this very important human activity. This is because once again the question is raised of whether the inner world of education should be determined by an autonomous educational awareness or is the current “relative autonomy” of education contemporary concealment of the processes of converting natural differences of people in their inequalities (Bourdieu and Passeron 1971, according to Gudjons, 1994, 209). The consequences of avoiding this theoretical - methodological discourse reflects in the fact that the reform of educational institutions is not directed towards and from the theory of education but it comes down to adopting various regulations which turn educational institutions from places of free education into places of “unfree service activity” (Liessmann, 2009, 77).

Emancipatory education involves developing opportunities for children and young people to participate in present and in some new world in a new paradigm of critical thinking because “education is the field where we show if we love our children enough not to force them out of our world and leave to themselves, not to take their opportunity to try something new but to prepare them in advance for the task of renewing our world” (Arendt, 1954). We are all responsible for this. Education can help, but today the education itself needs to be helped.

### 3. Instead of conclusion

Critical educational science provides if not a complete and fully developed concept then at least one very important segment in the range of different theoretical and empirical approaches to looking at contemporary educational crisis as well as the phenomenon of education in general.

At all times and in all areas of human life different ideologies are possible and sort of capture the different ways of social institutions including the sphere of education. The attempt to resolve numerous problems related to upbringing and education has always brought new forms of ideological submission. Education has always shared the fate of the society in which it is organized. All social processes and phenomena and social adversities have always folded up through education. But education, unlike other social subsystems has a very important and powerful opportunity. As well as receiving certain influences of the

society, because it is its integral part, education can influence the society and shine into it positive and developing forces. It has this possibility because the essence of education consists of young people that need to be taught and allowed to treat the world with all its constructive potential that a man can carry with himself. Education therefore should be the space in which we live and gain experience, the human one.

Theoretical concepts of critical educational science help to reflect and invent the situation and the position of children and young people more clearly and pedagogically expressed, for the sake of themselves.

# Recognition of diversity in the one and only Ivan from literature-based language lessons

Hyunhee Song

\*Research Professor, Hannam University

## Abstract

This paper is focused on recognition of diversity in *The One and Only Ivan* from literature-based language lessons. A literature-based approach in the second language (L2) classroom offers a variety of benefits. It encourages sense-making or meaning-making of a whole text (story, poem, etc). Fountas and Hannigan (1989) contend that once students understand the general meaning of the whole text, they are better prepared to deal with the analysis of the parts. A literature-based approach also promotes active engagement and collaborative work so that learners contribute to class activities through direct interaction with either the instructor or with peers. They also participate through sharing information, asking questions, and reflecting on their understanding, as well as working together to make sense of the text under study. Another advantage of this instructional approach is its incorporation of a human component so that learners can identify with characters who face common human conflicts and problems, such as fear, hate, love, etc. Learners have the opportunity to reflect on the characters' actions and choices and then discuss whether they agree or disagree with the characters' decisions (Adair-Hauck, 1996). Furthermore, a literature-based approach supports integrated as opposed to segregated skills and, as a result, its associated activities usually target in one lesson all the skills involved in reading, writing, listening, and speaking.

The purpose of this lesson is to put into practice some of these benefits. To carry out this intention, a story entitled *The One and Only Ivan* by Katherine Applegate (2012) was chosen. This story tells about a Old gorilla named Ivan who has been struggling with his current situation and forgotten his real life. One day while Ivan was considering, his old friend Old Stella died a very lonely and left young little elephant Ruby. At last Ivan and Ruby are both adopted by the same zoo. The story ends with Ivan and Ruby adapting to their new habitats and the other animals they will live with. I analyze this story with literature-based theory. This story was selected based on five components suggested by McWilliams (1993): Time and setting, Characters with personality, A major problem, Includes a problem and attempts to solve it, Has a quick resolution and ending. From these I prove the significance of a variety of culture.

**Keywords:** diversity, identity, prejudice, another one, literature-based language lessons, *The One and Only Ivan*

## 1. The meaning of Literature Based on Language Lessons

A literature-based approach in the second language (L2) classroom offers a variety of benefits. It encourages sense-making or meaning-making of a whole text (story, poem, etc). It also promotes active engagement and collaborative work so that learners contribute to class activities through direct interaction with either the instructor or with peers. This is its incorporation of a human component so that learners can identify with characters who face common human conflicts and problems, such as fear, hate, love, etc

## 2. The Relationship of Literature based on Language Lessons with The Use of *The One and Only Ivan*

I think we have to understand the meaning of children's literature. This includes stories, books, and poems that are enjoyed by children. Modern children's literature is classified in two different ways: genre or the intended age of the reader. This can be traced to stories and songs, part of a wider oral tradition, that adults shared with children before publishing existed.

And *The One and Only Ivan* has a special story. This story tells about a Old gorilla named Ivan who has been struggling with his current situation and forgotten his real life. One day while Ivan was considering, his old friend Old Stella died a very lonely and left young little elephant Ruby. At last Ivan and Ruby are both adopted by the same zoo. The story ends with Ivan and Ruby adapting to their new habitats and the other animals they will live with.

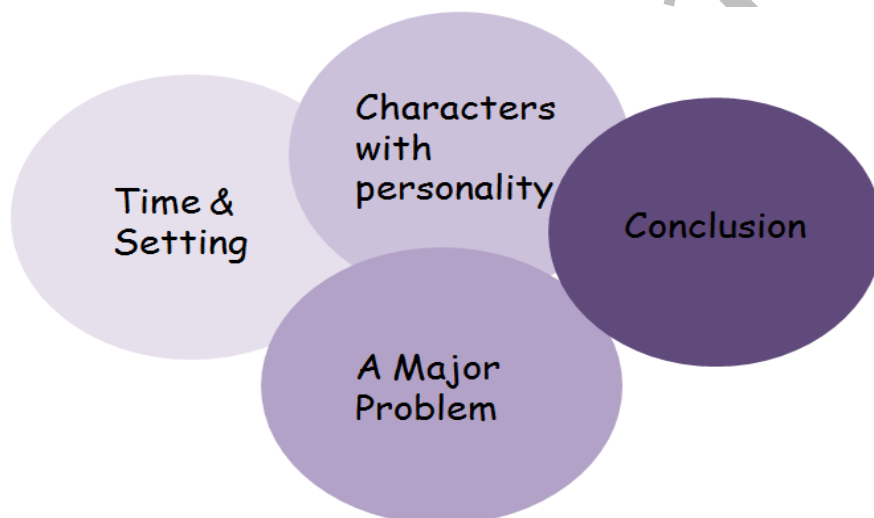

This book represents four things; diversity, education, ecology, possibility. These consists of below. First, diversity means race, nationality, LGBT. Characters of each animal represents human race. Second is education. This combined with literacy works with culture and more understandable language. Third is ecology. This is a true story who spent 27 years in a Washington mall before being transferred to the Atlanta Zoo. So we recognize the important things of nature from story. Last is possibility-

· Corresponding author. Tel.: +00-00-000-0000  
E-mail address: laerdal@naver.com

compare another book. It foster people's expanding creative thinking.

And I try to point out the strong point of using book. First is comparing. This means easy to access another culture & people, expand the range of level, and enhance their comprehension of similarity & difference. Second is problem solving; it is connected with time and setting, characters with personality, a major problem, includes a problem and attempts to solve it (McWilliams, 1993).

Last point is creating. It means that share ideas through book and make their own thinking (more creative).

### 3. Conclusion

This kind of book give some effect of literature based on language lessons. We cans easily understand another culture and world. From their reality, we can give some questions; Ivan's blocked shopping mall? Is this Africa? They want to go to the transferred zoo? And we can find the efficiency of studying English from making a map, creating a short story. Also enhance to make a collaboration.

There are lots of suggestion for further research; Combining with a various media, Cooperating with another book, Applying in the deep theory, Enhancing more efficient studying method.

# Record, evaluation and planning of knowledge work experiences on personal research environments via life logging system

Buket Kip Kayabas<sup>a,\*</sup>, Mehmet Emin Mutlu<sup>b</sup>

<sup>a,b</sup> Anadolu University, Eskisehir, Turkey

---

## Abstract

In this study, record, evaluation and planning of knowledge work experiences in personal research environments is applied via a life logging system, which has ability to capture screen shots and camera shots continuously for a month and then observations of this study are discussed. The life logging system is individually applied by first author for a month and then it is evaluated by both of the authors via logs and semi-structured interviews. As a result of the evaluation, it is seen that the life logging system has a potential for managing knowledge work experiences on personal research environments.

## 1.Introduction

### 1.1.Knowledge work environments and personal research environment

According to Mutlu (2014a) the experiences based on individual's personal data, information and knowledge can be gathered under seven different environments such as "personal communication environment", "personal media environment", "personal transactions environment", "personal working environment", "personal publishing environment", "personal learning environment" and "personal research environment" by using environment approach. When they are compared according to the competencies, they are required to have, personal communication environment is the most commonly used environment. And it is followed by personal media environment. After these two, personal transactions environment comes. The environments mentioned until this point are the ones which are used intensively by the groups other than the knowledge workers. The predominant environments of the knowledge workers start with personal working environment. Personal publishing environment follows that. Personal learning environment contains partially all the environments mentioned before. Last one is the personal research environment and it represents the highest level of the knowledge work.

Today, scientific research activities mainly carried out on computer environments and Web 2.0 technology provides significant opportunities to share the research, sources and results. Online libraries, research platforms, scientific social networks, document share applications, bibliographic reference management software, social bookmark managers, citation indexes, blogs and wikis, scientific news services, open access services have become the tools that researchers spent more time with and the group of these tools forms personal research environment. At the first phases of internet, accessing data and information were important but after Web 2.0 the "sharing" became the outstanding activity. In personal research environments, main activities are grouped as sharing the research's itself, sources and results of the research. (Rebuin, 2011, Mutlu 2013).

### 1.2.Knowledge work environments and personal research environment

When it is considered on an integrated basis, personal knowledge contains all the life experiences which are related to individuals' personal data, information and knowledge and happens at individuals' knowledge work environments and these experiences are mingled with the other life experiences of the individual. Not all of the knowledge work experiences are planned beforehand and neither they occur deliberately. By borrowing the approach which is used in "extended informal learning model" (Mutlu, 2014b) taxonomy given below can be formed according to initial planning and consciousness of the knowledge work experiences:

- Implicit (tacit) knowledge work experiences which are happens unconsciously and unplanned.
- Integrated knowledge work experience which happens unconsciously but planned.
- Reactive (incidental) knowledge work experience which happens consciously but unplanned.
- Self-directed knowledge work experience which happens consciously and planned.

While individuals easily realize their self-directed learning experiences simultaneously or later on, realizing other life experiences is not easy and it is mainly dependent on strength of the individuals' memory and ability to review their life. In order to realize the experiences at individuals' knowledge work environments, it is required to capture and record all the life experiences of the individual's physical and virtual environments.

### *1.3. Recording knowledge work experiences*

Simultaneous record of personal experiences is named as "life log" and it is focused to save, archive and access the data and information gained via wearable-portable sensors (Bell and Gemmell, 2009; Sellen and Whittaker, 2010). The first idea of saving life experiences is dated back to Memex vision of Bush (Bush, 1945). In 90s life log researches gained importance with the help of Mann's wearable computer studies (Mann, 1997), and Aizawa's studies (Aizawa et al., 2004), Microsoft's SenseCam camera (Hodges et al., 2006) and MyLifeBits Project developed by Gemmell and Bell (Gemmell et al., 2002).

Even though cognitive, spiritual and religious experiences cannot be saved directly, it is possible to save physical, social and virtual experiences. A tool named as "multiple device based life log system" developed by Mutlu (2014b) to save learning experiences can also be used to save knowledge work experiences. In this system, a wearable camera which records camera shots at every 30 seconds is used for saving experiences occur in physical environments. In order to save the experiences occur in virtual environments software which can take screenshots at each 30 seconds is used on desktop computers, laptops and tablets. The content belonging to knowledge work is not recorded via camera shots and screen shots instead a mnemonic visual related to the work is obtained. These visuals are enough for retrieval and recognition of the knowledge work experiences.

### *1.4. Recording knowledge work experiences*

Inspired by "management of learning experiences" (Mutlu 2014b) an approach which is for management of experiences in personal knowledge work environments, a three stepped approach mentioned below is suggested (Mutlu 2014a). Third stage of the approach is updated and typology of knowledge work experiences is included.

- Do the knowledge work. (With this aim individual uses processes and tools suitable for the nature of the knowledge work in knowledge work environments.)
- Save knowledge work experiences passively. (Experiences of individual in physical and virtual knowledge work environments are saved as screenshots and camera shots at 30 second intervals spontaneously.)
- Manage knowledge experiences. (At this stage, the individual relates the experiences with the context space and comments, do activities such as tagging knowledge work experiences, and activities such as evaluation-controlling-planning)

At the third stage of the suggested approach, the individual scans life experiences he/she obtained via the life log tool and interprets these experiences hierarchically such as "activities", "episodes", "stories". Then places, persons, events, behaviors, attributes and assets related to these experiences are transferred to lists of contexts and notes taken for every context. Knowledge work experiences are tried to be determined by evaluating experiences and comments, then these experiences are tagged as "implicit (tacit) knowledge experience", "integrative knowledge work experience", "reactive (incidental) knowledge work experience" or "self-directed knowledge work experience". Lastly, planning lists towards future, control lists for current situation and evaluation lists for past are created for management of knowledge work activities.

In this study, attainability and manageability of knowledge work experiences are researched by applying "management of knowledge work experiences" approach. With this aim, life experiences of the first author of the paper, who is also a Ph. D student at dissertation level, are recorded via life log system for a month and knowledge work experiences in her own personal research environment are tried to be caught and managed via experience processing software. Application is evaluated with the help of observations, logs and semi-structured interviews by both of the authors.

## **2. Method**

### *2.1. Action Research*

In this study, action research method is applied. Action research is a common self-reflective investigation technique which is carried out by participants in order to realize their own social or educational activities and the situations at which these applications take place as well as to develop rationalities and judgments related to them (Kemmis and McTaggart, 1988: 5; McNiff and Whitehead; 2002). Action research method can be applied for the studies in which action is applied by researcher's himself/herself, self-observation during the research and self-evaluation periods and it is also preferred because of the fact that it includes an applicable and controllable process. Action researches towards developing a new system, determining problems of an existing system or improving it are usually developed as action cycles. In this study, it is aimed to obtain new results and findings by applying an approach which is designed and tested before within a bordered area. Because of that action research is designed as an action cycle which contains steps such as (a) defining the question of action research, (b) defining the research, (c) planning and applying the action, (d) gathering data by examining the action, (e) evaluating the observation results and (f)

reflecting results in a critical approach.

## *2.2. Action research question*

If a knowledge worker saves daily life experiences via a life log system, can he/she catches and manages knowledge work experiences in his/her personal research environments among these experiences?

## *2.3. Definition of the research*

In this study daily life experiences of the first author is recorded via a life log system, then they are scanned in order to find knowledge work experiences in personal research environments and management activities related to these experiences are carried out. This process is observed and evaluated by both of the authors.

## *2.4. Planning and applying the action*

The action is applied from 15 May till 15 January 2014. During this term, first author of the study recorded her daily life experiences via a life log system and commented on them by interpreting these experiences with the help of a experience processing software once in every two days. A system which works on personal and business computers of the author and catches screenshots and camera shots at every 30 seconds and saves them on OneDrive (SkyDrive) cloud environment is used as a life log system. By scanning these records every week the author collected findings which are accompanied with these experiences and collected them on a personal research environment. Parallel to this transaction she caught and tagged personal research environment experiences within her life experiences. Lastly, she used “to do lists” “lists of the activities done” and “lists of the activities she completed” in order to plan, control and evaluate her experiences in her own personal research environment.

## *2.5. Collecting data by observing the action*

In order to observe the action, both of the authors recorded their daily activities belonging to this process via life log. Daily records are interpreted by both of the authors via an experience processing software, semi-structured interviews are done by meeting once-twice a week and interview notes are saved as daily activity notes.

## *2.6. Analyzing data in order to evaluate the action and critically reflecting the results*

Authors collectively evaluated observations and they have made mid-term evaluations by gathering together at the end of each term. With this aim, they used the records they made and interpreted them via life log system.

A report, which also includes critics towards application of the action, is formed by using the evaluation results.

## **3. Findings**

The first author's daily experiences by using life log system recorded for a month. And the “management of knowledge work experiences” approach is applied on them for a month. And the findings obtained via observations and evaluation meetings carried out by both of the authors are arrayed according to management of knowledge work experiences approach.

### *3.1. Critically reflecting the results*

Images belonging to life experiences which are recorded to the cloud environment via OneDrive (SkyDrive) and caught by life journal system are scanned on hourly, daily, weekly, monthly basis and activities, episodes and stories related development period of the software are tried to be determined. In order to make it clear in scope of management of knowledge work experiences, comments which can be found during longer research periods are also mentioned.

**Activities:** Because of the fact that the first author, whose life experiences are recorded via life log system, is at dissertation stage, it is seen that most of the knowledge work experiences she had on her personal research environments are about her dissertation thesis writing. In this phase, she deliberately worked on her thesis. Aims are determined by defining the problem and framework of the method part of thesis are tried to be formed. Draft of the thesis proposal presentation is prepared. At the same time, summarization and archiving of the researches are made with the help extensive literature scans for reporting process. During application period weekly interviews are regularly made with counselor and all of them are recorded. Another experience occurred in this period as a result of the writing process of two separate papers for presenting them at a congress.

If the study wasn't limited to a month, it would have been covered all the thesis writing process and it would have included a wide list which contains literature scan, taking notes, creation of the draft, quotation, referring, writing sub-chapters of the thesis such as summary, introduction, collection of data, data analysis, findings, discussion, results, suggestions, writing references,

making interviews with the counselor, preparing thesis follow-up juries and attending them, preparing thesis presentation and presenting them in addition to the activities mentioned above.

**Episodes:** During application period, dissertation proposal is prepared. During dissertation proposal preparation period, problem, aim, importance and limits of the thesis study is asserted first and main framework of the method chapter is determined. At the same time members of the jury is assigned and both the author and members of the jury are informed.

It is seen that main episodes of thesis writing process are determination of the thesis subject, making weekly interviews with the advisor, attending thesis follow up juries, writing parts of the thesis consequently or correspondingly, attending thesis defense jury. These episodes are the ones which triggers, directs and enables us to categorize meaningfully all the activities belonging to the process and they will be remembered even though long time passes after the thesis writing process.

**Stories:** Stories are summaries of life log entries at the highest level which are used for defining the individual's life with its main lines. For an academican conducting a research, giving lectures and performing his/her administrative tasks, if he/she had any, are main stories and main episodes related to his/her carrier. During application period main story defined in personal research environment is thesis writing process' itself. Other story contains other academic publishing works which are carried out during the same period. Third story is administrative tasks of the author who also continues her job as a manager of e-certificate Programmes of Faculty of Distance Education.

### *3.2. Findings Related to Contexts*

During research, findings related to recorded experiences are tried to be determined and persons, places, episodes, behaviors, features, emotions, assets are logged into their own lists. Even though, some of the entries in contextual lists related to the experiences are the ones which appeared for the first time during the research period, some part of them are the ones which are related to the new experiences she had during the research process. The data given below is found mainly in lists of contexts.

**Persons:** It is seen that thesis advisor, members of thesis follow up jury and the environment which mainly consists of colleagues with whom thesis subject is discussed, co-authors with whom she worked together while writing the paper, her supervisors to whom she communicates with in order complete her administrative tasks and her colleagues are main entries.

**Places:** It is seen that during that period personal research environment is mainly used at her office and home. Besides, she accessed her personal research environment for meetings she holds with other authors and her advisor for her administrative tasks.

**Events:** During this process main events are determination of thesis subject, appointment of members of jury and basic events related to administrative tasks (exams of the certificate programs she is responsible for and beginning of the new semester.)

**Behaviors:** Behaviors are routines we have. Daily, weekly, monthly and annual routines of the author during the research process are tried to be determined and recorded. Fundamental behaviors towards personal knowledge work in personal research environment defines our practices such as accessing the information, creation of information, changing, forwarding and saving it.

**Attributes:** The characteristics an individual have are formed, changed and accumulated in time. The new administrative responsibilities undertaken by the author of the paper during research period can be given as an example of the new characteristics she gained related to her personal research environment

**Emotions:** Contexts related to emotions may contain the entire perception that cover individual's inner world. Especially life-deep learning experiences are closely related to the individual's subjective perception, his/her inner world and his/her past and while individual manages his/her life he/she usually ignores these contexts. From time to time individuals know and manage themselves better as long as they put on paper the experiences which are accompanied to these contexts.

**Assets:** Assets of knowledge work experiences in personal research environments are the tools which can be usually defined as the software, hardware and services used, sources and contents. It is observed that during her research period author used online resources that belong to Anadolu University Library very often.

### *3.3. Findings belonging to knowledge work experiences take place in personal research environments*

The learning experiences found while scanning these experiences are tagged as "implicit (tacit) knowledge experience", "integrative knowledge work experience", "reactive (incidental) knowledge work experience" or "self-directed knowledge work experience". It is seen that the knowledge experiences of the author are concentrated on the headlines given below.

#### *3.3.1. According to knowledge work environments*

**Personal communication environment and personal media environment:** In addition to the e-mail, it is observed that various social media environments are used. It can be said that, especially on social media environments, covered knowledge work experiences happen unplanned and unconsciously. For example, while she was in communicating with her friends via a social network, an article about benefits of the yoghurt was suggested on the same screen and after it is read by author it made her to have an unplanned and unconscious learning experience. Suggestions of social media sites similar to this kind of knowledge sources which cause the occurrence of a lot of covered knowledge work experiences. These experiences are interpreted by scanning the screen shots which are taken at every 30 seconds.

**Personal transactions environment:** During research period, main transactions are the ones done at Anadolu University website, online library transactions, services of online magazines, transactions made on the website of the conference she is interested to.

**Personal working environment:** During research period, a personal working environment, on which Microsoft Office software and internet based software are mainly used, is utilized in order to complete administrative tasks.

**Personal publishing environment:** During research period nothing is published on author's o personal Blog and wiki pages. In real life, both of these two personal publishing tools will be used more in order to direct the PhD dissertation process.

**Personal learning environment:** It is seen that web browsers and folder, in which she backs up the documents she gets, are at the center of author's personal learning environment.

**Personal research environment:** It is observed that the author mainly benefits form online library services of Anadolu University. Also she plans to use Mendeley reference management software more in order to manage her academic studies.

Self-driven knowledge work experiences, which are consciously planned, carried out. And also they are observed on personal work, personal learning and personal research environments. While she is writing her doctorate thesis, the author follows certain calendar and obeys her daily, weekly and monthly working schedule. During application period she scanned sources she determined in literature, archived the researches which she will use in her thesis by summarizing them and she has done planned activities such as taking notes, recording, and reading.

### *3.3.2. According to activity type on personal research environment*

**Sharing the research:** Sharing the research on personal research environments are usually done via research platforms, scientific social networks and file share applications (Mutlu, 2013). It is also observed that the author shared her publications on Academia, ResearchGate and SlideShare in this period.

**Sharing resources:** Researchers would like to share their sources with the others and benefit from other researchers sources during their research. With this aim, they use bibliographical reference management software, bookmark managers and citation indexes (Mutlu, 2013). It is seen that the author uses Mendeley, Diigo, Google Scholar Citation and Microsoft Academic Research web sites during this period.

**Sharing results:** One of the fundamental characteristics of Web 2.0 and social networks is the fact that they enable researchers share the results of their researches via blogs, wiki sites, news services, open source magazines and open source archives. So researchers can introduce their researches more to the other researches and enable them to cite from their own work (Mutlu, 2013). Because of the fact that the academic studies of the authors haven't been resulted yet, activities related to share of the results haven't been observed.

### *3.3.3. According to knowledge work typology*

**Implicit (tacit) knowledge work experiences:** It is observed that, implicit knowledge work experience are unwittingly within the self-directed knowledge works which are carried out planned and deliberately. While author is conducting her planned knowledge work, she also realizes that she reached a lot of information and gained experience unwittingly and unplanned.

**Integrative knowledge work experiences:** While the author was writing the report of her thesis proposal, she had integrative knowledge work experiences which happened planned but unwittingly. Even though reporting period is a planned activity, the learning experiences she gained unwittingly during this period, are evaluated under integrative knowledge work experiences.

**Reactive (incidental) knowledge work experiences:** Unplanned and deliberate reactive knowledge work experiences are coincided frequently especially during literature scan. The knowledge work carried out which includes reaching primary sources of the citations made from other sources can be placed in this category.

**Self-directed knowledge work experiences:** When screenshots and camera shots taken during the application period are interpreted it is realized that self-directed learning experiences are the ones which disguised fastest and easiest. Author could determine easily the knowledge work experiences which were started in a plan and she was also aware of the fact that they will end up with learning by examining the record imageries.

### *3.4. Findings belonging to knowledge work experiences take place in personal research environments*

During the application period, it is seen that first author has abilities towards planning the future, supervising the current and evaluating the past and these are mentioned below:

A calendar, which is required to follow during the thesis writing period, is prepared and monthly activities are determined in accordance with this calendar. Studies are conducted mainly according to scheduled work-time chart. Monthly activities are determined on this calendar later on weekly and daily activities are also determined. Annual working plan is summarized on a monthly basis and logged into the AllMyListsLE experience processing software. When the time of planned episodes and activities come, they are evaluated by reviewing their completion rates. On the other hand, previous events and activities are also reviewed and this enabled user to update his/her current and upcoming episodes and/or activities. During research period planning, supervision and evaluation processes are applied for a month. It is foreseen that the process will be applied after the research period in order to easily follow knowledge work activities from previous year, current year and upcoming year.

#### 4. Discussions, results and suggestions

Continuous record of daily life experiences of the individuals via life logging tools enables us to evaluate these experiences later. The system is also required to be economic and easy for sustainability. In this study, passively and non-assertively recording the experiences via life logging system, then scanning fast and systematically the caught experiences by the individual and developing them by interpretation are enabled with the help of existing suitable tools.

The results mentioned below are obtained at the end of the research:

In this study, operating researcher recorded all of her knowledge work experiences via life logging system on her personal research environment for a month. She scanned these records once every two days via AllMyListsLE software and defined knowledge work activities, episodes and stories. Practitioner -researcher applied the three staged “management of knowledge work experiences” flawlessly from beginning to end with the help of the experience she gained during another research she conducted via management of learning experiences by using same tools.

The author focused on the knowledge work experiences, which belong to a specific story (writing a PhD thesis), so she was able to distinguish the episodes and activities related to this story amongst the others. She gained ability to interpret each episode together with the context they belong to while her awareness towards contexts related to these experiences are increasing. And she turned her personal database which is created by these contexts into a powerful personal knowledge management tool.

Later on, she also realized her unplanned or unwittingly learning activities in addition to her planned and conscious ones with the help of crosshatching. Especially determining unplanned and spontaneous covered knowledge work experiences in personal learning environments and recording them later on, supports revealing process of the covered knowledge of the operating researcher.

Planning knowledge work experiences in personal research environments as activities, episodes and stories, auditing and evaluating the experiences he/she had with these concepts enables us to manage these experiences flawlessly and fluently.

Systematical observation of knowledge work experiences is a relatively new research area. In this study, natural steps of method of management of personal knowledge work experiences are applied on only one practitioner for a month. If we apply method of management of personal knowledge work experiences in future studies on more subjects, it will be possible to find out the acquisitions of the individuals and nature of the method in details.

## Abstract

This article presents the innovations occurring in the context of education, in regard to basic principles that can be adopted in all disciplines. In the future our suggestion is that education methods should incorporate the principles of systemic thinking and the Global Compact of the United Nations, from which derive the principles for a comprehensive education, discussed in the pages to follow. The text also details the active participation of Brazil in global forums to discuss the new principles for education, clarifying its important role in the discussion and dissemination of important global initiatives.

## Introduction

Facing the new challenges imposed by our society, it becomes essential to rethink education in teaching, particularly in relation to higher education focused on business, such as administration, accounting sciences and economic sciences. This paper proposes a new concept for the subject, from an approach adopted by the United Nations as well as the practical experience of the authors, to participate in a comprehensive debate involving stakeholders: companies and organizations, government, academic and youth.

## The end of an era

Peter Senge (2014) stated the end of the industrial age, which does not instantly imply the emergence of a new era, but a transition. Fritjof Capra (1984), in turn, points out that: "Our obsession with economic growth and the values system that underlies it created a physical and mental environment in which life has become extremely unhealthy."

According to the author, we are living in a paradigm shift, being today the turning point of society, the Cartesian paradigm to systemic design. However, the author's "today" refers to many years ago, which only shows that the ongoing change is very complex and some more time will be required for the new culture to be established, or rather some new cultures, in order to verify it with the centralized model of American culture. Such transformations are structural, they are processes that are slowly updating and changing, although generating profound impact in society as a whole. After all, companies cannot succeed in societies that fail.

Society is undergoing fundamental changes, which are more easily identified in the workplace. With the introduction of customized services, changes in business organizational characteristics strongly affect the way we understand "work". Traditional plants are becoming old-fashioned and work units are fundamentally changing with the introduction of machines and outsourcing services. Changes felt in the career plans, due to this process, are a particular challenge for education, as the needs of society have distanced themselves from the old model adopted in industrial production. Reforms in education are necessary and should be considered in this new society that is on the making.

The teaching profession also faces the challenge of providing quality education in the new models of the XXI century. The economic, social, scientific and technological needs must adapt to the introduction of sustainable development.

It is important for a country to understand how to be successful, therefore it's crucial to identify the knowledge that will be essential to this new era. In this sense, it seems clear to many that education methodology needs to change and that new

E-mail address: luiz.calado@alfa.br

principles need to be adopted, since the current education system is still built on principles that are already outdated.

### **Tools for the education of the future**

In this scenario, the perspective of a systemic vision teaches us to understand the problem as a whole. As companies started to receive inputs from other segments of society (stakeholders), schools should also encourage such behavior. Particularly, NGOs also need to be more participative in the schools, encouraging discussions about topics of interest to society, this is a huge opportunity for interaction by NGOs, especially by those who defend their causes in the dialogue with companies and government. We need to work together, as we did in the past, as Peter Senge states in his last work, *The Dance of Change: The challenges to sustaining momentum in a learning organization* (2014).

The challenge for higher degree education teachers has been posed: how to reflect on their courses the significant changes that have affected our society, especially in the last five years. For example, the issue of NGOs expressed in the previous paragraph, or in which way the electronic social networks was introduced in their disciplines.

The information society has created new communication mechanisms. Anyone with a video camera, a web site and an opinion can post a subject. This fact must necessarily be reflected in our educational system. We need to guide students on how to use such tools. Teachers, therefore, need to understand the dynamics of this kind of environment and also make use of blogs and electronic social networks in order to maintain communication at the level of their students.

My experience on teaching suggests the improvement of some essential skills to further develop education in primary and advanced levels. The birth of a new thinking in business schools, in turn, is critical to place ourselves more assertively in the economic world context.

### **Understanding the Global Compact**

In order to contextualize the reader briefly, the Global Compact is an initiative developed by the United Nations. The goal of the Pact is to mobilize the international business community to adopt in their business practices the internationally accepted core values in the Human Rights, Labor Relations, Environment and fighting corruption. It is interesting to note that the United Nations, through the Global compact, are increasing their dialogue scope, by including companies as the core of the project.

As companies started to pursue a solution to manage their growth responsibly, the Global compact was able to draw the interest of companies from different industries groups and geographic regions, ranging from major multinationals, to small companies with local operations.

This Pact, by itself, is a voluntary initiative that seeks to provide guidelines for promoting sustainable growth and citizenship through corporate leaderships which are engaging and innovative. The ten principles are derived from the Universal Declaration of Human Rights from the International Labour Organization on Fundamental Principles and labor Rights, the Rio Declaration on Environment and Development and the United Nations Convention against Corruption.

- Principle 1: Businesses should support and respect the protection of internationally proclaimed human rights.
- Principle 2: make sure that they are not complicit in human rights abuses.
- Principle 3: Businesses should uphold the freedom of association and the effective recognition of the right to collective bargaining.
- Principle 4: the elimination of all forms of forced and compulsory labor.
- Principle 5: the effective abolition of child labor.
- Principle 6: the elimination of discrimination in respect of employment and occupation.
- Principle 7: Businesses should support a precautionary approach to environmental challenges.
- Principle 8: undertake initiatives to promote greater environmental responsibility.
- Principle 9: encourage the development and diffusion of environmentally friendly technologies.
- Principle 10: Businesses should work against corruption in all its forms, including extortion and bribery.

## Principles for comprehensive education

As educational institutions are involved in the present and future citizens education, such as business managers, the institutions joining the pact for education shall participate in a process of continuous improvement of the following principles:

- Purpose: To develop students' skills to be future generators of sustainable value for business and society in general and to work for an inclusive and sustainable global economy.
- Values: Include in the academic activities and curricula the values of global social responsibility presented in international initiatives such as the Global pact of the United Nations.
- Method: Create molds, materials, processes and environments that enable effective learning experiences for responsible leadership.
- Research: Commitment in conceptual and empirical research to improve our understanding about the role, dynamics and impact of companies in creating values of social, environmental and economic sustainability.
- Partnership: Interact with managers of business corporations to extend our knowledge about their challenges in the pursuit of social and environmental responsibilities and to explore effective ways to address these challenges.
- Dialogue: Facilitate and support dialog and debate among educators, companies, government, consumers, media, civil society organizations and other interested groups and investors (stakeholders) about critical issues related to global social responsibility and sustainability. We understand that our own organizational practices should serve as an example of the values and attitudes we pass on to our students.

The goal is to encourage the alignment of business policies and practices with the values of universally agreed goals which are internationally applicable, by also encouraging other academic institutions, associations and organizations to adopt and uphold these principles.

## An evolution in the way: the use of learning goals

A system of educational goals to identify suitable teachers eligible for bonuses in cash is being discussed in some states and cities in Brazil; mainly São Paulo and Rio de Janeiro, being a desirable way to improve the teaching.

These goals, if adopted, may restore the responsibility of the teacher, who will strive to improve the conditions of schools. The state of São Paulo since 2009 adopted the salary bonuses to teachers who improve student achievement, based on a pre-established goal. Minas Gerais and Pernambuco will also apply similar measures. However, it is necessary to adopt a system which would enable to evaluate the results of teachers, according to their conditions. i.e., it is preferable to adopt goals for each school individually rather than to take up universal goals.

Teachers often feel degraded by the lack of support and poorly equipped schools to deal the environment they work in. The more teachers with proper recruitment and training, wages and compatible benefits with those activities that require similar specific qualification, the better working conditions and opportunities for development and promotion are our key challenges.

During the development process, it is important to ensure the participation of all stakeholders in the debate, including politicians, teachers and their organizations. Social debates will help to build consensus for a more efficient implementation of "teacher's policies".

We are witnessing dramatic changes in higher education degrees, such as the crescent number of people taking it, especially in the developing countries, it's increasing commercialization (trading), as well as training with a greater focus on business needs. Despite all controversial debate, the important growth of information technology and communication is at hand; and finally, it hangs towards the internationalizing of education, which entails greater flow of students and academic staff.

It is necessary an investment on teachers and school administrators, particularly the latter, which have been left apart of the debate around this issue. Administrators must possess the tools in order to motivate school teachers; only then a greater goal will be achieved. They are the ones who, through their knowledge, lead young children into being more equal human beings with knowledge and capable of demanding and building a better world (Calado & Nadai, 2008).

In Brazil, many of our teachers face serious danger in the classroom, since students members of gangs threaten them demanding money and protection against drugdealers from favelas and sometimes from the police. Many of them still exposed to inhumane circumstances in developing countries, where children of different age groups attend to the same classroom, since there are not enough qualified staff to meet the demand. We can conclude that one reason why children drop out school is because they do not find the necessary encouragement to continue studying since the circumstances are so unsettling, the education level is low and the infrastructure is almost nonexistent.

It makes sense to remember the Maslow's hierarchy of needs. According to which, people only focus on certain personal goals when others more relevant have been resolved, i.e., unsafety, unemployment and poor living conditions come before education. Without these issues met to a certain degree, it will be very difficult to make progress in education.

### **Systemic thinking in education**

We propose a wisdom by Edgar Morin, integrated, contextualized and responsible for the solution of practical and existential doubts. While fragmented, knowledge offers neither sense nor interest, while responding to questions and natural curiosities of the human being; it creates interest and makes sense. Thus, we agree with Senge (2009), when he puts forward the question: "Learning for what?" And replies: so that schools are able to teach students how to learn, so that public organizations are able to fulfill their role, so that companies can be innovative and creative.

In this discussion, Morin (2003), also offers us inspiration for the educator, which refers to the essential knowledge for good educational practice. We adapted his theory to the follow principles

- 1<sup>st</sup> - Knowledge - Error and illusion: Do not keep away the error from the learning process, but integrate this error to the process, so that knowledge advances.
- 2<sup>o</sup> - Knowledge - The pertinent knowledge: Join the most diverse areas of knowledge against the fragmentation.
- 3<sup>o</sup> - Knowledge - Teaching the human condition: We are not only a somewhat. We are more than cultural individuals, we are mental, physical, mythical, biological etc.
- 4<sup>o</sup> - Knowledge - earthly Identity: Know that the Earth is a small planet that must be sustained at all costs. Idea of sustainability, land-homeland.
- 5<sup>o</sup> - Knowledge - Facing the uncertainties: Uncertainty principle. Teach that science should work with the idea that there are uncertain things.
- 6<sup>o</sup> - Knowledge - Teaching for understanding: Human communication should be directed toward understanding. Introduce understanding between school departments, between students and teachers, etc.

Physics, as assigned by the educational programs, for example, is entirely based on axioms, rules presented as stable and permanent, and requires answers to questions that have never been made (Calado & Barontini, 2008).

The policies and actions related to improving access to higher degree education should be based on a holistic view of the system and all its parts - primary education, secondary and higher education - connected with the outside to meet market needs and local and global societies.

The basic or elementary school education is a challenge for Brazil - as a developing country, our goal is to educate all schoolchildren who perhaps today do not attend the classroom.

### **Final considerations**

The Global Compact is to assist the implementation of a reliability system of companies focused on corporate responsibility. The huge deficit and social inequalities in our country impart the companies social responsibility even greater relevance. Brazilian society expects companies to play a new role in the development process: they are agents of a new culture, social change motivators and builders of a better society.

In this discussion about educational goals, started in São Paulo and Rio de Janeiro, it would be suitable to consider the principles outlined here. Thus, the education project for the future will include key incentives.

International discussions of the similar importance often take place and focus on issues such as education reform and financial budget that should be applied, become more critical as time passes, since both issues are essential to overcome this deficit today.

It is important to acknowledge that well-paid and content teacher tends to reflect a good education, a range of greater knowledge and better use by converting it into quality education. Of course, it is interesting to adopt mechanisms to motivate teachers to update, performing their work more engaged and committed, such as the application of variable remuneration. But, for that, the role of the director should be emphasized, because in elementary and higher education in Brazil, there are fixed wages for class hours, with no additional bonuses for teacher performance.

The education goes beyond the classroom. Books, magazines, encyclopedias, internet, "everyday" conversations, lectures and conferences carry information, knowledge and learning in a different way, but no less important. Visits and trips to historic cities which sometimes aggregate knowledge in the classroom are not covered in much depth and / or sometimes children and teenagers do not absorb so easily what is being proposed. In Conferences, the issues are addressed with greater depth of knowledge which leads to those who are present to a superior interest to continue their studies of the subject matter.

In recent times, there has been a need for further education for business professionals. It is these people who, in some cases, in a very near future, will manage reputable companies in the market and will participate helping the Global compact, supporting the cause.

In a more institutional aspect, one self-regulation could be adopted for the education segment. Calado (2013) states that the more developed schools could suggest the best practices to be adopted by other schools. The most qualified entities could go further, helping public schools to achieve their educational performance. Does it sound too unrealistic? No. Most quality private schools in Brazil already have scholarship programs for needy students. These resources would be better allocated if the school was willing to empower the leadership and teachers at a public school, thus greatly increasing the scope and impact of its work. Another idea, even in this sense, would be to develop a seal of certification for educational institutions that would introduce in their educational process the precepts discussed here. In a certain way, the use of the seal of the Global Compact would be a kickoff, despite the parentheses (there is not a consistent audit process for the compliance of the Pact by the UN).

## Abstract

By reviewing a series of achievements that professional degree education has obtained in China, the author think that China's professional degree education has entered into a new period of strategic transition for comprehensively improving the quality as the core task. By the end of 2012 to early 2013, the Research Center for Graduate Education of Beijing Institute of Technology did an investigation on students' satisfaction with postgraduate education. Results revealed that the quality of the professional degree education needs to move forward a single step. Improving the curriculum rationality, Changing teaching methods, Adding practice base construction and strengthening the construction of the tutor team are the new horizon for future reform.

*Keywords: Professional Degree; New Horizon; Satisfaction; Quality; China*

---

## 1. Introduction

In late nineteenth Century, American University for further enriched and developed modern degree system, set up professional degree. In England and Australia as representatives of the Commonwealth countries, also have formed a more perfect professional degree education system. Japan and South Korea since the 1990s, also attaches great importance to the development of professional degree education, and formed a professional degree education system independently in the short term. Today, the cultivation of high-level talents has become a global trend; professional degree education has also become an important part of many countries graduate education.

With the rapid development of Chinese economic background, the professional degree education starts to meet the social demand for high-level talents. Compared with the development of American professional degree education, which has been developed a century, China's postgraduate professional degree education belongs to a new field, there are still many aspects needs improving.

## 2. Current situation of China's professional degree education

### 2.1 The training scale is expanding constantly

In 1990, China piloted the first professional degree-MBA. By the end of 1996, there were only Bachelor and Master of Architecture, Master of Business Administration. Postgraduate professional degree accounting for the proportion of the total number of graduate's degree awarded only 0.7%. But from 1997, on-the-job personnel have been recruited to pursue a professional degree, a new field for the development of China's postgraduate professional degree education opened. From then on, the training scale is expanding constantly.

In 2009, the Ministry of Education decided to expand the recruitment of professional degree scope. Enrollment began to increase sharply. It can be seen from Table 1, the number of China's professional degree postgraduate enrollment in 2012 accounted for one-third of all enrollments, more than double the enrollment in 2009. It is expected that in 2015, professional degree graduates enrollment proportion will reach 50%. As shown in Figure 1, professional degree graduates number is also increasing.

The reasons for the expanding scale of professional degree graduates is due to the rapid development of China's social background, sustained demand application-oriented high-level personnel to produce. This makes the postgraduate education transform from cultivating academic talents training to academic talents training and applied talents training.

Table 1. 2009-2012 The number of professional degree graduates enrolment

Year	Postgraduates enrolment	Professional degree postgraduates enrolment	The Proportion of professional degree graduates enrolment ratio (%)

2009	510953	72239	14.1
2010	538177	119299	22.2
2011	560168	159942	28.6
2012	589673	198883	33.7

Fig. 1. 2009-2012 Professional degree postgraduates scale

## 2.2 The training types is continually enriching

From the structure point of view, 39 categories of professional degrees exist in China, including the master level 39 kinds, the doctoral level 5 kinds, and only one kind of bachelor level. Therefore, the doctoral level and bachelor level are weak, hierarchical layout is not perfect.

From the training type of view, as shown in Table II, professional degrees covering both the legal, educational, medical and other traditional career area; as well as engineering, business administration, accounting, art, sports and other modern career field. At the same time, China has also developed professional degree with Chinese characteristics, such as Master of Chinese Materia Medica, Master of Teaching Chinese to Speakers of other Languages.

But the species is still not rich enough. In the first place, there is still a certain gap between China and developed countries. As American has set up 74 kinds of professional degrees, 55 kinds of doctoral professional level degrees, have covered the country's economic construction and social development of much-needed high-level professional industries talents. In the second place, at present, the professional degree types are difficult to meet the rapid development of China's social and economic needs of high-level talents. According to the National Bureau of industry classification standard, Chinese industry can be divided into 20 categories, 98 kinds. The degree types can include Master of Design, Master of Forensic, Master of public bidding or something in the future.

Table 2. China professional degree category

Professional degree category	Abbreviation	Approved year
Master of Business Administration	MBA	1990
Master of Architecture	M.Arch	1992
Juris Master	JM	1995
Master of Education	Ed.M	1996
Master of Engineering	ME	1997
Master of Medicine	M.M.	1998
Agricultural Extension Master	MAE	1999
Master of Veterinary Medicine	VMM	1999

Master of Public Administration	MPA	1999
Master of Stomatological Medicine	S.M.M	2000
Master of Public Health	MPH	2001
Master of Military		2002
Master of Professional Accounting	MPAcc	2004
Master of Science in Physical Education	MSPE	2005
Master of Fine Arts	MFA	2005
Master of Landscape Architecture	MLA	2005
Master of Teaching Chinese to Speakers of Other Languages	MTC SOL	2007
Master of Translation and Interpreting	MTI	2007
Master of Social Work	MSW	2008
Master of Finance	MF	2010
Master of Applied Psychology	MAP	2010
Master of Applied Statistics	M.A.S.	2010
Master of Nursing Specialist	MNS	2010
Master of Taxation	MT	2010
Master of Journalism and Communication	MJC	2010
Professional Master of Pharmacy	M.Pharm	2010
Master of International Business	MIB	2010
Master of Publishing	MP	2010
Master of Chinese Materia Medica	MCMM	2010
Master of Insurance	MI	2010
Master of Cultural Heritage and Museology	M.C.H.M	2010
Master of Valuation	MV	2010
Master of Urban Planning	MUP	2010
Master of Tourism Administration	MTA	2010
Master of Policing	MP	2010
Master of Library and Information Studies	MLIS	2010
Master of Forestry	MF	2010
Master of Engineering Management	MEM	2010
Master of Auditing	MAud	2011

### 2.3 The training goal is continually clearing

Different degree types are corresponding to different training objectives. Academic degrees and professional degrees respectively correspond to the academic and applied graduate students. Application graduate students have strong business capability and are good at technical work as well as the management, operation and decision-making work. Postgraduate professional degree education based on specific working practice has a technical and practical nature. Thus all the professional degree postgraduate training objectives are emphasize the application of objective, occupational and academic unity.

Each type of professional degrees also has their own training goal, Such as Master of Finance training objectives are: Having good political quality and occupation moral accomplishment to fully understand the financial theory and Practice, mastering the

investment and financing management skills, technology and operation of financial transactions, financial product design and pricing, financial analysis, financial risk management and related fields of knowledge and skills, solving practical problems of high-level with strong financial capacity.

Many countries take professional degree as a prerequisite to engage in an occupation. In China, every type of professional degree also has a specific occupation orientation. Such as the Master of Finance (MF) career point include: Banking professionals, securities industry professionals, certified international investment analysts, actuaries, and associate financial planners. Master of Valuation (MV) career points include: price assessors, real estate values, land appraisers, real estate economics.

However, in China, apart from the MTI and M.Arch, professional degree education and vocational qualification is still not established a link mechanism. If we can establish a link system between professional degree training and vocational qualification, it can help the student’s employment and the development of enterprises.

### 2.4 The training quality is still need to improve

By the end of 2012 to early 2013,Research Center for Graduate Education of Beijing Institute of Technology launched an investigation on students’ satisfaction with postgraduate education in 37 different level and type postgraduate education institutes around China. The survey has 32 items delineated into 4 sections. A LIKEPT five-grade (very satisfied; satisfy; general; dissatisfied; very dissatisfied) scale covering course teaching, scientific research training, instructor mentoring, management &services of postgraduate education are applied in the investigation. And that aims to evaluating the quality of postgraduate education based on the perspective of students’ satisfaction. The survey of 14000 questionnaires was distributed, 10605 questionnaires were recovered, and the recovery rate is 75.8%, which surveyed 1804 postgraduate professional degree students.

The results are shown in Figure 2, generally 66.5% of professional degree postgraduates show their satisfaction for the current postgraduate education, only 6.3% of professional degree postgraduates expressed dissatisfaction. This data shows that the quality of Chinese professional degree education has been recognized by most of the students; basically meet the needs of postgraduate professional degree education of comprehensive development. But there are still 26.8% felt the quality of postgraduate professional degree education in a “general” level, 6.3% of postgraduates voted for dissatisfaction. And in the course teaching, scientific research training, management &services are still need improving the quality. It means that the postgraduate professional degree education training quality needs improving.

Fig.2.2013 Overall degree of satisfaction towards professional degree education

*Note: satisfaction rate refers to the proportion of “Very Satisfied” and “Satisfied” voted by postgraduates; dissatisfaction rate refers to the proportion of “dissatisfied” and “Very Dissatisfied” voted by postgraduates.*

Table 3 shows the summarized responses about course teaching. As can be seen, the satisfaction rate for curriculum system voted by professional degree graduates is less than 60%, while the dissatisfaction rate reaches 10.1%. The satisfaction rate for property of frontier of course content voted by professional degree postgraduates is only 58.1%,while the dissatisfaction rate reaches 8.6%.The results indicate that the rationality of professional degree postgraduate curriculum system and the property of frontier of course content remaining to be improved. Course teaching not fully functioned in professional degree education.

Table.3 Degree of satisfaction towards course teaching

Items	Satisfaction Rate	General	Dissatisfaction Rate
Curriculum system rationality	59%	30.9%	10.1%
Property of frontier of course content	58.1%	33.3%	8.6%

Students' evaluation on improving innovation ability and employment competitiveness from scientific research is relatively low. The results are shown in Table 4, as for the ability improvement of scientific research training, 37.2% of postgraduates think of "General", "Relatively small", or "Very small" effect on improving their innovation ability. At the same time, only 52.7% of graduates vote for "Relatively big", or "Very big" effect on improving their employment competitiveness.

Table.4 Ability improvement of research training

Items	Very big	Relatively big	General	Relatively small	Very small
Innovation ability	17.7%	45.1%	31.2%	4.3%	1.7%
Employment competitiveness	17.3%	35.4%	36.0%	8.2%	3.1%
Learning ability	25.1%	49.8%	21.6%	2.6%	0.9%
Practice abilities	23.6%	44.1%	25.5%	4.9%	1.9%
Academic accomplishment	21.2%	49.5%	25.6%	2.8%	0.9%

The survey found, the main reason why students are not satisfied with the management & services are that Double-Tutorial System and the professional practice base did not work out. In the aspect of instructor mentoring, each unit of China's Postgraduate education institute generally implemented the Double-Tutorial System, and the establishment of various forms of professional practice base. But the survey showed that only 23.2% professional degree postgraduates have an off-campus mentor; only 29.2% postgraduate enter the practice base. So that the off-campus mentors and practice bases are hardly meeting the needs.

### 3. Conclusion

At present, China has established a postgraduate professional education-training mode with Chinese characteristics. First, we should fully affirm that China's Professional degree graduate education made a series of achievements, Such as expanding scale, various training types and gradually clear training goal. Secondly, we should also be fully aware of the deep quality problems and hidden dangers existed, thus requiring the continuous reform and improvement.

By the investigation, this article believes that the professional degree postgraduate education quality should be enhance in the following aspects:

- ① To increase the postgraduate professional degree enrollment ratio.
- ② To add the professional degree types, and set up clear training objectives.
- ③ To establish the link system between professional degree training and occupation qualification.
- ④ To improve the rationality of curriculum system and the property of frontier of course content.
- ⑤ To add practice base construction.
- ⑥ To Strengthen the construction of the tutor team.

## Abstract

The aim of this research is to study the connections between operational chemistry and physics problems solving skills and Mathematics Literacy Self-Efficacy of Engineering Faculty students. This research is designed as relational scanning model. The sample of this study, Chemistry, Chemical Engineering, Electrical-Electronics Engineering senior students taking “General Chemistry” and “General Physics” course has formed. In the study; “Mathematics usage scale in Operational Chemistry and Physics Problems” (MUSOPCP) with two factors which is developed by Özsoy-Güneş, Derelioğlu&Kırbaşlar (2011) and Mathematical Literacy Self efficacy Scale (MLSS) which is developed by Özgen&Bindak (2008) are used as tool of data collection. As a result, between MLSS scale with “mathematics anxiety in chemistry and physics problems” factor of MUSOPCP has a negative relation and with “mathematics knowledge” factor of MUSOPCP has a positive relation. The significant differences were found between the department with “mathematics anxiety” factor score of MUSOPCP and between the gender with “mathematics knowledge” factor score of MUSOPCP. The significant differences weren't found between the gender, department and graduated secondary school with MLSS scales.

## Introduction

Engineering education should be designed according to this approach: equipped with basic knowledge and skills in the field of, analysis, synthesis, design capable, have acquired the habit of lifelong learning to educate individuals (Ertepinar, 2000). Engineering education should be based on a strong science and mathematics education. On the other hand, a well-trained engineer to issues outside their own discipline is often emphasized in familiarity.

Success is not simply based on the possession of necessary skills for performance; it requires the confidence to use these skills effectively. The belief of self-efficacy affects the perception, motivation and performance of a person. One of the most important reasons of students' failures in physics and chemistry problem solving is calculation based problems. Students' attitudes, self-efficacy and motivation are variables which play an important role in this type problem solving.

Mathematic literacy is the capacity of the individual as thinking, producing and criticizing citizen to think mathematically when solving problems to be encountered in the future and when making decisions by understanding the role of mathematics in the world and their surroundings (OECD, 2006). Mathematical literacy is the ability of students to solve problems, to analyze, to judge and to find effective solutions in different situations and fields. Mathematics, symbols and language teaches us to interpret life. Mathematical literacy however maintains mathematical skills that can be used in daily and social life (Özgen&Bindak, 2008).

Problem solving is an action has a wide range of mental processes and skills when reached the correct conclusion (Altun, 2002). An individual with advanced problem solving skills can effectively use knowledge and can easily solve the problems encountered (Altun, 2010).

Mathematics anxiety is the state of tension preventing us from using the numbers and finding the solutions for Mathematics Problems in daily or academic life or it is the illogical state of terror lowering their performance in Mathematical Thinking, consequently impeding their learning (Miller & Mitchell, 1994). The negative attitude adopted against Mathematics can be seen as an important factor preventing the outcome of Mathematics ability in students.

## Aim of the Research

The aim of this research is to study the connections between operational chemistry and physics problems solving skills and Mathematics Literacy Self-Efficacy of Engineering Faculty students.

The Problem Statement: Is there a connection between operational chemistry and physics problems solving skills and Mathematics Literacy Self-Efficacy of Engineering Faculty students?

Sub Problems:

1. What are the levels of operational chemistry and physics problems solving and mathematics literacy self-efficacy of students?
2. How do students' levels of operational chemistry and physics problems solving and mathematics literacy self-efficacy vary according to the varieties of gender, department and graduated secondary school?
3. Is there a connection between operational chemistry and physics problems solving skills and Mathematics Literacy Self-Efficacy of Engineering Faculty students?

## Methods of the Research

In this study, quantitative research method and relational screening model has been used.

### *Sample of the Research*

The sample of this study is formed by 214 senior students taking “General Chemistry” and “General Physics” course from departments of Chemistry, Chemical Engineering and Electrical-Electronics Engineering at Engineering Faculty. 58 of Students (27.1%) are from the department of Chemistry, 99 of them (46.3%) are from the department of Chemical Engineering, and of 57 them (26.6%) are from the department of Electrical-Electronics Engineering, 119 of students (55.6%) are female and 95 of them (44.4%) are male.

### *Data Collection Instruments*

For research a three fold form has been created. In the first part personal data like the gender, department and graduated secondary school have been collected. Second part includes Mathematics usage scale in Operational Chemistry and Physics Problems (MUSOPCP) scale which is developed by Özsoy-Güneş, Derelioğlu&Kırbaşlar (2011) for define mathematics usage inclinations in operational chemistry and physics problems of students. . Third part includes Mathematical Literacy Self efficacy Scale (MLSS) which is developed by Özgen&Bindak (2008).

Mathematics usage scale in Operational Physics and Chemistry Problems (MUSOPCP): MUSOPCP formed by 10 statements requiring “yes”, “no” and “neutral” as choice of answers is a three-point likert scale.

Following the factor analysis, it is noticeable that the scale is in two factor structure and disclosed total variance is 46.864 %. These factors are defined as: 1.Mathematics anxiety in Operational Physics and Chemistry Problems, 2.Conceptual knowledge and Mathematics knowledge relation in Operational Physics and Chemistry Problems. First factor consists of the statement numbers 2, 4, 5, 7, 9, 10; second factor consists of the statement numbers 1, 3, 6, 8. Total cronbach of the scale is  $\alpha=.713$  and cronbach for the first factor “Mathematics Anxiety in Operational Physics and Chemistry Problems” is  $\alpha=.720$ ; cronbach for the second factor “Concept knowledge and mathematics knowledge connection in Operational Physics and Chemistry Problems” is  $\alpha=.675$ . Students' responses to substances, “yes” option 3, “neutral” option 2, “no” option is given 1 point. The minimum and the maximum score that can be taken from the scale are between 6-18 for the first factor, 4-12 for the second.

Mathematical Literacy Self efficacy Scale (MLSS): Mathematical Literacy Self efficacy Scale (MLSS) developed by Özgen&Bindak (2008) the reliability coefficient is defined as cronbach  $\alpha=.942$ . 25-item scale consisting 4 Negative (6, 9, 18, 22) items was prepared as five-point Likert type scale. The response range of the scale is from “definitely disagree” (1), “disagree” (2), “uncertain” (3), “agree” (4) to “completely agree” (5). Factor analysis of the questionnaire responses using Principal Component Analysis resulted in 25 items which loaded on one factor. Explained total variance of MLSS was found as 59,475 %. The minimum and the maximum score that can be taken from the scale are between 25-125.

### *Analyzing Data*

SPSS 16.00 is used to analyze the data. ANOVA, independent t-test and Post-Hoc test techniques have been conducted to monitor the scores taken from the scales in terms of demographic varieties. PEARSON correlation coefficient analysis technique is applied in order to observe the relations between scales. In all statistical processes significance at a level of .05 has been sought.

## Findings

The research findings are evaluated in the context of sub-problems.

Sub-Problem 1. What are the levels of operational chemistry and physics problems solving and mathematics literacy self-efficacy of students?

The minimum and the maximum score that can be taken from the MUSOPCP scale are between 6-18 for the first factor, 4-12 for the second and 10-30 for the total score. In this study, Students' average score for the first factor which is Mathematics Anxiety in Operational Physics and Chemistry Problems is found as 9.1028; and average score for the second factor which is Concept Knowledge and Mathematics Knowledge Relation in Operational Physics and Chemistry problems is found as 11.5888. The minimum and the maximum score that can be taken from the MLSS scale are between 25-125. In this study, the taken total MLSS scale score was calculated as 92.7150. (Table 1).

Table 1. Distribution of scores of students taken from MUSOPCP according to the factors and MLSS Scale

Scales Score		X	SD	SE
MUSOPCP	1 <sup>st</sup> Factor	9.1028	2.74737	.18781
	2 <sup>nd</sup> Factor	11.5888	1.06108	.07253
MLSS Total Score		92.7150	9.96699	.68133

Sub-Problem 2. How do students' levels of operational chemistry and physics problems solving and mathematics literacy self-efficacy vary according to the varieties of gender, department and graduated secondary school?

As in table 2, as a result of independent group t-test applied to define whether the scores taken from the MUSOPCP factors differentiate according to the gender variable; for the second factor score the difference between the arithmetic average of the groups have been found statistically significant. Female students' score average is significantly higher than the Male students ( $p < .05$ ). The result of independent group t-test applied to define whether the scores taken from the MLSS Scale differentiate according to the gender variable; for the MLSS Scale total score the difference between the arithmetic average of the groups have not been found statistically significant ( $p > .05$ ).

Table 2. The results of Independent group t-test of the scores taken from MUSOPCP factors and MLSS Scale according to the gender variable of students.

Score	Group	N	X	SD	SE	t-test		
						t	df	p
MUSOPCP	1 <sup>st</sup> Factor	Female	119	9.1008	2.85644	-.012	212	.991
		Male	95	9.1053	2.61938			
	2 <sup>nd</sup> Factor	Female	119	11.7395	.69456	2.198	132.026	.030
		Male	95	11.4000	1.37144			
MLSS Total Score	Female	119	92.3025	9.57447	.87769	-.677	212	.499
	Male	95	93.2316	10.46621	1.07381			

As seen in table 3 as a result of ANOVA which is done in order to determine whether the scores taken from the first and second factors show a significant difference according to the academic department variable; for the first factor scores the difference between the arithmetic average of the group has been found statistically significant but the difference is found out to be insignificant for the second factor. Following this process Post-Hoc analysis techniques are started to be applied.

After ANOVA, conducted to define how first factor score changes among sub-groups, considering the academic department variable; LSD test is chosen among the post-hoc analysis techniques upon seeing: group variance is found not homogeny for the first factor according to the Levene's test applied ( $L=4.010$ ,  $p < .05$ ).

Table 3. The results of ANOVA of the scores taken from MUSOPCP factors and MLSS Scale according to the academic department variable of students.

N, X and SD Values					ANOVA Results					
Score	Group	N	X	SD	Var. K.	SS	df	MS	F	p
MUSOPCP 1 <sup>st</sup> Factor	Chemistry	58	8.0862	2.59070	Between	139.217	2	69.609	10.002	.000
	Chemical Engineering	99	9.9394	2.97890	Within	1468.521	211	6.960		
	Electric-Electronics Engineering	57	8.6842	1.96540	Total	1607.738	213			
	Total	214	9.1028	2.74737						
MUSOPCP 2 <sup>nd</sup> Factor	Chemistry	58	11.5517	1.20193	Between	.708	2	.354	.312	.732
	Chemical Engineering	99	11.5556	1.05194	Within	239.105	211	1.1335		

	Electric-Electronics Engineering	57	11.6842	.92886	Total	239.813	213		
	Total	214	11.5888	1.06108					
MLSS Total Score	Chemistry	58	93.0172	10.30669	Between	40.469	2	20.234	
	Chemical Engineering	99	92.2525	9.08839	Within	21119.143	211	100.091	
	Electric-Electronics Engineering	57	93.2105	11.15594	Total	21159.612	213		.202 .817
	Total	214	92.7150	9.96699					

As a result of this test it has been stated that Chemistry Engineering students get a higher significant level of score for the first factor than Chemistry and Electric-Electronics Engineering students.

As a result of ANOVA which is done in order to determine whether the scores taken from the MLSS Scale show a significant difference according to the academic department variable; for the scale total score the difference between the arithmetic average of the group has been found to be insignificant statistically.

As a result of ANOVA which is done in order to determine whether the scores taken from the MUSOPCP factors and MLSS Scale show a significant difference according to the graduated secondary school variable; for both scale and factors scores the difference between the arithmetic average of the group has been found to be insignificant statistically.

Table 4. The results of ANOVA of the scores taken from MUSOPCP factors and MLSS Scale according to the graduated secondary school of students.

N, X and SD Values				ANOVA Results						
Score	Group	N	X	SD	Var. K.	SS	df	MS	F	p
MUSOPCP 1 <sup>st</sup> Factor	General	66	8.5455	2.45690	Between	37.823	2	18.912		
	Anatolian	88	9.5455	2.90425	Within	1569.915	211	7.440		
	Other	60	9.0667	2.74243	Total	1607.738	213		2.542	.081
	Total	214	9.1028	2.74737						
MUSOPCP 2 <sup>nd</sup> Factor	General	66	11.4091	1.28874	Between	3.209	2	1.605

MUSOPCP 2 <sup>nd</sup> Factor	-	X=11.5888 SD=1.06108 N=214	r=.030
MLSS Total Score	-	-	X=92.7150 SD=9.96699 N=214

## Results

In this study, the students' Mathematics Anxiety in Operational Physics and Chemistry Problems factor average scores which is the first factor of Mathematics Usage Scale in Operational Physics and Chemistry Problems is close to minimum score that can be taken. Concluding from this result it can be stated that, though under the average, students have a higher level of anxiety than expected. The second factor Conceptual knowledge and Mathematics Knowledge Relation in Operational Physics and Chemistry average score of students is close to maximum score that can be taken. This result gives us the conclusion that the students are conscious of Conceptual knowledge and Mathematics Knowledge Relation in Operational Physics and Chemistry but they have higher Mathematics anxiety than expected while solving operational Physics and Chemistry problems. Czerniak&Chiarelott (1984) showed that higher level of science anxiety accompanies lower success in science. Research by Babayeva (2000) indicates a significant relation between student's ability to solve algorithmic problems and learning Chemistry concepts.

Researches can be found related to the necessity of operational problems and concept knowledge (Zhang & Watkins, 2001; Erdemir, 2009).

For the second factor of MUSOPCP the level is significantly higher for the female students in comparison with the male students. Sezgin, Çalışkan, Çallica, Ellez&Kavcar(2000) in their research conducted to find out problem solving strategies of university students having science lessons, indicated that there is no difference between the strategy preference of males and females and also between the students of Physics, Chemistry, Biology and Science Departments.

The score averages of MUSOPCP factors of the students don't significantly differentiate according to the graduated secondary school variance.

In this study, students' Mathematical Literacy Self efficacy levels were seen to be above average. It has been found out that the averages of students' total scale of MLSS Scale do not differ according to gender, the academic department and the type of graduated secondary school variances. Research by Akkaya&Sezgin-Memnun (2012), studies of teachers for gender has been determined that there is not significant difference. The studies of Akkaya&Sezgin-Memnun (2012) and Güneş&Gökçek (2013); there are significant differences between departments. In some studies the Mathematical Literacy Self efficacy levels has been found to be associated with the graduated secondary school variance (Schnulz, 2005; Yenilmez, 2010; Özgen&Bindak, 2011).

Between Mathematics Anxiety in Operational Physics and Chemistry Problems factor average scores which is the first factor of Mathematics Usage Scale in Operational Physics with Chemistry Problems and Mathematical Literacy Self efficacy Scale, have a negative significant relation.

## Abstract

The aim of the paper is to investigate to what extent the performance of students in the National Examination of Accounting Students (ENADE) relates to the Examination of the Sufficiency Federal Accounting Council (ES / FCA). The methodology used is empirical and theoretical, with the use of quantitative techniques. The results show that the performance in ENADE in 2009 had a fit (62.33%) on the rates of passing the examination of the FCA 2011, with a beta of 21.76%. It follows the performance ENADE has a significant relationship with approval ratings in the examination of the sufficiency of the FCA in Brazil.

## 1 . INTRODUCTION

Since the early 1990s have been repeated actions of governmental regulators and inspectors of education in Brazil , particularly in higher education , to promote the accreditation and certification of the quality of that training level through the establishment and improvement of tests for measuring performance and certification of the profession.

Accounting courses in general have gotten a poor performance, judging by the results obtained in the forms of assessment and accreditation existing today in Brazil: ENADE and examination of the sufficiency of the FCA. In the 90s, the Brazilian government established, through the Ministry of Education and Culture (MEC), instruments to regulate, supervise and evaluate the performance of higher education (Souza & Machado, 2011). This action became necessary in view of the increasing privatization of higher education in the country, started in the late 80s , due to neoliberal policies ( Santos, 2010).

This process resulted in a significant increase in the number of Higher Education Institutions (HEIs) and undergraduate courses in the country, pressing the demand for university lecturers, substantially boosting this job market, but prioritizing quantity over quality. In the case of undergraduate accounting, the number of courses increased from 194 (1986), to 1241 (2011) (Brazil, 2012a; Gee, 2003)

These data reinforce the need for verification and control of the quality levels of training counter. On June 11, 2010, according Kounrouzan (2012 ), with the enactment of Law No. 12,249 (Governing Law of Accounting) , examination of

sufficiency ( ES ) went again to be held by the Federal Council of Accounting System ( FCA ) which ensures a priori the minimum certification of professional quality Counter .

The 1st Exam Result Sufficiency FCA (ES / FCA) in 2011 , since its suspension in 2004 , recorded a 30.8 % approval . Subsequent data from CFC (2013 ) show approval ratings below: 2nd exam 2011 ( 58.2 % ) ; 1 examination , 2012 (47.2% ) ; 2nd exam 2012 ( 26.5 % ) ; and 1st exam of 2013 ( 35.6 % ) . These results generally suggest little relevance performances that seem to reveal a fragile accounting education in the country , similar to what has happened in other Western countries , like the U.S., according to study by Albrecht and Sack ( 2000 ) , discussed later in literature review.

From another angle, all Accounting courses (recognized and / or allowed) in the country , only 722 achieved a score ENADE in 2009 , according to data from INEP (2012 ) : 114, 608 public High Educational Institutions (HEIs) and private HEIs . ENADE of concepts ranging from 1 to 5, 46.5 % of public HEI obtained above concept of three, whereas only 16.6% of the private institutions achieved this performance. With these data, it is possible to suggest two things: the decline in accounting education and precariousness of private education in relation to the public.

Besides the above, there was a recommendation from Santos (2012), in a previous study, researchers sought to determine whether there is significant difference between the academic performance of students participating in the ENADE and the result obtained in Exam Sufficiency, promoted by the FCA. The reflections contained in all preceding context served as justification for the formulation of the guiding question of this research: to what extent the performance ENADE relates with approval ratings in the examination of the sufficiency of the FCA, taking into account the concepts obtained in these exams?

The aim of this study therefore was to ascertain to what extent the performance ENADE relates with approval ratings in the examination of the FCA, based on the grades obtained in these examinations. Besides ENADE, we sought to identify other variables that could enhance the explanatory power of implication on the rate of passing the examination of the sufficiency of the FCA.

The study hypothesis is that the approval ratings of the test of sufficiency of the FCA system is positively influenced by the performance of students of the Accounting exam ENADE , ie , a good performance in ENADE implies a greater possibility of success in the exam sufficiency of the FCA .

## 2 . LITERATURE REVIEW

The (or accreditation) of education in the country accounting certification systems similar to those of other countries of the Western world, of course with the existence of peculiarities of each country. In Australia, the accreditation process is often used to improve the quality of programs provided by the institution. However, its value is mainly dependent on the ability of the faculty to the accrediting institution providing some form of market advantage. Basically, accreditation is a mark or symbol used by schools accounting or business to inform the market - students, businessmen, teachers and others that their education programs fall into some global quality standards (Light body, 2010). Another highlight is that the fall in the levels of quality of accounting education, cited above, is not only a reality in Brazil. Albrecht and Sack (2000), in his classic study, have already proven this decline in accounting education in the U.S. itself. The authors criticized the accounting education the way he was being held in the USA in the year 2000 gone the first arguments were used in their criticism.

[...] The current accounting education suffers from many serious problems and our concern is that if these problems are not addressed seriously, they will lead to the disappearance of accounting education. [...] Leaders in Accounting and practicing accountants are telling us that accounting education, as is currently structured, is outdated, broken, and needs to be modified significantly. (Albrecht & Sack, 2000, p. 1).

In the 2000s some U.S. scandals (Enron, WorldCom , Arthur Andersen and others) showed a striking manner the need for an overhaul in the standards and legal accounting procedures, resulting in the improvement of science and better education accounting .

What changes are needed in education in accounting to make it look more professional? It is a question made by Zarkasyi (2009), based on the phenomena happened in the U.S. and its developments. He also comments that the accounting education currently faces a significant challenge: education aims to train young people who will work in increasingly intensive firms in advanced information technologies to monitor the continuous organizational changes. New products and services will emerge, requiring new procedures and judgments with respect to the accounting process. According to Chang and Sun (2008), the quality of continuing education in accounting depends on the competence and the availability of faculty to attract the best students in accounting. Although enrollment of students in higher education continue to grow , the quality of accounting education is threatened due to lack of qualified teachers in the area . The decline in the quality of accounting education is evident; many universities and colleges are dealing with the shortage of teachers, hiring alternatively, assistant professors of accounting ( Sun & Chang , 2008) . In contrast , Marin , and Casa Nova Lima (2011 ) , were more optimistic about the current line-up counter in Brazil , by claiming that , as a result , mainly , of the phenomenon of globalization and the quest for harmonization of international accounting standards , the accounting profession has been valued . However , according to the authors , this change brought the trailer, larger

market requirements in relation to the counter , such as : use of complex quantitative methods for analysis and simulation projects , leadership skills and socializing with cultural differences , critical analysis , need to learn foreign languages and a professional image of ethics and efficiency . In a recent article in USA, Clark and Latshaw (2012 ) cite Kerin (2002); Tucker et al. ; (2003); and Visser et al. (2006 ) , who observed that over the last forty years , the teaching profession has sought increasingly to identify and refine the focus of the teaching- learning in the learning styles of students . The main conclusion is that teachers should adjust their teaching styles to accommodate learning styles of students, aiming to continually improve student performance.

This type of effort has been going on with honorable exceptions in accounting education in Brazil, mainly in the southeast and southern regions, and more frequently , in large public and private universities . However, this decentralization of quality education still has a long way to go , is what it claims Rafael Villas Boas at UNB ( Brazil de Fato, 2012) argues that when compared with their Latin American counterparts , the Brazilian university , despite their islands of excellence , is far from corresponding to the demands for consistent size of its population and its territory education. According to Souza and Machado (2011), before the current evaluation phase of higher education in the country , various proposals and programs have emerged . Should be highlighted: the Assessment Program of the University Reform (PARU), 1983; and the proposal to review the draft of the Executive Group of the Education Reform

(GERES), 1986 . All these programs predate the enactment of CF/1988. Also according to these authors, in 1993 we implemented a program of Institutional Evaluation of Brazilian Universities (PAIUB) . The PAIUB prescribed self-assessment as the first step of the process, once begun, was deployed for the entire institution, complemented by an external evaluation . But PAIUB was short lived. There was also in the path , known as *prova*o National Course Examination (ENC) , which was made possible in 1996 a survey applied to learners between 1996 and 2003 , and was, according to Souza and Machado (2011 ) , evaluating courses in higher graduation specifically regarding the results of the teaching- learning process . On the quality of performance of teachers, Olak Alves , Corrar and Slomsky (2012 , p.3 ) emphasize that:

Initially, you should be aware that the central goal of undergraduate students is learning, and the teacher, therefore, should be part of this teaching-learning process, not just the teaching process, because the emphasis should be on student learning and not the transmission of knowledge from the teacher.

Another survey gauging the quality of teaching is ENADE , an instrument created according to INEP (2012 ) and Brazil ( 2012b ) , the enactment of Law No. 10,861 , of April 24, 2004 , which established the National Evaluation System Higher Education (SINAES) . The concept and purpose of ENADE are defined in Article 5 ° of the same law, which states that the evaluation of the performance of students of undergraduate courses will be determined based on the National Examination for Students - ENADE. The following paragraphs clarify a bit more : § 1 The ENADE will benchmark student performance in relation to the syllabus laid down in the curriculum guidelines of their undergraduate degree , their ability to adjust to the demands arising from the development of knowledge and skills to understand their issues outside the specific scope of their profession , linked the Brazilian and global reality and other areas of knowledge . [ ... ] § 3 The maximum frequency of application of ENADE students of each undergraduate course will be triennial.

This aspect of the validity of ENADE be triennial gave validity to the decision of the concepts ENADE 2009 is used, compared with approval ratings in January 2011. Already proficiency exams FCA system are held twice a year, under the law then current . Another indicator is the CPC (Preliminary Concept Course) which, according to INEP (2012) , aims to evaluate the contribution of the course for the training of their students .

The CPC binds various measures relating to the quality of the course: the information infrastructure and physical facilities, teaching - learning resources and faculty offered for a course ; the performance obtained by graduates and students entering the ENADE ; and the results of the indicator Difference between Observed and Expected Performances ( IDD ) . Altogether there are eight components eight measures of quality of the course. The formula for obtaining this concept, according to INEP (2009) Technique -17- 12-2009 CPC - Note is as follows:

All notes were processed using statistical techniques to default the result (quantitative continuous variable) between 0.0 and 5.0 could later be converted into a discrete concept, 1-5, as the following table:

All notes were processed using statistical techniques to default the result (quantitative continuous variable) between 0.0 and 5.0 could later be converted into a discrete concept, 1-5, as the following table:

Table 1: Determination of discrete concepts of CPC

Continuous Value of CPC	Continuous Value of CPC
0.0 to 0.94	1
0.95 to 1.94	2
1.95 to 2.94	3
2.95 to 3.9	4
3.95 to 5.00	5

Source: Data from INEP 2011

The determination of discrete concepts ENADE follows the same logic of the determination of the discrete concepts of CPC seen in the table above. Currently only the INEP promotes quality validation of IES and its courses, publishing a number of other indicators such as infrastructure, teachers and students, unlike the FCA has not released further their statistics by state approval since resumed the exam.

### 3. METHODOLOGY AND PROCEDURES USED

Was used in this study, an empirical, theoretical methodology, quantitative in nature, using descriptive and inferential statistics. Although the main objective was to verify the relationship between performance on ENADE and examination of FCA, we sought to identify other variables related to education to try more explanatory power for the change in approval ratings in the CFC by state. In regression analysis, it was considered as a dependent variable the change in approval ratings in the examination of the sufficiency of the FCA. A descriptive analysis of these variables to identify and eliminate those with linear associations below 0.30 therefore unsuitable for the study (Favero, Belfiore, Silva & Chan, 2009) was performed. Then a simple regression using only the two main variables of the research was conducted. The level of significance was set at 5 % and the proposed model is  $Y = \alpha + \varepsilon + \beta.X$ . Further, we performed a multiple regression to verify that the additional independent variables could contribute to the study. Later used to factor analysis (FA) to reduce the number of variables, and eliminate any issues of multicollinearity. Two new variables were created to perform the factor analysis, the first named FAC.APROV.X; and the second, called FAC.APROV.Y. Finally we performed a simple regression with the last factor found.

#### 3.1. Characterization of the population, sample and explanation of the variables used in the study.

The study consisted of a population of HEIs in Brazil possessing undergraduate degrees in Accounting. The sample population comprised primarily of IES, using the criterion of obtaining valid score in ENADE in 2009 (722 IES), distributed by the twenty-seven Brazilian states. The option for continuous concepts and ENADE CPC held the level of accuracy that the work aims to achieve, given the significant gap between the discrete and continuous concepts. After collecting and analyzing the descriptive statistics for the data from each State, it was decided to determine weighted averages by state for both ENADE concepts as for the CPC to be more representative, given that each course participates with quantities of students very different between the HEIs.

The seven (7) independent variables considered in the study are arranged as follows:  
Figure 1 - Independent variables used in the study.

ENADEMED	Indicator ENADE / INEP continuous (Weighted Average by dealunos number that enabled the ENADE by state.
CPCMED	CPC / INEPcontinuous Indicator (Weighted Average by Students that enabled the ENADE per state) of IEs with undergraduate degrees in accounting.
QAluMed	Number of students attending the school average in 2005, by state.
QCursos	Discounts courses degree in accounting by state in 2010.
InvEduMed	Average investment in education per student in 2005, by state.
RendaMe	Income per capita by state media in 2009.
IDH	Indices of human development in 2008, by state (only ones available at the time).

The collected data and their sources are explained as follows: the ENADEMED and CPCMED were determined from data obtained from original INEP (2012). The QAluMed, QCursos, InvEduMed and RendaMe variables were obtained from original data related to education (Brazil, 2012c); and HDI variable was obtained from the website Brazil School (2012). At the end of the methodological procedures and consistency tests, we managed to get just one factor, based on three independent variables, but that proved irrelevant results in linear regression compared to the first regression between performance on ENADE and approval rates in ES / FCA. These results are in the following topic.

### 4. ANALYSIS OF RESULTS

Of variables subjected to correlation, only five independent variables were given appropriate values for subsequent steps being discarded HDI and InvEduMed.

Then, the first simple regression was performed, yielding an  $R^2$  of 62.33 %, a specimen was as follows:

$$Y = -0.219 + 0.218 \cdot X + \varepsilon (1)$$

I.e. means that for every increase in ENADE concept obtained by IES from 2, a possibility of 21.8 % of students achieve success in the examination of the FCA.

Following a multiple regression analysis with five independent variables was performed, but the results were insignificant. In view of this, it was performed a factor analysis (FA), the KMO test was 0.784, ensuring its validity.

With this result, it became a new simple regression, yielding the following expression:

$$Y = -0.258 + 0.091 X + \varepsilon (2)$$

Where  $FAC.APROV.X = 0.091$  or 9.1 %

However, the results were inadequate;

A new factor analysis, excluding the lowest variable linear correlation with APROVMED variable was then performed. The AF has been validated by KMO test value approximately equal 0.7. Finally a simple regression analysis, where  $R^2 = 66.6\%$ , the expression of which is described below was performed:

$$Y = -0.258 + 0.093 X + \varepsilon (3)$$

Where  $FAC.APROV.Y = 0.093$  or 9.3 % However, when comparing the results of two regressions: a (1) to (3), we find:

The marginal benefit from the inclusion of two additional variables beyond converted to ENADEMED factor variable has no bearing on the first regression. Additionally, the beta of the latter regression was negligible compared to the first regression. In short, although attempts to include other variables in the study were made, only the first regression was satisfactory, that is, their results were not significant compared to the last regression because only one independent variable (ENADEMED) was obtained significant explanatory power, suggesting an influence on the variation in pass rates in ES / FCA, combined with a significant beta (21.76 %), although it cannot claim to be a relationship of cause and effect between these two variables. One can finally conclude that the performance in ENADE has a significant positive relationship with the functional examination of the FCA in the analyzed period, partially confirming the hypothesis of the study, i.e., the two tests are significantly associated. Although one cannot say categorically that the performance in the ENADE influences the results obtained in the examination of the sufficiency of the FCA, it is possible to suggest that obtaining a good performance on the exam entails ENADE obtain greater possibility of achieving similar performance in examining the sufficiency of the FCA.

## 5. CONCLUSIONS

The aim of this study was to determine to what extent the performance ENADE relates with approval ratings in the examination of the FCA, taking into account the grades obtained in these examinations. Answer to the research question: student performance in ENADE has a significant positive relationship with the functional variation approval ratings in ES / FCA of 62.33 %, partially confirming the basic hypothesis of the study. The inclusion of more variables, glimpsing more leverage this degree of involvement, proved ineffective in terms of cost-effectiveness. Besides the previous paragraph, it follows, referring to the suggestion made by Santos

(2012), there is no significant difference between the academic performance of students participating in the ENADE compared to the result obtained in Exam Sufficiency FCA. On the contrary: there is a significant functional relationship between the two tests.

By analyzing the regression coefficients (the constant was negative, -0.2187, and the independent variable was positive, 0.2176), we can say, in theory, that getting notes on ENADE (either individually or by HEIs state) ranging between 0 and 1 would be correlated with a failure in ES / FCA. But from the note 2 based on discrete concepts ENADE, each additional point obtained in the examination of ENADE, there would be a proportional relationship of increase of 21.76 % in the number of approvals in ES / FCA.

Some of the references used in this study sought to present: a) the contrast between the decline in the quality level of teaching Accounting courses in Brazil, b) through some research abroad, sought to show that the decline in the quality of accounting education and certification of the learning process of these courses are also problems in many Western countries, based on the U.S., Australia, among others; and c) an historical overview of the evolution of benchmarking tests and certification of higher education, in particular, the Accounting courses in Brazil;

To answer the research question, an extensive database of INEP (2012) was used, covering all IEs have Accounting courses in the country and have received ENADE score in 2009. This exam is conducted every three years to a number of upper-level courses. The next examination of ENADE for courses in Accounting happened in late 2012 and its results were not made available until late in the second half of 2013.

After a process of appropriateness of the original database INEP and the identification and exploration of other variables that could contribute to the desirability of research, statistical techniques for the processing of data were defined. We used a combination of these tools, involving descriptive and inferential statistics, using in the latter case an integration of the techniques of simple and multiple linear regression, combined with factor analysis. The findings were positive in some aspects: a) the novelty of the subject, since any work that addressed this specific issue was

not found; b) as already mentioned in the introduction, it was found that there was a recent thesis Santos (2012) recommended that an issue that also served as justification for the formulation of the research

problem; c) it is expected that the results may encourage the development of similar assignments, aimed at: improving throughout the country, the level of quality of the teaching- learning process; and promote greater openness of certifying agencies, especially the Federal Accounting Council, for a wide dissemination of statistical and dynamic approval of their proficiency exams not only by state but also by HEIs. Finally, the higher the distribution of statistics and information on the performance of education in the country, the greater the contribution of empirical work that may increase the real possibilities of improving the quality of education, not only the upper, as the levels of base produce the "raw material" for HEIs.

## Abstract

Making Modernism and Postmodernism a different sense of social life caused creation of different life and thinking styles. Modernism as a result of enlightening after the 18th century has taken its place in every area of the society. Post modern word has been defined as the further level of modernism. Every two kind of thinking styles have been effective at every point of life , also it affected education. Main elements of modern culture and postmodern education are combined and are being integrated with educational programs. The relationship of modernism and postmodernism is being examined since past till today in this essay and also their reflection on education has been examined. This research is in a survey model and documentary survey method has been used. As a result, the idea of entering postmodernism after modernism in our lives even in education, saturating the transition in the values of the society without realizing it and even not complaining about this situation awakened in us.

## 1. Introduction

Modernism came along as a different view with 1970's. All field experts calls this period as postmodernism. Postmodernism is thought as a structuring and a reaction against modernism and separating modernity. While post modernism is being examined in visual media of 21st century, it is required to talk about the relationship between modernism and postmodernism. Whereas acting starts from producing principle, consumption principle has been more important in postmodernist period. As superficial subjects have been more important in radical in every part of life, more daily subjects have been in agenda instead of upper explanations, it is a period when upper explanations have been rejected and central structure has been removed. (Harvey, 1997, p:60).

E-mail address: aysederyakahraman@gmail.com

It is thought that as Postmodernist period created problems in itself by being accepted in the society and cultural, social and economic arrangements at every level of the society in the context of the effects of the period, this period can be thought as consumption culture. Postmodern period with its production, production structure and Dynamics has a structure provoking consumption. Because of this reason, firstly giving meaning to every aspect of life, objecting values is required to provide production and forming a positive value for the life. While modernity affects firstly human beings, it includes positivism, techno centrism, globalism and rationalism, so it affects the world of human beings. (Aslan and Aydın, 2005, p.96).

In other words, trying to institutionalize "modernism" by the society under the title of "cultural society" and consumption by this way is called postmodernism. The society named as cultural society are the individuals who produce and consume popular equipment not caring about the formation of serious cultural products and all communication channels, universities, publishing houses which live in this area and use all mass media in its own cultural sub-structure (Harvey, 1997, p.78). This research is important in the frame of examining the effect of postmodernism on society by the way of visual media.

### 1.1. Modernizm

Modernism corresponds to "enlightenment" concept in English. Modern word based on enlightenment has been produced from Latin "modo" and means that modernus separates past and present. (Aslan and Yılmaz, 2005, p.94-96). Modern term the new one is used as synonymous of near future which has been furthered away from past (Kızılcılık, 1996, p. 9). This situation is the one which has been created form a radical change and been applied to human and its natural environment. Modernism is living and being in a qualified, different and new world which does not belong to the past (Yıldırım, 2009, p.382).

Modernism, as Jürgen Habermasın wrote in an essay named as "modernity, uncompleted Project" in 1980, is a product of an idea where the individual will be able to Orient everything as he requests and believes he can do everything by using his

intelligence (Doltaş, 2003, p.21). Modernism includes a change, transition to fine and beautiful things and also war. Modernism is formed of individuals who are living relationships basis for an intelligence world regularity formed of enlightened individuals and organizations of these individuals (Yıldırım, 2009, p.382)

So, according to Sarıbay (2001, p.4-5) modernism concept states as

*“A situation in which a differentiation of progressing, economic and administrative rationalization and social world opposite to traditional order in parallel with modern capitalist –industrial government and which has been started to be used in West with the Enlightenment in the eighth century (Yıldırım, 2009, p.383).*

Self-confidence of the individuals increased with modernism but human beings preferring narcissism of the individualism have been burst out in their internality by the loneliness of urbanization. Postmodernism, which is against aggrandizing the intelligence by modernism, came up by accepting multiplism and diversity instead of single mind(Gökçearslam, 2005, s.20-21).

## 1.2. Postmodernizm

Postmodernism is a society net which formed its own life forms. Postmodern societies do not foresee the freedom of mind, they defend local culture, they are formed of civil societies which have been formed of some pieces, there are relevant statement methods to their own living forms (Adak, 2010: 372).

Even Postmodern period had been in inclination of supporting with opposite cultural movements in 1960's ,the impulses are seen as an extension of discharging the will chains of instincts, conflict of rebel and bourgeois opposite to modernist actions in arts area(Best ve Kellner, 1998, p.29). The first one using this term is the historian Arnold Toynbee. Toynbee in his product called as A Study of History used postmodern term firstly. The period when west civilization entered a dark period since 1875 is called as postmodern period. (Doltaş, 1999, p.187; Aydın, 2006, p.3). According to Tenner(1997, p.34) in case of expansion of the term postmodernism, the word “post” as an affix has been defined as determination of what has to be done to overcome modernism(Yıldırım, 2009, p.386). The word “post” includes two meanings with its English usage. It is used in the meaning of “Later” or education after bachelor’s degree(Odabaşı, 2004, p.20).

According to Adak (2010, s.371) postmodernism is examined in three branches firstly aesthetically in different styles in arts and architecture, secondly as historical for a period starting from 1900's, and lastly ethical and philosophical as a questioning including an area in which the knowledge is being tested as radical epistemological (Gandy:1997, p.150).

Postmodernism period has been a historical period and also it has been serious paradox. In addition to individuals’ getting used to development and changes in every area, the reason of increasing the importance of societies’ life styles includes social and economic developments. Because of this reason, a differentiation or a collapse can be lived by the individuals who live concept chaos.

We can accept postmodernism as an extension of modernism as a living situation. However, postmodernism existed as a reaction against being modernism global in the context of knowledge, mind and values, development of humanist ideological values. Postmodernism internalizes objective approach in the realist ideal and has been objective society values. Because of this reason, it is understood that postmodernism is opposite to all values based on ontology, epistemology and rationalism. It exhibits an opposite attitude towards global human approaches and humanist ideologies (Aydın, 2006, p.1).

In other words, it can be told that postmodernism is a modernism which struggles and comes to an agreement with impossibilities living in itself and existing in life by itself. Also according to Kale Postmodernist artist is brave and criticizes the world he has been living in, he qualifies this period as the past of future period(Kale, 1993, p.284). In other words, individuals reverse the signs of the roof forming the structure of single type individual profile and globalism with postmodernism. This situation not only provides the individuals who internalizes postmodernism accept the differentiation of life styles but also live in this life style. So postmodern societies corrupts all rules by third learning , they leave all their behaviours (Bauman, 2005, p.156).

### 1.2.1. The features of Modernism and Postmodernism :

#### **Modern/ Modernity**

Regularity/Control  
 Certainty/ determiner  
 Fordism/Factory  
 Content/Depth  
 Development/tomorrow  
 Homogeneity  
 Hierarchy/Adulthood  
 Existence/reality  
 Cautious/External  
 Design  
 Relevancy

#### **Postmodern/ Post modernity**

Irregularity/ Chaos  
 Uncertainty /Indecision  
 Postfordism/Office  
 Style/Superficial  
 Stable/Today  
 Inhomogeneous /Multiplier  
 Equality/Youth  
 Performance/Imitation  
 suspicious/Self-centred  
 Participation/Parody  
 Irrelevancy/Luck (Odabaşı, 2004, s.29).

### *1.2.2. Social reflection of postmodernism forms six basic situation on the behaviours of individuals*

Top reality  
Crashing  
Replacement of production and consumption  
The subject not being at the centre  
Association of opposites  
Losing commitment and trademark loyalty  
Multiplism is also added to the features related to Postmodern situation  
(Yeygel, 2006; 204; Odabaşı, 2004, p.32-33; Kayaman ve Armutlu, 2003, p.3;).

As Kayaman and Armutlu(2003,p.3), transferred from Brown (1993,p.19), the most important features of contemporary postmodern societies are living today, emphasis on shape and style, acceptance of irregularity and chaos.

### *1.3. Reflection of modernism on education*

Modernism concept states changes related to arts and science in culture history. Modernism is seen as positivism in science beyond the reflection of its relationship with human being in a passive way. Because of this reason, modernism has developed as a reaction against realism.

The changes in social sciences affect education concept, institutions and educational services. So, there have been changes in the structure of the schools which carry out educational activities. The process of cultural differentiation, individualization, materialization and rationalization which form the roof of modernism will be effective in the development of individuals who will provide the sustainability of available status quo and changed the structure of the schools. Modern structure examining the schools ideologically pushes all structure, elements and staff of the school to a passive structure in the definition of duties. The teacher became the applier of the curriculum and transferring the knowledge and the student became the learner of rational knowledge related to the exams to provide the continuity of status quo (Aslanargun, 2007: 197).

The behaviours are based on reason-result relationship in the frame of behaviours in modernism. It is not related with feelings, beliefs or traditional forms. The reason of this situation is based on the change in cultural and social structure. In case of examining the change in reason and result relationship of social structure, it can be told that it is social mobility and the individuals' passing from general roles to special roles which they fictionalised in a specific way in their social lives. This situation caused changes in the general structure of the schools.

Modern educational approach is status quo and bureaucratic which defends management from centre. The individuals educated at schools did not meet the expectations who had been educated with the idea of happy ideal world of enlightenment thought; on the contrary a world which has been dominated with fright, chaos and war after the industrial revolution existed. The authority levels as hierarchically, determination of definition and duties of all school staff, priority of registration and documentation system for the students and also dominancy of individualistic preferences in addition to regulations in all central educational system are accepted as the basic features of modern schools. As a reflection of industrial revolution, transferring institution and factory environment to educational environments, using the rules and providing the sustainability of existent situation were accepted more important than the values they had (Aslanargun, 2007: 197).

### *1.4. Reflection of postmodernism on education*

Postmodernism discussions existed as a result of questioning modern educational approach since 21<sup>st</sup> century. Post modern education as an alternative to modern educational understanding exists as a new understanding. Postmodern educational understanding has discussions and questions related to knowledge and scientific traditions, such as whether science is particular to the individual or is it definite, knowledge should be directed at understanding or questioning, knowledge should include arithmetical and verbal mind in addition to rhythmical and kinaesthetic development(Özden, 1999).

Postmodernism as a culturally entity is commented as the organizations which the individuals formed have a culture, because of this reason management of postmodernism with cultural content is the point in question. Because of this reason, positivist paradigm is used as basic point of view in post modern education fact. This situation creates problems in the context of culture and philosophy; as a result an educational approach that does not give importance to local and cultural values in educational management approaches is being lived(Şişman, 1998).

Post modern educational approach is a questioning in this meaning. It is the rebellion of crushed groups in societies all through the time. Postmodernism is the interpretation of the relationship between power, knowledge and wish. Because of this reason, while Post modern educational approach contributes to social changes, it also emphasizes the individuals' stating themselves and difference of them. So, the educational institutions are not only the places giving information and training individuals as a subject but also contributing subjectivism to the individuals.

The individuals who have been trained with this understanding should not only know their language but also know the world languages. Because of this reason, knowledge provides the individuals have education which increase their democratic ideas and

trained as living cultural diversity in post modern education. Because of this reason, education provides opportunity for the individuals to use a definite content by adapting it to themselves (Kurt; 2009: 89). It is possible to talk about Postmodern educational approach as an approach where modernist educational approach problems exist and questioned. Standardization, centralization, catharsis from the values and rationalism of postmodern paradigm colours the modern educational approach. Postmodern educational approach thinks that modern educational approach and the structure of the schools are inadequate. Science and education builds its roof over dynamic knowledge in postmodernism, it develops its productivity by searching new ideas and concepts (Fritzman, 1995).

Enlightenment with Postmodernism defends that knowledge can be extended and globalised in usage and this will be a social success (Terren: 2002, 161). Uncertainty lived with postmodern social change causes negative effects such as decreasing the socialization at schools (Aslanargun, 2007: 197).

Relationship with subject in modernism, emphasis on privacy by the majority in postmodernism is combined and creates a combining effect of abstract rights, cultural, historical structure of the society. Pluralist life and mind are structured together in postmodern education and transforms life to democratic actions. Because of this reason, postmodernism education is a system that forms global, questioning structure by rejecting science and knowledge types (Giroux, 1991).

## 2. Research Methods

It has been a research in the survey model and has been prepared with documentary survey method, the research is the total of scanned documents, paintings, pictures, voice records, plaques, equipment, sculpture belonging to the past and in addition to these it also includes every kind of reports, encyclopedias, books, statistics and minutes (Karasar, 1999, s:183).

## 3. Conclusion

While individuals move with the idea of reaching ideal structure and production in modernist period, they start out with the idea of consumption in modernist period. The first priority of modernity is the building stones around the individual and the individual himself. However institutionalization of the structure defined as cultural society of modernism caused the existence of postmodernism. In the modernism period which means enlightenment, the individual is able to orient every kind of structure by using his mind. This situation has been seen as a movement of industrial revolution and capitalism, people became individualized in modernist period and have been drowned in their internalization. Post modernism is a rebel against the criticism of modernism. The questioning of arts in addition to architecture, history and epistemology has been talked about in post modernist period. Postmodernism society adopts objective approach in realism ideal and has been objective to the social values. Postmodernism reverse globalism and being single type of individual signs which are the central values of modernism. They also apply this life style. So, postmodern societies crash down all rules with third learning and give up all their habits. The changes lived in social sciences caused changes in work and functions of institutions in educational area. Claiming negative and invaluable approaches to individual and educational system at the experimental level by important changes and transformations realized in educational world and creation of dead-ends cause some critics. There have been some irregularities in the transition from modernism to post modernism and in the structure of postmodern educational system. Post modern educational institutions have an authorized structure in the context of curriculum, rules, knowledge and management. Because of this reason, cultural differences threat status quo, they have the quality that makes the provision of stability. They limit the education approach; they are not successful at not taking into account individual differences. So, quantity and quality chaos is lived along. There is a suspect about the absolute true. The schools are evaluated as the centre of the knowledge and the teachers are the ones transferring the knowledge. In modern period, educational activities are at the forefront, whereas individual satisfaction is at the forefront in postmodern period. Because of this reason, an understanding including different cultures in it should be adopted, not local values instead of post modern educational approach. You should work together with teachers and managers who have vision to adopt stability and flexible understanding. While educational activities are going on, the individualistic differences and emotional situations of teachers and managers, but firstly the students should be taken into account and flexible but an educational approach which has its own principles in it should be provided.

# Relationships among parents, students, and teachers: The technology wild card

Eva Patrikakou<sup>\*</sup>

DePaul University, Department of Counseling and Special Education, 2247 N. Halsted Str., Chicago, IL 60614, U.S.A.

---

## Abstract

Parent involvement and home-school partnerships have gained the status of a self-standing research area in the past three decades. While continuing to intrigue researchers and practitioners alike, a wild-card factor has been added that has changed the known dynamics, and has presented parents, teachers, students with a challenge that has neither been researched nor systematically addressed in everyday practice. The wild card is the explosion of technology use, and parents and schools are scrambling to find ways to monitor and control the influence of online interactions, often falling short on both fronts. The paper discusses the relationships of technology and cognitive, social and emotional processes, as well as the impact of electronic media on families and schools.

## 1. Introduction

Over the past three decades researchers and practitioners alike explored the power of parent involvement and the importance of fostering school family partnerships in order to enhance the academic, social and emotional learning for children and adolescents (Patrikakou, Weissberg, Redding, & Walberg, 2005; Patrikakou, 2004, 2008). As a fuller picture of variables, processes, direct and indirect effects influencing parent involvement, and, in turn, student success, became clearer, a major new factor has introduced itself, and has made the parent involvement and school-family partnerships literature enter a new era. Media access and its increasing use by children and teenagers have enormously changed the parameters in the field, which is pursuing anew to understand how technology use impacts relationships among children, parents and schools. The rapid internet boom since the 1990s, as well as the speedy expansion of mobile technology use in recent years, have introduced a new educational avenue and a communication factor that play an increasingly important role in the relationships among parents, teachers, and students. The current generation (known as the Net generation, i-generation, digital natives, etc) is the first one that has known digital technology since birth, and seems to feel the most comfortable using it. Children and adolescents spend more than seven hours a day with media, which, in cases, is the most time spent on any activity, including sleep) and 97% of adolescents report that they play video games on a variety of platforms, including computers, hand-held devices, and game consoles (Kaiser Family Foundation, 2010; Strasburg, Jordan, & Donnerstein, 2010). In a policy statement, the Council on Communications and Media of the American Academy of Pediatrics (AAP) expresses concern for the increased media use and its potential harmful effects, while it also recognizes the positive impact that media use can have. The AAP suggests that pediatricians incorporate questions regarding media use in well-visits and make recommendations to parents to monitor and limit media exposure and use (American Academy of Pediatrics Council on Communications and Media, 2013).

## 2. Technology and Cognition

These rapid technological changes have shifted the learner's profile. Access to knowledge is not relatively static (e.g., choice of books), but its form changes tremendously at light speed. The goals are no longer to acquire the best ways to access information from a source, such as a book, but, rather, to learn to keep up with the brisk changes in accessing resources: applications, blogs, virtual reality environments, instant messaging, texting, social networks, gaming, with more forms and applications added daily (Subrahmanyam & Greenfield, 2008).

In order for learners to be successful in this landscape, they need to have a *flexible cognitive schema*. This flexibility allows the learner to quickly adjust their thinking to adapt to yet another form of communication or venue of accessing information. A flexible cognitive schema is supported by fluid reasoning (the capacity to think logically and solve problems in novel situations) and relates to fluid intelligence, reading fluency and reading comprehension (Cattell, 1987). In this environment, cognitive

E-mail address: epatrika@depaul.edu

processes, which are part of a learner's personal competencies, assume an even more pronounced role with potentially a more narrow profile: learners without a flexible cognitive schema will struggle to keep up with new advances and, therefore, with accessing and processing information.

Research has mostly centered around the negative effects of media on cognitive development and academic achievement, but benefits have also been documented. For example, although exposure to educational programming on TV can foster cognitive development and academic achievement, violent programming can impact cognitive development, learning, and behavior in a negative way (Kirkorian, Wartella, & Anderson, 2008). Recent studies have further placed an emphasis on the benefits of media use. For example, gaming can have a variety of cognitive benefits such as improved spatial skills, faster and more accurate visual processing and attention, as well as problem-solving skills. It is important to note that observable gains in neural processing and efficiency obtained through game-playing are not restricted to just gaming, but they can generalize to other, non-gaming contexts improving an individual's performance and achievement (Granic, Lobel, & Engels, 2014; Ventura, Shute, & Zhao, 2013).

### **3. Technology and social and emotional development**

Technology has also altered the nature and quality of social relationships. Whether a public venue (e.g., chatrooms) or private media (e.g., instant messaging), a different type of social interaction has rapidly evolved. Online interactions lack features that have been a crucial part of human relations, such as eye contact, body language, etc., and, therefore, are often characterized as lacking the richness of face-to-face interactions. In addition, new phenomena such as "cyberbullying" have caught all involved in education by surprise, forcing them to scramble to address issues in a crisis mode.

There have been both positive and negative features identified in online interactions. Relieving social anxiety of meeting and interacting with people whom you do not know well is an example of the former, while cyberbullying and sexual predation is an example of the latter (Subrahmanyam & Greenfield, 2008). In addition, adolescents report feeling more comfortable sharing their feelings online, as they feel they can be more honest, and, especially, shy teenagers, utilize the safety of being behind the screen to reach out and communicate (Rosen, 2007). It has also been indicated that most adolescents use online networks to extend and enhance already existing, off-line friendships, indicating a "friendship-driven" and also "self-directed" form of social and emotional learning (Ito et al. 2008). On the other hand, other types of technology, such as cell-phones, and other hand-held devices, have undermined family practices, mealtimes, etc., and have established new generational boundaries, including the lack of screening calls by parents (Ling & Yttri, 2006).

Current research also draws attention to motivational and emotional benefits such as enhanced creativity, persistence and motivation in the face of failure, improved mood, and positive emotions as a result of media use (Granic, Lobel, & Engels, 2014; Ventura, Shute, & Zhao, 2013). Through targeted media use, adolescents can explore and develop specialized interests and connect with others sharing these interests outside their local community. They also have the opportunity to share and disseminate their work on such a broad, global scale, for example through youtube, something that would have been unthinkable a few years back. This "interest-driven" media use can significantly enhance not only academic, but also social and emotional learning, preparing individuals to better address and function in a tech-based, global world (Ito, et al., 2008).

### **4. Relation of face-to-face and online interactions**

#### *4.1 The chicken and the egg dilemma*

The ways in which online interactions affect face-to-face relations are not yet fully understood, and conflicting findings have created controversy regarding the relationship between these two types of interactions (Kujath, 2011). Emerging patterns beg the question of the direction of causality. In other words, were face-to-face interactions problematic to begin with, and that increased the desire, and pursuit of, online interactions, or vice versa? Some evidence indicates that youth seeking out online relationships with strangers had high conflict levels with their parents, as well as low levels of communication (Wolak, Mitchel & Finkelhor, 2003). Also, teenagers who spent a lot of time on sites such as "MySpace" felt that they received less support from their parents (Rosen, Cheever & Carrier, 2008). However, other evidence suggests that youth use online media to extend already existing, offline relationships, and do not pursue online interactions because the offline, face-to-face interactions are problematic (Ito, et al., 2008; Schurgin O'Keeffe, Clarke-Pearson, & Council on Communications and Media, 2011). Although, these two broad types of evidence seem to contradict each other, they may be just pointing to the intricacies of media-use, prompting us to closely examine the complexity of the reasons behind the use of certain media as a means to maintain, and to a different extent, form new friendships.

#### *4.2 Electronic media and parents*

Although the Net generation is the first to grow up in a digitalized world, this is not the first generation that created a media-use uneasiness for parents. When television became widely available, its use and effects on children became an issue for parents

and educators alike. However, in the present Net generation the accelerated pace of technological developments, as well as the short time period during which this technology has saturated world markets, have added several issues that have not been encountered before (Roberts & Foehr, 2008; Rosen, 2007). The mere fact that, on average, children and teens know more than their parents about the technological aspects of the new forms of communication and accessing information may lead to inter-generational conflicts unlike those seen before. Depending on the type of media use, effects could be positive or negative on family cohesion. For example, it has been indicated that if media were used for social purposes, it lead to family conflicts, whereas, if media were used for school-related purposes, it was not linked to family conflicts (Mesch 2006).

There are two ways that parents seem to be exercising influence regarding technology and media use: (a) by monitoring activity through filters and other software, and (b) by restricting access to certain sites, or limiting time that can be spent online. However, there is little research on what parents actually know regarding their own teens' e-media use. One study reported that parents were unaware about their adolescents' MySpace use (Rosen, Chever, & Carrier, 2008), while another study found that 90% of adolescents did not tell an adult, including parents, even instances of cyberbullying (Juvonen & Gross, 2008).

Initial evidence also links parenting style with online media use. Four parenting styles (authoritarian, authoritative, neglectful and indulgence) are based on two basic dimensions of parental behavior: acceptance and responsiveness on one hand, and demand and control on the other (Baumrind, 1966); Maccoby, E. E. & Martin, 1983). It has been indicated that authoritative parents were most knowledgeable about their child's use of social media. Authoritative parents were also more likely to set limits about media use and teenagers with parents of this parenting style were the least likely to engage in high-risk, online behaviors, such as sharing of personal information (Rosen, Cheever & Carrier, 2008). It is interesting to note that developmental differences were associated with parent style and monitoring online use. In general, parents of younger teenagers were displaying authoritarian and authoritative styles, and were more likely to closely monitor media use and set limits than parents of older teenagers who practiced more neglectful or indulgent parent styles.

It has also been shown that the type of media use may be mediating the parents' reaction and limit-imposing behavior. For example, if technology is used to complete homework, acquire new skills and information, it is deemed compatible with parent expectations, and, therefore, in these cases, media use is negatively associated with conflicts. However, if technology is used solely for entertainment and social purposes, these uses contradict parent expectations, increase parent-child conflicts, and, therefore, negatively affect family cohesiveness (Mesch, 2006).

If viewed as an isolating, individual-only activity, other issues are also associated with media use and families, such as time displacement, since spending time on electronic media is negatively associated with quantity and quality of family time. However, internet and media use can become a shared activity and provide families the opportunities to create family sites, play games, stream movies, create family movies and albums, etc.

## **5. Electronic Media and Schools**

### *5.1 Technology and Learning*

Schools are trying to handle the explosion of media use in a variety of ways. At one end of the continuum seem to be schools and districts that have completely blocked access to a variety of e-media forms including cell-phone use, websites, games, etc, sometimes even blocking sites and media that can be of legitimate use in the educational process (Simmons, 2005). At the same time, others have embraced the use introducing blended learning (instruction with both face-to-face and online components), flipped classrooms (students access new material outside of class, via online lectures, videos, etc, and then use of class time is applying, analyzing, evaluating, and debating issues). This approach has been picking up momentum and studies have offered evidence of learning gains compared to a traditional instructional method (Brame, 2013; Mazur, 2009).

However, a significant roadblock in broadly applying a blended learning format is educator preparation. On average, pre-service, and to a higher degree in-service educators, have not been prepared to integrate extensive and complex technology in their daily practice. Such training is not a simple dissemination of information in a number of workshops or courses, but rather a comprehensive revision of the current pedagogy and classroom ecology (Voogt, Almekinders, Akker, & Moonen, 2005). In many ways, the role of an educator will have to be re-examined and re-defined, as technology uses will expand in schools and in daily functioning, causing a big shift in theoretical paradigm and practice. In addition to this paradigm shift, another issue needs to be addressed in a pressing and comprehensive way: involving families to extend this technology-supported learning at home.

### *5.2 Technology and School-family Partnerships*

Technology can play a vital role in increasing parent involvement in the educational process. Since nearly all schools are connected to the internet, and more than 77% of adults in the U.S. have access to it, increasing home-school communication and

fostering meaningful home-school relationships should be easier than ever (Olmstead, 2013). With the help of technology, being actively involved does not necessarily require the parents' physical presence at school, and it can also provide increased immediacy in home-school communication. In addition, keeping parents informed about classwork and homework, as well as their children's progress has become much more efficient through technology. School and teacher websites can keep parents abreast of school and classroom workings, only if they are frequently updated. Through such a system the perennial statement "I don't have any homework" can be easily confirmed and, more importantly, give students the message that the line of home-school collaboration is ongoing and well-established, leaving little room for pinning parents against teachers. In addition, online progress and grade reports can provide parents with a systematic way of monitoring their children's school performance, and, also, foster direct communication between parents and teachers through posted links that parents can access if they have questions regarding their child's progress.

In this era of rapidly evolving demands for technology use in schools, establishing school-family partnerships extends beyond facilitating two-way, home-school communication and information dissemination. In the core of the extended use of technology in schools lies the assumption that technology-based student learning will extend to the home, as students are asked to use technology to complete homework, or, in a flipped classroom format, even familiarize themselves with new material and concepts. Under this assumption, fostering school-family partnerships assumes an even more important function than ever before, as it becomes an integral part of technology-based learning (Kong, & Li, 2009).

There have been several technological advances prior to the dawn of the digital age, but an important difference this time is that changes are swift and have immediate applications. This calls for swift and pressing changes and actions on several levels. Although educational policy and school systems are convoluted and slow to change, given that technological applications will continue to increase, and learning demands on students will continue to shift, we cannot afford to lose time. Better understanding of the way these applications affect parent, teacher, and student interactions, as well as addressing changes in the educational process, instruction, and outreach to families is an urgent mandate for researchers, practitioners, and policy-makers alike.

## Abstract

Gender relations are influenced by culture, education and religion, and often encourage situations of violence, especially against women. This article, through a literature review, aims to investigate the relationship between violence against women, culture and religion, as well as propose a reflection on violence against women and education. The religious morality perpetuated by culture legitimizes the violence against women, which is a urgent issue for the education area. An education that does not reproduce gender relations based on patriarchal system, valuing all people and aiming more equitable relationships without violence is needed.

## 1. Introduction

Gender relations are influenced by culture, education and religion, and are often permeated by violence. Education, culture and religion, often encourage situations of violence, especially against women. This article, through a literature review aims to investigate the relationship between violence against women, culture and religion, as well as propose a reflection on violence against women and education. This article discusses how the Christian religion legitimizes violence against women, perpetuating a symbolic violence and stresses the importance of an education that aims more fair and equitable gender relations, eradicating violence.

The religious morality perpetuated by culture legitimizes violence against women, and this is an urgent subject for education. The statistics of domestic violence in Brazil are troubling. The NGO Centre On Housing Rights and Evictions (COHRE) published on July 16, 2010 data from a survey entitled *A Place in the World: the right to adequate housing as a key to a life free of domestic violence* element, revealing that in Brazil, it is estimated that one in four women suffer and/or have suffered some form of violence (COHRE, 2010). According to data published by Perseus Abramo Foundation in 2010, a woman is assaulted every twenty-four second in Brazil, totaling approximately 1,314,000 women victimized by violence each year (Pesquisa Fundação Perseu Abramo, 2010).

Thus, it is urgent to find ways to eradicate domestic violence, in this way, education and religion are areas that need attention. In the Brazilian context, even if there's a person who says that is distant from religions, in some form or another, has its life riddled by religious morality, which are often oppressive to women. Churches and schools can not remain inert in relation to violence against women.

## 2. Christian Religion and Domestic Violence against Women

Religion, initially, is popularly associated with peace, with the common good of humanity, with love, with the protection of those less favored, which complicates the perception of the potential for violence that underlies its speech and in its practice, especially in relation to women (Citeli & Nunes 2010, p. 5). Religious taboos often collaborate to keep women suffering violence in their relationships. The lack of theological training to deal with domestic violence against women can also contribute and feed religious myths that condone this reality. One of the biggest myths of the Christian Church is home as safe and sacred place and should be kept foremost. Families with religious experiences may also be affected by the problem of domestic violence:

[...] Pastoral counselors need to recognize the reality that the family is the most violent group to which women and children belong. Even if there is a desire to see the family as a group living Christian values, where there is comfort, love and joy, we must recognize that the family is a place where not only violence but also the tragedy can occur. (Bergesch, 2008, p. 125).

Many women seek to understand the violent relationship who live through religion. Want to understand why their suffering and their stay in the abusive relationship. Seek answers in religion for the transformation fellow who once vowed to love her and respect her, but now the violent assaults and systematically (Lemos & Souza, 2009, p. 19). This search for understanding can occur, often through prayer, dialogue with God. Often this search - or even some religious counseling - to direct the story of the crucifixion of Jesus. It creates a kind of conformity to the violence through the suffering of Jesus, because it is the largest extant suffering. This theological affirmation reduces any human suffering:

[...] In the center of the Christian tradition, is the son of God, suffering and dying on the cross [...] When this theological and pastoral interpretation of suffering is combined with Genesis 3:16, where God greatly increases the pain of Eve in birth because of their sin committed, a double, lasting and complicated message is sent to the women. First, it is good and suffering is a God's wish, and second, suffering is the inevitable consequence of personal sin. Christian women are called to suffer as Jesus suffered; as daughters of Eve, women are eternally punished with suffering. (Tatman cited Bergesch, 2006, p. 220).

Religious values act with great force in the symbolic and subjective plane. The inferiority of women conveyed by religious discourse is a form of symbolic violence, enforced through social representations. (Tomita, 2004, p. 175). One example that is set up and maintained in religious values is the traditional model of a patriarchal family structure with heterosexual sex, male managers and submission of children and wife to husband and father (Citeli & Nunes, 2010). Women are subjected to so embedded in the culture and society that often do not realize what happens symbolic violence. This violence is so subtle that may be disguised in the name of women's freedom, but in fact is nothing more than slavery. That is, when women seek the job market, it is still common for housework and caring for children, elderly and other dependents, where applicable, are not shared with his companions, which is therefore that they have double or triple work shifts. Moreover, in Brazil, women with the same age and educational level than men still earn lower salaries, approximately 30% unless they (Centre, 2012). And this symbolic violence, in some cases, can turn into domestic violence. When these women fail to comply with perfection all obligations related to work outside the home, are punished with psychological and physical violence: The fact that women have gone to the public world of work is the scene of the forbidden fruit that she eats. Daily she disobeys, and follow the advice of the serpent. The subtlety of the speech will say that she will not remain without punishment (Roese, 2009, p. 182).

When religion teaches that women should be obedient, passive and submissive, it is just contributing to the production and reproduction of various forms of violence that affect. Religious discourse, sacred texts and their interpretations, practices of exclusion and sexist discrimination from church towards women, collaborate to maintain this violence (Ströher, 2009, p. 101). The history of violence against women within the Church, as the witch hunts, the biological discrimination, the omissions in violent conjugal relationships, contributed to discrimination against women from society and culture. Church is a place of training and influence on individuals who begin to act socially. (Bergesch, 2006, p. 114).

The witch hunt was one of the cruelest forms of violence against women, and what is more aggravating, was perpetrated by the Church itself. According to Karen Bergesch, torture was considered the most effective way to get the confession. The torturers were looking for any sign of abnormality, which would be a clear sign pact with the devil. Therefore, the victims were naked and depilated. If a woman confessed that she wasn't a witch, it was also considered an important proof of witchcraft, for "his alleged biological inferiority not allow resistance, unless she received aid from evil." (Bergesch, 2006, p. 112). In 1694, the responsible for religious persecution, beatings and executions of thousands of women considered witches, prepared a document based on a reading of the Bible manipulated to justify such acts. Among other things, reported in a document: a) all wickedness is little compared to women; b) when (women) use their good qualities, it's good, but when they use bad, it's the devil himself; c) a woman is evil by nature and it is easy for her to renounce her faith, which is the root of witchcraft; d) it must be said that there was a defect when it became the first woman since it was made from a bent rib, that is, the breast, that is made contrary to the rib of man, and since then, for this defect is an imperfect animal (Calabrese, 1998).

Churches condone with the reproduction and maintenance of the myths and violence against women at the time they become complicit in the culture of silence and inaction, refusing to report acts of violence and their authors, in addition to the institutional and social structures that perpetuate this unfair practice. "Ignore the women, do not take them into account, not to refer to them is a way of belittling them and denying them rightful place in society and in the churches." (Calabrese, 1998, p. 38). Because churches have behaved against violence against women as something natural and socially trivialized, they end up legitimizing its practice in intimate family, thus reinforcing the view patriarchal world in which man can and should exercise his power and authority over women and upon the children (Cavalcante & Soares, 2009).

Women were affirmed as naturally inferior to men by various Christian theologians, influenced by classical philosophy, argued from a supposed theological bases male superiority, thus legitimizing the domination of women. Augustine, for example, in *De Trinitate*, claimed that woman would be deprived of the image of God simply by being a woman. Thomas Aquinas, in *Summa Theologica*, argued that women had a lower nature and, therefore, should be subject to men. For Luther, the authority of the husband represented a sacred authority, and women who submit unquestioningly. Calvin, meanwhile, argued that women

should stay in the marriage even with physical violence because the husband has authority over his wife (Lemos & Souza, 2009). Until today, the arguments that the Catholic Church uses to deny women the right to ordination relate to supposedly inferior nature of women compared to men and also based on Ephesians 5:23 - the man is the head of the wife/house, so as Christ is the head of the Church (Bergesch, 2006).

The set of social representations that formed throughout the history of subordination and inferiority of women, mark yours perception and perception of others about them. Are these social representations that bring meanings that have caused the women resigned permission violence, and religious discourse participates in the production and reproduction process of these representations (Lemos & Souza, 2009, p. 59).

### 3. Christian Education and Religion to end Violence Against Women

According to Mary Hunt, the first work investigating the relationship between religion and violence against women was the Rev. Dr. Marie Fortune Marshall in 1977, in the United States. In order to inform, consult and provide education about domestic violence materials, Marshall established the Center for the Prevention of Sexual and Domestic Violence, now known as Faith Trust Institute (Hunt, 2009). Feminist students of religion and Marshall investigated the theological origins of violence suffered by women. Investigated, among many topics, language and exclusively male imagery and its relation to violence, for example. However, what surprised Marshall and its colleagues, was the discover that there were also priests and other religious authorities involved in violent behavior:

Pastors, rabbis and priests involved in sexual activity with his parishioners, the imams who advise women to have abusive marriages [...] show that violence is not just something that religions condemn, but something that their own leaders are involved. Moreover, the violence committed by religious leaders has the extra element of violating not only the physical and psychological dimensions, but also the spiritual dimension of the person. (Hunt, 2009, p. 9).

In 1983, the Faith Trust Institute revamped their programs of action, which are valid until today. These four programs are: 1) ethics for clergy: training and educational materials, in order to prevent instances of sexual abuse, and instruct on the topics of limits; 2) Safety and Health in the Congregation: support clergy and lay leaders in creating and maintaining safe and healthy congregations, emphasizing prevention of juvenile sexual abuse; 3) Healthy Families: printed and audiovisual educational materials about juvenile abuse, domestic violence and relationships in adolescence, educating the religious leaders to involve communities as part of a global community action against domestic violence; 4) Human Trafficking and Sexual Exploitation: Educational materials for clergy and lay leaders (Hunt, 2009).

Church often becomes the refuge, the place where woman suffers violence seek help and acceptance. This is because it is a space allowed to women by the men who assaults. Another relevant factor is that this religious space and their leaders are considered sacred, free of profane feelings. However, we must not forget that religious institutions and their representatives are inserted in the patriarchal system and its policies, ideologies and attitudes contribute, in most cases, for the maintenance of this social organization. An example that makes this clear is that the sins of men are always diminished and even justified, while women are the cause of this sin. When a woman is raped, is very common witness attitudes laying woman in the role of blame for rape. The causes of rape are attributed to women, because of women crept, caused, allowed and asked to be raped. This scapegoating of women is also present within religious institutions:

[...] Playing is a divine gift, and sexuality as a means to achieve the divine purpose of reproduction. This religious conception justifies the dispossession of women's bodies and makes room for violence against them when they want to exercise their rights to autonomy and freedom [...] There is a traditional view that makes women and their bodies guilty of violence who suffer, although in fact, violence is found rooted in society that is guided by a system itself violent in that engenders it, but it attaches to the body of the woman the violence itself, society, produces, and in which appear religious institutions as an important component. (Orozco, 2009, p. 138).

So when a woman seeks help in religion, feel their suffering lessened, cheapened and naturalized, understanding that suffering is part of being a woman. The patriarchal religions tend to legitimize the subservience of women by linking them to evil, the deviant, to disorder and moral weakness, leaving them at the mercy of punishments touted as natural (Citeli & Nunes, 2010, p. 6). Therefore, they take the blame for the violence they suffer. Women seek to recall moments of their lives or their relationships where they did something wrong, by which they are being punished.

Traditional theology, despite considering encompass the human being as a whole, leaves women at the margin, because there is, at least not enough, the fundamental questions going through their lives, such as domestic and sexual violence. "The woman is

disrespected because traditional theology does not consider female suffering at his reflection. Rather, the woman gets the blame upon himself for having introduced sin into the world" (Bergesch, 2006, p. 119). To this theology, there are only two choices for women: To be Eva, the sinful, or to be Mary, the holy.

The life and social position of women today is not the same as ten years ago, much less, than in centuries. However, the religious discourse never followed this change of female paradigms. "There is a religious and cultural mystification of woman, female, mother to a cult, the virginal, sacred, deified female." (Roese, 2009, p. 189) In relation to the family, religious discourse argues that this is sacred, untouchable and hence, and an unquestionable structure, hierarchy and even violent relationships. Thus it creates the culture does not place the spoon. Violence becomes cultural, structural and institutionalized, and sustained by a conservative moral (Roese, 2009).

The reality about many women in society and how the family organizes itself changed. Women today, in an increasing number, work outside the home, are qualified and competent professionals, living alone, and many, support their own families. The discourse of the Church today is not suitable for the everyday reality of these women, whether they are independent or whether they are in an abusive relationship [...] (Bergesch, 2006, p. 128).

Often, women who are abused ask God to free them from this calvary, because they believe in its power. However, they don't believe themselves. They seek support in religion not just for the wedding, but also for the divorce, when the cycle of violence becomes unbearable. "A religious legitimacy to get out of violent situations" (Lemos & Souza, 2009, p. 19). God cares for us with love and encourages us to make use of this inner power, opening the doors to understand who we are and how we are important in the world. You need to trust that God also believes in us. Women who undergo violent situations usually have a self-esteem so impaired that are slow to realize his own strength. Gradually, they can regain their human dignity that was stolen, discovering themselves as women created by God for happiness, solidarity and full life. And then, will be free to grow, first of all, the love itself. "The woman who loves herself always walks with his head high, look safe, and each day grows your confidence in yourself and your power as a daughter of God." (Calabrese, 1998, p.193). It thus becomes essential that gender relations and religious morality that fosters violent relationships be reviewed, and this has to be a role of education, even within the churches. Women need to be encouraged in their self-esteem, empowered, so that the cultural and religious context that underestimates women should just stay in the past, and that fair and just relationships start to be a reality.

#### 4. Final Thoughts

Considering the high incidence of domestic violence in Brazil, as the indexes indicated earlier in this paper (COHRE, Pesquisa Fundação Perseu Abramo, 2010), we question how many families are in this situation within a community or school. Many communities do not receive women and families experiencing violence in a empowering and liberating way, but legitimize violence, and encourage women to endure the violence they suffer, without considering that women are worthy human beings who deserve to have a life free, fair, and without violence. An education on gender is urgently needed in the educational and religious context in order to question and change the oppressive gender relationships taught and stimulated in culture, the schools, and by religions. Stereotypes of obedient, passive and submissive women are oppressive and destructive to the self-esteem of women, justifying acts of violence, and needs to be deconstructed. Women in situations of violence need to feel safe - both in relation to confidentiality as compared to non - prejudiced judgments:

A woman seeking aid and at the same time, have difficulty understanding the relationship of violence in which it participates, states that her history is recognized as true [...] requires a pastoral counselor understand and believe in his speech. Consequently, this also means receiving practical referrals, for example, house addresses shelter, aid phones and necessary referrals (Bergesch, 2006, p. 129).

Churches and schools should take the responsibility and training and qualification of their religious leaders and educators to prevent, educate, serve and host families and especially women living with domestic violence leaders. However, we must be alert to all aspects involving violence against women, such as the cycles of violence and threats of man with aggressive behavior, for example. It is quite common for women to seek help in their church and then repent of this act. In some cases, may even distance themselves from their community, need not explain why this new chance at your relationship and marriage. But if the spiritual counselor aware of all the complex issues that are involved in an abusive relationship, it will not (pre) judgments and know how to continue welcoming and advising this woman and her family. It is therefore crucial to deconstruct the oppressive gender relations legitimized by religion and education in order to eradicate domestic violence, empower women, and promote the ideal of peace, equity and justice for all people.

# Representation of the other in George Orwell's *Burmese Days*

Fatma Kalpaklı\*

\*Faculty of Letters, Selcuk University, Konya 42, Turkey

---

## Abstract

In *Burmese Days*, George Orwell presents the relationships between the English people and the Indian people in the days of the British colonialism in Burma. As time goes by, the interactions between the English and the Indians result in the othering process as differences rather than the similarities are emphasized by the English. Thus, the Indians are perceived as the other, as the non-white, non-Christian by the English. In this article the perceptions of the other will be studied with regard to George Orwell's *Burmese Days*. Moreover, the Eurocentric perceptions of the East and India will be dealt with closely.

## Introduction

The British presence in India began with the establishment of a few trading centers at Madras, Bombay, and Calcutta (Mahmud, 1988: 183) in the sixteen century (Edwardes, 1994: 15). As time went by India became "the jewel of the British Empire". Thus, India began to attract the attention of the adventurers, especially of the second sons of the wealthy families because of the British inheritance regulations, which dictate that the second sons do not inherit as much as the first sons. Therefore, the second sons end up in becoming either Army officers or officials in the colonies such as in India, Trinidad or Ceylon.

George Orwell was one of these officers in India and began his career as a member of the Burmese Imperial Police in 1922 and had the chance to learn India's culture. After returning to England in 1927, he began to write his first novel, *Burmese Days* (which was published in 1934) ("George Orwell").

The novel presents a realistic picture of the British colonialism in Burma. At the beginning of the British Raj in India, most of the Indians were content with the English people and the English existence in India. Until the Mutiny of 1857, the English and the Indians were on good terms. However, in 1857, the use of cow and pig fat in rifle cartridges was one of the main causes of the Mutiny and it created such fears among the Indians that Indian religion and culture would be erased by the English culture (Edwardes, 1994: 150). Therefore, some of the Indians rebelled against the British Raj.

Though the Mutiny of 1857 was suppressed and British authority was regained in India, its impact on Anglo-Indian relations continued. From then on, there was mistrust on both sides. Within the context of imperial policies, the British Empire decides to adopt a more strict paternal colonizer's attitude. Similarly, when Orwell began his service in the Imperial Police in 1922, the relations between the British and the Indians were not very well.

At the time, the British claimed that their presence in India was beneficial for the development of the Indian people, who are very backward and who are in need of the British guidance. Thus, they regarded the Indians as the child-like people, who should be taken care of and governed by a superior race, that is by the British people. The superiority complex of the British resulted in the othering process, racism and in the exclusion of the Indians from the white circles (such as the whites-only club in *Burmese Days*). The aim of this article is to analyze the representations of the other in George Orwell's *Burmese Days*.

Throughout the novel, the "us and them" attitude is prevalent and the Indians, being non-white and non-Christian, are perceived as the other. There are clear-cut distinctions and borders between the English and the Indians in *Burmese Days*. At one scene in the novel, Flory, who is the main character in *Burmese Days*, suggests that indigenous people should also be welcomed at the English club. Ellis, another Englishman in the novel, applies the othering process towards the indigenous people and illustrates the typical attitude of the Englishmen, or on a larger scale the Eurocentric attitude towards the indigenous people by expressing the following words to Flory: "You oily swine! You Nigger's Nancy Boy! You crawling, sneaking, bloody bastard! ... Look at him, look at him! Letting us all down for the sake of a pot-bellied nigger! After all we've said to him! When we've

only got to hang together and we can keep the stink of garlic out of this club forever. My God, wouldn't it make you spew your guts up...?" (Orwell, 1984: 235). Through his utterance of the words above, Ellis expresses the prevalent racist British belief that the white-men are superior to the indigenous people and that the Indians should not be welcomed at the English club in India. They further should be excluded from the white circles. Thus, they should know their places and boundaries and remain as "the other".

As an extension of the fear and hatred against the other, there is a tendency among the English to associate the Indians with bad and evil things. As a consequence of these racial tendencies and prejudices, the Indians become the scapegoats at the hands of the English people. For instance, in one scene in *Burmese Days* a British officer is killed and immediately an Indian is accused of, despite not having enough evidence, murder. General McGregor, the British officer, says to his fellow British officers that "[t]hese may not be the natives who murdered the man, but they'll do... We need a nigger, any nigger, and these are just as good as any. They will most definitely be found guilty and executed for the crime" (Orwell, 1984: 242). This passage is very remarkable to show the extent of the othering process and racism and these events remind us *To Kill A Mockingbird*, in which a black man is accused raping of a white girl, though he is innocent. These events pave the way for revolts and protests. Having been exposed to injustice for too long and for many times, the Indians begin to protest that they are not represented fairly "in the British courts" and therefore, the Indians try to solve their problems in their own ways. They begin riots to get what they deserve or achieve justice. For example, Ellis, an Englishman, causes an Indian boy to become blind. Upon this event, some Indians come together in order to punish Ellis themselves and to protest the injustice done to the Indians at the courts. They go to Ellis's house and seeing Flory with him there, they say, "Mr. Flory! Ah, Mr. Flory... Please, return yourself to the building... We have no problem with you. You are a good man and we do not wish to harm you. However, we do require that you deliver Ellit to us. He has struck one of the boys in the face and blinded him. You had better be quick, min gyi (sir). We know that there is no justice for us here in the courts, so we must punish Ellit ourselves" (Orwell, 1984: 247). Ironically, in their own homeland, Indians are judged with the English laws and consequently, the Indians are deprived of their human rights and justice.

Before the events narrated above, for a period of time, the Indians were unable to see the evil and corruption beyond the white mask. There were some Indians, who perceived the British as friends and tended to take side with the British. The best expression to explain this situation/or the colonization of India with the consent of some Indians by the English may be "it takes two to tango". These issues are also illustrated in detail in Orwell's *Burmese Days*. Throughout the novel, many of the Indians try to impress the British by adopting British manners and eventually become themselves mimic men.

This situation may stem from the fact that Indians are exposed to British culture and education for so long that they internalize the British values without questioning. Moreover, as it is also pointed out by Memmi and Fanon in their books, Indians have been brainwashed and "made to believe that a person of white skin is superior to one of dark skin". Therefore, Indians have a tendency to believe that the British are the best in their all deeds and beliefs.

With this respect, in *Burmese Days*, the discussion between Dr. Veraswami, an Indian doctor, and Flory, an Englishman, is remarkable. Dr. Veraswami takes a pro-British stance and expresses that "My friend, it is pathetic to me to hear you talk so. It is truly pathetic... You are forgetting the Oriental character. How is it possible to have developed us, with our apathy and superstition? At least you have brought to us law and order... Consider that there are also other achievements of your countrymen. They constructed roads, they irrigate deserts, they conquer famines, they build schools, they set up hospitals, they combat plague, cholera, leprosy, smallpox, venereal disease... Your people are truly the better... Behold the degeneracy of the East without the Europeans!" (Orwell, 1984: 42). Dr. Veraswami is such an admirer of the British that he feels gratitude to the British colonizers. He does not see the evil behind the white mask, whereas Flory, despite being an English, explains that the English are in India for the sake of Money and wealth, to exploit the land/India, not for the sake of humanitarian values.

Under the light of all the examples given so far, it can be suggested that Orwell in *Burmese Days* reflects the events in Burma towards the end of British Imperialism realistically and the power-struggle between the English people and the Burmese people is conveyed to the reader through the metaphor of the English club in Burma. Orwell defines the English club as "the seat of English power" (Bose, 1990: 61). Furthermore, in the novel, the willingness of Dr. Veraswami's to be a member of this club and his refusal by the British officers in Burma illustrates that they could not have a compromise due to "the othering process". The white men do not want to see the black man, Veraswami in the club, though he is well-educated and a doctor. Furthermore, Ellis looks down upon the Indian universities and does not see Veraswami as a real doctor since he "has done two years at an Indian so-called university" (Orwell, 1984: 24). The colour of his skin is seen as a barrier for the membership to the club. Though, he is an admirer of the British culture and though he imitates the Englishman, he is excluded from the white-men's circle. He neither belongs to the English, nor to the Burmese culture and he starts living in a social-limbo and he feels displaced in his own country. He does not question the British existence in Burma, on the contrary, he supports it and he believes in the superiority of the Englishmen blindly. Orwell's description of him is like a caricature and this may be taken as a critique of the indigenous people, who accept colonialism and who try to rise in the social-strata by co-operating with the British.

It is an undeniable fact that English men are there to exploit the land of the indigenous people and their sources. Thus, in the novel, Orwell draws a parallel between the usurpation of the Burmese land and the Burmese women. Even Flory, the most tolerant and friendly character towards the Burmese people, does not hesitate to abuse Burmese women sexually. He has a mistress called "Ma Hla May" and he treats her very harshly. He has sexual intercourse with her, and gives her money and then wants her to go out. It is like a take-and-give relationship, there is no feeling and emotion in their relationship. Just as they do to

Burma, the white man/Flory uses her for the satisfaction of his desires and needs. And perceiving her “as something disposable”, he leaves her eventually. In other words, she has no identity and no value in the eye of the Britishmen. From time to time, he does not avoid to use violence against her, he pushes her and hurts her (Orwell, 1984: 52-53). Flory/The British Empire gets rid of Ma Hla May/India, when she becomes a financial burden.

On the other hand, Ma Hla May is not very innocent and tries to get advantage of this relationship. She tries to get as much money as possible from this relationship, just like Dr. Veraswami thinks that India takes the advantage of Britain through the building of railways. Moreover, seeing herself as a white-man’s wife, she feels proud. Her attitude may be parallel to the attitude of U Po Kyin, who tries to benefit from the colonial system in the novel. Orwell points out that, “to fight on the side of the British, to become a parasite upon them, had been his [U Po Kyin’s] ruling ambition, even as a child” (Orwell, 1984: 6). Though Ma Hla May and U Po Kying try to exploit the colonizer, actually they are the exploited ones. They only deceive themselves by thinking that they could abuse the colonizer in return.

Parallel to the exploitation of India by the White-men, throughout the novel, women are exploited by the men and seen as “inferior”, regardless of their colour and their social statue, “[a] woman ranks at about the same level as a rat or a frog” (Orwell, 1984: 7). For instance, a white woman called Elizabeth is exploited sexually by white men, first by her boss in France, later by her own uncle, Mr. Lackersteen in Burma. Therefore, in a patriarchal society it is made clear that a woman has no other choice except marrying to a rich man. Only, Flory puts her “on a pedestal” and seems to appreciate her, but he cannot understand her and wants her to think in the same way as he does. He wants to colonize her by persuading her, not by force. He tries to conquer not only the white female body, but also her mind through persuasion. As an extension of this attitude, white “women cannot vote in the club” (Orwell, 1984: 219) in *Burmese Days*. In the novel, it is stated that Elizabeth’s mother is an artist and is a supporter of Women’s Suffrage Movement as the so called “civilized” white men oppress the white women. At this point, women suffragists may be likened to the Burmese nationalists, who try to gain their independence from the Oppressors. That is, women/Burmese nationalists are against the men/the British Empire. Relying on the dominance of WASP(M) people - which means White Anglo-Saxon Protestant (and in parantheses a hidden Male) - and the oppression of the indigenous people, it can be suggested that the oppressed/the other - non-White, non-Christian, non-Male that is Female - begins to look for justice in the novel.

On the other hand, paradoxically white women try to oppress black women. For example, Elizabeth finds “black women and her kinship with them” disgusting and sees them as “creatures with black faces” (Orwell, 1984: 113). This illustrates that there is not “sisterhood among the white and black women” and their colour is more important than their sex as a common denominator. Burmese women are put into some clichés by the English women and are likened to “boys” (Orwell, 1984: 84) with no curves in their bodies and described as “coarse-looking” (Orwell, 1984: 113) and as “small-footed” (Orwell, 1984: 123) and with “vegetable baskets on their heads” (Orwell, 1984: 119-120). Moreover, Burmese women have a tendency to imitate the white women and sometimes U Po Kyin’s wife dreams herself in “high-heeled shoes and in silk stockings” (Orwell, 1984: 136) and this Anglicised image makes her very happy in the novel. In other words, they become mimic-women. Furthermore, Flory cannot remember Burmese women’s faces (Orwell, 1984: 186) and their not having any faces reveals that in the eyes of Flory, they do not have an identity. Likewise, Verrall, a policeman, perceives (both black and white) women as “distractors and they take men away from polo and so on”(Orwell, 1984: 193). In addition to them, Mr. Lackersteen abuses both white and black women (Orwell, 1984: 201). In the novel, Elizabeth’s shooting birds and tigers may be taken as a reaction to these abuses of the women by the men. As she cannot control men, unconsciously she tries to control animals. That is, since she cannot take her revenge from the white-men, she becomes cruel towards the animals. The oppressed/Elizabeth becomes the oppressor for the animals and for the black servants. In the novel, it is emphasized that Burmese servants prefer man-sahib, no a woman sahib, since the English women are more cruel towards them. Therefore, servants also make “the othering process” and say “they [English women] are not even human, they are a different race” (Orwell, 1984: 112). And a white woman becomes superior to a man, only if the man is black. As it is mentioned before, the main determinant of one’s social position is one’s skin-colour rather than one’s sex. Then, if you are a colonized black woman, your burden is tribled.

Thus, the situation of the black women is worse than the situation of the white women. This becomes very striking in the scene when “Ma Hla May kisses Flory’s shoes” (Orwell, 1984: 147). Flory is the Man/Master/Colonizer and Ma Hla May is the Woman/Servant/Colonized and therefore she is suppressed three-times.

One may justify Ma Hla May’s situation, but in fact when a Burmese woman gets married her situation does not change much. For instance, Ma Kin, U po Kyin’s wife always “stands behind her husband and serves him”(Orwell, 1984: 13). Similarly, Doctor’s wife hides herself whenever Flory comes to their house like it is done in the *haremlık-selamlık* tradition in the Ottoman Empire and this shows that women are isolated and they do not take active parts in social life.

Yet, in *Burmese Days*, women are not the only ones, who are perceived as the inferior and “the other”, the indigenous people of Burma whether they are men or women face the same problems. In the novel, the Englishman’s negative stereotyping of the Burmese may attract a keen-eyed reader’s attention. First of all, Burmese people are “lazy, dirty and smell garlic”. They are not considered as human-beings, for example Mrs. Lackersteen says, our servant “loved us like a dog ”(Orwell, 1984: 28). They can love like an animal, not like a human being. An extension of this belief is that they do not have intellectual capacity and they “understand only violence”(Orwell, 1984: 107) like animals. And the British officers in Burma believe that only through the use of violence, one can make them work, not through persuasion.

Orwell himself unconsciously believes that all Burmese magistrates are dishonest and cunning and this belief comes to the surface, when he uses the following words for U Po Kyin, "he is a fair sample of a Burmese magistrate" (Orwell, 1984: 43). At the beginning of the novel, we are informed that he takes "bribes" (Orwell, 1984: 6) and abuses his power at work. Parallel to this, Eurasian overseers are seen as "inefficient in work" and therefore, it is stated that in Flory's absence, "everything went to pieces at the factory" (Orwell, 1984: 110). In addition to these, the early comers to Burma advise to the new comers not to trust to the indigenous people. The warning "[d]o not trust to Indians" (Orwell, 1984: 179) is repeated many times by the English in the novel.

Apart from these, the indigenous people are "supposed to be poor" and if someone has more wealth than the British expect him/her to have, then s/he is accused of being a thief in the novel. "How can a black have an Emerald Ring?" (Orwell, 1984: 71) says a British man and then accuses a Burmese man of being a thief.

In addition to these, the Burmese people are depicted as "superstitious" and irrational. In the novel, it is stated that the Burmese do not grease the axles of the bullock-carts because they believe that "the screaming keeps away evil spirits" (Orwell, 1984: 56). Furthermore, they are assumed to "drink urine and menstrual blood" (Orwell, 1984: 138) to cope with illnesses. And when an earthquake happens, the Burmese believe that Nga Yin, a giant is shaking himself (Orwell, 1984: 171-2).

What is remarkable is that throughout the novel, the Englishmen insult black people and especially Ellis calls them as "the incestuous children of pigs" (Orwell, 1984: 230). They are also defined as "a row of yellow, malicious faces" (Orwell, 1984: 229). Paradoxically, Burmese people themselves begin to believe in these images that even they themselves begin to perceive themselves through the negative images made by the white men. Doctor believes that "one European can do an Oriental more good than that of a thousand of his fellow countrymen" and as if to prove this belief, Orwell makes him enter to the club with the help of Flory. In other words, in *Burmese Days*, Burmese people are depicted in such a way that "they cannot do anything without the help of the Englishmen". And as they do not have any value as human beings, "every year, eight hundred Burmese are murdered and they are seen as nothing, but when a white man dies, it is taken as a massacre" (Orwell, 1984: 215). Thus, the Burmese do not deserve to sit in the same rows with the English people as they are inferior and as they are something to be avoided and consequently, Oriental Christians sit at the back rows in Church. Furthermore, it is pointed out in *Burmese Days* that Mandalay is famous for five main products all beginning with P. These five Ps are; Pagodas, Pariahs, Pigs, Priests and Prostitutes. It is clear that Pigs, Pariahs and Prostitutes are used to add to the negative stereotyping of Burma and Burmese people.

In the novel, the Englishman's positive representation of the Burmese people can also be found, though it is very rare. To exemplify, at one point in the novel, they are shown as "more humanistic than the English people" and this is expressed by Flory in the following words: "They [do not] let anyone to starve" (Orwell, 1984: 116). Apart from the negative and positive images of the Burmese people, there are some depictions of them which are neither positive nor negative. For example, like Edward Said does in *Orientalism*, Orwell in *Burmese Days* emphasizes the exotic nature of the colonies and the East. He depicts Burmese dancers and through Flory's expressions tries to persuade both Elizabeth and the reader that they are unique: "[T]his was the Orient, scents of coco-nut oil and sandalwood, cinnamon and turmeric, floated across the water on the hot, swimming air" (Orwell, 1984: 92).

Furthermore, Orwell deconstructs the image of the black man as something horrible and something to fear by depicting a black baby who begins "making water on the floor" (Orwell, 1984: 125), when he sees white-faces around him. It can be argued that in this instance, Orwell shows that "man is man" and suggests that as white man has doubts and fears about the black man, it is the same for the black man. As this baby has not been exposed to the British way of thinking and education, his reaction is very natural. Thus, Orwell juxtaposes the baby's natural behaviour and the Burmese adults' learned/or rather imposed and artificial behaviour (which results in the Deification of the English people) towards the British people. The Burmese men's idealization of the British people or the deification of the British people by the Burmese people attracts our attention and it is an imposed and learned behaviour. For example, Flory's servant calls him as "the Holy One", yet he cannot see the fact that Flory came to Burma as he was one of the typical hopeless Englishman who "cannot find a job in England" (Orwell, 1984: 62) and tried his chance in a colony as Albert Memmi expresses in *the Colonizer and the Colonized*. Likewise, Elizabeth came to Burma to find a husband in the Indian-marriage market, "when a girl's failed everywhere else she tries India, where every man's pining for the sight of a white woman" (Orwell, 1984: 104-5) says Mrs. Lackersteen in *Burmese Days*. Moreover, Englishmen wear white clothes, which show that they do no manual jobs and which shows their social-status. This whiteness may also be taken as a symbol of purity, which goes hand in hand with the act of deification. Moreover, they are fat, which show richness and healthiness. In other words, mostly they are given positive attributes.

On the other hand, the Burmese men's negative stereotyping of the British people is very rare and is made collaboratively. For example, British Empire is depicted as "an aged female patient of the doctors" (Orwell, 1984: 35) towards the end of Imperialism (which reminds us the saying *hasta adam* (an aged male patient) for the Ottoman Empire). It is interesting that the English people and imperialism are not depicted negatively by the Burmese, but by Flory and by the narrator, which may be taken as a self-criticism made by Orwell. We are informed that even clergymen, who are supposed to practise religious doctrines, sleep with Burmese girls and have mulatto children (Orwell, 1984: 117). Besides these, clerks become false-witnesses in the trials and all this information and self-criticism are given through the mouthpiece of Flory.

In addition to these, English officers in Burma are racists and therefore, they admire Germans (Orwell, 1984: 228) and Hitler very much. Interestingly enough, English women are more racists than men and can easily apply the othering process. Sometimes, they may become more cruel to cope with the fear of rape by a black-man. Mrs. Lackersteen unconsciously exaggerates this fear and she begins to see Burmese nationalism as a kind of rape as well: "To her mind the word sedition, Nationalism, rebellion, Home Rule, conveyed one thing and one only, and that was a picture of herself being raped by a procession of jet-black coolies with rolling white eyeballs" (Orwell, 1984: 131). Then not surprisingly, most of the English in Burma do not like "the missionaries" (Orwell, 1984: 26) who teach equality. Contrary to the missionaries, Englishmen in Burma are mostly the believers of violence. For example, Maxwell, an Englishman in the novel, shoots a Burmese and then, the relatives of the Indian boy kill Maxwell in return. Another example of violence is seen when Ellis blinds a Burmese boy, which later causes to the "Villagers' Revolt" (Orwell, 1984: 233) in order to have justice in courts (Orwell, 1984: 234). To suppress this revolt, Mr. Macgregor gives permission to the use of weapons. However, Flory makes sure that the police "fire over the crowds's head instead of straight at them" (Orwell, 1984: 244) and saves the Indians' lives. Yet, Nationalists are punished severely, for instance the editor of the Burmese Patriot had been put on trial for sedition and then went on "hunger strike", and two rioters (Orwell, 1984:106) died. Though, the use of violence against the indigenous people is forbidden by the British government, it is practised by the British officers in Burma. They disapproved these laws and call these humanitarian-laws as "kid-glove laws" and instead, they suggest to apply "the way of Turkish flogging" (Orwell, 1984: 107) to the indigenous people.

In *Burmese Days*, Flory's ideas seem to oscillate between two opposites. This may be taken as an inner-conflict. He sometimes sees Englishmen as heroes as they endure hot weather and illnesses in Burma. And he even says, "living and working among the Orientals would try the temper of a saint" (Orwell, 1984: 14). On the other hand, he declares that Englishmen are "despots" and Burmese men are more humane than the so called civilized Englishmen. And only after considering all the events in the novel, we can see clearly his stance and we deduce that he is a humanist and an Anti-Imperialist. To exemplify, he includes his servant Ko Sla in his will. And this shows Flory's good feelings towards the Burmese people. Moreover, in his biography it is stated that "Orwell himself was not happy to be a policeman in Burma" (Orwell, 1984: 166). Thus, in the novel Flory may represent Orwell's own ideas.

In addition to these, in *Burmese Days*, only Flory confesses that contrary to the common assumption Britain brings civilization to the colonies, in fact they destroy the unique culture of the colonies. For example, the development of Indian shipbuilding and Indian Muslims were prevented by the British Empire. Moreover, they do not give the important jobs to the Indians to make sure that the Burmese people will not become powerful and be a threat for the English in the future. Flory underlines the fact that only independent countries like "Japan and Siam" (Orwell, 1984: 39) developed their own industries, not the colonized ones. Thus, England wrecks (Orwell, 1984: 40) Burmese national culture, instead of bringing civilization.

To conclude, in *Burmese Days* George Orwell deconstructs Kipling's "White Man's Burden" and he is bold enough to say openly that Englishman is in Burma in order to take advantage of it and also contrary to the arguments of bringing civilization, in fact they destroy or rather kill the unique Burmese culture. Furthermore, Flory's act of committing suicide may stand for his belief that English existence in Burma is not a necessity and should come to an end. Flory/Orwell sees "the Empire as a system in which he could not continue to participate and keep his self-respect" (Orwell, 1984: 142). Therefore, in the novel by putting an end to his existence as a colonizer in Burma, he puts an end to the imperialism in Burma and let the other continue his life as s/he wishes.

## Abstract

This paper analyzes some curriculum practices developed in a Colombian school in which an experimental education project has been carried out. By taking the Foucauldian genealogy as our theoretical-methodological reference, we aim at evidencing some curriculum movements produced in that environment. The study shows that research as an educational principle and teacher protagonism can be important movements in the construction of a kind of education that is more concerned with the needs of the subjects and the local community and less committed to fixed, predetermined standards from which school curricula have been usually established.

## Introduction

Research inside the school and beyond as a curriculum movement. This is the starting point for discussion in this text. In the first section, we attempt to present the practice here considered by locating it among the findings of a more comprehensive research from which this study has stemmed. In the second section, we present Escuela Pedagógica Experimental, the Colombian institution where the experiment discussed here has been performed. Finally, in the third section, from the studies already carried out, we attempt to think about research by focusing on that Colombian school, its curriculum relationships amidst schooled and non-schooled practices, and its emphasis on teacher protagonism.

## School and non-school curricula

The objective of the research Curriculum in schooled and non-schooled environments in Brazil and Colombia: different relationships between learning and teaching is to problematize schooled and non-schooled curricula, in an attempt to analyze schooled and non-schooled movements and how such concepts have been articulated. The research was approved by the National Council for Scientific and Technological Development (Edital MCTI/CNPq Nr. 14/2013) and is linked to the Post-Graduation Program – Master Course in Teaching, Univates University Center. The research has addressed curriculum movements in four places: a school in Brazil, a school in Colombia, and a non-governmental organization (NGO) and a museum in Brazil.

We live in a highly schooled and pedagogicalized society where “school has been once and for all established as the great truth to which we all subject” (HATTGE, 2013, p. 95). According to Segura (2000, p. 159), “the school as it is nowadays is a scientifically supported institution whose management has been generally successful and, finally, has met the society’s expectations”. Of course, there are criticisms to its processes as well as questioning of its outcomes, but it is almost a consensus that every child should undergo the schooling process.

Noguera-Ramirez (2011) has analyzed the institution of what he called “learning society” (NOGUERA-RAMÍREZ, 2011, p. 21), in which, on the one hand, we can notice the “extension of the educative function beyond the school” (NOGUERA-RAMÍREZ, 2011, p. 21); on the other hand, there is the “resulting demand for constant and life-long learning by the inhabitants of this new social place, a demand that causes us to regard them as permanent learners” (NOGUERA-RAMÍREZ, 2011, p. 21).

It is understandable that the frontiers separating school from non-school contexts have been often questioned, relocated and re-signified by schooled and non-schooled movements, which have posed us different questions along the research. Therefore, we attempt to understand which curriculum movements have been instituted in the practices performed in each one of the places addressed.

The research began in March 2013. Based on Michel Foucault’s thought, the study has used genealogy as its methodological principle. Genealogy, from a Foucauldian perspective, can be understood as

[...] the attachment of knowledge to local memories, which allows the constitution of historical knowledge about fights and the use of such knowledge in present tactics (FOUCAULT, 2002, p. 15).

In this sense, as an initial methodological movement, it was necessary to search for local knowledges in every research environment – yellowish files, legal documents and archives, as well as texts written by teachers and managers of the surveyed institutions. Furthermore, it was necessary to talk to teachers that took part in the writing of those documents, as they would be able to contextualize and question them, and detail the movements made in their production.

However, it is important to explain that, in accordance with the genealogical perspective, we do not intend to reconstruct a “true” history by looking for a supposed essence that could characterize the institution and its actors. Rather, we attempt to understand how certain discursive and non-discursive practices have been instituted, the forces that have operated on their institution, how the subjects have related to them and which effects they have produced on that environment. Thus, through the analysis of those materials (documents, scientific texts, interviews), it is possible to know the process of constitution of those environments and evidence some practices that have constituted different curriculum movements, thus allowing several articulations. In this text, we focus on curriculum practices performed in Escuela Pedagógica Experimental in Bogotá, Colombia.

### **Escuela Pedagógica Experimental and the institution of an ever-changing curriculum**

Escuela Pedagógica Experimental, or EPE, was founded in 1977, when a group of five teachers working at Universidad Distrital decided to start the project with the objective of constructing an educational environment (SEGURA et al, 1999). With time, the school was integrated into a corporation that invests in teaching, research and extension projects. The following excerpt from an interview shows such a movement:

[...] the school was started in 1977 with five owners. In 1986, there were two owners because the others sold their shares. In 1986, we decided to increase the number of partners of that limited partnership until 1991. In 1992, the corporation was instituted, and all the partners either donated or sold their shares to make it a corporate non-governmental organization. (Interviewee F)

EPE was born as an experimental education project intended to disrupt the modern school model and its stratified ways to approach knowledge, space, time and subjectivity.

For many people, more than being a formal education institution, a pedagogical laboratory or a place where proposals are designed and tested, the *raison d'être* of EPE is the possibility of inspiring changes in the educational system (SEGURA et al, 1999, p. 42).

Since 2012, EPE has kept an agreement with the Pedagogy course of Unives University Center, and every semester two students undergo training in the school<sup>†</sup>. The purpose of this agreement is to make possible for Pedagogy students to have pedagogical experiences in schools whose curricula have been organized differently. This is the case in EPE.

The school was strongly established from the denial of both curricula and practices regarded as “traditional” by its founders. One of the statements that are often heard from the school teachers is that EPE does not have a curriculum, as we can see in the following fragment of interview:

Considering that the traditional view of curriculum as content organization, in which contents are seen as a list, a logical sequence from simple to complex, from this perspective, the school doesn't have a curriculum, that is, from such perspective we talked about, we don't have a curriculum. We don't respond to that kind of thing. We have a different proposal in which (...) the subjects construct their knowledge. In this sense, there isn't a pre-established order of actions that, for example, would allow or make that construction possible. (...) In that series of interactions, everyone interacts in a particular way. The group interacts as a whole, but there are subtleties in the interaction of each individual. (Interviewee M)

“Schooling is awfully mortiferous”, states Gutiérrez (2000, p. 101). The school thought as a synonym for schooling is related to education with institutionalized objectives, whose actions seek for “uniformization of several sociability patterns and lifestyles

<sup>†</sup> Eight students have undergone the training at Escuela Pedagógica Experimental as required by the Pedagogy course curriculum.

under the citizenship veil” (CORRÊA; PREVE, 2011, p.188). It is possible to notice that EPE, in its curriculum movements, attempts to distance itself from a schooling model. Despite being constituted as a school environment and acknowledged by the Ministry of Education in Colombia, the school has produced disruptions with the marks of schooled education for more than three decades.

What we actually require from a school is neither education nor knowledge, but certificates. We have arrived at this unfortunate, unspeakable situation because we have seen schooling as education. Naively, we believe that schools educate, but that is not true. The school does not educate, it does not have time to do that. The school instructs and does it very badly. Despite being compulsory, free school is still the slogan used by politicians from every party (GUTIÉRREZ, 2000, p. 100).

Marques and Hattge (2013) carried out a research to understand the different views of curriculum that have been mobilized in the school. In order to do that, they interviewed the school teachers and students of Univates Pedagogy course that underwent curricular training at EPE. The authors say:

We know that sight “has been celebrated as a privileged sense able to perform an accurate mediation between us and reality, i.e. to show how the world really is” (VEIGA-NETO, 2002, p. 24). In this paper, however, we have a different objective by bringing forward the view issue. Our intention is not to say how the EPE curriculum really should be and understood. Our intention is to show that meanings are instituted from different ways of looking at them, thus producing distinct experiences on approaching the same space. From the interviews with the Colombian teachers, it was possible for the student and her advisor to perceive how those teachers understand the school curriculum – as a school concerned with the students’ interests, in continuing construction and development, a school that prioritizes meaningful learning, is interested in daily topics and addresses issues related to the society as a whole. Univates students regard EPE’s curriculum similarly. (...) Activities challenge students to think, design strategies to solve problems and research into the studied subject or theme. In this way, students become protagonists of their own learning process and their academic and personal growth and development (2013, p. 72-73).

In the next section, we analyze more deeply the way the research that was started at EPE and has been extended to the social environment has become an important movement in the curriculum and produced effects on the modes of teacher and student subjectivation at EPE.

### **Research started at the school as a curriculum movement: teacher protagonism**

On analyzing how the curriculum has constituted relationships at EPE, our attention is drawn to how research has become a routine practice there. The investigation projects, as they are called, gather teachers and students around a variety of themes and usually enable inter- or trans-disciplinary experimentations. These investigation projects go beyond the school boundaries and expand to build bonds with the school community, as it is the case of the project entitled Blue Economy, which seeks to problematize practices that affect the planet and the ways that learning related to sustainability can occupy the school space. In interaction with the school community and the local community, EPE has tried to find solutions for imperious environmental problems both inside and outside the school, such as the recovery of a stream in the school surroundings. To do so, teachers and students have allied themselves with other professionals that can contribute with their knowledge, as well as with community people that, not necessarily having professional education, may be considered as experts in a particular theme and contribute with their knowledge to help find a solution for the problems they are facing.

We believe that in the school we must do much to prepare for living in a rapidly changing world and, at the same time, have a solid education to contribute to those changes. The goal is that all human beings are happy and able to share our existence by respecting the existence of other living beings. (CORPORACIÓN ESCUELA PEDAGÓGICA EXPERIMENTAL, 2014, s.p)

This project is an example of how to get away from that curriculum and, say, integrate all the areas. (...) So, teachers from every area are working in this project and learning. (interviewee V)

Inherent to this possibility of knowledge construction that disrupts the disciplinary and hierarchical frontiers of knowledges, we would like to highlight an issue that has drawn our attention amongst the curriculum practices developed in the school. Research at EPE has been usually associated with teacher protagonism, since students have the chance to construct their knowledge through searching, experimenting, exchanging with their classmates and the environment. But it is possible to

perceive that more than, or even before, investing in teacher protagonism, EPE invests in the student protagonism. This was the first challenge faced by the school, as we can see in the excerpt below:

Trust teachers so that they could generate options of a different school according to their context – that was the idea. (Interviewee F)

## Conclusion

The partial results obtained from the research have enabled us to perceive that, amidst discussions about curriculum, we intend to understand to what extent the concepts of school and schooling have been intertwined, thus defining curriculum movements. From this perspective, EPE is a potent place for investigation, as it is a school that seeks to create fissures in the curriculum model of the modern school. However, the research does not either aim at finding an ideal curriculum or working with the comparative notion of “good” and “bad” curricula. The focus is on the situations and conditions that enabled the emergence of such curricula, as well as on possibilities of weaving other curriculum movements and relationships. One of the issues that have become apparent up to this moment and we have attempted to evidence in this text is the importance of a research practice that goes beyond the school limits, in order to solve community problems; this is only possible through the reconfiguration of teacher subjectivity. A teacher that plays the main role in other ways of experiencing the schooling process by disrupting knowledge hierarchies makes possible the student protagonism, thus allowing the experimentation of new schooled configurations in their intersections with non-schooled practices in a continued movement.

# Research-based guidelines for evaluating educational service website: case study of Thailand cyber university project

Jintavee Khlaisang<sup>\*</sup>

Associate Professor, Department of Educational Technology and Communications,  
Chulalongkorn University, Bangkok, 10330, Thailand (jintavee.m@chula.ac.th)

---

## Abstract

The research aims to develop User Interface (UI) guidelines and a prototype for evaluating an educational service website. Thailand Cyber University Project (TCU) under Office of the Higher Education Commission, Thailand was used as a resource of detailed examination in this research. The guidelines development based on quantitative and qualitative data collected from the 3 data sources (n=139,482, n=7,147, and n=188,428 respectively) during the last 3 years. After the data were analyzed; the guidelines were developed; the prototype was tested by 107 users; and they were approved by the experts. Both the guidelines and the prototype were focused on 3 perspectives: technology, pedagogy, and accessibility, as detailed in the article.

## Introduction

The article on 'Research-Based Guidelines for Evaluating Educational Service Website: Case Study of Thailand Cyber University Project' presents the results of the research, focusing on the research process and the research results which readers can apply as guidelines in evaluating educational service website in different context. This includes evaluation process, evaluation guidelines, evaluation framework, and evaluation results. The article contains (1) Summary of research objectives and research methods, (2) Research results, (3) Discussion of the research results, and (4) Suggestions.

### 1. Summary of research objectives and research methods

The research aims to (1) study the use of TCU website from quantitative and qualitative data collected by TCU, (2) study website structure, user interface design, and conduct usability test of TCU website, (3) present a model of suitable website for TCU service, and (4) design and develop a prototype of TCU website from the proposed website model. Also, it presents recommendations and suggestions to develop the website suitable for TCU service. The research process consists of 4 phases including:

**Phase 1: Study the use of TCU website.** The data were collected from a system analyzing the statistics of the use of TCU website from 3 sources (1) data of link clicking on TCU website, (2) data of satisfaction survey of TCU website users, and (3) the overall statistics of the website. The report presented quantitative and qualitative data, classified by the variable features of users, satisfaction level, and other related context from the sample group of 139,482, 7,147, and 188,428 respectively.

**Phase 2: Study website structure, user interface design, and conduct usability test of TCU website.** The research was conducted using evaluating framework for educational service website in two main areas: (1) technology area, including user interface design, navigation design, accessibility from various devices such as computers, notebooks, tablets, and smart phones, and (2) pedagogy area including primary information sources, supporting information sources, quality of the design contributing to education, reliability, and preparation for the ASEAN Community in 2015.

**Phase 3: Present a model of suitable website for TCU service, using data from Phase 1 and Phase 2** includes: (1) the results of the study of the use of TCU website; (2) the results of the study of website structure, user interface design, and usability test of TCU website, based on two research conducted in 2010 and 2013 which the author was a principal researcher. The research includes "Proposed Models of Appropriate Website and Courseware for E-Learning in Higher Education: Research Based Design Models" and "Analysis of the Cultural Factors Affecting the Proper Design of Website and Electronic Courseware for e-Learning in ASEAN"; (3) literature review including research, articles, and samples of domestic and international sites; (4)

E-mail address: jintavee.m@chula.ac.th

interviews with experts; and (5) analysis and synthesis of data obtained from step 1-4 to find a suitable educational service website.

**Phase 4: Design and develop a prototype of TCU website from the proposed website model.** Make recommendations to develop the site that is suitable for TCU service by: (1) designing and developing a prototype of the TCU website; (2) conducting satisfaction and feedback survey of users; (3) having the prototype approved by the experts; and (4) redesigning the prototype using the results from steps 2-3.

## 2. Research results

Research results included 4 phases of the research including:

### **Research Phase 1: The result of the study of the use of TCU website**

The study of the use of website collected the data from a system analyzing the statistics of the use of TCU website. The data consisted of quantitative and qualitative data, classified by the variable features of the users, satisfaction level, and other related context. The data was collected from 3 sources and can be analyzed as followed.

**Data source 1:** Data of link clicking on TCU website (n=139,482). Data, which was collected during January 2010 to December 2013, found that there was access to internal links and external links which can be classified into 7 groups: (1) education, religion, and culture, (2) science and technology, (3) economy and social, (4) language, (5) health, (6) energy, and (7) information published by TCU.

Regarding the top 10 links which had the most visitors, there were both internal links and external links. Popular internal links were TCU Open Educational Resources, TCU E-Books, and TCU Open Courseware. Popular external links included websites offering information about science and technology and language.

**Data source 2:** Data of satisfaction survey of the TCU website users (n=7,147). The objective of the survey was to compare the differences of user satisfaction in 2011, 2012, and 2013. The data was classified by gender, educational level, occupation, and access to services. The results showed that most users were female, younger than 21-30 years old, with educational level of bachelor's degree and occupation of students, followed by government officers / employees. Most users accessed the lessons in the TCU-LMS with the internet from educational institutes. Overall results found that users had satisfaction at high level and there was no significant difference in terms of gender (male), age (age group 21-30 years, 31-40 years, 41-60 years, and over 60 years), educational level (high school, vocational education, master degree, doctoral degree), occupation (state enterprises and private enterprises), and access to services (3G, educational institutes, Internet Café, and modem) that affected the user satisfaction of TCU website. Considering each item, it was found that users satisfied with stability of TCU-LMS, the publication of information on TCU website, the easiness in using TCU-LMS with minimal guidance or none at all.

**Data source 3:** The overall statistics of TCU website (n=188,428). Data was collected during January to December 2013. The results were divided into 4 quarters, including Q1 (Jan-Mar 13), Q2 (Apr-Jun 13), Q3 (Jul-Sept 13), and Q4 (Oct-Dec 13). The results were as follows; Hour Distribution, it was found that most visitors visited the website during 10:00 am - 16:59 pm, most visited on weekdays (Monday-Friday); Browsers, it was found that, in every quarter, TCU website visitors used Internet Explorer, followed by Safari; Reference, it was found that, in every quarter, most visitors visit TCU website from google.co.th.

### **Research phase 2: The results of the study of website structure, user interface design, and usability test of TCU website**

The results of this phase will be presented into 2 parts: (1) the results of the study of site structure and user interface design of TCU website, and (2) the result of the study of the structure of TCU website according to two researches conducted in 2010 and 2013.

**Part 1:** The report on the study of site structure and user interface design of TCU website consists of 3 parts. The first part is site structure. It was found that there were 3 types of link: 1) internal site, 2) external site, and 3) external site maintained by TCU. The second part is menu bar. It was found that TCU website consisted of 6-leveled menu. Considering the link to internal sites, external sites, and external sites maintained by TCU of the 6-leveled menu, it was found that there was a lack of consistency in the structure of the menu bar. The third part is page design. It can be grouped into 5 types. Every type has main components which were page header and page body. However, navigation menu was not consistent; sometimes it appeared on the left, sometimes on the right, or both. It can be concluded that the site still lacked of consistency in the choice of a model based on the type of link and content (site structure are shown in Picture 1-3).

**Part 2:** The report on the study of the structure of TCU website, according to the research conducted in 2010 and 2013 by the authors as a main researcher: (1) Research on "Proposed Models of Appropriate Website and Courseware for E-Learning in Higher Education: Research Based Design Models", and (2) Research on "Analysis of the Cultural Factors Affecting the Proper Design of Website and Electronic Courseware for e-Learning in ASEAN". The areas of evaluation consisted of 3 areas (1) Technology, including 1) user interface design, 2) navigation system design, 3) access to data, and 4) the compatibility of tools; (2) Pedagogy, including 1) primary information sources, 2) supporting information sources, 3) the quality of the design contributing to education, 4) reliability, and 5) preparation to the ASEAN Community in 2015; and (3) Accessibility, using "Thai Web Content Accessibility Guidelines" (TWCAG) which evaluated the ability of the website that can be perceivable,

operable, understandable, and robust.

The results of TCU website evaluation, considering the click of TCU website in order of Top 10, the first is the link to a PDF file which cannot be included in the analysis. In the evaluation of other 9 websites, the 3 areas to be evaluated included 1) Technology, 2) Pedagogy, and 3) Accessibility (TWCAG 2010).

*Analysis by the evaluation form of the site components on technology* found that the 9 websites had the first 3 user interface design components. They consisted of the clear identified name, quick access to information, and the easiness and convenience in controlling the using, respectively. For the components of navigation design, all sites had the top 3 components, including a link back to the main page, having a content overview, and using symbols that were easy to understand and convey meaning, respectively. For the accessibility components, all sites used and had the clear classification of content. For the components on the compatibility, the top 3 components that all sites shared were that they offered mobile Learning, were accessible via the tablet, and can be read on portable devices; both vertical and horizontal with text didn't exceed the screen when reading vertically.

*Analysis by the evaluation form of the site components on pedagogy* found that all sites had 3 components of primary information sources, including short and concise content, the division of content, and the classification of content into categories, respectively. For the components of supporting information sources, the top 2 components that all sites had were promotional tools for an online community and tools that helped in sharing information. Three components on the quality design that all sites had included short, concise, and update content, accurate and non-biased data, and complete information. For the components on the reliability of the site, the top component that the sites shared was that site creator and contact e-mail was published on the sites. For the last component on the preparation for the ASEAN Community, there was a single component that only 2 sites had which were content about the local culture of countries in ASEAN.

*The evaluation of the site components on accessibility according to TWCAG 2010* found that the components on perceivable, the 2 components that the sites had were the providing of alternate text for time-based media, followed by the presenting of the content that users can see or hear clearly, as well as the distinguish of the foreground and background colors. For the components on operable, the top 3 components that the sites had included the use of only keyboard to access all parts and use web pages, offering sufficient time to allow users to read and use content, and not creating content that caused seizure. For the components on understandable, the top 3 components that the sites had included the web pages appeared and operated in a predictable manner, users can read and understand the content in the text form, and the site helped users to avoid mistakes and suggest a solution. For the last component, robust, it was found that most sites (6 sites) had the ability to accommodate a wide variety of web technologies both now and in the future.

### **Research phase 3: Presenting a model of suitable website for the TCU service.**

The report was divided into 3 parts (1) the presenting of a suitable site model (2) the results of expert interviews, and (3) the analysis of data from 1-2 to find a model of suitable website.

#### **1) Presenting a model of suitable website for TCU service using data from the research phase 1-2.**

The literature review included research and articles related to the definition of educational websites, including the definition, types, guidelines for evaluating educational website, and samples of websites from both domestic sites and international sites. Also, information from research phase 1 and phase 2 was used as guidelines for evaluating educational websites and for designing and developing a prototype in the next phase.

#### **2) The results of interviews with 10 experts on the design and development of educational service websites.**

##### **Case studies: evaluation of the operation of TCU website.**

The results of the expert interviews could be summarized into 3 main areas that the reader can use as guidelines to design and evaluate websites.

**1. Technology:** (1.1) Navigation system design should focus on site map, add search box in a position easily seen. The design should accommodate users with different preference such as the design for people who like to search and the design for people who like to click, which should add social media icons to allow users to share their learning with each other. Icons should be consistent and harmonious in the whole site. Each module should be placed in the order of importance of the content. (1.2) Accessibility. Information display should not exceed one page and a half. Website should be in two languages. (1.3) The compatibility of tools. The website should be designed to accommodate the access by portable devices (Mobile site).

**2. Pedagogy:** (2.1) Primary information sources should separate internal information sources and external information sources clearly. MOU should be done to share course contents. Information should be updated and there should be an announcement about online courses. Organization image should be more emphasized by presenting the vision and mission. Tag Cloud may be used to present organization image. (2.2) Supporting information sources should add social media icons to allow users to share their learning with each other. (2.3) The design quality. Color tone of each module should be harmonious and well blended. Log-In area for should be placed in a position clearly seen (top left of the website). (2.4) The preparation for the ASEAN Community. There should be cooperation in ASEAN. News about ASEAN or courses related to ASEAN should be added. The website should be in 2 languages to support the ASEAN Community. Additional feature to translate languages of web browsers might also be used.

**3. Accessibility:** (3.1) The website should be developed to be user friendly site which users can use easily

without the need to learn. (3.2) The difficulty to access information. The website should be improved to enable easier access to information. Content structure should be redesigned to suit the user. (3.3) Information should be grouped according to the scope of TCU contents or the frequency and interest of TCU users. (3.4) The website should be designed to accommodate the access by portable devices (Mobile site). (3.5) Registration system should be improved by providing access without registration (Open Access). Single Sign-On system which allows users to access the services of the entire system with a single authentication should be used. In the first phase, it could offer to a small group of users and gradually develop further in the future. (3.6) User statistics. Tools that can show information of domestic sites may be used such as True Hits. (3.7) Search Box should be in a position easily seen and has a format compatible for users with different preference; people who like searching and people who like clicking.

### **3) Analysis of data obtained from step 1-2 to find a model of suitable educational service website.**

The analysis and synthesis of data from step 1-2 can obtain a model of suitable website (Page Design and Site Structure) and then data was used to develop a prototype for educational service website. This will be presented in comparison along with the research phase 4.

### **Research phase 4: The result of the designing and developing a prototype of TCU website from the proposed website model. Presenting recommendations and suggestions to develop the website that is suitable for TCU service.**

Research phase 4 will be presented in 4 parts: (1) Presenting a prototype of a redesigned educational service website; (2) Reporting the results for the satisfaction and feedback survey of the user of the TCU prototype website; (3) Reporting the results of the approving of the TCU website prototype by 5 experts, and (4) Reporting the redesigning of the prototype of TCU website from the results of part 2-3, including the feedback from users and experts.

1. Based on the analysis and synthesis data obtained from the report 1-4, a suitable site structure and page design can be created and then developed into a prototype of educational service website. Comparison detail will be presented in phase 4.

2. The report of satisfaction and feedback survey of 107 users of TCU prototype website. The report was done in qualitative and quantitative data analysis. It was divided into Part 1: Basic information the respondents and Part 2: Satisfaction of TCU website users in five areas: (1) web technology, (2) content design, (3) multimedia design, (4) interaction, and (5) identity and creativity.

**Part 1:** The survey of basic information of the respondents. It was found that most respondents were female (61.68 percent), aged 31-40 years (44.86 percent), educational level: master degree (42.06 percent), occupation: student (29.95 percent), experience in using the computer: 11-15 years (43.93 percent), having a computer or electronic device connecting to the Internet (98.13 percent), using a portable computer (notebook) to visit TCU website (36.03 percent), and having experience of using websites offering TCU service (45.79 percent).

**Part 2:** The survey of the satisfaction of users of TCU website. It was found that users had satisfaction at a high level ( $\bar{X}$  = 4.17, S.D. = .62). Considering each area, it was found that the highest area was identity and creativity ( $\bar{X}$  = 4.29, S.D. = .76), followed by content design content ( $\bar{X}$  = 4.24, S.D. = .60), and interaction ( $\bar{X}$  = 4.21, S.D. = .70), respectively.

3. The report of the approving of the prototype of TCU website from 5 experts. It was found that the experts had satisfaction at a high level ( $\bar{X}$  = 4.21, S.D. = .63). Considering each area, it was found that the highest area was web technology ( $\bar{X}$  = 4.35, S.D. = .51), followed by interaction ( $\bar{X}$  = 4.25, S.D. = .62), and content design ( $\bar{X}$  = 4.21, S.D. = .68), respectively. Examples of suggestions included: (1) A banner which can convey the meaning of the organization, without interpretation, should be used, (2) a screen design should be designed with elements and contents that attracted the attention of the general web audience and web members, and (3) there should be instructions showing in the first page and can be seen easily.

4. The report of the redesigning of the TCU website prototype based on the results of parts 2-3. The redesigning of the website developed by Content Management System: CMS can be summarized into 2 parts: the graphics and the system. The graphics have been redesigned based on the feedback, in both Homepage of TCU OOC and TCU GLOBE. The system has been modified in 10 parts which were in accordance with the suggestion in the research phase 1-3.

From the research phase 1-3, the author will introduce a website model and prototype that is suitable for TCU service. The presentation will be a comparison of 3 models: (1) the site structure and prototype before redesigning which was the result of the research phase 1; (2) Redesign 1 which was the result of the research phase 2; (3) Redesign 2 which was the result of the research phase 3. Examples are as follows.

1. Comparison of site structure before redesign, after Redesign 1 and Redesign 2, as shown in Figures 1-3.

2. Comparison of Homepage of the prototype before redesign, after Redesign 1 and Redesign 2, as shown in Figures

4-6.

### **Comparison of site structure before redesign, after Redesign 1 and Redesign 2.**

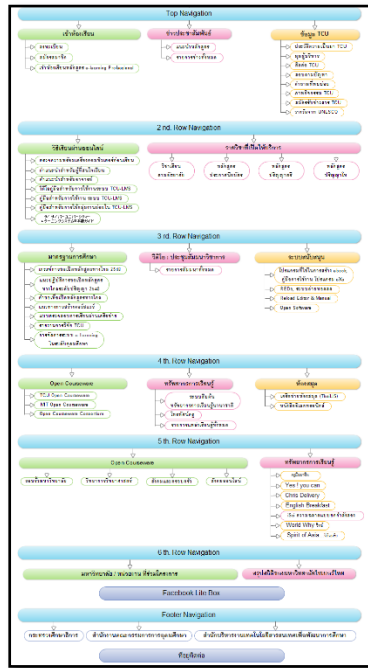

Figure 1: Site structure before redesign

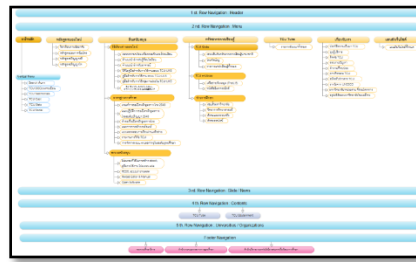

Figure 2: Site structure after redesign 1

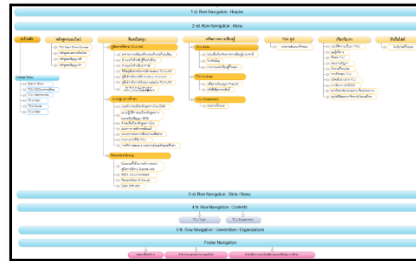

Figure 3: Site structure after redesign 2

Comparison of Homepage of the prototype before redesign, after Redesign 1 and Redesign 2

Figure 4: Homepage before redesign

Figure 5: Homepage after redesign 1

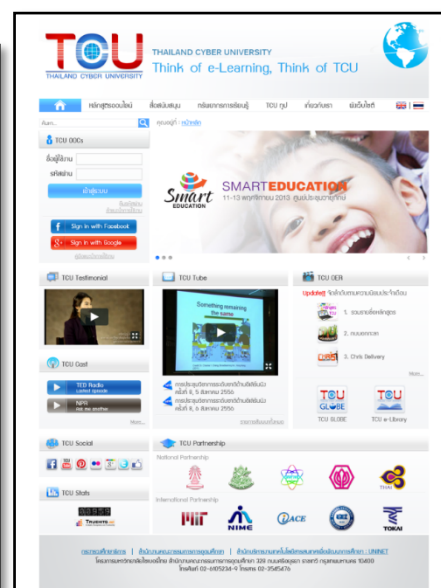

Figure 6: Homepage after redesign 2

### 3. Discussion of the research results

Considering the relevance with other researches, it was found that there were many other researches that were relevant and consistent with this one. For example, TCU website can be classified as many types of website considering its content and services. According to the concept of Anantakal (2005), they are (1) Information site which has the main objective to introduce organization, activities, and progress report; (2) Portal site with a variety of contents that does not specific on any subject. It offers both internal links and external links for the target audience; (3) Branded Promote site which aims to promote a specific issue such as new curriculum or course developed by TCU and annual national and international conferences; (4) Personal & Community site which users study in TCU programs or courses such as E-Learning Professional in a virtual classroom, specifically created for a group of people with specific interests; and (5) Educational site because overall TCU website has a clear purpose to disseminate knowledge, education, teaching, research in the organizational level.

When considering the type of educational site, it can be said that the distinctive feature of the technology of TCU website is Portal site. It consists of a search engine that compiled links of interesting websites as well as services related to the mission. In addition, the portal site is a place for people to share and discuss their opinions in various issues, which are called community web. It is a web hosting provider for a group of people who are interested in the same subject to exchange and comment with each other (Ping and Gisela, 2000; Sukekyu et al., 2003).

This is also consistent with the concept of Khlaisang (2010) discussing about a suitable website for e-Learning in higher education. It was concluded that there were 16 issues about the model of educational service website that the developer can use to design and develop website. This included technology, pedagogy, and accessibility. It is also consistent with the findings of the research on "Research on Analysis of the Cultural Factors Affecting the Proper Design of Website and Electronic Courseware for e-Learning in ASEAN" (Khlaisang, 2012). The research aimed to conduct Exploratory Factor Analysis: EFA on the culture and proposed a website and courseware model suitable for e-Learning in ASEAN. It was found that cultural components that affected website suitable for e-Learning in ASEAN consisted of 9 elements, 56 variables, divided into 6 direct elements and 21 variables and 3 indirect components, 35 variables, including technology, pedagogy, and accessibility. Thus for, the 2 researches can be additional sources of information in the process of designing, developing, and evaluating the quality of educational service website.

This is in line with the concept of Ping and Gisela (2000) which noted that in evaluating educational website, there were 2 issues to be taken into account: (1) the satisfaction of the user; the customer must be satisfied with the website appearance, including the design, the benefits gained, the use of graphics and (2) easy and uncomplicated access to information; users can access information and can go back to main page easily. This is in accordance with the guidelines for the development of the prototype website which focused on the design of user interface and adding social media to meet the interest of the target user. The design of a navigation system to provide a simple access to information, providing 2 languages, and the compatibility of the tool which focused the access by mobile devices were the issues to be in consideration.

Considering the type of educational service website, it can be said that the distinctive feature of education in TCU website is the content. According to World Best Website Awards (2004), the organizer defined evaluation and scoring criteria. The component of content has a weight of 30 %. The criteria consisted of *Purpose*: (1) having the clear mission and goals, (2) the

benefits and quality of content, (3) providing resources free of charge; (4) having a reason to return to visit, *Interaction*: (1) having interaction with users, (2) providing the privileges to members, (3) providing a list of e-mail, newsletters, news groups, (4) providing other useful services for users, and *Information*: (1) making complicated information easier to understand and summarizing the essence, (2) the structure of information and basic objectives are short and concise. Providing FAQ, (3) attracting interest and having a clear working system, and (4) access to information, content evaluation system, searching system, site map, steps to goal, the ability to read, effective graphics.

They are consistent with the concept of the American Association of Webmasters (2007). The organizer of AAWM Awards defined evaluation and scoring criteria based on the components, including the content which considered the following issues (1) clearly stated purpose, (2) title on each page, (3) naming titles and having persuasive message inviting viewers; (4) writing style, clear language; (5) contact information; (6) Policy and Terms of Use; (7) Copyright; (8) grammar and spelling; (9) a statement on user's privacy and confidentiality; and (10) content suitable for all genders and ages.

#### 4. Suggestions

Suggestions of each research phase can be described as followed.

**Research phase 1:** The results of the study of the use of TCU website can be used as basic information to design and develop a website to meet the needs of the target users and the objectives of the organization. Also, it can be guidelines for the study and analysis of the needs in other research.

**Research phase 2:** The results of the website structure, user interface design, and analysis of the suitability of the website for the use of TCU will be important information to analyse the suitability of the site by using guidelines to design and develop a website on international standards. Also, it can be guidelines for the designing and developing of educational in other research study.

**Research phase 3:** The results of the presentation of a model of suitable website for TCU service will be important information in developing suitable educational service website. The research employed data from the literature review, expert interviews, and feedback from the user. The results of this research will be useful for other research such as evaluation questionnaires of suitable educational website which were developed from literature review and the samples of 40 websites to get the questions that covered all aspects of the evaluation.

**Research Phase 4:** The results of the designing and developing a prototype of TCU website from the proposed website model and the presentation of recommendations and suggestions to develop the website that is suitable for TCU service. It will be important information to develop suitable educational service website. The researcher presented the prototype (Mock up) design and development methods of the 3 main pages with an emphasis on the use of Open Source Software which are internationally used and popular among of the website developers. So the website has international standards and can be delivered for future maintenance. The results of this research will be useful for other research in the part of the suggestions from experts who are professional in the designing and developing educational website.

#### Acknowledgements

This paper was based on the research study titled *Research-Based Guidelines for Evaluating Educational Service Website: Case Study of Thailand Cyber University Project* which was conducted by the author of this paper in 2013. The research study was funded by Thailand University Project, Office of Higher Education Commission, Ministry of Education. The author would like to thank advisors, scholars, and experts for their help and support in creating new knowledge via this paper to strengthen the educational technology field.

# Review of The Critical Reading Education in The Primary Schools\*

Erol DURAN\*\* - Esra YALÇINTAŞ\*\*\*

Uşak University, The Institute of Social Science/ TURKEY

## Abstract

The purpose of this research is to determine the 4th grade primary school students' level of attaining critical reading gains in their Turkish lessons. In the study also it was aimed to reach opinions of the teachers about examining of the 4th grade primary students' level of attaining critical reading skills. According to the results of the study, implementation of the available activities and critical reading gains can be said to that it provides contribute to critical reading skills of the students. However, when numeric datas are analyzed, critical reading attainment level averages of the students are seen to vary in between 32.75 and 72.94, and is observed to be critical reading skills an intermediate level of the students. It has further been concluded that, nearly total of the students could not have attained the gain "Determines, and questions the emotional and exaggerated elements in what he/she reads. (32.75)" at all. That have not still reached gains of some critical reading or that have possessed of a critical reading skills of intermediate level in the 4th grade of students should be interrogated when considering of the gains of critical reading taught from the 2nd grade. Expected that it provides contribute to the literature and applications with these aspects of the research.

## 1. Introduction

It is quite important for the individuals' social and academic achievements to gain reading habit after learning how to read and write, and then to begin reading with a critical point of view (Gokturk, 1997). Therefore, critical reading is the key of productive thinking and most important part of the reading education (Cifci, 2006). Critical reading is not only limited in understand the text, also thinking on a text which read, determination of true and false in the text (Ozdemir, 1997, pp. 19), and the interpretation (Bagcı & Sahbaz, 2012, pp. 2) and the assessment of the opinions or knowledge (Candan, 2003, pp. 105) is the process. Critical reading begins with the interpretation of the subject based on individual's own life, accumulation of knowledge, to his/her observations, to his/her views (Orhan, 2007, pp. 49). According to Ozdemir (2002), critical reading is a skill that should be used throughout life. Critical reading has been defined as the ability to make judgements and inferences, distinguish between fact and opinion, and recognize the author's purpose or points of view (Darch & Kameenui, 1987). In short, critical reading is to actually thinking about the subject, moving beyond what the text concluded to the point of how the author reached that conclusion and the degree to which that conclusion is accurate (Wheeler, 2007).

Critical reading has been defined as learning to evaluate, draw inferences and arrive at conclusions based on the evidence (Zintz and Maggart, 1984). Critical reading is like a key inquiring, questioning, researching, giving the consciousness of becoming intellectuals (Pirozzi, 2003, pp. 25). According to Yildiz (2008), determining whether the readers agree with what is told in the text, searching for answers to question in their mind, establishing a cause-effect relationship between emotions, thoughts and events, give the meaning based on your own experience what they read is required. According to Devoogd (2007, pp. 22), first, critical reader must be open to understanding the content and perspective presented. Secondly, instead of merely accepting the text and automatically adopting the author's perspective, readers must consider which may be incomplete and inaccurate aspects of the text. The students not mustn't read looking only for information but also must read for different ways of thinking about the subject matter (Knott, 2013, pp. 1).

Critical reader, while reading the text is not content with what he/she want to give of the author. The critical reader evaluates from numerous angles including logical, rhetorical, historical, ethical, social, and personal perspectives, taking advantage of past experiences what he/she reads (Wheeler, 2007), and creates a new meaning according to himself/herself (Asilioglu, 2008, pp. 8). Thus, the reader may decide on the applicability and the suitability of ideas and opinions to own lives (Wheeler, 2007). In this way, also readers be conscious that it is essential the role of background knowledge and the student's ability on the critical reading/learning (Collins, 1993, pp. 3), and that requires the development continuously of critical reading skills (Leist, Woolwine & Bays, 2012, pp. 37).

The purpose of this research is to determine the 4th grade primary students' level of attaining critical reading skills. Answers to the following questions were sought with this purpose:

\* This study was generated on the basis of the thesis which was prepared by Esra YALÇINTAŞ in consultation with Assoc. Prof. Erol DURAN. This research is supported by Usak University Scientific Research Projects Unit (Project Nu: 2014/TP002).

\*\* Assoc. Prof. Uşak University, Faculty of Education, erol.duran@usak.edu.tr

\*\*\* Master Students, Uşak University, The Institute of Social Science, esrayalcintas@hotmail.com

- What is the level of critical reading skills of the 4th grade primary students?
- What are the opinions of teachers about levels of critical reading skills of the primary school 4th grade students?

## 2. Method

Screening model is applied in the research. The data obtained for the first sub-problem of the research by descriptive analysis, the data obtained for the second sub-problem of the research by content analysis are evaluated. The study also interview technique is used.

### 2.1. Study Group

The study group of the research is consisted of 109 fourth grade primary school students, who are studying in the primary schools located in the Centrum of the City of Kırıkkale (Turkey) in the 2013-2014 academic year. While the study group is selected, random sample selection technique is used.

### 2.2. Data Collection Process

Data collection process of the research is consisted of five phases. First of all, the required permits are received. Then, what kind gains of critical reading education to be able to determine, Curriculum of the Turkish Lesson of the Primary Schools (4th grade) (MEB, Ministry of National Education, 2013) is examined and thirteen gains are identified. At the third phase, fifteen worksheets by critical reading activities in the MEB (Ministry of National Education) Fourth Grade Textbook and Workbook is formed and this worksheets are applied to students. At the fourth phase, worksheets are assessed by the researchers, together with an expert. In the evaluation, the arithmetical means of the points obtained to from activities for each gain of the students is recorded to be the point earned by the students per each gain. Finally, semi-structured "Interview Form" composed of four questions, developed by the researchers and an expert in order to learn the opinions of teachers about levels of critical reading skills of the primary school 4th grade students are applied to twenty-eight classroom teachers.

### 2.3. Data Analysis

The data obtained for the first sub-problem of the research are evaluated by descriptive analysis. Each created worksheet is "100 points". The scoring of the questions in the pages are different from each other and a student can take from any worksheet the highest "100 points" and the lowest "0 points". The points received from the worksheet of the students are entered into SPSS statistical program and the arithmetical means of this points are taken. In addition, "minimum" and "maximum" points of the students are calculated in order to determine the effectiveness of the gains. The datas are examined to looking at the arithmetical mean points of the students. The data collected through the interview form for the second sub-problem of the research are evaluated by content analysis.

## 3. Findings and Comments

Findings addressing to the sub-problems of the research, and the comments addressing to these findings are lined up upon taking the order of the sub-problems into consideration.

### 3.1. Findings and Comments Regarding the First Sub-Problem

The data collected for the answer of the question of "What is the level of critical reading skills of the 4th grade primary students?", namely the first sub-problem of the research, are shown in Table 1.

Table 1. Descriptive data regarding the critical reading skill levels of the students

	N	Minimum	Maximum	Mean
Questions the knowledge, news, and opinions, being transmitted via mass media (newspaper, magazine, TV).	109	20.00	95.00	65.85
Criticizes the text – visual relationship.	109	18.00	95.00	57.41
Sorts out the problems put forth in the text, and derives various solutions thereto.	109	20.00	97.00	66.02
Sorts out the similarities and differences between the opinions in the text and his/her own opinions.	109	30.00	100.00	62.43
Reads the interrogator.	109	.00	100.00	55.87

Determines, and questions the emotional and exaggerated elements in what he/she reads.	109	.00	92.00	32.75
Criticizes the headline – content relationship.	109	10.00	95.00	59.31
Sorts out the language, expression, and information mistakes out of what he/she reads.	109	8.00	96.00	62.11
Distinguishes what is real, and what is imaginary out of what he/she reads.	109	20.00	96.00	69.98
Distinguishes the objective and subjective conclusions from the text he/she reads.	109	.00	100.00	66.05
Assesses his/her reading, content of the text he/she reads, and the reading environment.	109	20.00	100.00	69.66
Determines the purpose of the writer.	109	20.00	100.00	72.94
Determines, incomplete and unrelated information in what he/she reads.	109	6.00	100.00	64.57

In consideration of the data given in Table 1, critical reading attainment level averages of the participant students of the research are seen to vary in between 32.75 and 72.94. Out of the critical reading gains of the students, they seem to have attained the gain of “Determines the purpose of the writer. (72.94)” at well level and nearly all of the students have not attained the gain of “Determines, and questions the emotional and exaggerated elements in what he/she reads. (32.75)” at all.

### 3.1. Findings and Comments Regarding the Second Sub-Problem

The themes and codes emerged in the results of interview for the answer of the question of “What are the opinions of teachers about levels of critical reading skills of the primary school 4th grade students?”, namely the second sub-problem of the research is presented in detail in Table 2.

Table 2. Emerging themes from content analysis

Theme	Code	Sample Explanations
Critical Reading Activities	Adequate 35.7 %	<ul style="list-style-type: none"> <li>• Yes, can be given. These activities are adequate. (n = 8)</li> <li>• Activities too much, some of them are unnecessary. To obtain the critical reading skills should be read in other books and comparisons should be made. Activities should be least, adequate, rational and from daily life.</li> </ul>
	Inadequate 50.0 %	<ul style="list-style-type: none"> <li>• If there is activity of the critical reading skills can be gained. However, there is no adequate activity. We are faced with this issue in the “Individual and Society Theme”.</li> <li>• Activities are not enough. More detailed and more different activities may be included.</li> </ul>
Critical Reading Gains	Adequate 57.1 %	<ul style="list-style-type: none"> <li>• Yes, adequate and appropriate. (n = 13)</li> <li>• The gains are adequate. The important thing is to realize the gains and is to obtain.</li> </ul>
	Inadequate 25.0 %	<ul style="list-style-type: none"> <li>• Not appropriate. Because level of children is not enough in terms of critical thinking.</li> <li>• The gains of critical reading skills are incompatible with the application books. So it does not show development.</li> </ul>
The Challenges of Development of Critical Reading Skills		<ul style="list-style-type: none"> <li>• First, the concept of "criticism" is required perception as good in the society. It is difficult to give the critical reading for we saw as criticism to say only negative things. The acquisition of critical skills will facilitate learning to find solutions our children instead complaining.</li> <li>• The time of lesson hours is not enough. (n = 5)</li> <li>• Reading habits of students is inadequate. (n = 8)</li> <li>• In the education system should be made changes concerning this issue. (n = 2)</li> <li>• Applications are not compatible with each other for gains. Therefore, the teachers are forced in the practice. (n = 2)</li> <li>• The difficulties encountered in attaining critical reading skills;</li> </ul>

	<p>1) During the reading to be passive. 2) To accepting without discussion that contains text. 3) Not benefiting from past experience while reading.</p> <ul style="list-style-type: none"> <li>• 1) The people who were respected to their thoughts will have the critical reading and critical thinking skills. 2) Encountering with people's reactions weakens the critical reading.</li> <li>• The difficulties of attaining critical reading skills have been increasing as the age small. Expressing their thoughts is experiencing more distress via writing and orally. The visual and practical activities and examples will reduce these problems to be more than.</li> <li>• The children often find everything ready. They do not use too much things like thinking, analyzing, questioning. They do not read very carefully what they read. They only see as stack of word what they read. They do not form connections, do not need to struggle, do not pay attention to parts of the introduction, development and conclusion in the text. The awareness of students is very important.</li> <li>• The gains in critical reading skills is crucial to the student's permanent information.</li> <li>• The students find boring the attaining of critical reading skills that questioned the imaginations and thoughts while reading.</li> <li>• I do not encounter with any difficulties in the attaining to critical reading skills. (n = 2)</li> <li>• My thoughts, if done more reading and oral expression to students, there is no problem.</li> </ul>
Other	<ul style="list-style-type: none"> <li>• If activities be short and applicable and dramatized, the students can attain the critical reading skills. We must learn and teach to act with cases and we must teach. We need to read understandable and observe good. While we conclusions reached, we need to determine the reasons correctly and explain. We need to understand the subject good. we just need to talk about subjects. If we do not know, we should prefer to remain silent.</li> <li>• The images and sentences are compatible very few with each other. Subjects and content very much. Also the terms and words must be prepared in accordance to nowadays.</li> <li>• The relevant studies and activities having to visuality are required for small classes. When they reached to gains, the benefits of critical reading in the students are immediately noticeable.</li> <li>• The concept maps should be included at the end of each text. Because all of the critical reading gains are not at the end of each text.</li> <li>• If the physical conditions appropriate to implement all activities difficult. In the absence of appropriate physical conditions are harder to implement all the activities. The levels of grade also are forcing us to perform activities.</li> <li>• The gains of critical reading skills are adequate. Commencing to critical reading at the smaller grades will make it easier to overcoming the challenges.</li> <li>• The reading studies done in a proper manner to punctuation marks, use punctuation marks, obey the writing rules is important very much.</li> </ul>

10 (35.7%) out of total 28 teachers from stating their views think that is "adequate" of the activities in the Turkish books. 4 (14.2%) teachers find "partially adequate" the activities. This teachers remark that it is above the class level of some part of the activities and that more time should be allocated to activities directed to be able to look critical to events of the students. The remaining 14 (50.0%) teachers think that is "inadequate" of the activities.

16 (% 57.1) out of the teachers stated their opinions find adequate and appropriate the gains about whether it is appropriate of the critical reading gains stated. This teachers express which to be realized the gains and the importance of considering the differences between students. In consideration of the results addressing to the previous question, it is understood that have nothing to do with gains of finding inadequate of activities the teachers. Because the existing gains are found suitable for attaining skills of critical reading by most of the teachers. 7 (% 25.0) out of the teachers stated that are not appropriate of the gains. To this case the teachers demonstrated reasons as that it is not enough level of students, that are incompatible with the application books of the gains, that it should be remarkable the activities and the texts.

26 teachers have expressed their thoughts about the difficulties of attaining critical reading skills. Most of the interviewed teachers stated that they are reachable the purpose of attaining the critical reading skills, that but they have difficulty in

reaching these aims in the students. Their opinions usually states being long of the activities and the short duration of the lessons (the shortage of time), deficiencies in the skills of understanding, questioning and critical thinking for that it is not the habit of reading.

#### 4. Conclusion

This Research has been conducted so as to determine the 4th grade primary school students' level of attaining critical reading gains in their Turkish lessons. In the study also it was aimed to reach opinions of the teachers about examining of the 4th grade primary students' level of attaining critical reading skills. In consideration of the findings addressing to the first sub-problem of the research, critical reading attainment level averages of the participant students of the research are seen to vary in between 32.75 and 72.94. In that case, the 4th grade primary school students seem to having attained the critical reading skills either at well level (72.94) and medium level (in between the points of 55.87-69.98), or having not attained such skills at all. It has further been concluded that, nearly total of the students could not have attained the gain "Determines, and questions the emotional and exaggerated elements in what he/she reads. (32.75)" at all. The reason of not reaching this gain of the students may be activity deficiency of this gain in textbooks. In order to give further of gains may be not prepared an alternative activity might be.

In consideration of the findings addressing to the second sub-problem of the research, 57.1% out of the teachers who were received their opinions that the critical reading gains find adequate and appropriate, and 25% out of the teachers who were received their opinions that find inadequate is concluded. The teachers who find inadequate the gains stated reasons as that it is not enough level of students, and that are incompatible with the application books of the gains, and that they are hard to understand. The critical reading is a skill which requiring process and settling over time. Therefore, in an instant, to be critical reader of students can't be expected. In consideration that should be given throughout an academic year to students of gains, assessment immediately after being given the gain the students of the teachers and would not be appropriate to draw a conclusion.

Finding inadequate the activities 50% out of teachers stating their opinions about whether adequate of the activities, which makes think, whether it is the effective of this case in lack of critical reading skills in our students. The teachers stated reasons as being the long of the activities and the shortage of time, deficiencies in the skills of understanding, questioning and critical thinking about the difficulties of attaining to critical reading skills.

## 8. Sınıf Öğrencilerinin Matematik Dersi Yazılı Sınav Puanlarının TEOG Sınav Puanlarına Göre İncelenmesi

Investigation of 8<sup>th</sup> Grade Students Math Written Exam Scores comparing to TEOG Exam Scores

Bulut Yıldıztekin<sup>a</sup>, Gökhan Kumlu<sup>a</sup>, Sinan Yavuz<sup>a</sup>, Levent Yakar<sup>a</sup>

<sup>a</sup>Hacettepe University, Educational Sciences Institute, Educational Measurement and Assessment, Ankara, Turkey

### Özet

Bu araştırmada 8. sınıf Matematik dersi 1. ve 3. yazılı sınav puanları ile TEOG'dan elde edilen 2. yazılı sınav puanları arasındaki ilişki incelenmiştir. Araştırmanın evrenini Ankara ili Altındağ ilçesinde bulunan 32 ortaokulun 164 şubesinde eğitim gören 5038 İlköğretim 8. sınıf öğrencisi oluşturmaktadır. Verilerin analizi için öncelikle okul sınavları ve TEOG sınavı arasındaki puan farkları hesaplanmıştır. Ardından aradaki fark puanlarının karşılaştırılmasına yönelik varyans analizi uygulanmıştır. Matematik dersine ilişkin TEOG sınavından düşük puan alan öğrencilerin puanları ile öğretmen tarafından yapılan 1. ve ayrıca 3. yazılı sınav puanları arasında farklılık olduğu görülmüştür. TEOG sınavından yüksek puan alan öğrencilerin puanları ile öğretmen tarafından yapılan 1. ve 3. yazılı sınav puanları arasında ise fazla farklılık olmadığı görülmektedir.

**Anahtar Kelime:** TEOG matematik puanları, yazılı puanları

### Abstract

In this research 8<sup>th</sup> grade Math courses 1<sup>st</sup> and 3<sup>rd</sup> written exam scores between 2<sup>nd</sup> exam scores, which are obtained from TEOG exam, relations have been investigated. Universe of the research is 5038 students of 8<sup>th</sup> grade students from 32 middle schools located Altindag district of Ankara city. For the analysis of the data firstly, score differences between written exams and TEOG exam has been calculated. Then, those differences of the scores have been analyzed by ANOVA. There are statistical difference on TEOG mathematics exam scores of students with low ratings and made by the teacher written exam scores between 1<sup>st</sup> and 3<sup>rd</sup>. Students, who get higher scores from TEOG exam were not high difference between 1<sup>st</sup> and 3<sup>rd</sup> written exams made by teacher.

**Key Words:** TEOG Math scores, Written Exam

TEOG temel öğretimden ortaöğretime geçiş sınavının kısa adıdır. TEOG' da 3 sınavı olan dersler için 2. Sınav, 2 sınavı olan dersler için ilk sınav merkezi sınav olarak gerçekleştirilir. Öğrenciler sınavda Türkçe, Matematik, Fen ve Teknoloji, TC İnkılap Tarihi, Yabancı Dil, Din Kültürü ve Ahlak Bilgisi dersleri olmak üzere 6 farklı temel dersten sorumlu tutulurlar. Sınavların ardından, ağırlıklandırılmış merkezi sınav puanına eklenmiş yılsonu başarı puanlarının ortalamaları ile liselere yerleştirme işlemi gerçekleşir. Buna göre 6, 7 ve 8. sınıf yılsonu başarı puanlarının ortalamasının %30 'u hesaplanarak temel eğitimden ortaöğretime geçiş sınavları puanlarının %70' ine eklenir. Böylece öğrencilerin liselere yerleştirilmeye esas puanları elde edilmiş olur. Alan yazın incelendiğinde Okul sınavları ve ulusal sınavlar arasındaki ilişkiyi inceleyen araştırmalara rastlanmamıştır. Ancak Baş (2013) "İlköğretim İngilizce Dersi Akademik Ortalamaları İle Seviye Belirleme Sınavı İngilizce Alt Testi Sonuçları Arasındaki İlişkinin Yapısal Eşitlik Modeli İle İncelenmesi" başlıklı çalışmada ilköğretim öğrencilerinin İngilizce dersi akademik ortalamaları ile Seviye Belirleme Sınavı (SBS) İngilizce alt testi sonuçları arasındaki ilişkiyi yapısal eşitlik modeli ile incelemeyi amaçlamıştır. Bu araştırmada, 6. 7. ve 8. sınıf İngilizce dersi yazılı sınav puanları, proje görevi, performans görevi ve ders içi etkinliklere katılım yılsonu akademik başarı puan ortalamaları ile bu sınıfların SBS İngilizce alt testi ham puanları arasındaki ilişki incelenmiştir.

### YÖNTEM

#### EVREN

Araştırmanın evrenini Ankara ili Altındağ ilçesinde bulunan 32 ortaokulun 164 şubesinde eğitim gören 5038 İlköğretim 8. sınıf öğrencisi oluşturmaktadır. Tüm okulların yeterince temsil edilmesinin istenmesi nedeniyle örnekleme işlemi

gerçekleştirilmemiştir. Veriler Hacettepe Üniversitesi ile Altındağ İlçe Milli Eğitim Müdürlüğü'nün imzalamış olduğu protokol çerçevesinde edinilmiştir.

## VERİLERİN ANALİZİ

Verilerin analizi için öncelikle okul sınavları ve TEOG sınavı arasındaki puan farkları hesaplanmıştır. Ardından aradaki fark puanlarının karşılaştırılmasına yönelik varyans analizi uygulanmıştır. Bu uygulama ile değişkenlik kaynakları ve değişim ölçüsü belirlenmiştir.

## BULGULAR VE YORUMLAR

Bu bölümde araştırma verileri, araştırma sorularına paralel olarak analiz edilmiş ve elde edilen bulgular sunulmuştur. TEOG matematik sınavına göre gruplandırılan öğrencilerin matematik dersine ilişkin 1. yazılı sınav-TEOG sınav fark puanlarına bağlı olarak istatistiksel yönden farklılaşıp farklılaşmadığı varyans analizi ile test edilmiş ve sonuçlar Tablo 1'de verilmiştir.

Tablo 1

TEOG Matematik Sınavına Göre Gruplandırılan Öğrencilerin Matematik Dersi 1. Yazılı Sınav-TEOG Sınav Fark Puanlarının Karşılaştırılmasına İlişkin Varyans Analizi Tablosu

Varyansın Kaynağı	Kareler Toplamı	sd	Kareler Ortalaması	F	P	Fark (Scheffe; $p \leq 0.05$ )
Gruplar arası	169334,208	9	18814,912	57,850	,000	1-2; 1-3; 1-4; 1-5; 1-6; 1-7; 1-8; 1-9; 1-10; 2-3; 2-4; 2-5; 2-6; 2-7; 2-8; 2-9; 2-10; 3-4; 3-5; 3-7; 3-8; 3-9; 3-10; 4-10; 5-10; 6-10; 7-10;
Gruplar içi	1635293,694	5028	325,237			
Toplam	1804627,901	5037				

TEOG matematik sınav puanlarına göre 10 gruba ayrılmış 5038 kişilik öğrenci grubunun, matematik dersine ilişkin 1. yazılı sınav-TEOG sınav fark puanları arasında fark olup olmadığını sınamak için, TEOG matematik sınav puanlarına göre oluşturulan grupların matematik dersine ilişkin 1. yazılı sınav-TEOG sınav fark puanları ortalamaları ilişkisiz örneklem için tek yönlü varyans analizi ile karşılaştırılmıştır. Test sonunda, TEOG matematik sınav puanına göre gruplandırılan öğrencilerden,

1.grupta (0-10 puan alan) yer alan öğrencilerin fark puan ortalaması ( $\bar{X}^1=27,50$ ), 2.grupta (10-20 puan alan) yer alan öğrencilerin fark puan ortalaması ( $\bar{X}^2=19,46$ ), 3.grupta (20-30 puan alan) yer alan öğrencilerin fark puan ortalaması ( $\bar{X}^3=11,27$ ), 4.grupta (30-40 puan alan) yer alan öğrencilerin fark puan ortalaması ( $\bar{X}^4=6,98$ ), 5.grupta (40-50 puan alan) yer alan öğrencilerin fark puan ortalaması ( $\bar{X}^5=5,85$ ), 6.grupta (50-60 puan alan) yer alan öğrencilerin fark puan ortalaması ( $\bar{X}^6=7,46$ ), 7.grupta (60-70 puan alan) yer alan öğrencilerin fark puan ortalaması ( $\bar{X}^7=5,20$ ), 8.grupta (70-80 puan alan) yer alan öğrencilerin fark puan ortalaması ( $\bar{X}^8=4,21$ ), 9.grupta (80-90 puan alan) yer alan öğrencilerin fark puan ortalaması ( $\bar{X}^9=1,53$ ), 10.grupta (90-100 puan alan) yer alan öğrencilerin fark puan ortalaması ( $\bar{X}^{10}=-1,97$ ) arasından en az ikisi arasında istatistiksel olarak anlamlı fark gözlenmiştir ( $F(9-5028)=57,85$ ,  $p<0.05$ ). Test sonucunda hesaplanan etki büyüklüğü ( $\eta^2=0,09$ ) bu farkın orta düzeyde (orta etki) olduğunu göstermektedir. Yapılan Scheffe çoklu karşılaştırma testi sonucunda anlamlı farkın 1. grup ile diğer tüm grup fark puanları arasında, 2. grup ile diğer tüm grup fark puanları arasında, 3. grup ile 6.grup hariç diğer tüm grup fark puanları arasında, 4. grup ile 10. grup fark puanları arasında, 5. grup ile 10. grup fark puanları arasında, 6. grup ile 10. grup fark puanları arasında ve 7. grup ile 10. grup fark puanları arasında olduğu görülmüştür. TEOG

matematik sınavına göre gruplandırılan öğrencilerin matematik dersine ilişkin 3. yazılı sınav-TEOG sınav fark puanlarına bağlı olarak istatistiksel yönden farklılaşıp farklılaşmadığı varyans analizi ile test edilmiş ve sonuçlar Tablo 2’de verilmiştir.

Tablo 2

TEOG Matematik Sınavına Göre Gruplandırılan Öğrencilerin Matematik Dersi 3. Yazılı Sınav-TEOG Sınav Fark Puanlarının Karşılaştırılmasına İlişkin Varyans Analizi Tablosu

Varyansın Kaynağı	Kareler Toplamı	sd	Kareler Ortalaması	F	P	Fark (Scheffe; $p \leq 0.05$ )
Gruplar arası	277107,992	9	30789,777	100,677	,000	1-2; 1-3; 1-4; 1-5; 1-6; 1-7; 1-8; 1-9; 1-10; 2-3; 2-4; 2-5; 2-6; 2-7; 2-8; 2-9; 2-10; 3-4; 3-5; 3-6; 3-7; 3-8; 3-9; 3-10; 4-7; 4-8; 4-9; 4-10; 5-8; 5-9; 5-10; 6-8; 6-9; 6-10; 7-10;
Gruplar içi	1537704,841	5028	305,828			
Toplam	1814812,833	5037				

TEOG matematik sınav puanlarına göre 10 gruba ayrılmış 5038 kişilik öğrenci grubunun, matematik dersine ilişkin 3. yazılı sınav-TEOG sınav fark puanları arasında fark olup olmadığını sınamak için, TEOG matematik sınav puanlarına göre oluşturulan grupların matematik dersine ilişkin 3. yazılı sınav-TEOG sınav fark puanları ortalamaları ilişkisiz örneklem için tek yönlü varyans analizi ile karşılaştırılmıştır. Test sonunda, TEOG matematik sınav puanına göre gruplandırılan öğrencilerden,

1.grupta (0-10 puan alan) yer alan öğrencilerin fark puan ortalaması ( $\bar{X}_1=32,68$ ), 2.grupta (10-20 puan alan) yer alan öğrencilerin fark puan ortalaması ( $\bar{X}_2=24,02$ ), 3.grupta (20-30 puan alan) yer alan öğrencilerin fark puan ortalaması ( $\bar{X}_3=14,30$ ), 4.grupta (30-40 puan alan) yer alan öğrencilerin fark puan ortalaması ( $\bar{X}_4=9,67$ ), 5.grupta (40-50 puan alan) yer alan öğrencilerin fark puan ortalaması ( $\bar{X}_5=8,61$ ), 6.grupta (50-60 puan alan) yer alan öğrencilerin fark puan ortalaması ( $\bar{X}_6=8,74$ ), 7.grupta (60-70 puan alan) yer alan öğrencilerin fark puan ortalaması ( $\bar{X}_7=4,50$ ), 8.grupta (70-80 puan alan) yer alan öğrencilerin fark puan ortalaması ( $\bar{X}_8=2,32$ ), 9.grupta (80-90 puan alan) yer alan öğrencilerin fark puan ortalaması ( $\bar{X}_9=0,66$ ), 10.grupta (90-100 puan alan) yer alan öğrencilerin fark puan ortalaması ( $\bar{X}_{10}=-3,66$ ) arasından en az ikisi arasında istatistiksel olarak anlamlı fark gözlenmiştir ( $F(9-5028)=100,68, p<0.05$ ). Test sonucunda hesaplanan etki büyüklüğü ( $\eta^2=0,15$ ) bu farkın yüksek düzeyde (geniş etki) olduğunu göstermektedir. Yapılan Scheffe çoklu karşılaştırma testi sonucunda anlamlı farkın 1. grup ile diğer tüm grup fark puanları arasında, 2. grup ile diğer tüm grup fark puanları arasında, 3. grup ile diğer tüm grup fark puanları arasında, 4. grup ile 7., 8., 9. ve 10. grup fark puanları arasında, 5. grup ile 8., 9. ve 10. grup fark puanları arasında, 6. grup ile 8., 9. ve 10. grup fark puanları arasında ve 7. grup ile 10. grup fark puanları arasında olduğu görülmüştür.

## SONUÇ

Araştırmada, matematik dersine ilişkin 1. ve 3. yazılı sınav-TEOG sınav fark puanları incelenmiştir. 1. yazılı sınav-TEOG sınav fark puanları açısından elde edilen bulgular incelendiğinde, TEOG sınavından 0 ile 10, 10 ile 20 ve 20 ile 30 puan alan öğrencilerin 30 ile 100 puan alan öğrencilere göre, matematik dersine ilişkin TEOG sınavı ile 1. yazılı sınavı arasındaki puan farkının daha fazla olduğu sonucuna ulaşılmıştır. Ayrıca matematik dersine ilişkin TEOG sınavı puanları ile 1. yazılı sınav puan farkının, TEOG sınavından 0-10 arası puan alan öğrencilerde en fazla olduğu görülmektedir. Dolayısıyla, matematik dersine

ilişkin TEOG sınavında düşük puan alan öğrencilerin, öğretmen tarafından yapılan 1. yazılı sınavdan daha yüksek puan aldıkları sonucuna ulaşılmıştır. Matematik dersine ilişkin TEOG sınavından yüksek puan alan öğrencilerin puanları ile öğretmen tarafından yapılan 1. yazılı sınav puanları arasında ise fazla farklılık olmadığı görülmektedir.

Benzer şekilde 3. yazılı sınav-TEOG sınav fark puanları açısından elde edilen bulgular incelendiğinde, TEOG sınavından 0 ile 10, 10 ile 20, 20 ile 30 ve 30 ile 40 puan alan öğrencilerin 40 ile 100 puan alan öğrencilere göre, matematik dersine ilişkin TEOG sınavı ile 3. yazılı sınavı arasındaki puan farkının daha fazla olduğu sonucuna ulaşılmıştır. Ayrıca matematik dersine ilişkin TEOG sınavı puanları ile 3. yazılı sınav puan farkının, TEOG sınavından 0-10 arası puan alan öğrencilerde en fazla olduğu görülmektedir. Dolayısıyla, matematik dersine ilişkin TEOG sınavında düşük puan alan öğrencilerin, öğretmen tarafından yapılan 3. yazılı sınavdan daha yüksek puan aldıkları sonucuna ulaşılmıştır. Matematik dersine ilişkin TEOG sınavından yüksek puan alan öğrencilerin puanları ile öğretmen tarafından yapılan 3. yazılı sınav puanları arasında ise fazla farklılık olmadığı görülmektedir.

Ayrıca matematik dersine ilişkin 1.yazılı sınav-TEOG sınav puan farkı ile 3.yazılı sınav-TEOG sınav puan farkı incelendiğinde, düşük puan alan öğrencilerin 3. yazılı sınavdan aldıkları puan ile TEOG sınavından aldıkları puanların farkının, 1. yazılı sınavdan aldıkları puan ile TEOG sınavından aldıkları puan farkından daha fazla olduğu sonucuna ulaşılmıştır. Bu durumun matematik dersine ilişkin TEOG sınavında düşük puan alan (0-60) öğrencilerin 3. yazılı sınav puanlarının 1. yazılı sınav puanlarına göre artış göstermesinden kaynaklandığı söylenebilir. Yüksek puan alan öğrenciler açısından incelendiğinde de 3. yazılı sınavdan aldıkları puan ile TEOG sınavından aldıkları puanların farkının, 1. yazılı sınavdan aldıkları puan ile TEOG sınavından aldıkları puan farkından daha az olduğu sonucuna ulaşılmıştır. Bu durumun da matematik dersine ilişkin TEOG sınavında yüksek puan alan (60-100) öğrencilerin, 3. yazılı sınav puanlarının 1. yazılı sınav puanlarına göre azalış göstermesinden kaynaklandığı söylenebilir.

## Abstract

This study aims to determine the thoughts and opinions of the school principals on the FATİH Project initiated by the Ministry of Education to facilitate a technology-supported education in Turkey. 24 Principals were involved in the study. The answers of the principals received on structured interview forms that contained open-ended questions and were analysed with content analysis method. Results of the research show that a majority of the principals have positive opinion about the FATİH Project. The principals state that the FATİH Project has brought a new energy to their schools and motivated the students. Nevertheless, the principals also stated that, to enable the system to run smoothly; specialised staff are needed to be recruited to solve arisen problems immediately, for the teachers to learn how to use the interactive board, tablet PC, document camera and multipurpose printers that have been given as part of the Project, they should be provided with adequate training sessions that are extended over a year and that, although it is very important for this process, the role of IT teachers are still not clearly defined.

## Introduction

The fast change in the Information and Communication Technologies (ICT) have affected and transformed the societies in many ways. Many countries nowadays give importance to involving technology in the learning and teaching process in order to improve the students' technology skills and equip them with digital abilities. Being also aware of this fact, the Ministry of Education (MEB) initiated the FATİH (Turkish initials for Movement of Increasing Opportunities and Improving Technology) Project.

As part of the FATİH Project in Education, that is launched to promote equal opportunities in learning environments and improve the technological conditions in our schools, 570.000 classrooms in all our nursery, primary and secondary schools will be provided with LCD Interactive Panel Boards and Internet infrastructure. With this project, it is aimed to appeal more senses of students during learning process and increase the efficiency of the teaching in classrooms. Within the scope of this Project, every teacher and every student will be given a tablet PC. Meanwhile the teachers will receive in-service trainings to help them to use the IT hardwares installed in the classrooms more effectively. In this period of time, the curriculum will be tailored in accordance with the IT-supported education and educational e-materials will be created. The FATİH Project is focused on providing five main components:

1. Installation of Hardware and Software Infrastructure
2. Creation and Running of educational e-materials
3. Efficient use of IT in the Education Programs
4. In-service Training of the teachers
5. Attentive, Safe, Manageable and Measurable IT use

The FATİH Project is implemented by the Ministry of Education and supported by the Ministry of Transportation and planned to be completed in five years. It is targeted to complete the IT hardware and software installation, create e-material contents, update the teachers' guide books, give in-service trainings for teachers for the secondary schools in the first year, for the second primary graders in the second year and for the first primary graders and pre-schoolers in the third year (MEB 2014). Apart from these components, the FATİH Project also has stakeholders such as the students, teachers, principals and service providers.

E-mail address: buket@hacettepe.edu.tr

With this Project, the Ministry of Education targets to form classrooms equipped with interactive panel boards and necessary technology where each students is provided with a tablet PC to enable the students and teachers to use these technologies effectively. For this target to be achieved, it is necessary for the school principals, who are at the position of supporting and guiding the Project, to adopt the Project and support the teachers who are the main implementers of the Project.

A literature scan shows us that studies carried upon the FATİH Project are mostly focused on the usage of the system by the students, perception of the Project by the teachers and on determining the computer literacy levels of the teachers and students (Çiftçi, Taşkaya & Alemdar, 2013; Gürol, Donmuş & Arslan, 2012; Kayaduman, Sırakaya & Seferoğlu, 2011).

This study aims to determine opinions of school principals upon the utilisation of the interactive panel boards and/or tablet PCs that were distributed as part of the FATİH Project launched by the Ministry of Education to facilitate the students to receive a technology supported education.

These are the research questions addressed to the principals to be examined within the scope of this research:

1. What are the opinions of the principals upon teaching and learning practice that is supported with the technologies in question?
2. According to the principals, what are the reasons that render or hinder the use of those technologies?
3. What are the suggestions of the principals for using those technologies more efficiently?

## Method

In this research, case study method is used. According to Yin “A case study is an empirical inquiry that investigates a phenomenon within its real-life context, especially when the boundaries between phenomenon and context are not clearly evident” (Yin, 2003). While Baxter and Jack (2008) state that the case studies give the researchers the opportunity to reply the “how” and “why” questions while investigating how the phenomenon is affected by its context. Although different case study researchers give different classifications, in this study we used the “descriptive case study” method which has been described by Yin (2003) as mentioned earlier. Therefore, the case investigated in this study is the principals’ opinions regarding the interactive panel boards and tablet PCs that were distributed in the schools as part of the FATİH Project. Data gathered in this research have been analysed with content analysis, a known qualitative research paradigm.

### 1 Study Group

This research is conducted on a voluntary basis in the 2013-2014 Academic year, over 24 school principals (13 principals, 11 vice-principals; 2 of whom were women, 22 of whom were men) from different fields working in the high schools where FATİH Project is launched. The frequency and percentage rates of the principals participated in the research according to their professional seniority are given in Table 1.

**Table 1:** Distribution of the principals in accordance to their professional seniority

	Professional Seniority (Year)													
	1-3		4-6		7-9		10-12		13-15		15-		Total	
	f	%	f	%	f	%	f	%	f	%	f	%	f	%
Principal	-	-	-	-	2	8.3	3	12.5	2	8.3	17	70.83	24	100

## 2. Data Collecting Tool

Data are collected with questionnaires containing open-ended questions. The research questions are tailored so that the opinions of the principals upon the interactive panel boards and tablet PCs, distribution and usage of which have been especially emphasized in the FATİH Project, can be revealed.

## 3. Data Analysis

The data obtained from the research have been investigated with content analysis. Fraenkel, Wallen and Hyun state that the content analysis is a research method that is flexible, systematic and reduces data. In the study, in order to assure the validity and reliability of the research and of the codes and themes, we conducted cross-checks that were defined by the researchers.

### Findings

This section comprises the findings and comments that were obtained by analysing the questions and the answers given to those questions. Here, findings of the data analysis, the defined codings, frequency and percentage rates of the themes have been supported with striking quotations from the statements of the participants.

*What are the opinions of the principals upon teaching and learning practice that is supported with the technologies in question?*

The analysis of the opinions of the principals on the teaching experience supported with interactive panel boards and tablet PCs shows that the opinions were gathered around the codings of “effective learning”, “saving time and productivity” and “motivation, interest and participation” (Table 2).

Table 2: Principals' opinions on the technology-supported education in question

	f	%
Learning can be more permanent and efficient through lessons taught with interactive panel board and tablet PCs.	17	70.83
Regular use of interactive panel board and tablet PCs during teaching process saves time.	12	50
Use of interactive panel board and tablet PCs in classrooms motivates the students and increase their involvement in the class.	11	45

While 70.83 % (f=17) of the principals think that the lessons taught with the support of interactive panel board and tablet PCs provide more permanent and efficient learning, 50% (f=12) of them think that the usage of interactive panel board and tablet PCs provides saving in time and 45% (f=11) of them think that using interactive panel board and tablet PCs in classrooms motivate the students and increase their involvement in the lessons.

*“These technologies enable visually enriched materials to be used during the lessons and this attracts the attention of the students more ...” Y1*

*“It attracts the students' attention, motivates them which can eventually increase their success..” Y3*

Principals claim that the use of the mentioned technologies in the lessons can save the teachers time and can serve as a good tool to attract the students' attention. They also think that the technology-supported education will render both students and teachers to use the technology more efficiently and more productively.

*“It saves teachers time, hence they can teach or revise more subjects and it also attracts interest and attention of the students better...” Y10*

*“It helps students and teachers to use the technology more efficiently and more productively.” Y2*

*According to the principals, what are the reasons that render or hinder the use of those technologies?*

The principals were asked "Are the interactive panel board and/or tablet PCs used efficiently in the schools?" (Table 3).

Table 3: Principals' opinions on the reasons that render or hinder the effective usage of those technologies

Are the interactive panel board and/or tablet PCs used efficiently in the schools?	f	%
Yes	14	58.33

While, 58.33 % (f=14) of the principals think that the technologies offered with interactive panel boards and tablet PCs are not being used efficiently, 41.67 % (f=10) of them think that those technologies are adequately utilised.

Principals with positive opinion stated that the tablet PCs and interactive panel boards save teachers time in teaching their lessons and they visually support the learning process.

*"Significant increase in visual materials has success-promoting benefits such as keeping the students alert." Y18*  
*"Students' interest in the lesson increased, it allows more illustrative teaching and more productive use of time."*

Y21

*"By means of illustrations, students' level of perception is kept high..." Y28*

*"They can reach visual and illustrative materials more easily. This saves time especially in lessons that require drawing." Y3*

According to the principals who gave negative answer to this question, the reasons hindering the efficient usage of these technologies are mainly inadequate technical facilities (weak internet infrastructure, poor technical support, etc.), incompetence of teachers in using these technologies, negative approach of the teachers towards using technology in class, teachers remaining distant from innovative changes and poor availability of electronic lesson materials.

*"...S/he cannot give up the classical teaching methods. S/he talks about innovation and change, but acts in a way opposing innovation..." Y19*

*"Some of our teachers enter lessons unprepared and they have lack of confidence in using these technologies and cannot pull themselves out of monotony ..." Y5*

*"... the biggest handicap that they do not quickly adapt themselves to the new technology and to applying this technology into their teaching." Y24*

*"Some of them did not use computer before and they do not want to change their habits." Y12*

*"Some of the teachers keep themselves distant from the technology and some of them think that the technology cause more mistakes than human beings." Y22*

*"Electronic lesson contents and materials are inadequate, teachers do not know how to use or how to prepare lessons with the available contents." Y12*

The study conducted by Gürol, Donmuş and Arslan (2012) also supports the opinions of the principals who filled our questionnaire. According to this study, teachers think that, although this Project will be beneficial, it also has some problems such as inadequate resources and lack of information.

*What are the suggestions of the principals for using those technologies more efficiently?*

The school principals were asked "What would you suggest to make these technologies to be used more efficiently?" (Table 4).

**Table 4: Principals' thoughts on more efficient use of the technologies in question**

	f	%
Teachers should be trained to be more competent	14	58.33
Scope of the in-service training given to teachers should be revised and a hands-on training should be provided	20	83.33
Electronic lesson contents are inadequate, the number and quality of them should be increased	18	75.0
Durations of the in-service trainings given to teachers should be increased	13	54.16
Teachers should be encouraged to use the new technology	22	91.66

When we examine the opinions of the principals, we see that they mainly laid stress upon subjects such as; increasing teachers' competence, reconsidering both the content quality and durations of the in-service trainings, increasing both number and quality of the electronic lesson contents and encouraging teachers to use the new technology.

*"Teachers should be given a hands-on and purpose-built training that involves more practice." Y11*

*"Trainings given for using the electronic contents should be increased and the teachers should be encouraged to prepare such resources." Y22*

*"More efficient in-service trainings should be provided. And they should be active, hands-on training, not just theoretical. More time is needed to learn how to use the provided lesson materials." Y29*

Principals expressed that, to increase the level of usage of the FATİH Project, more training is necessary and told that the current in-service training given to develop teachers' professional abilities and technological literacy involves using only the interactive panel board and the software for a very limited time.

Most of the principals (91.66 % f=22) stated that the teachers are needed to be encouraged to use the new technology.

*"Especially teachers reached at a certain age experience great difficulties. These teachers need extra support and more practice to increase their efficiency in using the technology. MEB should promote them in this direction."* Y26

## Conclusion, Discussion and Suggestions

The aim of this study was to determine the opinions of the school principals about the FATİH Project. According to the results of this research, the principals think that the technology used in this project will effect the educational process positively on three points defined as "efficient learning", "saving time" and "motivating and increasing the interest and involvement of students". Involving devices such as the interactive panel boards that alert more sense organs of the students, in the teaching-learning environment renders more effective and permanent learning. The study of Şad and Özhan (2012) shows that giving lessons with interactive boards both saves time and provides better learning with the use of visual resources and the multimedia. Another study conducted by Gursul and Tozmaz (2010) over teachers who use interactive panel boards in their classes defines that the interactive panel boards have positive effects upon raising the interest of the students in the subject being taught.

The principals, who think that in the schools, the technologies in question are used effectively, stated that the usage of interactive boards and tablet PCs in the teaching practice, saves teachers time during giving their lessons and visually supports the students' learning. The principals who think that these technologies are not used efficiently stated that the reasons of this are the technical deficiencies and teachers' incompetency in using these technologies.

The principals stressed the significance of the electronic teaching resources for the effective use of the technologies in question and underlined that the contents of these resources are very important to be able to use the interactive boards and tablet PCs effectively in the teaching and learning process. The principals also noted the importance of the teachers' trainings and stated that increasing the number of hands-on in-service trainings is necessary. Among their suggestions to render the FATİH project to be conducted more efficiently and more productively were giving more regular and continuous in-service training, providing technical support and solving infrastructural problems. Results obtained with this study are also affirmed by other studies conducted by Günbayı and Yörük (2014), Türel (2012) with Adıgüzel, Gürbulak and Sarıçayır (2011).

As a conclusion, we suggest that by enriching the lesson contents, updating teaching materials, making in-service trainings regular and continual, the FATİH project can proceed in a more wholesome manner. Studies conducted by Günbayı and Yörük (2014); Türel (2012) and Adıgüzel; Gürbulak and Sarıçayır (2011) emphasize that teachers are needed to receive more comprehensive training to learn how to use the materials provided as part of the FATİH Project.

## Abstract

Presented paper deals with the relationship between the school self-concept and the risk behaviour of adolescents. The key theoretical background includes the self-concept and its components (Greenwald, & Pratkanis, 1984), the beneffectance concept (Greenwald, 1980), the self-evaluation concept (Rosenberg, 1982) and its resources (Tafarodi, & Swann, 1995), the theory of self-discrepancy (Higgins, 1991) and the concept of self-mastery (Bandura, 1997), theory of psychological needs (Langmeier, & Matějček, 2011), etc. Based on the relatively high prevalence of various forms of the risk behaviour (based on various researches), there has been put forward the assumption that (1) the measure of the risk behaviour will increase together with increasing of the adolescent age and (2) that the adolescents with higher school self-concept will produce less risk behaviour. The research has been carried out in Slovakia with the sample of 1,704 adolescents in the age from 10 to 15. Two research methods have been applied: Self-concept of School Effectiveness Questionnaire (Matějček, & Vágnerová, 1992 in modification of Čerešník, 2013) and Prevalence of Adolescents Risk Behaviour (Skopal, & Dolejš, 2013; Slovak modification of Čerešník, 2013). Both hypotheses can be supported. The outcomes point to need to strengthen the self-concept at children and adolescents in terms of support of self-exploratory activity, the preference of instrumental assistance ahead executive, or the support of emotional expression and confrontation.

## Introduction

The aim of the research is the exploration of the relationship between the school self-concept and the risk behaviour of adolescents. The school self-concept is defined through the self-assessment within general skills, math, reading, spelling, and writing with self-confidence. The risk behaviour is defined in subscales abusos of addictive substances, delinquency and bullying. Population in adolescent age is defined in the range of 10 to 15 years. Its choice has been determined by sensitivity to the questions of self-concept during this period, highlighting the self-exploratory motive and active work with possible self.

## School Self-concept, its Age Specification and Relation to the Risk Behavior

The school self-concept represents the specific part of self-concept which develops after a child starts attending a school. According to Erikson, industry versus inferiority is related to the solution of the conflict and it might lead to development of virtue, if the conflict is solved in a positive way, and it is called competence (Erikson, 1999). From the point of view self-regulatory theories (e.g. self-efficacy (Bandura, 1999), perceived control (Skinner, 1995), effortful control (Eisenberg, Smith, & Spinrad, 2011), etc.), the school self-control might be characterized as a mental presentation of selves and their outputs in a school environment which is based on self-recognition (information about themselves) and evaluation of selves and their outputs. It includes a personal belief in the contingency between their own behaviour and effect which (this behaviour) causes it. In structural terms, it has the same components as a general self-concept, so-called cognitive, affective and conative aspect (Greenwald, & Pratkanis, 1984).

Cognitive aspect of the school self-concept consists of declarative knowledge about the world and about oneself, which reflects effectance of a child (educant) and procedural knowledge, so-called application strategies that reflect beneficence of a child (educant). A.G. Greenwald (1980) joined these two terms (effectance and beneficence) into one – beneffectance – which represents a social dimension of knowledge acquisition and a personal dimension of applying the learning and life strategies. A several representations of self are a part of the cognitive aspects of the school self-concept. They include:

- actual and ought self (Higgins, 1987) representing personal beliefs who a child, pupil (educant) is and who he/she should be like;
- desired and undesired self (Ogilvie, 1987) representing confrontation of positive and negative ideals;

E-mail address: mceresnik@ukf.sk

- possible selves (Markus, & Nurius, 1986) representing diverse ideas about who the educant might be (and in what kind of conditions);
- real and ideal self (Rogers, 1951) representing beliefs about the current form of self and ideal form (it means something, the educant could tend to be).

Representations of self are defined as a set of hypothetical personal constructs, which are compared with each other and lead to the evaluation of themselves in terms of satisfaction or dissatisfaction with a given state.

As regards evaluation, or self-evaluation (for instance Rosenberg, 1982), it refers to affective aspect of the school self-concept. There are two resources of self-evaluation. According to R.W. Tafarodi, & W.B. Swann (1995), they are self-competence and self-liking. Competence represents a personal belief about the ability to produce desired (school) achievements through their own skills. Self-liking can be understood as a perception of the other people's emotional bonds to the oneself. The other important things of self-evaluation may be derived from these variables, as there are polarity (positive and negative) (for instance Baumeister, Heatheron, & Tice, 1993) and stability (for instance Marsh, 1993). Self-evaluation is thus derived from external and internal sources. The external sources of self-evaluation are diverse and can be located among members of small social groups (primary and also secondary ones). A key prerequisite, however, is subjective significance of others for the human beings themselves (Shavelson, Hubner, & Stanton, 1976), for example parents, peers, friends, partners, colleagues.

The fundamental change while evaluating the relationship to selves is the period of adolescence, it means in the age from 9 to 11, which is, according to E.T. Higgins (1991), a significant shift from identification (with parental model) to internalization, when the external norms become self-guides. They allow evaluating the world and selves independently, out of opinions of others.

Conative aspect of the (school) self-concept closely relates to the personal beliefs of consistency and controllableness of the self and the world, but especially with the motivation of personality. Beliefs about consistency and controllableness of the self and the world are basal personality structures based on successful solve problems in the early stages of personality development, it means problems like trust versus mistrust, autonomy versus doubt, initiative versus guilt (Erikson, 1999). They relate to the development of virtues such as hope, will and decisiveness and with saturation of psychological needs, which are inseparable part of the motivation system. They include a need for stimulation, a need to bond, a need for meaningful world, a need to define one's own identity and needs of the future (Langmeier, & Matějček, 2011). These needs protect against deprivation and sub-deprivation symptoms that may lead to the development of mental abnormalities. They are closely tied to the primary family environment, which is the source of prototypical types of behavior and socializing experiences. Motivational aspect of the self-concept associates with the development of self, which becomes the supreme regulator of behavior. Motivation as a part of the self-concept can be conceptualized through self-discrepancy theory (Higgins, 1991), and self-mastery concept (e.g. Bandura, 1997). Self-discrepancy theory is based on the concept of self-guides, which Higgins refers to the life standards. They belong to the content of an ideal and desired self. The personal standards represent motives that initiate, focus on behavior and give it an emotional charge. The result of motivated behavior is then comparison of the current state with the desired one, leading to either evaluation "consistence" or similarity, or to the evaluation of "discrepancy", or disagreement. In case of discrepancy, regulatory processes are activated, which are based on modified behavior in the direction of achieving the desired (school) outcomes. The concept of self-mastery (Bandura, 1997) can be explained as a high belief in self-efficacy, it means a belief that one can influence events in oneself and around the self (control upon one's life). This belief is filled especially with self-mastery; it means one's own competence in specific situations.

The self-concept is a complex personality structure, which development is very sensitive in the period of starting school, puberty and adolescence in general. After entering the school the child is confronted with new tasks and responsibilities. Except the game, which is important mean in forming, a child has to pay attention to school tasks and after managing the adaptation process they lead to evaluation of their performance. It means to the performance of themselves as well as of their peers. They find out, they are good at some subjects more than in others and on the other hand, they are bad at some other ones. What happens in this age can be labelled as a separation of school self-concept from the global self-concept. Of course, there is an important relationship between them, but the school self-concept becomes a variable which significantly influences a child and its further development. However, a child in its early school age expects that if he/she is initiative, it means if he/she invests the time and energy to solve given tasks, he/she will be rewarded (in a form of a mark or orally). He/she is not always successful and based on repeated cycles achievement - reward (or missing reward) may lead to forming a school self-concept. A system of declarative knowledge is being formed (about self and one's own performance), as well as a system of procedural strategies which are both necessary to acquire adequate high self-evaluation. On the other hand, the self-evaluation significantly affects interests, goals, or aspirations. The whole process leads to the fact that a child will select the fields where its self-concept is high and he/she wants to involve in them because they bring benefits in the form of a high self-evaluation, positive evaluation of parents or teachers, or it may bring belief for the own competency. The fields with low self-concept are not interested for a child, nor are they a source of rewards or benefits.

When a child enters a puberty period, it means a development of higher cognitive processes, development of abstract thinking, introspection, active work with information of emotional features, in accordance with a rational system. Adolescence period is characterized with a strengthening of self-exploratory motive and (normative expected) active work with self-defining. In comparison with a previous period, which is characterized by a desire for attention and positive evaluation of the effort, for

adolescence period is typical critical thinking to performances (the own ones and the other ones). Awareness of established standards explicitly or implicitly and the need for their achievement leads to early development of self-reflection of adolescents, and their metacognitive skills. Adolescents begin to aware of polarized nature of the world and themselves, it means their positive and negative features which must be integrate into relatively closed and consistent system. Emotional instability in early adolescence period is just an indicator of how adolescence work intensively with their own self-concept and how it is difficult for them to integrate personal and social standards, relativity of positive and negative aspects of life, but also sthenic and asthenic emotions associated with emerging adulthood (Arnett, 2000) and the growing need to define their own identity, which has rather diffuse features in this period in the form of a relatively large number of possible self (Markus, & Nurius, 1986) .

The development of self-concept requires intensive mental work. However, it cannot be either mobilize or supported by the absence of external factors. The most important ones are parents and teachers. The main objective of education (the parental and school ones) should be in terms of a healthy personality development and its self-concept (1) sufficient stimulation of the environment associated with relatively great degree of freedom and as well the presence of boundaries, (2) emotional stability generated through saturation of emotional needs, the relative stability of the environment and the possibility of emotional confrontation, (3) support of self-worth, which is derived from a slight overestimation of their abilities - this leads to the perception and use of the life challenges, awareness of the possibilities of a positive perception of the future (defined as paraphrase of psychological needs according to Langmeier, & Matějček, 2011).

The optimal development of personality and self-concept is not always possible to realize. It is evident in rapidly growing number of psychopathological diagnoses (or at least pathological symptomatology) in children and adolescents, for example child depressions, schizoaffective disorders, acute stress disorders, neurosis, but also behavioral disorders and addictions in terms of risk-taking behavior. Risky behavior is defined as a set of phenomena which existence and consequences can be subjected to scientific research and that can be influenced by preventive and therapeutic interventions. The risk behaviour concept mostly includes bullying and violence, truancy, substance and non-substance addictions, sexual risk behavior, delinquency, maltreatment, abuse, racism, xenophobia, intolerance, and so on. (Miovský, & Zapletalová, 2006). Lepík F. et al. (2010) found out (except other outcomes) that 23% of adolescents were ridiculed at least once a month, 25% of them take money to their parents, 23% of adolescents have already had a problem with the police, 25% smoke more than 5 cigarettes a day, 52% drank some alcoholic beverage in the past month, 41% have ever tried marijuana. Similar findings also noticed J. Vacek, J. Šejvl, & M. Miovský (2008). They have found out that 31% of adolescents (over 14 years old) smoke daily, 87% drank some alcoholic beverage in the past month, 21% were ridiculed. J. Vacek (2008) reported 33% of adolescents who are ridiculed at least once a month, 99% of adolescents have an experience with alcohol, 21% of adolescents have an experience with illegal drugs, 23% of adolescents in the ninth year of studying in primary school have a sexual experience. M. Dolejš, & O. Skopal (2014) found out that adolescents in the age 11-15 have experience with alcohol (78%), tobacco (31%). There were five percent of them who drunk in the last month and 3% smoke more than 5 cigarettes a day. The American Psychological Association introduces similar alarming findings (2002). In the context of the relatively high prevalence of various forms of the risk behavior we ask if this behavior relates to school self-concept of adolescents.

## Method

The basic research sample includes adolescents in the age 10-15, permanently living in Slovakia. According to the census list in 2011, there are approximately 180,000 people in the age 10-15 living in Slovakia (Statistical office, 2012).

The sample can be characterized as stratified. Criteria that were taken into account in the drafting are the following ones: adolescents in the each class from 5-9 in primary schools secondary school at about the same representation, boys and girls around the same representation, the regions of the Slovak Republic in about equal representation. Characteristics of the sample are given in Table 1. Whole research sample consists of 1704 adolescents. All these criteria have been met.

Table 1. The counts in the research sample.

		class					total
		5 <sup>th</sup>	6 <sup>th</sup>	7 <sup>th</sup>	8 <sup>th</sup>	9 <sup>th</sup>	
sex	boys	143	177	181	164	172	837
	girls	162	164	184	181	176	867
total		305	341	365	345	348	1704

There have been applied two diagnostic methods in the research, particularly *Self-concept of School Effectiveness Questionnaire* (Matějček, & Vágnerová, 1992) and *Prevalence of Adolescents Risk Behavior* (Skopal, & Dolejš, 2013). The first mentioned is a standardized diagnostic method, which includes six subscales: (1) general abilities (2) mathematics (3) reading (4) spelling (5) writing (6) self-confidence and the total score of the school self-concept. It includes 48 items. The questionnaire has been developed as the Czech (Czech-Slovak) modification of the Student's Perception of Ability Scale Questionnaire set up by F.J. Boersma, & J.W. Chapman (1979 in Matějček, & Vágnerová, 1992). It has been adapted to form SPAS III. Standardization

took place in 1987. On its basis have been developed sten norms for individual age groups, which it is intended to, it means adolescents aged 10-15, or to adolescents attending classes 5-9 in elementary schools. Reliability of individual subscales is defined by Cronbach  $\alpha$  0.89 and more. The presented research applied the original structure of the questionnaire. The items have been modernized and formulated to the correct Slovak form.

Prevalence of Adolescents Risk Behavior set up by O. Skopal, & M. Dolejš (2013) is a diagnostic method, which has been in the process of standardization. It includes three subscales: (1) abusos, (2) delinquency, (3) bullying and total score of prevalence of risk behaviour. It includes 18 items. Reliability of individual subscales is defined by Cronbach  $\alpha$  in the range from 0.53 up to 0.81.

The following hypotheses were put forward based on theoretical background presented in chapter 2:

H1: We assumed that the range of the risk behaviour will be increasing together with the increasing age of adolescents.

H2: We assumed that adolescents with higher school self-concept will produce less risk behaviour.

## Results

While testing the hypothesis 1, the statistical method of the range difference was applied, Friedman test. It is a parametric statistical test developed to compare three and more independent samples. The significant standard level  $\alpha \leq 0.05$  was accepted. The aim of the analysis was comparison of the risk behavior prevalence of adolescents in relation to their age.

The risk behavior descriptors and all their subscales are listed in Table 2. The average values for all the variables were increased along with the number of class which the adolescents attended. The variance of analyzed data was relatively large. The values kurtosis and skewness indicate not normal and asymmetric distribution of data, except data collected in the ninth class. Similar trends appeared in Table 4 while testing hypothesis 2 (available in the text below).

Table 2. Descriptives of the risk behavior in the relation to the age.

class		N	Min	Max	AM	SEM	SD	kurtosis	skewness
5 <sup>th</sup>	abusos	291	0	7	0.21	0.05	0.81	33.97	5.42
	delinquency	290	0	6	0.41	0.06	0.97	12.04	3.25
	bullying	292	0	4	0.55	0.05	0.88	2.33	1.66
	risk behavior	286	0	16	1.13	0.12	2.09	15.69	3.49
6 <sup>th</sup>	abusos	336	0	7	0.38	0.05	0.98	13.97	3.47
	delinquency	336	0	7	0.71	0.07	1.23	5.08	2.15
	bullying	336	0	4	0.69	0.06	1.00	1.54	1.46
	risk behavior	333	0	15	1.76	0.14	2.54	4.74	2.10
7 <sup>th</sup>	abusos	360	0	7	0.64	0.07	1.33	9.42	2.92
	delinquency	356	0	7	1.19	0.09	1.71	2.46	1.71
	bullying	359	0	4	0.89	0.06	1.04	1.00	1.22
	risk behavior	352	0	18	2.67	0.18	3.37	4.96	2.06
8 <sup>th</sup>	abusos	336	0	7	0.76	0.07	1.29	4.56	2.10
	delinquency	339	0	7	1.20	0.08	1.38	2.09	1.33
	bullying	338	0	4	0.91	0.06	1.07	0.62	1.12
	risk behavior	331	0	16	2.84	0.16	2.81	1.83	1.25
9 <sup>th</sup>	abusos	340	0	6	1.22	0.08	1.54	0.74	1.28
	delinquency	344	0	7	1.98	0.10	1.81	0.09	0.87
	bullying	346	0	4	0.82	0.05	0.95	0.29	1.00
	risk behavior	332	0	16	4.03	0.19	3.41	0.47	1.00

Legend: N = count; Min = minimal measured value; Max = maximal measured value; AM = average mean; SEM = standard error of mean; SD = standard deviation;

The increase in the average risk behavior values is also evident in the form of statistical indexes - namely F-values (Table 3). All found differences are highly statistically significant, namely the level  $\alpha \leq 0.001$ . This means that among adolescents in the age cohort 10-15, there are significant differences in the rate of the risk behavior production. If we compared only the fifth and ninth classes, it means adolescents aged 10 and 15, we would find out that older adolescents produce about 3 risk behaviors more than younger adolescents. Similar results were also recorded in the subscales abusos (an increase in 1 symptomatic response), delinquency (1.5 symptomatic response) and bullying (0.3 symptomatic response).

Table 3. Comparison of the risk behavior in the relation to age.

ANOVA						
		Sum of Squares	df	Mean Square	F	p
abusos	Between Groups	196.486	4	49.122	32.485	$\leq 0.001$
	Within Groups	2507.082	1658	1.512		

	Total	2703.568	1662			
delinquency	Between Groups	461.269	4	115.317	53.432	≤0.001
	Within Groups	3582.641	1660	2.158		
	Total	4043.91	1664			
bullying	Between Groups	28.799	4	7.2	7.281	≤0.001

	Total	1676.172	1670			
risk behavior	Between Groups	1542.962	4	385.74	45.415	≤0.001
	Within Groups	13836.347	1629	8.494		
	Total	15379.309	1633			

Legend: df = degree of freedom; p = significance

We divided the sample to two groups before testing hypothesis 2, which may be presumed that they will differ in characteristics related to the risk behavior production. There, the school self-concept variable was set up to 25<sup>th</sup> and 75<sup>th</sup> percentile. The group that scored at the 25th percentile and below was marked as a group with low self-concept. The group that scored at the 75th percentile and more was marked as a group with high self-concept. They are indicated as “low” and “high” in Table 4. Therefore, we excluded adolescents who scored in the mean value of the variable from the analysis. Afterwards, data were tested applying t-test for two independent selections with acceptance standard level  $\alpha \leq 0.05$ . The results are available in Table 4.

Table 4. Descriptives and comparison of risk behavior in the relation to school self-concept

We have found out that the groups with low and high school self-concept differ in the risk behaviour production. Significant differences were observed in all variables (abusus, delinquency, bullying, and risk behaviour) in the 8<sup>th</sup> and 9<sup>th</sup> classes. None significant differences were observed in subscale abusus in the 5<sup>th</sup> and 6<sup>th</sup> classes. In the 7<sup>th</sup> class were not observed any significant differences in the subscale bullying. There are significant differences in individual classes quantified by a difference of mean of symptomatic responses. In the subscale abusus, it is an increase 0.69 to 0.98 responses. In the subscale delinquency, it is an increase 0.45 to 1.01. In the subscale bullying, it is an increase 0.44 to 0.59 responses. The increase is always at the side of adolescents with low school self-concept. In the total score of risk behavior, an increase of 1.18 to 2.3 of symptomatic response at the side of adolescents with low self-concept was recorded. The increase of the risk behavior was in accordance with increasing age. It means the most evident difference in the risk behavior production while comparing groups with low and high self-concept was recorded in the 9<sup>th</sup> class.

## Discussion

Based on presented results above we may conclude that we can support both hypotheses. Adolescents in the age 10 to 15 produce more risk behaviour in relation with increasing age. Adolescents with low school self-concept produce more risk behaviour in comparison with adolescents with high school self-concept. Presented results are consistent with R. Jessor (1991) who perceives inadequate self-concept as one of factors leading to the production of risk behaviour in adolescence. Inadequate self-concept may also lead to behaviour which can be interpreted as problem or risky. Paraphrasing Čerešniková (2005) we present behavioural symptoms which can be considered for undesired behaviour of the children with inadequate self-concept: (1) unacceptance of the authority, (2) slight relations, (3) prosocial behaviour related to close group, (4) extreme emotional expressions, (5) extreme attitudes, (6) breaking the social norms, (7) development in lightly stimulating environment which can have pathological features.

If we think about the indirect indicators of the relation between risk behaviour and self-concept, we can write about the consistency of our results with outputs of various researches. M. Verešová (2004) states that the users of addictive substance (1) have strong discrepancy between internalized values they should have and the values they actually have as users of addictive substances, (2) weakened decisional skills and goal allocation, (3) lower self-esteem and self-confidence, (4) lower social skills and resistance. M. Verešová, D. Malá, & V. Gatál (2009) found that the production of risk behaviour has positive relation with general personal tendency to risk and stimulation seeking. M. Verešová, & M. Pohánka (2009) found out lower life meaningfulness and life satisfaction in alcohol users in comparison with abstainers. M. Verešová (2010) who found out that students using addictive substance have lower proactive coping and sense of coherence in comparison with abstainers. M. Verešová, & D. Malá (2011) repeatedly confirmed the relation between low proactive coping of addictive substance users and their risk behaviour. They found out the relation between low self-efficacy of addictive substance users and their risk behaviour.

In terms of education and self-education of child and adolescent population we may on the basis of our results recommend a clear concentration on the development of their self-concept in terms of the support of self-exploratory activity, preference of instrumental assistance before executive, or support of emotional expression and confrontation. If talking about a particular strategy and key development areas (school) self-concept, we could accept recommendations of M. Nevoralová, & L. Čablová (2012), which are aimed at development of self-determining abilities. They include (1) critical thinking, (2) creative thinking (3) problem solving, (4) decision making, (5) setting goals, (6) self-motivation, (7) self-reflection, (8) self-awareness, (9) self-evaluation (10) self-efficacy, (11) emotions coping, (12) stress coping, (13) planning and control, (14) time management (15) perception of obligations, (16) flexibility. Basically, they are metacognitive processes, which are typical for a mature personality, who is able to accept self and others as human beings who are exceptional in some areas, and in other ones they is lack of professional competence.

# Science as a cultural activity: comparative study of Brazilian and Portuguese teachers' conceptions about science

Geilsa Costa Santos Baptista<sup>a§</sup>, Graça Simões de Carvalho<sup>b</sup>

<sup>a</sup>Assistant Professor, Department of Education (State University of Feira de Santana), Feira de Santana, Brazil

<sup>b</sup>Full Professor, CIEC-UM, Institute of Education (IE), University of Minho (UM), Braga, Portugal

---

## Abstract

This is a comparative study on Brazilian and Portuguese science teachers' conceptions about science and cultural diversity awareness. Interviews before and after the TE-CD course revealed differences between teachers of both countries, which may be associated to their previous teacher training and social context. This preliminary study showed that further research in both countries is of paramount importance in order to elucidate in more detail the differences not only between the science teachers' conceptions about science but also between their teacher training. This can contribute to improve science teacher training curriculum in both countries, with special reference to cultural diversity.

## Introduction

In the last two decades, it has been increasingly more common the view that science teachers must construct appropriate conceptions about the nature of science (NoS), since only in this way they will be able to convey appropriate conceptions about science they teach (Ameh & Gunstoner, 1985; Rutledge & Warden, 2000; Gil-Pérez et al., 2001; Capps & Crawford, 2013). Appropriate conceptions about the NoS mean those related to the understanding of science as a cultural activity of scientists in particular periods, comprising a set of inherent values and assumptions in the development of the scientific knowledge (Lederman, 1992).

However, most teachers and future teachers have inadequate conceptions about the nature of science (Gil Pérez et al., 2001). One must highlight that in some cases the concepts are missing or made incomprehensible when teachers are unable to express any meaning or fail to conceptualize the scientific concept clearly. Gil-Pérez et al (2001) have identified among science teachers the following seven views about science: 1 - empirical-inductive and non-theoretical (observation and experimentation assumed as neutral, i.e. not influenced by preconceived ideas); 2 - Rigid (algorithmic, exact, infallible, etc.). 3 - non-problematic and non-historical (hence dogmatic and closed); 4 - Exclusively analytical (highlighting the studies demarcation and specialization, their limited and simplifying character, and so forgetting efforts of unification and construction of coherent bodies of knowledge); 5 - Cumulative linear growth (scientific findings as the result of a purely cumulative linear growth, which ignores paradigm crises and major reconstructions); 6 - individualistic and elitist (scientific knowledge is the result of the work of isolated geniuses, ignoring the role of collective and cooperative work with exchanges within and between teams) and 7 - decontextualized (socially neutral).

In science teacher training for cultural diversity, a proper understanding of the nature of science should be stressed in order to allow the teacher to understand the characteristics that are intrinsic to science, as one among the numerous existing cultures. This will contribute to the demarcation of scientific knowledge (school) in relation to other cultural knowledge that can be present in the classroom (Cobern & Loving, 2001). In addition to the didactic transposition of scientific knowledge in the context of the classroom (Chevallard, 1985), the values and social practices should be taken into account (Clément, 2006; Carvalho, 2009). In this sense, the intercultural dialogue between the thought science and other systems of knowledge becomes pertinent. In such dialogues the relationships between the science culture (which is transmitted by the teachers) and the students' cultures should be established in order to make students understand the origin and the domains of validity of various systems of knowledge and systems of values. When this happens, students may develop their visions of the nature enhanced with scientific ideas and apply the acquired knowledge (either from scientific culture or from their own cultures) in contexts and practical situations (El-Hani & Mortimer, 2007).

Considering that a great number of science teachers have inadequate conceptions about the nature of science (Gil-Pérez et al., 2001), it is necessary that they develop epistemological reflections, by analyzing the NoS of their teaching and providing them of

E-mail address: geilsabaptista@gmail.com

a broader view of knowledge as object of teaching, the curriculum and the methodologies of teaching (Apostolou & Koulaidis, 2010). According to Carvalho (2002), teacher's reflections about the NoS can provide a more adequate understanding of what science is about, how scientists operate as a social group in particular periods, etc. In this way, a more appropriate science teaching is possible so that students can understand better the nature of science they are learning about. Included in this scientific view of knowledge, some relevance has also been given to the cultural knowledge, which can involve the complex set of relationships of plants and animals with the past and present human societies, in the so called field of Ethnobiology (Berlin, 1992).

The NoS can be better understood by teachers if the contribution of history and philosophy of science is taken into account (Clough, 2012), assisting in the epistemology of science, i.e. helping the “*understanding of the structure of science and the space it occupies in the intellectual system*” (Matthews, 1995, p. 165).

In this paper, a comparative study of Brazilians and Portuguese science teachers' conceptions about science are presented and discussed in view of the influence on science teaching course addressing cultural diversity: “*Contributions of Ethnobiology, History and Philosophy of Science for Teacher Education addressing Cultural Diversity*” (in short: TE-CD). The purpose of this course was to create opportunities for teachers to reflect about research and understanding of the cultural knowledge that certain societies and cultures have towards nature and its elements. Data was obtained before and after teachers' training on history and philosophy of science, with particular focus on the consequence of the cultural knowledge demarcation to intercultural dialogue in science education. Addressing cultural diversity in science teaching means to investigate, understand and consider students' cultural diversity in order to promote intercultural dialogue in the classroom. The research questions are the following: (i) how do Brazilian and Portuguese science teachers conceive the science they teach? (ii) What are the similarities and/or differences between Brazilian and Portuguese teachers' conceptions about science? (iii) What are the influences of Brazilian and Portuguese teachers' science conceptions on teaching science addressing cultural diversity in both countries? Stated in other words, what intercultural dialogue can be established between the scientific contents and cultural knowledge of student-teachers?

## Methodology

This qualitative research was carried out with semi-structured interviews (Bogdan & Biklen, 1994), in a multiple-case study (Godoy, 1995; Duarte, 2008).

### Participants

The participants in the Brazilian sample were 9 Biology teachers of public middle school (teaching 15-17 years old students) of different towns in the Eastern Region of the Bahia State. The age of these female teachers was between 28 and 41 years old.

Six Biology teachers composed the Portuguese sample (3 female and 3 male) of public kindergarten and primary school (0 to 12 years old children) of the Northern Region of Portugal. The age of these female teachers was between 26 and 44 years old.

Between the two data collection moments (before and after the TE-CD) dropouts in both samples occurred, being at the end 6 Brazilian teachers and 4 Portuguese ones.

Qualitative research requires consideration of ethical issues, particularly due to the proximity between the researcher and participants (Martins, 2004). In Brazil, the standards of the Resolution 196/1996 on research involving humans of the National Health Council of Brazil were taken into account. Therefore, for this study, a Statement of Consent from each participant was obtained. This term included the following items: explanation about the research, including the freedom to refuse to participate or withdraw his/her consent at any stage of the research; explanation about the social relevance of this research; information about the methodology of the study; assurance that the research would cause no costs for the participants; declaration on confidentiality, ensuring the privacy of the identity of the subjects; respect for cultural values and feelings expressed by subjects, among other aspects. Similar ethical issues were considered in Portugal.

### Teaching module on Ethnobiology

The TE-CD courses on “*Contributions of Ethnobiology, History and Philosophy of Science for Teacher Education addressing Cultural Diversity*” were carried out by the first author in subsequent periods, the first in Brazil and the second in Portugal. In Brazil it had a total workload of 132 hours and was held in the State University of Feira de Santana (UEFS), in the city of Feira de Santana, Bahia, Brazil. In Portugal, the TE-CD course had a total workload of 130 hours and was held at the Institute of Education, University of Minho (UMinho), in the city of Braga, Northern Region of Portugal.

The overall aim of this TE-CD course addressing cultural diversity was to contribute to raising science teachers' awareness of cultural diversity in classroom and how to deal with it in science education. In other words, it was intended to promote the cultural dialogue of science with the students' cultural knowledge. The course had interconnected theoretical and practical approaches and consisted of the following strategies: dialogic presentation; reading and discussion of papers; and preparation and presentation of educational resources in order to carry out intercultural dialogue in science education.

The following themes were discussed with both Brazilian and Portuguese samples: (i) “Ethnobiology and its contributions to intercultural dialogue in science education”; (ii) “Science teachers' training for cultural diversity”; (iii) “Contributions of the history and philosophy of science for the demarcation of cultural knowledge in Science Education”. A further theme (iv) was specific for the Brazilian teachers “Agricultural pest, a possible content for intercultural dialogue in Science Education” and for the Portuguese teachers “Health, a possible theme for intercultural dialogue in science education”.

### Data collection and analysis

Semi-structured interviews were applied to the Brazilian and Portuguese participants. They were recorded and transcribed. The average time was 30 minutes for interviews prior to the TE-CD course and 24 minutes for interviews after the course.

A sequence of codes was given to each interviewed teacher, in order to ensure her/his privacy, as follows: From Brazil: BT-1 (Brazilian Teacher 1), BT-2 (Brazilian Teacher 2), and so on; From Portugal: PT-1 (Portuguese Teacher 1), PT-2 (Portuguese Teacher 2), and so on.

In order to facilitate comparisons, two categories were created *a priori*: (i) before the TE-CD course and (ii) after the TE-CD course. In each of these categories, the answers given by the Brazilian and Portuguese teachers were arranged side by side in tables (see Tables 1 and 2 in “Results and Discussion”).

The analyses was carried out on these two categories by interpreting and comparing the Brazilian and Portuguese answers and discussing them based on the literature in science education and teachers training for cultural diversity. The objective was to identify similarities and/or differences between the conceptions of the participating teachers before and after the TE-CD course.

## Results and Discussion

Of the numerous interview questions, for this paper only the following ones were analyzed and discussed:

*“In your idea what is science? For example: Evolutionism or Intelligent Design? Astronomy or Astrology?”*

### Category 1: Before the TE-CD course

The most relevant speeches of Brazilian and Portuguese teachers answering to the question before attending the course on "Contributions of Ethnobiology, History and Philosophy of Science for Teacher Education addressing Cultural Diversity" are shown on Table 1.

Table 1. Speeches of Brazilian and Portuguese teachers before the TE-CD course

Brazilian Teachers	Portuguese Teachers
Science is a part of our culture that attempts to explain the phenomena in nature ... which tries to investigate solutions to the problems we have and try to know the environment where we live... (BT-1).	Science... to know, isn't it? Knowledge, isn't it? It is... linked to different areas of knowledge... the science is related to the method which can be proved... and also cannot be proved, isn't it? (PT-1).
Science ... is such a big field ... is a range of related knowledge... I don't know, I got lost now ... you shook me ... It's such an abstract thing to say, isn't it? (BT-3).	Science ... has to do a bit with scientific methods ... I don't know ... there are themes ... There is only one science ... science ... There are various issues ... I do not know (PT-2).
It [science] is knowledge about something ... related to something ... it's knowledge... scientific is all that needs to be investigated ... scientifically proven, but I believe they also bring is a... is science, is a popular knowledge, or traditional... (BT-4).	... To say what it is, it's complicated! Science tries... to show by a method, and a goal, to explain the phenomena of nature ... of our day to day, through the scientific method ... there is a method which is the scientific method ... (PT-3)
In the way to study ... there are several sciences ... I guess it is the question of... disclosure ... and the methodology of the study... the academic, he works on steps ... not only disclosure. I think this thing is the method ... (BT-5).	Science ... is what is linked to research ... but it's hard to speak ... it isn't only that science, the one we are used in the laboratory but it is science ... it has to do with methodology... it's theoretically supported... (PT-4).
... it would be linked... to the method, an observation, experimentation and an outcome and a discussion of these results, including a likely ... then a repetition of this ... (BT-8).	Science to me is ... science is the study that has the experience, isn't it? Has an underlying theory experimentation ... (PT-5).

Among the answers given by the Brazilian teachers the conception of **science as culture** emerged. For example, BT-1 said (Table 1):

*“Science is a part of our culture that attempts to explain the phenomena in nature”. (BT-1).*

In contrast, this concept of science as culture was not revealed in the speech of the Portuguese teachers before the TE-CD course.

The conception of science as culture is very close to that hold by most researchers in the science education literature. For example, Lederman (2006) has mentioned that science is one among the various cultures that seeks to describe natural phenomena and, according to Gil-Pérez et al (2001), one must understand the social nature of the scientific development, influenced by the problems and circumstances of the historical moment, and also consider that the scientists' actions have a strong influence on the physical and social environment in which they operate.

Another conception disclosed in the statements of Brazilian and Portuguese teachers was **science as any study or knowledge about something**, as the BT-4 and PT-1 (Table 1) said:

*“It [science] is knowledge about something ... related to something ... it's knowledge”. (BT-4).*

*“Science... to know, isn't it? Knowledge, isn't it? It is... linked to different areas of knowledge”. (PT-1).*

This conception of science as any study or knowledge about something is too general, too wide, which can result of the lack of historical-epistemological studies during the teachers' training in both countries. Delizoicov et al. (2002) as emphasised that a fragmented degree in teaching modules that focuses on specific content learning and lacking discussion about science epistemology and its historic role, ends by leading the future teachers not understanding the nature of science. Therefore, teachers are unable to make boundaries between science and other systems of knowledge, as was evident in the speech of PT-4, who included all forms of knowledge as science:

*“Science ... is what is linked to research ... but it's hard to speak ... it isn't only that science, the one we are used in the laboratory but it is science ... it has to do with methodology... it's theoretically supported”. (PT-4).*

The BT-4 speech also shows to be very influenced by the specific asked questions “For you what is science? For example: Evolutionism or Intelligent Design? Astronomy or Astrology?”:

“Scientific is all that needs to be investigated ... scientifically proven, but I believe they also bring is a... is science, is a popular knowledge, or traditional”. (BT-4).

It is possible that the teachers have interpreted these questions as a collection of choices between the two examples given, as if they were closed questions. So, they struggled to formulate clearly a response to the meaning of science.

In addition, from the BT-4 answer emerges the science conception that traditional knowledge is a kind of science that differs from the one practiced by the scientific community. Indeed, in the view of El-Hani & Bandeira (2008) traditional knowledge is not constructions of science, but rather legitimate constructions of traditional communities and, therefore, valid according to epistemic criteria that are defined in their own cultural patterns. Thus, the differentiation between traditional and scientific knowledge is the entire set of characteristics that are peculiar to each of these forms of knowledge (Bandeira, 2001).

The teachers’ reference that science is knowledge can be explained by the etymological meaning of the term “science” from the Latin “*scientia*”, meaning knowledge. However, how the scientific processes are carried out today are so much specific that the definition of science just as knowledge is too wide. Therefore science must be viewed as one of the several forms of knowledge, with specific modes of knowledge production (El-Hani & Bandeira, 2008). In contrast, Cobern & Loving (2001) admit that all forms of knowledge can be considered as a science, but this view does not contribute to intercultural communication. It rather contributes to the failure to recognize cultural differences in classrooms, in that instead of recognizing the variety of knowledge existing among students, it embraces all different kinds of knowledge in a general form of science. One consequence is that students will not be able to apply their different knowledge in various contexts and situations in which such knowledge may be requested.

The demarcation between science and other forms of knowledge should be preserved in science education addressing cultural diversity. In this way, students can be aware of the structure and scope of the different ways of knowing, and so science education will be valuing cultural diversity by its own criteria of validity and legitimacy (El-Hani & Mortimer, 2007).

Brazilian and Portuguese teachers showed responses that suggest insights that **science has a specific method** and that scientific knowledge is derived from observation and experiences and observations about the natural world. Examples of these responses can be found in the quotations shown on Table 1 of Brazilian teachers BT-5, BT-8 as well as Portuguese teachers PT-1, PT-3, PT-4 and PT-5.

However, as discussed by Gil-Pérez et al. (2001), one must reject the idea that science works with a single method, since the history of the construction of scientific knowledge is marked by a methodological pluralism. This author further refuses the only view of “*an empiricism which sees knowledge as a result of inductive inference from raw data*” (Gil-Pérez et al., 2001, p. 136). After all, scientific data cannot be obtained nor interpreted on the basis of observations in trials only, i.e. data obtained in scientific research should always be interpreted in light of its theoretical framework in order to make sense.

Although accepting the argument that there is no single method for doing science, Irzik & Nola (2011) point out that the scientific method cannot be regarded as less controversial about the nature of science, because there are methodologies and methodological rules that guide the scientific practice in general. Alternatively, these authors propose a characterization of science based on “family resemblance”, being necessary to consider that there is a set of characteristics that are specific to some sciences, but not to others, thus forming a set of family resemblance. In other words, there are differences between the specific sciences, but also similarities between one another (Irzik & Nola, 2011).

Finally, before the TE-CD some teachers, BT-3 and PT-2 (Table 1), were not able to give any understandable explanation of what science is about.

### Category 2: After the TE-CD course

The most relevant speeches of Brazilian and Portuguese teachers answering to the question after attending the course on “Contributions of Ethnobiology, History and Philosophy of Science for Teacher Education addressing Cultural Diversity” are shown on Table 2.

Table 2. Speeches of Brazilian and Portuguese teachers after the TE-CD course.

Brazilian Teachers	Portuguese Teachers
To define [science] is still very difficult for me ... There is Western science, which is the one thing that came out of colonialism, which in turn is related to the seventeenth century, the steps, the method ... is the path that will allow understanding the natural world ... I say it isn't, but sometimes I wonder medicine has been developing studies that show how a patient's faith has helped him improve ... science does not work with the supernatural world but when I see certain things that was not the domain of science being researched, so I'm wondering... (BT-5).	Science is a proved experimental method, through a way which is usually a journal ... and that is recognized by a group as such. Science is one culture, because there are other cultures (PT-1).

There isn't a unique concept [of science] ... it has to do with the natural ... in fact it isn't immutable ... to be scientific, a concept must go through a scientific community... and define what science is... it has features that ... are their own because it is a culture ... the fact that there is not a single definition, it is because of this mutability ... (BT-6).	It is a system that acquires knowledge based on methods, scientific methods. Science is a culture with its own characteristics (PT-2).
Culture... with features, language, ways of communicating... Like other cultural groups also have. It's what makes being validated within it ... science as a way of explaining the nature validated by a group, which is the scientific group (BT-8).	Hey, what is science? Difficult! Science has to do with facts, with the method ... Science has a method, has a goal. It is knowledge that is acquired by various methods, goals. Science has to do with culture, the scientific culture (PT-3).
Community... that produces knowledge and this knowledge is scientific knowledge... studying and allows other scientists to study from their discoveries... something that is not ready... you can always find new discoveries with the day to day... (BT-9).	Science ... it's still hard to explain! Well, science is a cultural activity of scientists... that produces scientific knowledge through scientific methods... That's it! (PT-4).

The attempt to define the term science is not an easy task and, indeed, there is not a single epistemological position among philosophers of science. This difficulty was also identified by Brazilian and Portuguese teachers, not only before (Table 1) but also after their participation in the TE-CD course (Table 2). After the course, teachers BT-6 and PT-3 attributed the absence of a unique concept for the term "science" due to the variability of the scientific activity itself:

*"There isn't a unique concept [of science] ... it has to do with the natural ... in fact it isn't immutable ... to be scientific, a concept must go through a scientific community... and define what science is... it has features that ... are their own because it is a culture ... the fact that there is not a single definition, it is because of this mutability". (BT-6). "Hey, what is science? Difficult! Science has to do with facts, with the method ... Science has a method, has a goal. It is a knowledge that is acquired by various methods, goals. Science has to do with culture, the scientific culture". (PT-3).*

Despite demonstrating difficulties in defining the term science, the Portuguese teacher PT-3 revealed an adequate conception of science as a cultural activity of scientists. In addition, after the TE-CD course he was able to conceive that scientific activities are not conducted by only one method, but rather by several methods (compare PT-3 before and after the TE-CD course, Tables 1 and 2, respectively).

Also after the course, the Brazilian teachers' conceptions of science improved as shown by the above BT-6 speech, but also BT-8 and BT-9:

*"Culture... with features, language, ways of communicating... Like other cultural groups also have... science as a way of explaining the nature validated by a group, which is the scientific group". (BT-8).*

*"Community... that produces knowledge and this knowledge is scientific knowledge... studying and allows other scientists to study from their discoveries". (BT-9).*

They conceive science as a culture that has its own language and investigates natural phenomena (BT-8) and that it is historical and has a specific field of research that conducts and enables new discoveries (BT-9). After the TE-CD course, in general, Brazilian teachers achieved an appropriate definition of science but one of them, BT-5, showed insecurity in her speech, as she not only agrees with the idea that scientific activities are just about the natural world but also accepts the possibility of studying supernatural phenomena:

*"[Science] is the path that will allow understanding the natural world ... science does not work with the supernatural world but when I see certain things that was not the domain of science being researched, so I'm wondering". (BT-5).*

On this issue, one must consider that for defining science it is important to question its nature, including the set of its specific features, which in turn are shared by scientists of a particular period. One of these features, as Cobern & Loving (2001) declare, is that scientific activities are just about the natural world.

After the TE-CD course, the Portuguese teachers extended their conceptions of science, understanding it as an inherent cultural activity of scientists. However, as it happened before the course, they kept focusing their definitions on the methodological aspects of scientific development as the four teachers (PT-1 to PT-4) say:

*"Science is a proved experimental method, through a way which is usually a journal ... and that is recognized by a group as such. Science is one culture, because there are other cultures". (PT-1).*

*"It is a system that acquires knowledge based on methods, scientific methods. Science is a culture with its own characteristics". (PT-2).*

*"Science has to do with facts, with the method... Science has a method, has a goal. It is knowledge that is acquired by various methods, goals. Science has to do with culture, the scientific culture". (PT-3).*

*"Science is a cultural activity of scientists... that produces scientific knowledge through scientific methods". (PT-4).*

These teachers left out the other characteristics that are peculiar to scientific activities, for example, that science is historical. In fact, Cobern & Loving (2001) claim that science involves a set of theories, activities, ideas, habits, norms, values etc. that are shared by the wide scientific community, being socially and historically constructed. The absence of historic and epistemological perspective of science by the participants may be due to the complete lack of these subjects in their regular teacher training process.

## Final Considerations

Before the TE-CD course most teachers did not conceive that in their teaching of science they should assume science as a cultural activity of scientists. By participating in the course on “*Contributions of Ethnobiology, History and Philosophy of Science for Teacher Education addressing Cultural Diversity*”, Brazilian and Portuguese science teachers extended their conceptions about the nature of science.

In a broader sense, this implies that teachers can reflect and assign new meanings to their pedagogical practices in relation to the intercultural dialogue, especially regarding the creation of opportunities for students to understand science as one among the numerous existing cultures. Thus, not assigning hierarchy of science towards cultural knowledge of those students who may have values and contexts that are specific to the social environments where they come from.

It was interesting to note similarities and differences between the Brazilian and Portuguese teachers’ conceptions either before or after their participation in the TE-CD course. In short, the Brazilian teachers, although with some difficulties, showed a broader definition of the term science as compared to Portuguese teachers. The former characterized science as knowledge, as a culture that has its own language and it investigates natural phenomena, being historical and demarked in specific fields of research and that performs and makes possible new discoveries. In contrast, the Portuguese teachers focused their science conceptions to the knowledge produced by scientists and the scientific method.

The fact that there are differences between the conceptions of Brazilian and Portuguese teachers may be directly related with their previous undergraduate training, as well as their wider social and cultural environment. In the case of Brazilian teachers, it is possible that they have more training on the nature of science related to the sociology of science, which considers the influence of external factors on the development of science. In Portugal, the science teachers training may be more linked to the positivist view of science, which is based on the idea of science as a value-free activity and separating the relation between science, technology and society (Gil-Pérez et al., 2001).

It can be concluded from this preliminary study that further research with larger samples of participants in both countries is of paramount importance in order to elucidate in more detail the differences not only between the science teachers’ conceptions about science but also between their teacher training in Brazil and in Portugal. This will generate data that will contribute to improve science teacher training curriculum in both countries, with special reference to cultural diversity.

# Searching of the concept in Tirilye: an architectural design studio

Zafer Sagdic<sup>a</sup>, Ali Degirmenci<sup>b</sup>

<sup>a</sup>Assist.Prof.Dr., YTU Fac.of Arch., Dept.of Arch. Barbaros Bulv., Istanbul, Turkiye

<sup>b</sup>Asist., YTU Fac.of Arch., Dept.of Arch. Barbaros Bulv., Istanbul, Turkiye

## Abstract

Tirilye is one of the most ancient towns in Bursa Province of Turkey, situated 12 km on the west of Mudanya. It is almost located on the Marmara Sea shoreline. The area, which was inhabited since 5th Century BC, was formerly known as Τρίγλεια, Trigleia or Βρύλλειον, Brylleion in ancient Greek. Trilye has been an important religious center for Greek Orthodox Christians and is a first level protected area since 1980 because of the Byzantine and Ottoman architectural monuments. It is also considered as an open-air museum with various historical buildings. Thus the site is not only an important place with its' history, but also it is one of the precious places of Turkey to have an architectural search on new forms and concepts on an existed historical area. With 20 students of the Faculty of Architecture, Department of Architecture of Yildiz Technical University, The Design Studio 4 has been searched to find the best places and related architectural concepts to create new architectural forms on Tirilye, during the spring semester of 2013-2014 educational year. Thus the paper will have the long process of the Design Studio 4, with the best 5 projects of 20 different location and concept proposal projects to Tirilye.

Peer-review under responsibility of the Sakarya University.

**Keywords:** design, architecture, creative thinking, thinking creatively.

## Introduction

It is known that there are two specific way of thinking; critical thinking and creative thinking. *Critical thinking* is intellectually disciplined process of actively and skillfully conceptualizing, applying, synthesizing, and/ or evaluating information gathered from, or generated by observation, experience, reasoning, and/or communication, as a guide to belief and action, while *creative thinking* belongs to a phenomenon whereby something new, artistic, aesthetical and valuable is created. Etymologically, critical thinking means exercising or involving careful judgment or judicious evaluation; it means crucial, and discerning judgment, while creative thinking etymologically means having or showing an ability to make new things or think of new ideas; using the ability to make or think of new things: involving the process by which new ideas, stories, etc. are created. Thus, it is seen that, learning methods related with critical thinking, are used generally on either mathematical based lectures, or researches, which have much more concrete results, having equations and formula based structures. Critical thinking does not refer to the theory of thinking, and thus, it defines the intellectually disciplined process of skillfully and actively conceptualizing, analyzing, synthesizing and/ or applying. And it is known that this process is generated by observations, and/ or researches. Creative thinking is the process, which is used to generate new ideas, products, services and innovations. It is essentially the act of changing; combining, reapplying and merging seemingly unrelated things in unique ways in order to pave the way forward to new inventions, concepts and processes. Thus, in many ways creative thinking is visual thinking taking physical form. Also, it requires periods of brainstorming, questioning, playing and self-reflection. According to most authorities it needs time to sprout and grow, yet can come quickly at a moments notice with a little imagination and inspiration. When it comes to visual thinking, the concept of a picture has divided into six distinct categories: metaphors, sketches, diagrams, charts, tables and combos.

## Methodology

Since 2004, it is a common way to use the creative thinking method of Jeffrey and Craft, which is called as a teaching for creativity- teaching creatively (Sagdic, 2013). Their draft method is defined as “using imaginative approaches to make learning more interesting and effective” (Jeffrey; Craft, 89). And they added that teaching for creativity method involves teaching creatively and note that, “young people’s creative abilities are most likely to be developed in an atmosphere in which the teacher’s creative abilities are properly engaged” (Jeffrey; Craft, 90). As it was mentioned before, metaphors, sketches, diagrams, charts, tables and combos are ways of producing the visual thinking, which is the taking physical form of the creative thinking as it is mentioned above. In architecture, producing process is started as metaphors creating, which is called as concept creating. Then drawing part of the process is formulated by creating of not only the plans, but also the sections and elevations as the technical necessities of the architectural designing.

Thus, during the 15 weeks of one semester education on The Design Studio 4 of the Faculty of Architecture, Department of Architecture of Yildiz Technical University, first, it was asked to create one contextual background from each of the 20 students. The project site was Tirilye. Jeffrey and Craft’s *teaching for creativity- teaching creatively theory* method is used during this period to ask an architectural creation to the group in Tirilye. Thus, students searched to find the best places and related architectural concepts to create new architectural forms on the site. The project group went to the site not only to make analysis of Tirilye, but also to create the best concept and select the most suitable place for their projects according to the analysis on the first three weeks of the semester, two times during the week. Students also made some interviews according to their concepts with the citizens of Tirilye. From the 4<sup>th</sup> week to the 8, the process had the synthesis period. During this period, each and every student prepared the synthesis of their projects according to the income datas from the site analysis and the interviews that have been done in the site in the early period of the project process.

## Content And Context Of The Lecture

The project creating process of the Design Studio 4 has 6 main steps:

1.site seeing, 2.making of analysis, 3.preparing of synthesis, 4.the creating of conceptual background, 5.specifying decisions of making ecological based projects or creating contemporary architectural examples, 6.the design process of the project; preparing of the technical drawings, plans, sections and elevations, 7.creating of details of landscape, 8.making presentations on the auditorium, 9.discussions of each project on final jury.

Moreover then this, during 15 weeks long semester, informative seminars related with the history of the site, the economical and cultural potentials of the site were given to the students on the first 2 weeks, and from the 3<sup>rd</sup> week to 10<sup>th</sup>, three digital programs,

which are chronologically photo-shop for architectural representation, sketch up for understanding 3 dimensional modeling quickly and rhino 5 for creating the design of the project, were shown to students on three different workshops. During this process, also 2 seminars about eco-design, 1 about architectural patterns and geometrical form creating and 2 about light-weight structures were given to the group, as well.

In the Design Studio 4 it was known that, the group experience and imagination would be a major part of the process of investigating knowledge using such devices as possibility knowledge (Woods and Jeffrey, 1996) and possibility thinking (Craft, 2002) and according to Lucas (2001), as well. Thus, the method of *teaching for creativity* was used to involve generating ‘learner inclusive’ pedagogy, according to Jeffrey and Craft. This method is tried to develop further here, on this selected group of design studio students (Craft and Jeffrey, in press; Craft, 2003). According to this method, the learner is encouraged to engage in identifying and exploring knowledge. The instructor was encouraging the group to believe in their creative identity; identifying the group creative abilities not only architecturally, but also related with culture; fostering creativity by developing some of the common capacities and sensitivities of creativity such as curiosity, recognising and becoming more knowledgeable about the creative processes that help foster creativity development and providing opportunities to be creative.

### Projects And Discussions

There were 20 submitted projects from the group of the Design Studio 4, on which students searched to find the best places and related architectural concepts to create new architectural forms on Tirilye, during the spring semester of 2013-2014 educational year. The best 5 projects of 20 different location and concept proposal projects to Tirilye are:

1. *Trilye Cultural Center, by Kardelen Akkus*  
TCC, Trilye Cultural Center has halls for exhibitions of old and new pictures of Tirilye. This center is located on one hill of Tirilye, where is a vista point to see the old city view and the sea shore together. Thus, TCC has a specially designed view-ramp, which has many vista points on itself. Photographers or travelers can take pictures of beautiful Tirilye from these vista points.

Fig.1. *Trilye Cultural Center, by Kardelen Akkus*

2. *TSEM, Trilye Sustainable Energy Museum, by Begum Samanci*  
TSEM, Tirilye Sustainable Energy Museum is created to show how important is to preserve the already existed sources for producing energy. The special form of the museum is based on a concrete shell form and the TSEM is created as designed as an example of parametric architecture. This museum also has halls for its’ children users.

Fig.2. TSEM, Tirilye Sustainable Energy Museum, by Begum Samanci

### 3. BF, Barracks of Fisherman Units, by Duygu Bingul

BF, Barracks of Fishermen units is created to preserve the fisherman culture on the zone and give a new look and renovate the special and traditional barracks of the group of local fishermen on the original place by the shore of Tirilye. BF has units, which are made of containers. These containers have different colors according to their own function. Red one are individual personal units of fishermen and green ones are serving area containers.

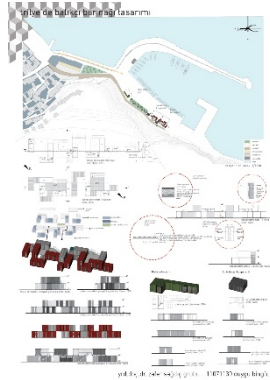

Fig.3. BF, Barracks of Fisherman Units, by Duygu Bingul

### 4. The House of The Horizon, by Duygu Oy

The House of The Horizon is a common house on where visitors can stay free on charge, but helping to the local producers on the season of harvest of olives. They are helping to the production of the olive oil. The name of the commonly used house is related with its' special location from where the horizon can be seen during the day and night. It also refers that all of the people are equal under the same horizon.

Fig.4. The House of The Horizon, by Duygu Oy

### 5. TVH, Tirilye Wine House, by Aslihan

TVH, Tirilye Vine House is designed to vineyard at the back of its' producing on the vine testing menus and a vine shop

### Dazkir

use the vineyards potential of Tirilye. TVH has its' own units. Also TVH has a restaurant, which is specialized to sell traditional produced local vines.

Fig.5. TVH, Tirilye Wine House, by Aslihan Dazkir

## Conclusion

Among multiple benefits of the exercise some that stand out are: (1) students participated in solving a creative design problem, (2) students learned to work on an estimated time period, (3) students familiarized themselves with creating designs on a relationship among context and concept while thinking on architecture, (4) students learned to appreciate different point of views on the same project site, (5) students were able to visualize their designs in context, (6) students learned important digital programs for their future designs.

## Abstract

The article presents the educational activity of the Centre of Geoeducation in the City of Kielce (Poland). The Centre was established in 2012 and thanks to a variety of provided services, it quickly gained a wide audience. By drawing inspiration from a very rich geological assets of the whole Świętokrzyskie Province, the Centre transmits geological, ecological and geographical knowledge, mainly with the use of many interactive teaching methods. The Centre's educational offer involves various activities, i.e. theoretical, practical and field classes. What is more, the Centre of Geoeducation acts as an initiator and coordinator of many cyclical or occasional events which promote geological assets of the Świętokrzyskie Province. The growing number of visits provides evidence for a wide interest of the Centre's activity – in 2013, there were up to 6.2% more visitors than in the previous year. It is worth mentioning that the Centre of Geoeducation is visited not only by organised groups, but also by individual visitors coming from the Province and the whole country, as well as from abroad.

## 1.Introduction

The possibility of extending knowledge outside the school environment is of particular importance to the development of children and adolescents. It is widely believed that the informal approach to teaching shapes a world view, develops imagination, and especially increases efficiency at acquiring new, often difficult and complex contents (Malcolm at al., 2003). Learning through practice base its assumptions on the full involvement of both teachers and students, by using interactive teaching methods. Their main aim is not only to strengthen, but also to make the process of enhancing knowledge, developing manual skills and acquiring logical thinking more attractive. Another, but no less important quality of interactive teaching methods is that they help foster interactions among students, while integration as well as collaborative problem solving result, *inter alia*, in equalising differences in students' educational level (Sessoms, 2008; Kedrayate, 2012).

The beginnings of informal education are dated back to the 60's of the 19<sup>th</sup> century (Sharma, 1989), but a real flourishing of various ways to promote learning through practice has taken place in recent years (Hernandez at al. 2013). Moreover, it is believed that the use of interactive teaching methods is gaining popularity thanks to commonly noticeable effects, what indirectly results in improving the quality of human capital and increasing people's standard of living, and in the developing countries – decreasing poverty rate (Handa at al. 2009).

In modern Europe, it can be seen a dynamic growth in the number of centres that specialise in informal ways of transmitting knowledge. One of them is the Centre of Geoeducation in Kielce (Poland) which is based on a very rich geological potential of the Świętokrzyskie Province. Owing to educational offer abounding in many modern interactive tools, the Centre's popularity is gradually increasing what is additionally confirmed by a wide interest of visitors not only from the Province and the whole country, but also from abroad.

## 2.Elaboration

### 2.1.Principles of Educational Offer of the Centre of Geoeducation

The Centre's premises are located in the area belonging to the Wietrznia Inanimate Nature Reserve named after Zbigniew Rubinowski (prominent Polish geologist) in the south-eastern part of the City, and make up the most important point on the route of the Świętokrzyski Archeo-Geological Trail (Fig. 1). The ongoing activity of the Centre of Geoeducation confirms that education is no longer an exclusive preserve of schools, training institutions, or seats of learning, and the process of education has its place beyond the formal educational systems and is fully voluntary. The Centre is a place where ecological, geological and geographical knowledge is transmitted in an accessible way through using modern methods and didactic tools. That is why, its activity is based on benefiting from a very rich geological assets of the whole Świętokrzyskie Province, whose capital city is Kielce. There are numerous geological reserves of high scientific and tourist qualities so that they provide many unique landscapes and at the same time are an excellent opportunity for preserving exceptional values of geological heritage in the Province (Wójtowicz, 2011).

Fig. 1 View on the Centre of Geoeducation

## 2.2. Selected Educational Activities of the Centre of Geoeducation

The Centre of Geoeducation has been classified as a museum and exhibition institution. However, as its ongoing activity shows, the nature and specificity of the educational offer differ greatly from those which are typical for that kind of institutions. The Centre's educational offer is indeed based on interactive teaching methods which guarantee a high efficiency of didactic process, so that for most visitors it seems to be an amazing scientific adventure. It also involves various activities, i.e. theoretical, practical and field classes. Noteworthy is the fact that each of these classes consists of some modules which can be compiled by any manner of means, depending on the needs of visitors.

Theoretical classes, despite their name, are not based on conventional teaching methods, but focus on audio-visual transmission. And for this purpose, many multimedia presentations, visualizations as well as short demonstration films are used, which aim at bringing a particular issue closer to the visitors in a different and thereby attractive way (Fig. 2). Many scientists point out that strengthening any transmission with interactive methods, including audio-visual techniques, may contribute to understanding and more efficient memorising of larger amounts of knowledge (Allen and Gutwill, 2004; Schwier 2010). The thematic scope of the educational offer is consistent with the specificity of the Świętokrzyskie Province, i.e. it mainly concerns geological processes, including karst phenomena and endogenous processes. Furthermore, the proposed issues, thanks to the possibility of their optional modification, can be an excellent introduction, complement or even extension of school curricula, being implemented at every stage of education.

Fig. 2 Exhibition hall where theoretical classes are organised

One of the biggest attractions of the Centre of Geoeducation is unquestionably the 5D capsule called “A Journey inside the Earth”. This simulation, by engaging almost all human senses, produces an imaginary picture of the internal structure of the Earth which for a while becomes virtual reality. Numerous fossils encountered during the journey enable the visitors not only to learn about environments from millions years ago, but also to understand the changes that they had undergone in the past.

Practical classes in the Centre of Geoeducation are in turn based on the idea of educational workshops which, according to many scientists, successfully activate young people (Eshach, 2006). This form of education, by the possibility of developing manual skills of its participants, has chiefly cognitive character. The workshops aim at familiarising their participants with the geological richness of the Province. The most popular activities involve identifying and then grinding selected mineral specimens, coming from the area of the Świętokrzyskie Province. When grinding, they become souvenirs after visiting the Centre. Another proposal for practical classes are workshops on the secrets of fossils, whose attraction is the possibility of making any fossil model by oneself. And younger age groups can participate in art classes which develop imagination and manual skills by doing paleo carvings.

The Centre's educational offer is additionally enriched by field classes on the areas of nearby geological sites. The proposed trip programmes include two nature reserves, i.e. the Wietrznia Nature Reserve, where there are numerous karst phenomena (both paleokarst and modern karst) and well-preserved Devonian fauna fossils, such as four-radial corals, siliceous sponges, brachiopods, crinoids, as well as fossil fishes (Fig. 3); and the Kadzielnia Nature Reserve with a number of interesting geological phenomena, such as fauna remains (e.g. corals, brachiopods, crinoids, and fossil fishes), calcite ore mineralisation, tectonic and karst forms, as well as rock vegetation relics (Nita and Myga-Piątek, 2010). For elder age groups, the Centre of Geoeducation also proposes a trip to the Ślichowice Nature Reserve named after Jan Czarnocki (prominent Polish geologist), which abounds in interesting tectonic forms as well as numerous preserved herbaceous and shrub vegetation (Wróblewski, 2008).

Fig. 3 View on the Wietrznia Nature Reserve named after Zbigniew Rubinowski

Theoretical and practical classes in the Centre of Geoeducation last 45 minutes, while duration of field classes depends on the visitors' age and thematic scope being discussed during trips. But they do not usually exceed 120 minutes.

Interactive education of the Centre of Geoeducation is also realised through a series of events and initiatives addressed to various age groups. These activities can be cyclical as the project "Winter Holidays with Geology" or occasional as the project "Nature Close to the Blind" which was addressed to disabled people. In order to ensure continuity of activities, the projects are realised at fairly regular intervals, and additionally with increased intensity during each holiday season, due to demand for attractions of that kind. Also noteworthy is that in order to provide high-quality services and appropriate teaching standards, the Centre of Geoeducation is still expanding its educational offer by cooperation with numerous scientific institutions, research and development institutes as well as non-governmental organisations, including the Świętokrzyskie Branch of the Polish Tourist and Sightseeing Society in Kielce.

### 2.3. Interest in the Centre of Geoeducation

The Centre of Geoeducation has been realising educational activities since 2012 and it very quickly gained a wide audience. The growing number of visits provides evidence for this. In 2013, i.e. a year after the Centre's opening, there were 39 136 visits, which indicates up to 6.2% more visitors than in the previous year. Noteworthy is the fact that a great interest in the Centre's services has a permanent character, with increasing tendency during the spring and early-autumn periods (Fig. 4). Thus the table below confirms the need to increase the frequency of educational activities at that time.

Fig. 4 Number of visitors benefiting from the educational offer in the Centre of Geoeducation in 2013 by individual months

There is a slight dominance of organised groups among the recipients of the educational offer (56%), while the rest of the visits are made by individual visitors (Fig. 5). During the spring and autumn period, there was a greater interest in the Centre's services among organised groups, consisting mainly of pupils and students. An increasing interest among individual visitors is observed in turn during the summer period. This means that the Centre of Geoeducation is regarded as the place of high-cognitive values, which offers alternative ways of spending leisure time.

Fig. 5 Variability in the number of visitors benefiting from the educational offer in the Centre of Geoeducation in 2013 by individual months

The Centre's educational activity is innovative and unique as evidenced by the great interest of visitors not only from the Province, but also from the whole country (29%). It is also worth mentioning the fact that the Centre was additionally visited by 19 foreign organised groups in 2013.

### 3. Conclusions

Despite the fact that it can be seen a dynamic growth in the number of museum and exhibition institutions, the Centre of Geoeducation, by benefiting from natural conditions of the Świętokrzyskie Province, distinguishes itself from other institutions of that kind in the country. A wide range of the Centre's educational activities is based on theoretical, practical and field classes, which are complementary to one another and transmit the knowledge about geological conditions of the Świętokrzyskie Province in a comprehensive and accessible way.

What is more, the Centre of Geoeducation offers a number of occasional and cyclical initiatives addressed to the general public. It should be noted that its educational offer is free of charge and available for everyone as well. In addition, it is a domain of free choice so that it is treated not only as an opportunity to enhance knowledge and complement school curricula, but also as one of the effective ways to interest young people in natural sciences. The growing number of visitors, also outside the Province and from abroad, provides evidence for the success of these educational activities.

# Self esteem among college students: a study of satisfaction of basic psychological needs and some variables

Durmuş ÜMMET <sup>††</sup>

Marmara University Atatürk Educational Faculty 34722, "İstanbul", Turkey

## Abstract

The aim of this study is to examine college students' self esteem according to the satisfaction of their basic psychological needs and some certain variances. The sample of the study consisted of 342 students studying in college. The data was collected through Coopersmith Self Esteem Inventroy, Basic Psychological Needs Scale and an information form developed by the researcher. When the obtained data was examined, it was found that the satisfaction of autonomy and relatedness needs of the students significantly predicted their self esteem, while the satisfaction of competence need did not predict self esteem. Also, self esteem of the students showed significant difference as to educational level of mother, income level and perceived parent attitudes by them, whereas educational level of father and gender did not have effect on self esteem.

**Keywords:** Self esteem, Satisfaction of Basic Psychological Needs, College Students

## 1. Introduction

Many psychological movements make their own description about self concept. However, the most detailed definition was made by Carl Rogers, who developed person-centered approach. According to Rogers, the sense of self of an individual includes the individual's thought about oneself, perceptions and opinions. Sense of self summarizes how the individual sees oneself. Rogers believes that to develop positive sense of self, the individual must grow up in an environment of unconditional love. When there is an inconsistency between exhibited behavior and sense of self of the individual, anxiety comes out. Rogers says that if the individual deceives oneself, anxiety level will increase and the sense of self will not be preserved in time. Carl Rogers accentuated on three important points of parent-child relationship for developing self esteem. The first is to reflect acceptance, concern, compassion and warmth towards the child. The second is allowance and punishment. The third critical point is the democratic attitudes of parents. The child raised with these three criteria will have higher self esteem (Hall & Linzey, 1957; Morgan, 1990).

Self esteem can be defined as a form of self-acceptance, personal appreciation and subjective respect of one's own (Morganett, 2005). Self esteem is to evaluate the difference between their image of self and ideal self. We understand the self esteem level of the individual by looking at the discrepancy between how the individual perceive oneself and the self they would like to be (Pişkin, 20014). Self esteem represents the individual's feelings such as self acceptance, personal appreciation, overall acceptance of the personality and self-love (Adams and Gullota, 1989). Rosenberg (1965) defines self esteem as negative and positive attitude of the individual to oneself. According to him, self esteem arises in the result of self-evaluation of the individual. The judgment attained as a consequence of self-evaluation is indicative for the level of self esteem. Self esteem is the judgment of worthiness related to the concept of self.

One of the important variables of forming the background of and in the development of self esteem is the satisfaction of basic psychological needs, as it has been a need since the birth of the individual. Self determination theory is one of the most current theories and tries to explain the psychological needs and traits of the individuals. The theory, which has been improving for 40 years and increasing its effect, was founded by Edward L. Deci in 1970's, and elaborated with Richard Ryan by collaborative work. Aiming to explain the factors for the sake of healthy development of individuals and societies, Self Determination Theory shows that there are three basic needs of an individual: *Autonomy, Competence and Relatedness*. These basic needs are necessary to structure the individuals' own social development and state of well-being. According to the theory, in case of meeting the needs, they work effectively and develop healthily; however, if they are prevented, people exhibit unwilling behaviors and negativity signs (Andersen, 2000; Deci & Ryan, 1985, Kesici et. al. 2003).

According to the theory, autonomy can be defined as when a person take into consideration one's own intrinsic processes, have the ability of acting independently and self approval while deciding. Autonomy is also to exhibit strong-willed behaviors and show self-approval. This need is met by leading and controlling one's own life, and making one's own choices. These people generally approve their behaviors and accept the consequences of one's actions. It was stated that autonomy is considered

<sup>††</sup> Corresponding Author. Tel: +90-216-345-90-90; fax: +90-216-338-80-60  
E-Mail address: dummet@marmara.edu.tr

particularly more important than competence and relatedness (Mithaug et.al., 2003; Ryan, 1995; Ryan and Deci, 2002; Ryan & Lynch, 1989). Competence is the ability of making necessary regulations and organizations for reaching the person's goal, and having the perception of self confidence for accomplishing them. Personal competence is achievement, the others' success, the person's belief of his own success and his psychological state. Competence is formed by the individual's learning, adaptation and interaction with environment. Insofar as the person has that perception, it is more likely to be successful (Deci ve Ryan, 1985; Carver and Scheier, 1990; Garcia & Pintrich, 2009). The other psychological need of the individual, relatedness is identified as to feel sympathy and satisfactory closeness to the people that are regarded as important by the individual, feel belongingness with one's social environment and perform common satisfactory actions with the people in that environment. Relatedness can be defined as a form of confidence to others' support and guidance. According to Self Determination Theory, the opponent of relatedness is not autonomy. The opponent of relatedness is being independent defined as not to have confidence to others' support or help. A person can be autonomous but dependant to others. If a person considers another person as supportive, then he/she may have confidence to the other's concern and attention (Deci, Ryan, 2008; Kowal and Fortier, 1999). Self determination theory defends that social environment and the individual as a variable should be handled together. Human behaviors should be regarded as an ongoing relationship between social-environmental factors and personal traits (Vallerand, 1997).

The satisfaction of basic psychological needs of people is closely related to the state of psychologically well-being. It was asserted that there is a positive correlation between life satisfaction, which is the cognitive aspect of well-being, perceived as positive by the individual and self esteem (Baumeister et. al., 2003; Ntoumanis, 2009). Ryan and Recı (2000) alleged that dependence and autonomy are the basic needs of people in all cultures. The more socialization mechanisms support these needs, the more well being states of the children increase. The family is the most basic socialization mechanism of the individual. According to psychosocial development theory, mother is the representation of external world and mother is the person meeting the needs of the infant from birth until one and half year. Feeding the baby when he/she is hungry, putting the diaper when it is dirty, meeting the needs regularly, while doing those actions touching her baby, making the baby feel love produce a special relationship between mother and child. This positive relationship between mother and child constructs the base of self-confidence (Erikson, 1984).

Within the framework of theoretical explanations and conducted studies, emphasizing the importance of the family's effect on satisfaction of basic psychological needs, it can be said that there are studies presenting the high self esteem proposes to have positive and good relationship with the parents (Gecas and Schvelbe, 1996; Felson and Zielinski, 1989). The most dominant factor of these studies is that parents positively affect their children's affirmative perceptions to them by behaving with love and respect, showing necessary warmth and concern, and meeting the needs of their children.

### *1.1. Problem Statement*

The aim of this study is to examine college students' self esteem according to the satisfaction of their basic psychological needs (autonomy, competence and relatedness) and some certain variables (gender, parents' educational level, income, perceived raising children attitude).

## **2. Method**

### *2.1. Participants*

The sample of the survey consists of 342 students in total (125 female and 217 male students) studying at collage in Turkey. All students selected on voluntary basis and randomly.

### *2.2. Measures*

To determine the demographic information of the students, 5-item personal information form (gender, parents' educational level, income, perceived parental attitude) was used. The form developed by the researcher. The following measuring instruments were used in data collection:

*2.2.1. The Self Esteem Scale:* Developed by Coopersmith (1986) and adapted by Pişkin (1997) to Turkish, The Coopersmith Self Esteem Inventory was used to measure the self esteem of the students. The short form of the scale consisting of 25-item can be answered approximately 8-10 minutes. According to the results of KR-20, reliability coefficient of the short form of the scale was found to be .76 and internal consistency reliability coefficient was found to be .81. Total score of self esteem was obtained by adding the items based on the individual's own perception and associating this perception to personal competence. The scale items are answered as "yes" or "no". Each student are asked to put an X mark on the "yes" column if the item is suitable for the student, if not, put an X mark on the "no" column.

*2.2.2. The Basic Psychological Needs Scale:* The scale was developed by Deci and Ryan (1991) and adapted to Turkish by Cihangir-Çankaya and Bacanlı (2003). The scale is a twenty one-item and seven point Likert-types, and it has three dimensions (autonomy, competence and relatedness). According to the results of reliability analysis of the sub-dimensions and total score of the scale, Cronbach-Alpha coefficients was found to be .82 for autonomy sub-dimension, .80 for competence sub-dimension and .81 for relatedness sub-dimension (İlhan, Özbay, 2010). In the result of retest, the correlation coefficient was found to be .71 for Autonomy, .60 for Competence, .74 for Relatedness and .83 for total Need Satisfaction Scale.

### 3. Findings

The result of the analysis conducted to determine whether or not participants' satisfaction of basic psychological needs (autonomy, competence and relatedness) predict their self esteem were stated in Table 1. Accordingly, it was seen that 7% of the variances were explained by all the basic psychological needs ( $F=8.705$ ,  $p<.001$ ). The examination of Standardized Beta coefficient shows that both autonomy need ( $\beta=.241$ ,  $p<.001$ ) and relatedness need ( $\beta=.121$ ,  $p<.050$ ) significantly and positively predicted self esteem.

**Table 1.** Hierarchical regression analysis for satisfaction of basic psychological needs and self esteem

Predictor	<i>B</i>	<i>S. Error</i>	$\beta$	<i>T</i>	<i>R</i>	$R^2$	<i>F</i>
Autonomy	.577	.135	.241	4.281***			
Competence	-.299	.143	-.092	-1.599	.268	.072	8.705***
Relatedness	.267	.122	-.121	.2185*			

\*\*\* $p<.001$  \* $p<.050$

The result of the analysis conducted to determine whether or not participants' gender differentiates their self esteem were stated in Table 2. According to the results, gender variable significantly differentiated the participants' self esteem ( $p>0.50$ ).

**Table 2.** Independent sample *t* test for gender and self esteem

	Gender	n	Mean	s.d.	<i>t Test</i>		
					Df	T	P
Self Esteem	Female	125	86.91	6,20	340	-2.273	.076
	Male	217	89.05	7,22			

The result of the analysis conducted to determine whether or not participants' some variables differentiate their self esteem were stated in Table 3. According to the results, it was seen that fathers' educational level did not significantly predict their children's self esteem. However, the increase of mothers' educational level ( $\chi^2=13,516$ ;  $p<.050$ ), the increase of income level ( $\chi^2=9,980$ ;  $p<.050$ ) and perceived parental attitudes as being democratic ( $\chi^2=21,833$ ;  $p<.001$ ) significantly differentiated the participants' self esteem compared to other categories of variables.

**Table 3.** Kruskal wallis-H test for some variables (mothers' educational level, fathers' educational level, level of income perceived parental attitudes) and self esteem

<i>Variables</i>		<b>n</b>	<b>Mean Rank</b>	$\chi^2$	<b>Df</b>	<b>p</b>

#### 4. Discussion and Conclusion

While examining the findings of the research, it was seen that satisfaction of autonomy and relatedness needs, the basic psychological needs, positively predicted the individual's self esteem. Defined by Self Determination Theory, the satisfaction of these needs positively affects the state of well-being included positive self-perception. (Cihangir & Çankaya, 2009; Garcia & Pintrich, 2009; Özer, 2009; Ryan & Deci, 2000). Ryan and Deci (2000) averred that particularly relatedness and autonomy are the basic needs of people in all cultures and the state of well-being of the children will be enriched by supporting these needs. Autonomy is closely related to positive sense of self and self-confidence in order to maintain the interpersonal relationships in a healthy manner (Sheldon & Elliot, 1999). One of the basic statements of the theory is, when compared, autonomy is considered as more important than competence and relatedness by the individuals (Ryan, 1995; Ryan and Deci, 2002). The findings of this study showed us that the most predictive need of the individual was autonomy and this result is coherent to the literature.

Another findings of the research showed that the individuals' self esteem did not differentiate considering gender. In other studies, the same findings were stated (Eriş & Ekiz, 2013; Gürşen, Otacıoğlu, 2009; Öztürk, 2006; Özdemir, 2009; Uyanık Balat & Akman, 2004). It can be asserted that some other variables are more effective on developing self esteem than the gender factor. Especially for satisfying the psychological needs, it can be thought that parents' general attitudes are more effective rather than the gender of the child.

It was seen in the research, mothers' educational level of the participants had an effect on the participants' self esteem. According to the results, the more mothers' educational level increases, the more the children's self esteem increases. In parallel, the more fathers' educational level increases, the more the children's self esteem increases, however, this increase was not regarded as significant. In other studies done in the field, the same findings were stated (Dinçer & Öztunç, 2009; Kahriman, 2005; Özkan, 1994; Yılmaz, 2000). The increase of the parents' educational level enables them to be more consciousness about how to raise a child. Educated parents satisfy their children's basic psychological needs with a healthily approach.

The other findings showed that the more the participants' income level increases, the more their self esteem increases. People should have a certain income to feel them comfortable, valuable and competent enough to have an active role in their lives. Therefore, the relationship of income and self esteem can be regarded as an expected outcome. Karadağ et.al. (2008) stated the same findings in their research. In the literature, it was emphasized that having higher income affected self esteem positively (Dinçer & Öztunç, 2009; Özdemir, 2009; Özkan, 1994).

According to the last finding of the research, it was seen that perceived parental attitudes had an effect on the individuals' self esteem. Accordingly, perceiving parents' attitude as democratic increases self esteem. Other negative parental attitudes, particularly neglecting attitude, negatively affect the individual's self esteem. Democratic parents are identified as modest, accepting, encouraging autonomy and not insisting on psychological control. The children of these parents are most likely to be active, socially positive and independent as well as amiable, creative and friendly towards their environment and oneself (Sarı, 2007; McGinn et. al. 2005; Olmuş, 2001). According to Rogers, democratic attitudes such as acceptance within the family, compassion and warmth will affect positively and directly to the child's self esteem in the adulthood period (Hall & Linzey, 1957). It is obvious that raised in such a family environment, the child's self esteem would be high. The other conducted studies presented the same findings (Erikçi, 2005; Gecas and Schvelbe, 1996; Gürşen, Otacıoğlu, 2009; Özdemir, 2009; Turan et. al., 1998). In conclusion, it was seen that this finding is consistent to the findings in similar studies had conducted in the literature.

# Self-directed learning, andragogy and the role of alumni as members of professional learning communities in the post-secondary environment

Rita Egizii\*

University of Calgary, 2500 University Drive N.W., Calgary T2N 1N4, Canada

---

## Abstract

Framed around the context of the historical policies and practices that have brought us to the current state of affairs in the education sector, this paper presents several key themes which focus on the need for schools to provide educated adults who can enter the society and the workplace fully prepared and ready to contribute to the organizations and corporations of a 21<sup>st</sup> century global economy. This preparedness now includes both *work readiness* and the development of *global citizenry* (diversified, culturally sensitive and fully contributing social citizens). The challenge of educating such citizens becomes particularly poignant to post-secondary (PSE) institutions. The paper explores self-directed learning, a stronger focus on andragogy (versus pedagogy) and re-visiting the role of the multidimensional stakeholders who have a vested interest in the success of adult learners. A theory of action is presented as a starting point for educational leaders to leverage collaborative relationship-building, connectivity and linkage to key groups such as alumni and community leaders.

## 1. The challenge: adult learners preparing for societal 'readiness'

Hargreaves & Shirley (2009) provide a poignant review of the educational movements that have impacted didactic reform over the past seventy-five years. The mid-40's to the mid-70's were a period of complete teacher autonomy and innovation, but also, inconsistency. The next decade introduced the first concepts of privatization and performance targets. This quickly morphed into another ten year period of massive standardization (in curricula and assessment) and established the fierce competitive arena which still exists today. The new millennium introduced the concept of "New Public Management" (Hargreaves, 2007) and the increased role of government in driving policy and establishing goals. The introduction of the No Child Left Behind Policy Act in 2001, which legislated that every child deserves access to quality teaching & learning, sealed that fate for many American schools (Leithwood et al., 2004; Webber & Scott, 2012).

The shift from an industrial economy to a knowledge economy has seen many of our educational institutions struggling with revolutionary cultural shifts, loss of direction and vision, re-invention of identity, and the re-defining of leadership. Concurrent with these transformations is an emergence into a 'new era' – a period that promises a strategic focus and renewed engagement by a multidimensional group of broad stakeholders (students, staff, faculty, alumni and community members). The exploration of partnerships with external stakeholders became a key strategy in re-defining policy (Elmore, 2010; Labaree, 2011; Pawlowski, 2009; Robinson, 2006). The current environment has now expanded to include the importance of defining an inspiring and inclusive vision, strong public engagement, achievement through investment, corporate educational responsibility, students as partners in change and 'mindful' learning which embraces personalized learning and lively learning communities (Christensen et al., 2011; Hargreaves & Shirley, 2009; Harris & Jones, 2010; Holmes, Clement & Albright, 2013; Labaree, 2011; Leithwood et al., 2004; Pawlowski, 2009; Stewart, 2004; Wahlstrom et al., 2010; Willms et al., 2009).

It is, indeed, a brave new world. And one which now seems to be defined by the need to provide educated adults who can enter the workplace fully prepared and ready to contribute to the organizations and corporations of a 21<sup>st</sup> century global economy (Christensen, et al., 2011; Collini, 2012; Ferguson, 2012; Hargreaves & Shirley, 2009; Selingo, 2013; Wagner et al., 2006). In the context of this paper, this 'preparedness to contribute' includes both *work readiness* and the development of *global citizenry* (diversified, culturally sensitive and fully contributing social citizens). This challenge becomes particularly poignant to

PSE institutions and in particular, to professional faculties within those institutions (such as science, engineering, medicine, business and law) which focus on disciplines critical to a knowledge-based economy in the midst of recovering from the recent financial tsunami that has shaken our economy-based world to its core. Wagner et al. (2006) point out that the industrial economy of the early twentieth century needed only a small number of college-educated citizens:

It wasn't until the 1950s that half of our students received a high school diploma; even through the 1960s, a majority of midlevel managers in businesses did not have college degrees. Throughout the twentieth century, students who dropped out of high school were able to seek and hold good stable jobs that paid a middle-class wage. (p. 9)

Wagner et al. (2006) postulate that not only have those secure blue-collar jobs all but disappeared, the basic requirement for a young adult to be considered 'work ready' now includes completion of not only secondary school, but also finishing a college diploma (at the very least), and better still, a University undergraduate degree. This seems to suggest that the purpose of elementary and secondary schools has changed from skill and competency training to preparing our youth to become 'college-ready' (Leithwood et. al., 2004; Willms, Friesen & Milton, 2009). It has also created interesting discussion amongst philosophers and scholars of educational theory about the historical and re-defined purpose of public education (Labaree, 2011; Stewart, 2004) and the role of universities in particular (Collini, 2012). If one was to embrace this new paradigm – that elementary/secondary schools prepare our youth for higher education – then this shifts the onus of preparing young adults for the world (in the broadest sense), to the post-secondaries, colleges and universities. The adaptive challenge of reinventing any type of post-secondary institution now becomes very much about how we teach adults for the purpose of preparing them to 'take their places in society' (Independent Schools Queensland, 2012), including initial entry into the workforce (or re-entry via a new career) and taking on the role of a global citizen.

## 2.The opportunity: Self-directed learning, andragogy and engagement of vested stakeholders

The concept of 'flow' – deep absorption in an activity that is so intrinsically interesting that people see it as worthwhile even if no further goal is reached – provides an understanding of the experiential factors which may be critical in providing an 'optimal experience' for human learning (Nakamura & Csikszentmihalyi, 2005; Willms et al., 2009). The concept of learning, for learning's sake, is further expanded in the findings of Dunleavy et al. (2012) who demonstrate that intellectual engagement is highly linked to flow, and subsequently, results in both higher grades and a richer learning experience.

### 2.1 Self-directed learning

Expanding on the concept of intellectual engagement, Hargreaves & Shirley (2009, p. 85) posit an interesting, and simple set of questions which help contextualize 'personalized learning': Does the learner have a passion? Is the learner good at it, or can (s)he become so? Does it serve a compelling social need? Cross (1981), in her review of adult learning, suggests that self-directed learning (SDL) as a vehicle for personalized learning is a highly effective method, supported by motivational theory which takes into consideration important factors that impact the learning process in adult learners (point in their life cycle, cultural and personal preferences and interest in the subject matter). Self-directed learning is not for everyone. It does seem to better suit a characteristic type (Cross, 1981; Stockdale & Brockett, 2011) with an inherent interest in the flow model of intellectual engagement. The author's personal assessments indicate that self-directed learning (as a sub-set of personalized learning) can be one solution that supports several key opportunities currently available to post-secondary institutions targeting adult learners. These include needing to: 1) engage in continuous program improvement; 2) consider andragogical methods over pedagogy; 3) meet recent changes in accreditation standards that require increasing experiential learning and assurance of learning; 4) better meet the needs of a demographically and culturally diverse student body; 5) develop expansion initiatives to ensure programs keep current with the shifting needs of employers and 6) engage with community (alumni, donors, community and business leaders).

Table 1  
*Possible Strategies and Actions for Implementing an SDL Program*

Strategy	Action
Focus on improving teaching & learning for the purpose of increasing societal readiness.	<ul style="list-style-type: none"> <li>• Establish a culture where instruction is 'student-centred' (Cornelius-White, J.H, 2010) and held as a 'gold' standard; SDL is faculty <i>facilitated</i>, for maximum benefit to the student (as <i>the student</i> defines that benefit).</li> <li>• SDL is identified, by the leadership, as a priority solution for preparing eligible adult learners to take their place in society and in the workplace;</li> </ul>

Develop teachers who support SDL.	<ul style="list-style-type: none"> <li>• Recruit teachers who value student-centred instruction;</li> <li>• Encourage and support personal performance goals which include participating/leading student-centred experiential projects;</li> <li>• Establish Professional Learning Communities (PLCs) and Communities of Practice (CoP) specifically for the purpose of discussing SDL: what defines an ‘SDL-eligible’ student? how do SDL students learn? how do we assess and measure learning in an SDL program? what needs to be changed in current teaching methods to accommodate this type of learning?</li> <li>• Explore what is needed for a teacher to guide an SDL learner. (Grow, 1991);</li> <li>• Consider ‘team teaching’ approaches (assign 3-5 core faculty per SDL project) which invite diversity in teaching methods and provide a richer student/teacher interface;</li> <li>• Welcome and engage teacher coaches – trusted ‘experts’ who enrich course content, ensure applicability to real-world situations and have joint responsibility for the accountability of the student; this could be a key role for alumni.</li> <li>• Encourage on-going personal reflection and the self-testing of assumptions and beliefs that could be blocking movements forward;</li> <li>• Provide teachers with additional pay, course release or equivalent merit allocation for their participation in SDL courses.</li> </ul>
Build infrastructure & technology needed to support an SDL program	<ul style="list-style-type: none"> <li>• Build trust and ensure that the conditions teachers need to improve SDL student outcomes are in place;</li> <li>• Establish a variety of e-site, virtual and open source learning forums (myVLE, Moodle, Studifi, etc);</li> <li>• Provide on-going training for staff who are uncomfortable with new technologies or the means in which they are used;</li> <li>• Create physical learning &amp; study spaces (other than a traditional classroom) where SDL students can gather, share, discuss and assist one another.</li> </ul>
Develop a comprehensive SDL program	<ul style="list-style-type: none"> <li>• Develop intake criteria for SDL students using reliable measures of self-directedness (e.g. PRO-SDLS, Stockdale &amp; Brockett, 2011);</li> <li>• Determine and set ambitious learning goals for SDL students;</li> <li>• Set an andragogical framework for student-driven SDL programs.</li> <li>• Each SDL project must work directly with a business and/or community partner, incorporating out-of-the-classroom engagement and demonstrating applicability to real-world problems; this is another key role for alumni.</li> <li>• Integrate a fully-blended rigorous learning experience which includes attending selected classes, on-line learning, internship, and both a written and oral ‘defense’ component;</li> <li>• Leverage existing non-credit ‘co-curricular’ opportunities to incorporate a credit component (e.g. student club and community projects).</li> <li>• Position SDL opportunities as capstone courses in the last year of a multi-year program.</li> <li>• Encourage graduate and PhD students to work with undergraduate students on SDL courses.</li> </ul>
Reallocate resources	<ul style="list-style-type: none"> <li>• Engage and/or hire expert facilitators (alumni) to help. A ‘multi-dimensional’ CoP needs to stay focused on improving teaching and learning (through SDL programs) and not drift into fulfillment of self-interest. (Pawlowski (2009); Pawlowski (2011); Robinson, 2006).</li> <li>• Re-assign internal advancement staff (development/fundraising, marketing/communications, alumni relations, community outreach) to search for ways to support the mechanisms needed for SDL-focused programs.</li> <li>• Consider the use ‘sports coaching’ techniques to motivate and support SDL students.</li> </ul>
Assess ‘assessment’ and make data-based decisions at specified times	<ul style="list-style-type: none"> <li>• Develop a detailed, specific rubric for SDL courses, encompassing the 3 R’s of ‘effective instruction’ (rigor, relevance and respectful relationship) – in both content <i>and</i> instruction. (Wagner et al., 2006). Success in an SDL will be highly dependent on these 3 core competencies working together;</li> <li>• Ensure that there is consistency in the usage of the rubric (meeting assurance of learning</li> </ul>

along a defined continuum.	<p>and accreditation identified criteria), including timely and accurate collection of data.</p> <ul style="list-style-type: none"> <li>• Measure progress regularly.</li> <li>• Ensure 1:1 interaction that includes face-to-face (and not just technology);</li> <li>• Develop testing of reasoning and application of knowledge, focusing on what students should be <i>able to do</i> once they complete an SDL (that they wouldn't have been able to do through completion of a traditional course).</li> </ul>
Develop collaborative relationships with alumni and key community partners	<ul style="list-style-type: none"> <li>• Establish clear lines of authority;</li> <li>• Ensure alumni and community partners remain an integral part of any learning networks – develop partnership agreements with external individuals/groups who wish to join the CoP and/or PLC;</li> <li>• Establish clear communication channels for teachers to communicate with partners, and partners to communicate with both the SDL students and with each other;</li> <li>• Work with the Alumni Office staff to identify, build, strengthen and steward relationships and seek new interest;</li> <li>• Work with Development Office and Career Centre staff to identify funding and placement opportunities that provide a defined return on investment for alumni and partners;</li> <li>• Recognize, acknowledge and celebrate SDL partners.</li> </ul>

## 2.2. Andragogy versus pedagogy

Merriam (2001) offers a provoking discussion on the emergence of andragogy (the art and science of helping adults learn) as a distinct professional field of practice – its own scientific discipline different from that of pedagogy (the art and science of helping children learn). Wlodkowski's (2008) groundbreaking work presents four motivational conditions he believes to be critical in teaching (motivating) adults: Creating an atmosphere that promotes a learning community where everyone feels respected and connected (establishing inclusion); helping learners see relevance to their experience (applicability); creating challenging and engaging experiences that value learners' viewpoints (enhancing meaning); and helping learners recognize that they have been successful in their learning – according to their own standards (confidence and asymmetry). Knowles (1980) presents five assumptions underlying andragogy. These describe the adult learner as being an individual who: Is independent and wanting to direct their own learning; has learning needs related to changing social roles; has an 'accumulated reservoir of life experiences'; is problem-centered and interested in immediate application of knowledge; and is primarily motivated by intrinsic rather than extrinsic factors. A key differentiator between the adult classroom and the child's classroom is the existence of mutuality between teachers and students as 'joint inquirers'. In other words, adult curriculum should be student-directed as opposed to teacher-directed (Cornelius-White, 2010).

## 2.3. Engaging invested stakeholders

Alumni, as a sub-group of community, are an exceptionally relevant unit to any educational institution (Dolbert, 2002; Flynn, 2012; Shakil & Faizi, 2012; Singer & Hughey, 2002). Their achievements directly reflect the success of their alma maters and, reciprocally, any enhancements to the quality of education at their schools automatically increases the perceived value of a graduate's degree. The nature of this connection creates a highly synergistic relationship. Alumni are valued, vital, lifelong stakeholders of an educational community and, should be kept informed and involved in its vision and priorities. They are their schools' best ambassadors. They bring real world experience to the contemporary learner. They are in a unique position to provide advice and counsel. Opportunities can be developed for involvement at all levels: governance, advisory councils, as members of PLCs, special task forces and projects; in the classroom they can provide mentoring, guest lecturing, knowledge exchange and funding for scholarships, program support, research and faculty/staff salary support; in the work place, they can offer practicums, summer and co-op placements.

Ultimately, faculty, staff, students, alumni and community/industry leaders have a vested interest in coming together in a sharing of responsibility for teaching and learning that is school-wide, university-wide and district-wide. This interest supports the features recommended by key researchers (Birman et al., 2000; Guskey, 2000; Killion, 2002; Pugach & Johnston, 2002; Zepeda, 2012) as being critical to designing a collaborative culture that 'works': A reform approach; a significant duration of time for planning; diverse participation; content focus; strategies designed around active learning; and encouraged coherence. Preparing to fully engage multidimensional stakeholders begins by taking a look at the "no shame, no blame, no excuses" approach suggested by Wagner et al. (2006, p. 144). In addition to alumni, social venture businesses, socially responsible corporations, government organizations and community organizations are embedded in societies around the world. They meet specific needs unique to the communities they serve. They embrace local values, pride of place, integrity and commitment to

civic duty.

Trusting these groups for the purposes of assisting with curriculum and/or course re-design is not instinctive. The fear of 'letting outsiders in' is an on-going challenge for many educational institutions. Moving from co-operation to true collaboration means having to identify reciprocities and overcoming the fear of being critiqued and losing control (Pawlowski, 2007). The importance and necessity of developing strategic, healthy partnerships with those who share the responsibility for educational needs is prevalent in the literature (Jeynes, 2007; Pawlowski, 2009; Pugach & Johnson, 2002; Steinmann et al., 2008; Wagner, et.al., 2006). PSE School highly encourages the role of students in its decision-making (Astin & Astin, 1996; Louis et al., 2010, Pugach & Johnson, 2002). They have also been exceptionally successful at identifying and sustaining key external partnerships. Advancement professionals, already employed in key roles such as alumni relations, community outreach, fundraising and government relations, can be deployed to ensure that external partnerships are fully collaborative alliances which are reciprocal and: i) serve to fulfill the school's mission of improving teaching, learning and/or student outcomes; ii) clearly identify roles; iii) take into consideration underlying motivators important to both partners and iv) support valid business motives such as corporate citizenship and return on investment (Pawlowski, 2009; Pawlowski, 2011). Incorporating best practices in volunteer management is also key. Educators are encouraged to seek advice and counsel on volunteer management from exemplar local volunteer organizations who have engaged these stakeholders very successfully through their not-for-profit work. The time, effort and resources given to building external relationships can result in invaluable rewards, including: Objective advice; sharing of 'real-world' expertise, knowledge and talent; mentorship; advocacy; financial contribution; and the offer of internships and employment opportunities for PSE School graduates (Pawlowski, 2009; Steinmann, et al., 2008). Examples of opportunities that can be offered to alumni, in particular:

- Invite alumni to create their own Community of Practice (CoP) that would bring content experts together with students, key staff and faculty members to explore the repertoire of skills and knowledge that influence work readiness, citizenship and continuous learning, and, how self-directed experiential courses can teach and strengthen these skills.
- Expand PLCs to bring in as much diversity, and gather as many multiple perspectives, as possible. Expansion can include multidisciplinary alumni – those who may have participated in SDL as students, prospective funders, leaders in religion, arts, social sciences, the not-for-profit sector, businesses and professional associations.
- Utilize surveys and focus groups of alumni and employers to determine whether former students who participated in self-directed learning (either at your school, or elsewhere) were better prepared for their post-graduation worlds. Also of interest would be whether participation and scoring on key national and global school rankings improves because students feel they had better hands-on experiences through self-directed learning. This could be tracked through analysis of historical data and conducting targeted sample surveys.

### 3. Managing the Change Process

The effective use of critical data creates the need for urgency that often begins moving organizations forwards towards meeting many of the difficult challenges identified in this paper. Wagner et. al. (2006, p. 133) suggests that the way to move from one's current reality to a future desired state involves moving through specific staged 'whole-system' phases of the change process. These phases include *preparation* (a thorough understanding of the problem the school is trying to solve), *envisioning* (exploring what success could look like) and *enactment* (implementing a new practice). These authors recommend the use of critical 'change levers' which have been proven to help ensure successful implementation: strategic use of data, accountability by all stakeholders (internal and external) and a keen understanding of relationship building.

Authentic change is not about simply 'fixing' an existing product, but taking the nucleus of that product through an innovative revolutionary adaptive change – one which is intentional and planned, involves many organizational components, and eventually creates a better or more effect product (Cawsey & Deszca, 2007; Holmes, Clement & Albright, 2013). Basom and Crandall (1991) pinpoint several barriers that cause resistance to educational change innovation. These include an interrupted sequence of leadership, the tendency to cling to tradition, competing needs and the possible under-representation of faculty in the decision-making process.

Tangible change is about taking an old concept and adding a disruptive innovation which could have impactful consequences. Disruptive innovation is a term coined by thought leader Clayton Christensen and which he refers to as 'the innovator's dilemma'. According to Christensen (1997) and Christensen, et. al. (2011), a new concept begins to take root at the 'bottom of a market' and then consistently and relentlessly moves up the market (because of demand), eventually displacing established systems. In this case, the author is postulating that the 'disrupter' is the student – the adult learner seeking new ways of learning through a format that meets both individual learning style and the need to participate in highly experiential 'real-world' application that contributes to finding his or her place in society and gaining a competitive advantage in the workplace upon

graduation. The disruptee is our current university educational system. This system accepts the concept of self-direction but operates within the current paradigm of putting the teacher ‘in charge’.

In turn, creating the need for urgency begins with by an objective, thorough self-analysis. Wagner et. al., (2006) suggest incorporating four key components – context, culture, conditions and competencies (4C model) – to set the arena for change.

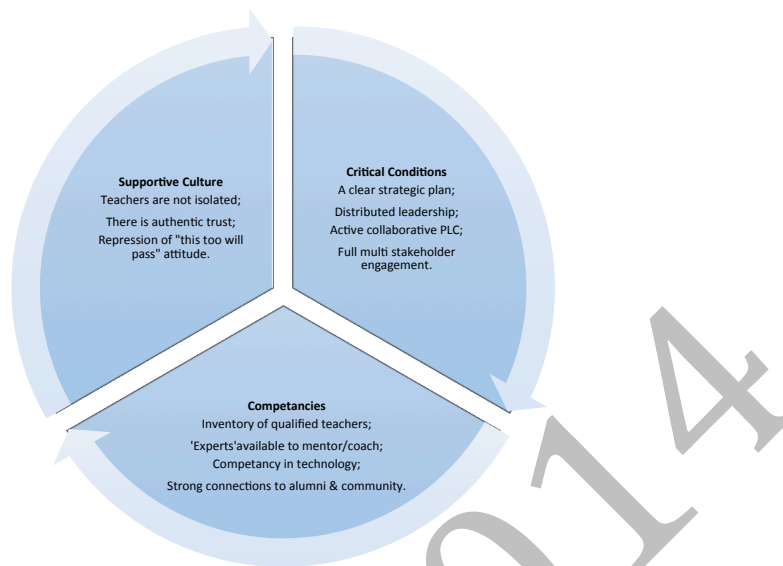

Figure 1: A 4C self-analysis system framework for a post-secondary institution. PLC: Professional learning community.

#### 4. Theory of action and the role of leadership

##### 4.1 Theory of action

If we believe that our purpose is to educate our students to take their place as ethical, responsible and contributing global citizens, and that our alumni and valued stakeholders (members of our professional, business and civic community) are treasured, lifelong partners of an educational institution, then we must include them in the shared responsibility and shared accountability of supporting continuous improvement of learning for these students.

##### 4.2 The role of leadership

Beyond establishing trust and realizing the importance of communication skills, instituting a collective culture – at the individual, school and district level – depends strongly on leadership. The literature fully supports the concept that distributed leadership, in particular, makes a difference in improving learning (Alberta Education, 2009; Burns, 2002; Datnow, 2011; Fullan, 2001; Fullan, 2007; Leithwood et. al., 2007; Robinson, 2006; Scott & Webber, 2008; Spillane, 2010). There appears to be a multitude of perspectives as to what the actual definition of distributed leadership is, what role each of the players (the principal, the teacher, parents, alumni, community and business leaders) should take, and who is ultimately responsible and accountable for it (Elmore, 2010; Hargreaves & Shirley, 2009; Leithwood et al., 2004; Wahlstrom et al., 2010). Robinson (2006) suggests the technique of ‘backward mapping’ to ground leadership in the core business of teaching and learning – looking at how a particular teacher makes a difference to the achievement of their students, identifying the conditions that support this outcome and then selecting those that can best assist that teacher to create those conditions. An interesting model on shared leadership is presented by Hoy & Tarter (2008). The authors introduce a normative matrix for ‘participative’ decision-making which looks at the relevance of an individual’s expertise, personal commitment to student outcomes (personal stake) and the trust placed on making a decision for the best interest of the organization (versus personal gain) – to determine the type of decision ‘situation’, the degree of involvement, and the different leadership roles that can be taken on by different individuals within various structures of decision-making groups. The author’s role in this process involves continuing as a member of the School’s advancement and senior leadership team, serving as an active PLC participant and leveraging her position with alumni and community stakeholders.

## 5. Conclusion

Hargreaves & Shirley (2009) state that the Fourth Way is about purpose and partnership. They postulate that through an inspiring and inclusive vision, strong public engagement, achievement through investment, corporate educational responsibility, students as partners in change and mindful learning which embraces personalized learning and lively learning communities, we can move forward in 'creat[ing] the schools that will undergird and catalyze our best values to regenerate and improve society'.

Zepeda's (2012) concluding remarks auger well for the desired outcome to create an inclusive, effective and sustainable collaborative culture which will take higher education organizations to the next level: "[Collaboration] is not easy work. Getting to the destination is a never-ending journey ...[as]...the work associated with it emphasizes continuous learning", (p. 286). Many business schools teach the 'kaizen' approach to continuous improvement. It is a process identified by improvements that are based on many small changes rather than radical ones, ideas that come from the talents of an existing workforce, and the expectation that *all* stakeholders are expected to take ownership and continually be seeking ways to improve their own performance (Imai, 1986). Ultimately, success will be determined by the development of key performance indicators and metrics that will definitively quantify improvement in student outcomes as a result of curriculum changes that can be directly related to involvement with alumni and the cultivation of sustainable business and community stakeholder partnerships.

## Abstract

When students feel better about themselves, they do better in life. This research studies self-reflection process from critical friends and multisource feedback that effects the development of students' self-esteem and academic oral presentation via online social media. Students use video recording for self-reflection practice, receiving critical friends positive advice for improvement, and finally multisource feedback for improving their oral academic presentation ability. Online social media appears to be a new communications channel that student practice an oral presentation skill through a network feedback, meanwhile building up a self-esteem through their self-reflection techniques.

## Introduction

One of the academic activities in universities is oral presentation, including class report, presentation, and public speaking. Efficient speaking is the process that speaker can convey meaning and idea to audience successfully. However, not all people are good at speaking and presenting. For some students, oral presentation is one of nightmare. Many students avoid such situations and feel shameful about it. Psychologically, people who fear of public speaking are called "Public Speaking Phobia". Public speaking phobia often referred to as speech anxiety or stage fright, involves a central fear of being scrutinized or evaluated by others (Botella, Hofmann & Moscovitch, 2004; Wallach, Safir & Bar-Zvi, 2009; Pull, 2012). The Counseling Center of University of Wisconsin explains that this fear is often accompanied by a variety of physical and emotional reactions that can significantly interfere with a person's ability to successfully give a speech or presentation, including intense feelings of anxiety, worry, nervousness, trembling or shaking, sweating, and/or dizziness.

Oral presentation is one of the reasons of low self-esteem that a reflection of central negative beliefs about the self (Fennell, 2005). Most of the students who have fear of oral presentation intense to avoid making presentation or taking courses that require active participation. Self-esteem is a defining factor if students want to become an excellent speaker, trainer, and consultant or coach because they have to be a successful communicator first and outmost. Their abilities to communicate in turn depend on their view of themselves, which is based on how they feel about themselves. Students with low self-esteem on the other hand will not think highly of themselves. They will constantly depend on other people's approval of them. They have little confidence; they are not able to look at themselves realistically. They overrate their shortcomings and undervalue their uniqueness, their skills, talents and personality. They feel threatened by people who evaluate, let alone, criticize them.

However, Psychological Counseling Department of Istanbul Bilgi University (2011) says that it is not a disorder but certainly a problem. Because it makes students feel bad and decreases their performance in class. According to the information from Psychological counseling Department of Istanbul Bilgi University, people who have fear of public speaking tell that they are mostly afraid of others' judgments. For this reason, encouragement, positive words, encouraging students to review their actions is very important to develop the ability of oral presentation.

Self-reflection is defined as a purposeful thinking toward a goal (Dewey, 1933). Self-reflection is related to inquiry and critical thinking. This inquiry is processed through thinking and action as thinkers learn from their actions. The aspects that stimulate reflective thinking can be surprising or doubtful topics, ineffective thoughts and actions, differences between reality and ideal, or differences between actual and expected situations (Peter, 1991). Schön (1983) describes two types of reflection: reflection-in-action and reflection-on-action. Reflection-in-action happens when we apply past knowledge or experiences to cope with current situation as immediate feedback, while reflection-on-action happens after experiencing the situation, thus requiring careful thinking about previous history. Thinker will analyze advantages and disadvantages of doing or not doing something, and

summarize into learning to be applied for future situations. Therefore, self-reflection is one method used to strengthen students' oral presentation skills and self-esteem.

Nowadays, social media have a role in everyday life. The online social media is generally developed to offer opportunities for reflection (Lamy & Goodfellow, 1999). It is helpful for students to build their own knowledge if an automatic mechanism could be designed to assist them to focus on learning and to guide their engagement in reflection. Many researchers have studied students' reflection that facilitates their problem-solving and deep thinking and understanding through online systems. For example, Saito & Miwa (2007) have designed a system that supports reflective activities for information seeking on the Web and found students' performance is supported and improved by the system. The study of van den Boom, Pass & van Merriënboer (2007) concludes that reflection combined with peer feedback positively affects students' self-regulated learning outcomes. In fact, there were reports that people are more likely to disclose suicide plans to a computer than to a human being (Proudfoot et al., 2003). According to Zabinski, Celio, Wilfley, & Taylor (2003), on-line interventions also offer practical advantages. Time constraints are removed and communication can be done asynchronously. Therefore, this method is able to enhance relaxed attitude of students who practice oral presentation.

One way to increase oral presentation skills and self-esteem is giving positive feedback. Critical friends and multisource feedback are based on positive feedback that motivates students to achieve self-esteem and confidence to speak in public. Gibbs & Angelides (2008) suggest that critical friends is within the nature of their friendship, which extends prior to and beyond the specific of the critique. The worthiness of the critical intervention is based on trust and respect for the vulnerability and wellbeing of both partners who have mutual concern, status and regard. Like critical friends, multisource feedback is one of the better tools that may be adopted and implemented to provide feedback and guide performance when interpersonal, communication, professionalism, or teamwork behaviors need to be assessed and guidance given (Lockyer, 2003).

These reasons encourage research to study self-reflection process from critical friends and multisource feedback that effects the development of students' self-esteem and academic oral presentation via online social media. Advantages of online social media promote self-reflection and openness to get feedback of oral presentation from Critical Friends, which allow friends and family to involve in sharing comments, thus enhancing self-esteem and oral presentation skills. Interaction with people allows students to obtain alternative, non-biased ideas and to reduce self-misunderstanding. Experience sharing causes relaxation and collective learning, promoting sustaining development.

### **Objectives of the study**

The objective of this research is to propose a model for developing "Self-reflection with Critical Friends and Multisource Feedback via Online Social Media" to enhance students' oral presentation ability and self-esteem.

### **Method**

This research is Qualitative Research which consists of 1) Documentary Research and 2) In-depth interview. The processes are as follows;

Documentary Research includes study of concepts, theories and research about 1) Self-reflection 2) Critical Friends 3) Multisource Feedback 4) Online Social Media 5) Oral Presentation and 6) Self-esteem. Findings will be synthesized for further analysis.

In-depth interview applies Opened Form Structured interview to study insights of specialists in psychology, education, and education technology. Researcher will gather findings for Content Analysis.

### **Result**

The focus of the proposed model is how self-reflection with critical friends and multisource feedback via online social media enhance students' oral presentation ability and self-esteem. This model is called PCPSP that includes 1) Problem identification 2) Cause analysis 3) Positive Feedback 4) Summary 5) Planning.

PCPSP model has 5 factors that cause oral presentation skills and self-esteem are self-encouragement, friends feedback, compliment of others, self-accomplishment, and replanning. The activities also involve self-reflection, critical friends, and multisource feedback. Instructor acts as advisor to observe behaviors of respondents. Data will be gathered week by week to regularly analyze improvement of oral presentation and self-esteem.

Students write and prepare the oral presentation outside of class. The topic may be informative or persuasive; instructor is set. Each presentation is 3 minutes. The topic should be assigned early in the program. Instructor builds in periodic due dates to make sure students stay on track. Oral presentation evaluation is the guidelines for effective speeches. Students are scored on a scale of 1-4 in Presentation content, Visual aids, and Performance. The evaluation includes eye contact, voice, knowledge and

understanding of the topic, enthusiasm, and audience awareness. Instructor must to give students the oral presentation rubric ahead of time so that they know and understand what they will be scored on.

Students need to record videotape their oral presentation. Instructor makes sure they are aware that they follow a description. Each oral presentation recording is determined by camera direction, camera angle, and camera distance. All oral presentations are recorded and uploaded to social networking sites that can publish video such as YouTube, Voice Thread. When students have seen their own oral presentation recording, students will reflect on their capacity to analyze weaknesses and strengths in their oral presentation including explain feelings about themselves and plan the next oral presentation. Friends will serve as critical friends. The friends who will act shall be selected as a qualifying match for critical friends to promote self-esteem to actually happen. Parents and teachers have a role in multisource feedback. It is one of the better tools that may be adopted and implemented to provide feedback and guide performance. Figure1 shows the PCPSP model.

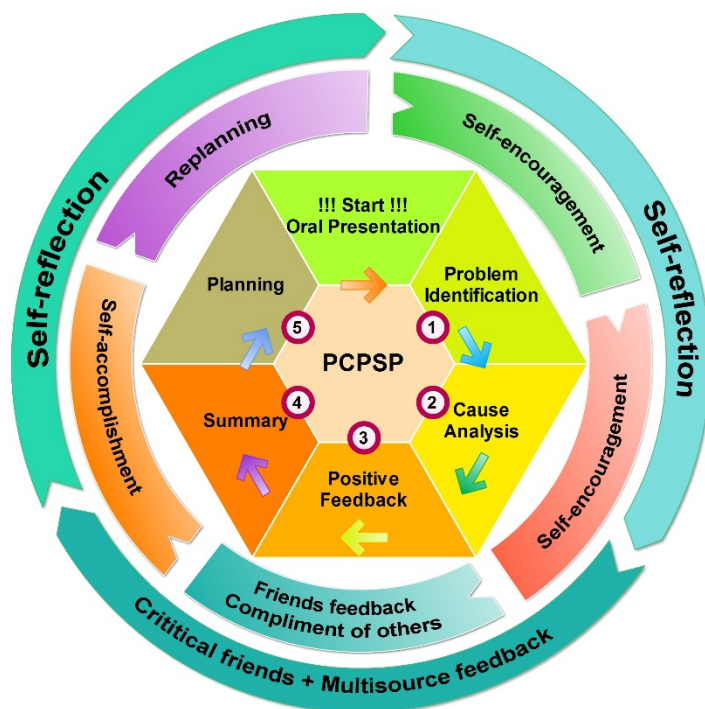

Figure1. The PCPSP Model

## Discussions and Recommendations

The model proposes that self-reflection exposes expectation, awareness, and feeling about experiences through speaking or writing, with the objective to analyze and compare data, formulate planning, and develop solutions. Self-reflection is related to self-observation and analyzing that cause new perspectives and ideas, leading to understanding of others. Students need to learn about self-reflection from oral presentation which facilitates review of learning and speaking. Such self-reflection leads to critical thinking which is beneficial for knowledge development and problem-solving capability for further speaking. Self-esteem promotes positive thinking and self-respect, social acceptance, and self encouragement. Students can gain support from recommendation and admire of others through critical friends process so as to enhance own value and appreciation. Critical friends can provide constructive feedback by observing oral presentation and share facts based on sincerity and trust. This shared experience can improve oral presentation skill and promote pride for speaker. Multisource feedback provides various insights to evaluate oral presentation and allow speakers to understand strengths and weaknesses from constructive feedbacks. Furthermore, the process leads to participative atmosphere that create effective communication and mutual trust. Such activity is conducted through online social media to avoid social exposure and increase confidence of speakers. Online social media can be applied to improve oral presentation skills and self-esteem. Features of online social media allow user to share identity and background, take note, create photo album and video, and create friend groups or networks via internet.

Self-reflection plays an important role in encouraging self-esteem and oral presentation because persons who are capable of reflecting themselves are open-minded for ideas, despite negative feedbacks. Such people can accept the truth that their concepts may not be right because they are sincere and dare to reveal their own feelings and perceptions. Self-reflection can lead to both negative and positive truth. Persons who accept unfavorable truth without applying defense mechanism may suffer from pressure, confusion, and mental discomfort. Persons who cannot tolerate such pressure may ignore negative effects of self-reflection by

delaying thinking or finding deceptive reasons to protect themselves. This process obstructs true feedback so people need supports from others to ensure that self-reflection is continued. Once persons gain benefits from self-reflection, they can relax and reduce pressure.

Future research may also examine the effects of PCPSP process on oral presentation and self-esteem and the model has been developed based on past research. The model needs to be tested empirically.

## Abstract

The paper presents findings on self-regulatory behavior in Czech adults, as measured by SRQ-CZ, an instrument originally developed by Brown et al. (1999), and on self-efficacy in learning as measured by SEQ, an instrument developed by Jakešová (2014). The two results correlated low, which indicates that SRQ-CZ measures the generic ability while the SEQ measures domain specific beliefs. As expected, the scores on positive dimensions of SRQ-CZ (Goal Orientation and Decision Making) were above the midpoint of the scale used, while in negative dimensions (Self-direction and Impulsivity Control) the scores were below the midpoint.

## Introduction

In comparison with other living beings, humans have the unique capability to control their inner feelings, impulses and processes. In general, people are able to adapt their behavior based on set standards (external factors) and also to focus on their own goals (internal factors). The term self-regulation is often described as the ability to develop, implement, and maintain planned behavior in order to achieve one's goals (Brown, Miller & Lawendowski, 1999).

Self-regulation broadly indicates the processes of goal setting, self-direction, decision-making and impulse control. It includes dealing with a range of challenges which individuals may face when trying to achieve something important but difficult to attain (Mischel, Cantor & Feldman, 1996). This phenomenon is considered for example in relation to organizational learning (Boekaerts, Pintrich & Zeidner, 2000) and is also examined in other contexts, such as health behavior (Ridder & Wit, 2006), drug use (Baumeister & Heatherton, 2009), alcohol abuse (Wills, Sandy & Yaeger, 2002) and truancy (Veenstra, Lindenberg, Tinga & Ormel, 2010).

Researchers have attempted to uncover the phases or stages of self-regulation. A three-phase theory consisting of self-monitoring, self-evaluation, and self-reinforcement was introduced by Carver and Scheier (1982). Subsequently, this model was extended by Kanfer (1970) and Miller and Brown (1991) to seven phases, consisting of self-evaluation, informational input, instigation to change, planning, search, implementation and evaluation. However, when this model was empirically tested, the result of factor analysis led to a single-dimension solution (Carey, Neal, & Collins, 2004). Another research (Neal & Carey, 2005) demonstrated two self-regulation phases.

As previous research yielded inconclusive results concerning the number and sequence of dimensions and phases of self-regulation, it opens new challenges for further research. In the present study we endeavor to continue in this direction. In addition, we shall provide data on the processes in self-regulation of non-Anglo-Saxon respondents, thus expanding the research field and offering a possible cross-cultural comparison.

## Research methodology

There is a large volume of studies that aims at self-regulation in learning (e.g., Zimmerman, 1990; Winne, 2001; Pintrich, 2004). However, relatively little effort was made to investigate self-regulation in a wider range of life situations. Ample examples of this line of effort are given by studies conducted by Brown, Miller, & Lawendowski (1999), Carey, Neal and Collins (2004) and Neal and Carey (2005).

This study explores the broad, or generic, self-regulatory ability with the aim to shed more light on how this is self-perceived by respondents throughout their life. In addition, the ability for self-regulation will be compared to self-efficacy, which is an important factor related to self-regulation.

The basic research purpose was to determine the achieved level of self-regulation of students in the Zlín region and to determine the differences of this level by gender and age. Another purpose was to determine the relationship between self-regulation and perceived self-efficacy in learning.

Due to the nature of the research purpose, we grounded our research on a quantitative approach using exploratory methods. Data were analyzed using the statistical program Statistica v. 12 Base and IBM SPSS v. 21.

## 1. Measurements

Two self-report instruments were used to gather data, the Self Regulation Questionnaire and the Self-Efficacy Questionnaire. The Self Regulation Questionnaire (SRQ-CZ) is a Czech version of the original Self-Regulation Questionnaire (SRQ) by Brown, Miller & Lawendowski (1999). The original instrument was constructed to measure generic self-regulation, i.e., the ability to regulate one's behaviour in a broad range of everyday situations. The authors define self-regulation as the ability to develop, implement, and flexibly maintain planned behaviour to achieve one's goals. Based on Kanfer's (1970) theoretical model, they claim that self-regulation of behaviour proceeds in seven consecutive steps from receiving relevant information to making a plan of action and assessing the results of the implementation of the plan. Brown, Miller & Lawendowski's (1999) original instrument has seven subscales corresponding to the seven step-theoretical model of planning and executing behaviour. There were two attempts to prove the empirical validity of the seven-step theoretical model; however, none of them was successful. In their study Carey, Neal and Collins (2004) demonstrated a single-factor model, while data by Neal and Carey (2005) yielded a 2-factor model. In our previous study where we used a sample of 360 university students in the Czech Republic the best factorial solution was a 4-factor model (Gavora, Jakešová & Kalenda, in press).

For the purpose of this study we re-validated the instrument with a broader sample. It consisted of 1,238 respondents from the region around Zlín in the Czech Republic. The age of the respondents ranged from 19 to 83. The best solution proved to be a 4-factor model with dimensions entitled Goal Orientation, Decision-Making, Self-direction and Impulse Control. The current form of SRQ-CZ has 22 items. Dimensions, number of items per dimension, item examples and dimension Alphas are illustrated in Table 1. Items in the first two dimensions (Goal Orientation and Decision Making) were positively worded, thus the higher the score the better the self-regulation. The latter two dimensions (Self-direction and Impulse Control) were negatively worded, therefore the lower the score, the better the self-regulation (see Table 1).

Similarly to previous studies, it was not confirmed that self-regulatory behaviour is necessarily performed in seven successive steps (represented by the seven dimensions of the questionnaire) as claimed in Kanfer's (1970) theory. The alternative interpretation offered is that even if such steps do exist, while filling in the questionnaire, respondents did not relate their behaviour to them. Rather, they considered each questionnaire item as a separate entity. The reliability of the questionnaire was .85 (Cronbach Alpha).

Table 1. Dimensions, number of items, item examples and dimension Alphas of SRQ-CZ.

Dimensions	Example of items	No. of items	Cronbach Alpha
Goal Orientation	I usually proceed to accomplish my aims.	5	.713
Decision Making	A new problem is an immediate challenge for me to find solutions.	6	.720
Self-direction	I fail to learn from my mistakes.	7	.705
Impulse Control	I give up easily when facing an obstacle.	4	.692

The Self-efficacy Questionnaire (SEQ) is a 10-item instrument developed by J. Jakešová (2014) in which respondents self-rate their belief in the ability to study efficiently. The factor analysis with this sample revealed a single factor model with Cronbach Alpha of .90. Example of an item: "If I concentrate sufficiently I can learn even a very hard subject matter". Both SRQ-CZ and SEQ used scale items ranging from 1 (strongly disagree) to 5 (strongly agree).

The two instruments were administered in group sessions of respondents. Online administration was rejected because of the threat of a low response-rate.

## 2. Sample

The base sample consisted of 1,244 respondents from the region of Zlín in the Czech Republic who were students in a medium-sized university. Out of the base sample, three subsamples were selected for this investigation as seen in Table 2. The students were registered at bachelor, master's and doctoral degree programmes at the University of the Third Age. For statistical calculations the age of the respondents was divided into three categories: (1) 19-25 (65%), (2) 26-45 (19%), and (3) 60 and over (16%). The age group 46 to 59 was not taken into consideration because it was underrepresented. The majority of the respondents was female (903 or 73%), the number of males was 333 (27%).

Table 2. Subsamples.

Age groups	N	%
19-25	800	64.3
26-45	236	19
60-83	192	15.4
Missing	16	1.3
In total	1.244	100

## Results

First, we shall present the descriptive data on self-regulatory behavior, and then data on self-efficacy in learning. The descriptive statistics showed that respondents scored on Goal Orientation ( $\bar{x} = 3.99$ ,  $SD = .65$ ) and Decision Making ( $\bar{x} = 3.53$ ,  $SD = .59$ ) above the midpoint of the five-point scale used in the questionnaire (see Fig. 1)<sup>\*\*\*</sup>. This indicates a rather good level of perceived self-regulatory behavior. On the other hand, students achieved lower scores in Self-direction ( $\bar{x} = 2.93$ ,  $SD = .48$ ) and Impulse Control ( $\bar{x} = 2.81$ ,  $SD = .79$ ). As these dimensions were negatively scored, this signifies that respondents can control their impulsivity and can self-direct their behavior. The results showed that the respondents achieved above-midpoint on the Self-efficacy scale ( $\bar{x} = 3.38$ ,  $SD = .43$ ), which shows that they judge their self-efficacy as being rather high.

Fig. 1. The average scores on self-regulation and self-efficacy.

Regarding the relationships between dimensions, there was a positive correlation between the Goal Orientation and Decision Making dimensions ( $r_s = .464$ , statistically significant at the 5% level; Table 3). A positive correlation was also found between Self-direction and Impulse Control ( $r_s = .455$ ). We can say that respondents who are goal-oriented (i.e. "I reward myself for progress toward my goals") also scored high in decision-making (i.e. "I am willing to consider other ways of doing things"), and vice versa. On the other hand, respondents who had higher scores in Self-direction also reached higher scores in controlling impulsivity, and vice versa. These findings confirm the existence of inverse relations between positively and negatively worded dimensions of self-regulation in this questionnaire<sup>†††</sup>.

Self-efficacy scores had positive and statistically significant correlations with the positive dimensions of self-regulation, i.e. with Goal Orientation ( $r_s = .345$ ) and Decision Making ( $r_s = .305$ ), and low and negative correlations with negatively worded dimensions of self-regulation. This indicates that the two variables are mutually dependent entities.

Table 3. Correlations of self-regulation and self-efficacy.

Components	$\bar{x}$	SD	Decision Making	Self-direction	Impulse Control	Self-efficacy
Goal Orientation	3.99	.65	.464	-.146	-.294	.345

<sup>\*\*\*</sup> It would be worth comparing our data with American studies that used SRQ. However, they used scores that summed up all item points, while our sample was scored on a 1-5 point scale.

<sup>†††</sup> To get an idea of how many percentages of the variance are involved in two variables the coefficient of determination ( $r^2$ ) was calculated. In the first case ( $r_s = .464$ ) variables reached 22% of the shared variance, and in the second case ( $r_s = .455$ ) it was 21%.

Decision Making	3.53	.59	-.139	-.353	.305
Self-direction	2.93	.48		.455	.035
Impulse Control	2.81	.79			-.044
Self-efficacy	3.38	.43			

Note: Correlation is significant at the .05 level.

The results show statistically significant differences in Goal Orientation ( $p = .024$ ,  $p < .05$ ) and Impulse Control ( $p = .000$ ,  $p < .05$ ) between men and women (Table 4). Women achieved higher scores on Goal Orientation than men but lower scores on Impulse Control. In other words, women are better goal-oriented but are likely to control their impulsivity less than men do.

Table 4. Findings on self-regulation and self-efficacy by gender and age.

Components	Gender					Age						
	man		woman		p	19 – 25 years		26 – 45 years		over 60 years		p
	$\bar{x}$	SD	$\bar{x}$	SD		$\bar{x}$	SD	$\bar{x}$	SD	$\bar{x}$	SD	
Goal orientation	3.91	.71	4.02	.62	<b>.02</b>	3.91	.65	4.16	.61	4.14	.62	<b>.00</b>
Decision Making	3.56	.62	3.52	.58	.08	3.41	.57	3.73	.53	3.77	.62	<b>.00</b>
Self-direction	2.94	.47	2.93	.49	.62	2.88	.45	2.89	.47	3.19	.55	<b>.00</b>
Impulse control	2.66	.81	2.86	.78	<b>.00</b>	2.87	.78	2.59	.75	2.85	.85	<b>.00</b>
Self-efficacy	3.38	.43	3.37	.43	.62	3.36	.42	3.42	.39	3.40	.48	.26

Note:  $\bar{x}$  = represents the average value on a scale of 1 to 5; SD = standard deviation; p = nonparametric test (K-W ANOVA, M-W U test).

The age of the respondents affects all four dimensions of self-regulation, though differently. It was found that the youngest age subgroup scored the lowest on most of the assessed dimensions. The middle aged subgroup of respondents (26-45) were the most goal-oriented. Conversely, respondents aged 19-25 scored lowest on Goal Orientation. Similar results were also achieved in Decision Making. The ability of decision-making increases with the age of respondents. In other words, the oldest respondents, aged over 60, provide the highest level of decision-making. The youngest respondents, aged 19-25, showed the lowest level in decision- making (see Table 4).

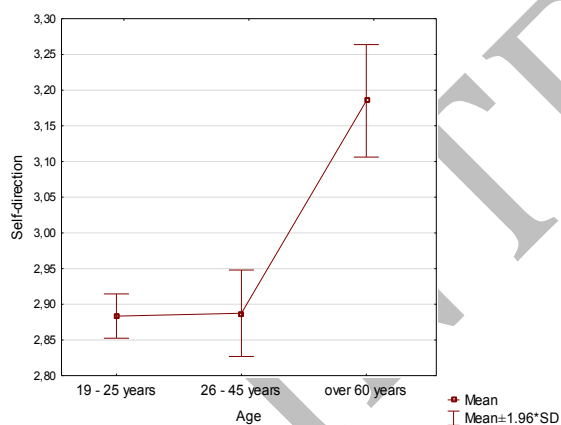

Fig. 2. Self-direction by age.

Fig. 3. Impulse Control by age.

The divergent results were shown in the two negative dimensions of self-regulation, where achieving lower scores is perceived as indicating a greater ability in self-regulation. According to descriptive statistics and hypothesis testing, it was proven that respondents aged 60 and over reached the lowest level of self-direction (i.e. "I can't learn from my mistakes"). Younger respondents achieved similar results (see Fig. 2).

Respondents in the middle age subgroup (26 to 45) showed better control of their impulsivity (i.e. "Even if I decide for something, I have a problem to realize it"). In contrast (see Fig. 3), for the youngest and oldest respondents the impulse control presents a greater issue.

The level of self-efficacy, which can be seen as the belief that an individual has about himself/herself, was not related to gender or age. This result together with the low correlation between the dimensions of self-regulation of behaviour and self-efficacy in learning suggests that the former is a generic concept covering a wide range of life situations while the latter is domain specific and concerns learning contexts.

## Summary and discussion

The concept of self-regulation relates to a wide range of life situations. According to Brown, Miller & Lawendowski (1999) it is seen as the ability to develop, implement, and flexibly maintain planned behaviour in order to achieve one's goals. Self-regulation is accepted as an important skill for today's successful student, as well as for the successful individual in contemporary society.

The main aim of the study was to determine the achieved level of components of self-regulation, namely Goal Orientation, Decision Making, Self-direction and Impulse Control and to determine the differences in the scores by gender and age. Another objective was to find out the relationship between the components of self-regulation, detect the perceived level of Self-efficacy in learning and uncover the relationships between and differences in Self-regulation and Self-efficacy according to gender and age.

The 1.244 respondents from the region of Zlín in the Czech Republic who were students in a medium-size university completed the Self-Regulation Questionnaire (SRQ-CZ) and the Self-Efficacy Questionnaire (SEQ). The original instrument (SRQ) was constructed to measure generic self-regulation, i.e., the ability to regulate one's behaviour in a broad range of everyday situations (Brown, Miller & Lawendowski, 1999). For the purpose of this study we revalidated the instrument with a broader sample of 1.238 respondents. The ages of the respondents ranged from 19 to 83. The best factor solution proved to be a 4-factor model with dimensions entitled Goal Orientation, Decision Making, Self-direction and Impulse Control. The current form of SRQ-CZ has 22 items with a reliability of  $\alpha = .85$ .

The presented results showed that students achieved higher than average scores on the scale's midpoint in Goal Orientation and Decision Making. On the other hand, they reached lower values in Self-direction and Impulse Control. The research also focused on Self-efficacy, which is an important factor related to self-regulation. According to the descriptive statistics, respondents achieved above-average levels on the scale's midpoint in self-efficacy, highlighting the strength of students' belief in their own ability to learn successfully.

Positive correlations were found between positive components of self-regulation (Goal Orientation and Decision Making) on the one hand, and between negative components of self-regulation (Self-direction and Control Impulsivity) on the other.

Gender had an impact on Goal Orientation and Impulse Control, while the results of testing by age identified significant differences in all four components of self-regulation. Women achieved higher levels in Goal Orientation than men but lower levels in Impulse Control. It was found that with increasing age goal orientation and decision-making also increases. Middle-aged respondents (26-45 years) were the most goal-oriented and the ability of decision-making increases with the age of respondents. A different situation was revealed within the negative components, where achieving lower values is perceived as a better ability of self-regulation. The oldest respondents aged 60 and over reached the lowest levels in self-direction and together with respondents between the ages of 19 to 25 Impulse Control represents a greater issue.

There are two main points of discussion emerging from the present results. The first concerns the interpretability of the original instrument to measure self-regulation of behavior, SRQ by Brown et al. (1999), upon which the Czech adaptation was based. The SRQ contains 7 dimensions which were theoretically developed to capture the seven phases of planning and execution of an individual's behavior. Our previous attempt (Gavora, Jakešová & Kalenda, in press) with a smaller sample of adult respondents had already failed to confirm the 7-phase model. This attempt yielded a 4-component model, which was reconfirmed in the present study. This suggests either that the planning and execution of one's behavior does not proceed in the sequence as anticipated by Brown et al. (1999), or that while filling in the questionnaire respondents did not relate the items to the self-regulatory *phases*. Rather, they responded to questionnaire items as to separate, disconnected phenomena. Another feasible interpretation is that the situations in SRQ items were unspecified. Thus, they might elicit virtually infinite self-regulatory associations because respondents could relate them to any event or action, either real or fictitious. Further research is needed to uncover how the questionnaire findings relate to real-life self-regulatory situations, probably using research methods such as observation and think-aloud procedures.

Another point of discussion is the relationship between self-regulation of behavior and self-efficacy in learning. They are two distinct variables, since self-efficacy in learning is the *belief* in one's abilities to learn, while self-regulation of behavior is the *ability* to plan and perform a broad range of actions. However, we determined statistically significant correlations between positively-worded components of self-regulation (Goal Orientation and Decision Making) and Self-efficacy in learning. This suggests that the two variables share similar properties. Obviously, belief in one's learning efficiency at university requires good goal planning and decision-making abilities. On the other hand, low belief in one's learning abilities coincides with inefficient self-direction and learner impulsivity.

## Abstract

Everything which is related to human being is actually a communication tool. Art is also one of the communication tools which are related to human. Building an effective communication depends on using the common language by sides and comprehending one another. History of art is a visual discipline whose material is indicators. Consequently, comprehension of the art depends on analyzing of the indicators. This study exemplifies and highlights the importance of iconography and symbol analysis which are included in the field of history of art and plan, map, architectural and urban reading. It is aimed that the main purpose of an art historian should be construing not describing. The ways of construing is reading the indicators. Therefore more courses or contents related to the relationship between history of art and semiology should be included in undergraduate education of history of art.

*Keywords:* History of art; semiology; iconography; symbol; indicator in history of art

## 1.Introduction

When the definitions of art which have been made from antiquity to the present are evaluated it can be seen that there are different extensions of those definitions<sup>\*\*\*</sup>. According to Sözen & Tanyeli (1996, p.208); the art which changes in accordance with individuals, ideas, aims, period of time, and societies is a technique of crafting stimulus with the aim of developing satisfactory artistic experiences. The art is an important tool in conveying feelings and opinions, images and assets by means of symbols.

History of art is an academic discipline analyzing historical evolution of the art<sup>§§§</sup>. It analyses the appearance of artistic work and relationships with the other works and society. History of art bounds to the environment where the work is made. Various factors such as geographical location of the work, socio-cultural, economical, politic, and regional factors and belief and religion affect the work of art and, of course, history of art. Therefore the history of art is related to the other disciplines such as geography, history, anthropology, sociology, psychology, archeology, economy, the history of politics, and theology.

The art is one of the components which compose the society and means of communication of the society. Human being is in the environment surrounded by images, symbols and various indicators from coming into being. They try to communicate by giving meaning to those images and indicators.

## 2. The relationships of indicator-semiology and history of art

Indicators are a situation, an action or an entity which substitute for a concept in our mind. They can be kept as a word a picture. They inform about the situation. The information or the input which indicator gives is the reflection of the entity or the object in our mind. This concept is the acquired knowledge (Erkman-Akerson, 2005, p.17-25).

Semiology is an art which evaluates the process of emerging, analyzing, and interpreting of indicators which exist in every part of life.

\* Corresponding author. Tel.: +0-370-433-8294; fax: +0-370-433-8264

E-mail address: lgktaskaya@karabuk.edu.tr

\*\*\* Refer to different definitions of art; (Bozkurt, 1995, p.16-18), (Türkdoğan, 1984, p.11), (Erzen, 1997, p.1607).

§§§ Refer to different definitions of the history of art; (Mülayim, 1994), (Kırıçoğlu & Stokrocki, 1997), (Eyice, 2003).

In order to analyze and interpret the indicators they, firstly, need to be seen. Because indicators of being an art built over “visuality” an art historian should be a good “viewer”. So, what is the definition of “a good viewer?”

The verbs “to look” and “to view” are different. But these terms either are used for each other or misused like other diverse terms or concepts. While “looking” is an action which every healthy eyes can take, “viewing” is a fact having lots of dependents. The usage of these terms in our daily life gain dimension and content when it is moved to the fields of art and science. Consequently, each eye looking at something doesn’t mean that they are viewing it. Eye is a visual organ which is not equipped with the feature of “viewing”. At this point, while “to look” appears as a team, “to view” appears as a concept which has diverse extensions. “To view” is related to the knowledge.

Being a mean of communications art is molded with indicators. Apprehending of art and enjoy the work of art depends on equally apprehending of indicators by receiver and sender. Therefore receiver’s knowledge about message and subject knowledge are important in interpreting of each type of message. Thus knowledge is required to interpret the indicator.

Indicator is variously classified into categories by semiologer. While Charles Sanders Peirce classifies the indicator into indicator visual indicator and symbol from the aspect of the object of the indicator, Pierre Guiraud categorizes the indicator into four categories from the aspect of used norms as natural indicators, reflective indicators or images, nominal indicators, and image-symbol compound indicators (Guriaud, 1984, p.13).

Günay (2008) classifies the types of indicators as natural and artificial. While iconography which can be classified into two sub-groups as reflective and nominal ones is the type of reflective-visual indicator, symbol is the type of nominal-artificial indicator.

The study field of history of art is related to iconography and symbol indicators. Consequently the new definition like “history of art is a visual academic discipline composed of iconography and symbol indicators” can’t be evaluated as wrong.

### 3. Art historical indicators

#### 3.1. Iconography

It is the type of indicator composed of the subject and contents of the work of art. It is also an academic discipline comparatively analyzing the subjects and the contents. Apprehension, understanding and evaluation of the work of art depends on acquisition of iconography (Cömert, 1980).

Iconography, which is a visual indicator, can be more easily perceived compared to the other indicators. According to the Adam and Bonhomme (2003, p.56); the relation of proximity and similarity can be constructed between visual indicator and the object (Günay, 2008, p.4).

#### 3.2. Symbol

It is the most frequently used type of indicators which can be easily perceived by people, but comprehension and acquisition of this indicator is difficult.

Symbol is defined as “the mark which has appeared through reflecting or representing it.” This mark can exist as a figure, an object, an indicator or a word.<sup>\*\*\*\*</sup>

Symbols are visual and aural facts expressing things more than demonstration. It is a complicated item. It is a tool of abstraction. It is always a concrete indicator of abstracts.

Picture carries the common characteristics of demonstrative and the things which are demonstrated. However, “symbol” is described as a mark which doesn’t have the relation of causality and isn’t constructed over the natural relations.<sup>††††</sup>

Representation of an abstract thing with a concrete thing changes in accordance with the society, community, groups, individual, culture, language, religion and numerous variables. Any symbol exists in different periods and cultures through change of meaning without demonstrating any formal changes. Therefore the symbol which is unique to a specific culture either cannot be comprehended by a foreigner or the meaning can be changed although the form is the same.

An symbol is never arbitrary or empty. They need to be apprehended, analyzed, and comprehended. Therefore, it requires more detailed knowledge. Symbol arises with the result of the relation between indicators and the object. Comprehension of symbol depends on learning the object itself and analyze of symbol depends on acquiring the relation between the indicator and the object (Günay, 2008, p.4).

Symbols are capable of conveying the subjects which can take long time to explain with succinctly but profoundly. These characteristics strengthen their capable of expressing diverse things with using little things. They have not only content richness but also easy and fast systematic of meaning as a formal language. Thence belief, discipline and approach which have every types of philosophical profundity on earth are surrounded with symbols.

Symbol is an indispensable part of culture, art, language and literature, religion and mythology. Not only social sciences but also natural sciences completely possess symbolic language. Especially math, physics and chemistry are disciplines completely constructed with a symbolic structure.

\*\*\*\* Metin Bobaroğlu, “Simge Kavramı ve Simgesel Düşünme ” [www.anadoluyadinlanma.org/Yazilar/simge\\_kavrami.pdf](http://www.anadoluyadinlanma.org/Yazilar/simge_kavrami.pdf)

†††† Metin Bobaroğlu, “Simge Kavramı ve Simgesel Düşünme ” [www.anadoluyadinlanma.org/Yazilar/simge\\_kavrami.pdf](http://www.anadoluyadinlanma.org/Yazilar/simge_kavrami.pdf)

Iconography and symbol are artificial indicators which human beings created. Actually iconographic and symbolic analyses are the type of study related to cognitive process. Visual symbols reach more people than verbal symbols. Beside the rate of learning through viewing is high in scientific studies.

According to scientific studies; %1 of acquired items by tasting, %1, 5 of them is acquired through touching; %3, 5 of them is acquired by hearing and viewing, respectfully. According to the study conducted with the aim of perceiving and acquisition of information %10 of read items, %20 of heard items, %30 of viewed things, %50 of both viewed and heard things, %70 of utterances, and %90 of actions which are taken while uttering can be stored in mind (Günay, 2008, p.11).<sup>\*\*\*</sup>

Because of having visuals sustained by iconography and symbol indicators as a working material in the history of art it is essential to know what iconography and symbol is, to view and to interpret through analyzing. At this point some examples can be given so as to embody the subject from the aspect of the discipline “history of art”.

#### 4. Art historical icons

##### 4.1. The maternity goddess

It was started to confront the term “maternity goddess” in Çayönü, Anatolian, in the years between 7200-6250 BC. The symbol “Maternity Goddess” which turned into a cult after a while reached a certain standard in Çatalhöyük. The woman was seen the reason of everything because of her fertility and was apotheosized. Abundance was symbolized as a body of woman giving lots of birth (see Fig. 1-2).

Fig. 1. Neolithic Period.  
Çatalhöyük. Anatolian Civilizations  
Museum, Ankara.

Fig. 2. Late Neolithic Period.  
Hacilar. Anatolian Civilizations  
Museum, Ankara.

##### 4.2. Lion

Lion is the symbol of strength, power, the sun, light and the water (Öney, 1971, p.1; Öney, 1992, p.40). It is a guardian and protector from evil. It is a spirit which helps shamans in their journey in the sky and earth, according to old Turkish belief. It is used as a spirit in graveyards, the protector from evils in castles, towns, thrones and palaces, the water and light in the palaces such as fountain, both and gargoyles (see Fig. 3-6).

The other symbolic meaning of the lion is related with horoscopes. According to this opinion which reached to Mesopotamia, Egypt, Greece and Rome and was prevail in the whole Islamic world in middle ages several stars belong to solar and lunar

<sup>\*\*\*</sup> Günay has received this information from Sönmez (2005, p.122).

system are related with the one of the animals symbolizing twelve horoscopes. The reason of the usage of the sun and leo together is the sun's relation with leo.

The leo was commemorated as the home of the sun in old Egypt (Kerametli, 1972, p.14). Moreover it has been the symbol of (the most important day of Assyrian calendar) nawruz, which is also the beginning of agricultural year since 4000 BC. in the Near East.

Fig. 3. Wall-door. Late Hittite Period. Aslantepe, Malatya. Anatolian Civilizations Museum, Ankara.

Fig. 4. Citadel, Kayseri. 1224 dated. Seljuks Period.

Fig. 5. Bronze Door Knocker. 11th Century. David Collection, Denmark.

Fig. 6. The Liquid Container. BC The End of the 8th Century. Anatolian Civilizations Museum, Ankara.

Lion is one of the good examples of the situation which symbols can change their meaning in accordance with the culture or group without changing their form. Hz. Ali is called as “the lion of the God” (in Quran) referring the event taking place during ascension (Noyan, 1985, p.50-52; Fiğlalı, 1911, p.247-249). Therefore lion is the symbol of Hz. Ali. It is seen in “Vilayetname of Hacı Bektaş-ı Veli” that Hacı Bektaş Veli makes a great number of miracles through turning into a lion. So lion is also the symbol of Hacı Bektaş Veli (see Fig. 7-8).

Fig. 7. Balım Sultan Candlestick.  
Hacıbektaş Museum, Nevşehir.

Fig. 8. The base of the Balım Sultan's Candlestick.  
Hacıbektaş Museum, Nevşehir.

#### 4.3. *Sitting cross, chalice*

“Sitting cross” is the symbol of sovereignty based on the traditions of Central Asian Turks (Esin, 1969/70; Esin, 1970/71). Nobody can sit cross except the emperor. Retinues of the emperor kneel. It was written in Kutadgu Bilig that servants mustn't sit across (Yusuf Has Hacıp, 1991, p.298) (see Fig. 9-12). This culture affected the west and emperors and kings confronted us sitting cross (see Fig. 13).

Seljuks Period. İnce Minareli Medrese  
Museum, Konya.

Fig. 10. Ceramic Cruse Fragment.  
11.-12th Century. Great Seljuks Period.

In addition chalice is also the symbol of sovereignty tracing back the traditions of Central Asian Turks (Roux, 1982, p. 102-108). When social structure and way of living is carefully taken into account the figures holding chalice in their hand in description symbolize the emperor (see Fig. 9-12).

Fig. 13. Painting Ceiling Panel.  
Middle of the 12. Century.  
Feasting Ruler with Attendants.  
Capella Palatina, Palermo.  
(Ettinghausen 1977).

#### 4.4. Dome

Architecture is also built over symbolic meanings. Dome is the symbolic architectural element which is seen as hemisphere. Circle is the symbol of eternity because of ambiguous points of start and finish. This symbol accords with Islamic philosophy and religion. Gathering people under the only dome by creating a continuous place also accords with the philosophy and the religion mentioned above. Moreover, the belief “the God is in the sky” is backed with the dome rising to the sky. The history of East and west architecture tried to build the biggest and the highest dome. The purpose is to reach the God. Dome which is an architectural element is the symbol of the vault of heaven and reaching the God. Therefore the construction rises gradually in the mosques built especially in the classical period of Sinan the architect and the duty of element in every grade is actually to help the emphasis of central dome (see Fig. 14).

Fig. 14. Sultanahmet Mosque. 1609-1617 dated. İstanbul.

## 5. Art historical readings

Reading is not an activity that you only read written items as most of the people think. Benamou (1979, p. 10) described reading as 'receiver's process of inference and the activities that he takes in towards meaningful context which was previously built. In parallel, reading plan, reading map, architectural reading, and even reading cities are included in this group and are one of the fields which history of art works. While reading the items mentioned above indicators are, firstly, analyzed. Plans and maps are comprised of symbols (see Fig. 15-16). Most of the architectural element has symbolic meaning as well as their static duties.

Fig. 15. Hamamlı III Bath Plan. 19th century. Eskipazar, Karabük.

Fig. 16. Demirli Mosque Plan. 1485 dated. Eflani, Karabük.

A city carries abstract meanings coming from different cultures besides having concrete features seen by everyone. The description of the culture can be made as physical and moral values created in the process of historical and social development

and the process of transferring those values to next generations. Transferring of the values occurs with abstraction, usage of symbols and, mainly, systems developed by language (Doğan Topçu, 2005, p. 238).

An architectural symbol as an object of usage is a demonstrator which has a viewer possessing absolute and agreeable straight meaning when evaluated from the aspect of the conveyed meaning. The first demonstrated thing of a house is its function of living space in the dimension of straight meaning. But turning an architectural symbol into the functional ones depends on grounding its past processes of encoding and reconciliation even if it is in the dimension of straight meaning. If created architectural symbols are not related with reconciliations already known it can't be comprehend and used. But if symbols gain different meanings, it refers another function in the dimension of straight meaning.

For instance the important feature of couches in traditional Turkish houses is being always located in the south side of the most beautiful wall. They function like impressive altar delicately created from floor to ceiling. While the first function of this wall is to symbolize the direction of Mekka in conformity with the Islamic belief in the dimension of straight meaning, in the dimension of connotative meaning this wall symbolizes the supremacy of the God and is the reflection of the love and admiration (Doğan Topçu, 2005, p.243).

## 6. Conclusion

It is possible to increase the history of the art indicators and the examples of reading materials. Iconography and symbol analysis, plans, maps, architectural and urban readings are among the fields over which the discipline 'history of art' works and they are difficult and complicated side of the discipline when especially evaluated from the aspect of the students.

The courses under the title of Semiology which are related to the topics mentioned above are among the postgraduate courses. However, implementing this kind of courses to undergraduate curriculums will be beneficial. The student graduated from the undergraduate degree of 'History of Art' gets the title 'art historian' even if he doesn't continue to his academic career. Therefore an art historian should know the relation between the history of art and Semiology and he should put it into practice. The job of an art historian should be giving meaning to the indicators not only describing them.

# Serious games effects: an overview

Hans W. Giessen

Universität des Saarlandes, Information Science, Gebäude C5.2, R. 106.1, D-66041 Saarbrücken, Germany

---

## Abstract

"Games und Gamification" were declared by the "New Media Consortium" as one of the important trends in E-Learning for the near future. If the NMC's assumptions are correct, we need a discussion on whether Games, especially so-called "Serious Games" indeed help in learning. The paper wants to give an overview on the state-of-the-art of what can be expected by Serious Games, according to the research already done.

*Keywords:* Serious Games, E-Learning, Media Effects, Language Learning

---

## Serious Games

It is widely known that fear, stress - or also boredom, for that matter - activate the amygdala, whilst knowledge and information connected with positive emotions is absorbed by the hippocampus and then transferred to the cortex for further processing. Thus, learning content should be prepared in a way that activates the hippocampus, not the amygdala, that is, should be transmitted in a somewhat pleasant way that evokes interest and positive emotions.

In this context it seems to be manifest to use ludative methods of teaching and learning (Sanchez 2011; Knautz 2013).

Following the rise of digitalisation, games can be composed with the help of the computer, or can even be adopted for and with the computer, in order to "learn by playing" (a term used by Blumberg 2014; similar, for example, Ritterfeld 2011).

Meanwhile *Serious Games* clearly have become a genre of its own right in computer-based ludative teaching and learning (overview: Ritterfeld et al. 2009; Fromme/Unger 2012; Bredl/Bösche 2013). More so, this genre has become more and more important in recent years, as can be concluded for example from the fact that the "New Media Consortium", an international expert group with members in the fields of educational technologies who work in universities, museums or other (mainly American) institutions, in its latest annual reports declares "Games und Gamification" a trend most likely to make a significant impact within the near future, that is, in a time horizon of the next two or three years (NMC 2013: 20ff.; NMC 2014: 40ff.).

## Theoretical and empirical questions

On the other hand, question is in how far games can be used for pedagogical purposes. For example, Kerres et al. (2009) discuss (insofar referring to Oerter 1999) whether a "game" that is "exploited" for didactical purposes is still a "game". The authors acknowledge that almost every game transmits experiences that can be used for reflection and thus are connected with teaching and learning (not only motor learning, but also acquiring declarative information). Therefore, it seems to be possible to utilise games for teaching and learning; however, the topic remains somewhat fuzzy (see for example Szilas / Sutter Widmer 2009).

Apart from the theoretical discussion, there are problems in appliance. For example, many learners try to avoid "learning modes" in order to as fast as possible return to a "gaming mode" (again, Kerres et al. 2009).

At least, *Serious Games* have to find a balance between the ludative element that exists for its own sake, and didactical or pedagogical goals that should neither be all too intrusive, nor lose sight of the aims.

Within these manifold and differing aspects it seems to be still uncertain whether *Serious Games* indeed help to improve learning results. In regard of what has been said before, two assumptions are possible: (1.) result might be a certain predominance of the ludative aspect that could even be so intense that it hinders learning; or, and on the other hand, (2.) result might be an intensification that, by activating the hippocampus, enforces successful teaching and learning.

Of course, the question on whether teaching and learning in the context of / with computer-based games is discussed so acutely as this question itself is quite fresh: whereas *Serious Games* exist as a didactical tool since some two decades, the games develop and change so fast and so divert that every specific assertion has to be verified again and again, as it very much depends on specific games, their character, the very medium, and thus is very much time-dependant, too (Ke 2009).

## State-of-the-Art

In consequence, all meta-analyses we found (Squirre 2003, Kirriemuir/McFarlane 2004, Heers 2005, Vogel et al. 2006, Arnseth 2006, O'Neil et al. 2005, or, more recently, Ritterfeld et al. 2009 or Wouters et al. 2009) state that until now there exist but meager findings in regard of the teaching and learning effects of *Serious Games*; O'Neil et al. (2005) and Wouters et al. (2009: 232) both even use the drastic term of "scant". Clarke et al. (2010) state that there is no prove whatsoever that *Serious Games* enhance teaching and learning, and the result of the overview by Vogel et al. is as follows: "no significant advantage was found" (Vogel et al. 2006: 229).

The reasons for this assessment are comprehensible: Ke (2009) stresses for example the difficulties to come to basic conclusions when so many different games - and even genres of games - exist that can hardly be compared with each other. Not only the games are different, but also the topics, and the content that has to be learnt. Also, different games have different designs and structures, respectively. Thus, every game has specific possibilities of how it's effects would be.

Ke wanted to examine (1) what the cumulative qualitative and quantitative evidence for using computer games for learning would be, and (2) what the factors that weigh in an effective application of instructional gaming would be - "if any", as he added (2009: 2). Indeed he found out that the success of *Serious Games* very much seems to depend on the context and the content, but also on the pedagogical competences of the teachers who include the very game in their lessons, and the topic. Advantages were found in regard of higher-order thinking (e.g., planning and reasoning) and affective outcomes, whereas the effects of games on factual or verbal knowledge acquisition were weaker. These results correspond with the findings of Breuer and Bente (2010).

The results of a meta-study by Sitzman (2011) point in the same direction. She emphasizes the importance of an active (instead of a passive) acquisition of learning contents. Also, a game must not stand alone but should be included in a context with other learning assets. All in all, activation of the learner is the crucial criterion, according to Sitzman. However, she found that up to now computer games seem to assign the students mostly to a passive role. However, even when learners from an experimental and from a control group both were able to take over an active part the progress of learners who did not play with a computer-based game as a rule was more convincing. Similar results were presented by Domagk et al. in 2010.

The meta article by Wouters et al. (2013) at least declared that the research situation has improved within the last five years up to then. The main reason seems to be that the technical development has improved, enabling new implementations and new realizations. Still, results are not definite. Most studies still show that when comparing a test group with a control group that learnt in an ordinary classroom context the results don't differ from those found out already by Ke (2005) or Sitzman (2011): Learning in the context of digital games needs training as well as suitable preparation and follow-up activities in order to be successful. - Quite interesting is the fact that the achievements were higher for example with language learning then with other topics, according to Wouters et al. (2013). The content or the topics thus seem to be an equally important factor (see also Cruz-Lara et al. 2011).

Language learning itself touches different areas, the majority of them not belonging to the sphere of higher-order thinking where Ke (2005) found the most convincing results in game-based learning. So it is quite surprising to read with Wouters et al. (2013) that there even exists a study that proves positive results with vocabulary learning with English learners from Hong Kong, obviously even significant in the statistical sense (Yip/Kwan 2006). My own research added a similar study from Iran, according to which vocabulary learning again was significantly more effective in the context of gaming (Alemi 2010). So it seems language learning is a sphere where computer-based games are quite convincing. A French study saw positive motivational effects with language learning in a three-dimensional game (Amoia et al. 2012). - Other studies quoted by Wouters et al. (2013) that proved positive effects of game-based learning in languages refer to reading competences (with children from Chile: Rosas et al. 2003) or with hearing, reading and writing comprehension (in Korea: Sug et al. 2010).

Yet another very recent meta article is by Hamari et al. (2014). The authors examine 24 empirical studies focussing on *gamification* for learning purposes. Again it could be shown that digital games are able to boost the learner's motivation and interest, and yet again that embedment and user behaviour are crucial aspects for the success of *gamification* in education.

## Future Tasks

All in all, the overview showed that *gaming* itself is not clearly defined and might refer to very different ways of how to proceed. The research papers use the general term for example for "Video Games" (Rosas et al. 2003), "Websites with Online-Games" (Yip/Kwan 2006) or a "massive multiplayer online role-playing game" (Suh et al. 2010). In regard of these multifold possibilities to play on and with the computer in a learning context (and assuming that these multifold possibilities might be a cause for success or failure), Ke (2005) already stressed that all empirical results are time-based, or rather dependant on the technical development and the tools used. Thus the current state-of-the-art should not primarily lead to the question of *whether* games should be integrated in a learning environment (or not), but on *how* this could be done best, with what topic, at what opportunity, in what embedment (thus, with what kind of "instructional game design"), maybe even with what kind of learners. In any case a careful planning of the external and internal support is compulsory, external support referring to the classes and the game's embedment, a positive gaming environment, and well structured cooperative gaming scenarios; internal support referring to elaborated ways to give feedback or the multimodal presentation of the learning content.

Thus, we are still far away from a general result on whether computer-based gaming or *Serious Games*, for that matter, are successful or not. Of course, a convincing integration of gaming and learning is compulsory in each new effort to create a

computer-generated game. However, success is not guaranteed, nor is failure necessary. We still have to "try out", as Petko said already in 2008 (11).

# Should national accounts be taught by macro-economists or statisticians?

## Abstract

National Accounts as a subject taught at economics-oriented universities is a field on the borderline between macroeconomics and (economic) statistics. It is based on the logic of economic theory, on which a system of quantified statistical indices is built. However, will economic knowledge be sufficient for the student's understanding of not only the substance and logic of national accounts, but also of the substance of indices and their mutual relationships, constructions and the balance documents of the national accounts? The authors of the present paper have, for many years, been teaching National Accounts at universities, to both statisticians and non-statisticians.

## 1. Introduction

National Accounts as a subject taught at economics-oriented universities<sup>§§§§</sup> is undoubtedly a field on the borderline between macroeconomics and (economic) statistics. This fact is implied by the very substance of National Accounts<sup>\*\*\*\*\*</sup> as a descriptive model of the national economy based on macroeconomic statistical considerations. It stems from the logic of economic theory, on which a system of quantified statistical indices is built. Without economic theory, national accounts would be not a system but just a collection of indices. And vice versa: without statistics, national accounts would be just a description of notions and their mutual relationships without the ability to quantify them. In other words, statistics takes from economic theory its notions and their mutual relationships, looking for the (best) corresponding indices and ensuring that the relationships between indices (i.e., variables) derived from relationships between notions were also valid<sup>††††</sup>.

We have to keep these basic ideas in mind in order to answer the question asked in the title of this paper. Who should be teaching National Accounts to university students of economic fields? Economists? Statisticians? Moreover, will mere economic knowledge be sufficient for the student's understanding of not only the substance and logic of National Accounts, but also of the substance of indices and their mutual relationships, constructions and the balance documents of the national accounts (in particular input-output tables and integrated economic accounts)? Is it possible to work with the national accounts data without knowing (at least on the user level) statistical procedures for data collection and processing, methods of statistical deflation, and other statistical methods and procedures?

## 2. From economic theory to statistics

Let us have a look at the basic problem in the relationship between the economic theory and economic statistics, which seems to be a key one from the viewpoint of our main question; we will show it as a simple example of a path from a relationship defined within economic theory to a relationship between indices and their values in the system of national accounts. This simple case may enable us to realise that, once we progress from notions to indices, we have to consider not only their definitions, but also their properties, methods of valuation, etc. And in national accounts we must add relationships between indices that make up the basic structure of the system – national accounts form an extensive system of mutually intertwined indices and their values.

Following the Keynes economic theory<sup>†††††</sup>, which is the economic basis for national accounts, equality between resources and

§§§§ Cf. for example Archambault and Boeda (1999), Hronová et al. (2009), Lequiller and Blades (2006), Malherbe (1992).

\*\*\*\*\* In this paper, "National Accounts" (capitalised) is used for the university subject, while "national accounts" (in lower case letters) stands for the system of the accounts used in the national economy.

†††† Cf. Giovanninni (2008).

††††† Cf. Keynes (1991).

use of goods and services is given as follows:

$$Y = C + I + G + NX, \quad (1)$$

where  $Y$  – output,  $C$  – consumption,  $I$  – investments,  $G$  – government purchases of goods and services, and  $NX$  – net exports.

Formula (1) represents a relationship between notions, i.e., it is an economic formula based on the fundamental method of social sciences, namely, abstraction. The theory is not interested in whether these relationships are also valid quantitatively. When we come to a verification of such a relationship on the basis of statistical data, we have to ask which indices are used to replace the general notions in formula (1). What is output  $Y$  here? Will it be domestic product or national product? Whether domestic or national, will it be net or gross? Perhaps the output index is even meant? And what is consumption here? Is it just the households' consumption? And does it stand for the households' consumption expenditure or their actual consumption? We can even hear that  $Y$  is the gross domestic product (hereinafter GDP), total output (or the quantity of manufactured output), total income or total expenditure. But all of these variables are different! It may not be a problem from the viewpoint of theoretical economists, but a statistician cannot accept such an approach: not even as an essential idea. Output and GDP are indices that are fundamentally different from each other both formally and by their contents; and, naturally, their values are different as well!

Arguments which theoretical economists bring forward to support the validity of Formula (1) are based on their methodology. By Formula (1) they want to represent the basic economic relationships that are valid within the "thought model" as a basis of economic theory. It is an approach possible within the framework of teaching macroeconomics, even if such unclear definitions of notions do not enable students to understand how the validity of Formula (1) (and other, similar formulae) can be proved. Should they be able to verify it in a real economy, they must look for the corresponding indices – it means, turn to statistics, which provides indices that (more or less) express the economic notions used. Let us go through the ideal procedure to be followed by students progressing from economic notions to indices and their relationships and values so that the statistical data are understood and properly processed. It is clear that this way is not an easy one: a simple notion-index translation table is not a solution, and methods for representing national accounts play the key role.

As mentioned above, a balance between resources and the use of goods and services is valid in economic theory. Translating this observation into a form of index relationships<sup>§§§§§</sup>, on the left hand side stands the value of goods and services produced and imported in the national economy, and on the right hand side we have their use for intermediate consumption and final consumption by the population and government, investments and exports. Hence it is true that

$$O + Im = IC + FCE + GCF + Ex, \quad (2)$$

where  $O$  – output,  $Im$  – imports of goods and services,  $IC$  – intermediate consumption,  $FCE$  – final consumption expenditure,  $GCF$  – gross capital formation, and  $Ex$  – exports of goods and services.

Statistics will not, however, be satisfied with expressing relationships between indices as variables copying the macroeconomic balance formula. Statistics must prove that the relationships are not only valid between the variables that represent the quantified forms of economic notions, but also between the values of these variables. An obstacle preventing the left and right hand sides of Formula (2) from being equal to each other is given by the fact that different types of prices are used in the definitions of different indices (output is expressed in basic prices, imports in CIF prices, intermediate and final consumption and the gross capital formation in purchase prices, and exports in FOB prices. If Formula (2) is to hold quantitatively, an "appraisal correction" must be added to its left hand side – so-called net taxes on products, representing a difference between purchase and basic prices. Formula (2) is thus transformed into Formula (3).

$$O + Im + NTP = IC + FCE + GCF + Ex, \quad (3)$$

where  $NTP$  – net taxes on products.

There is no economic reasoning to justify the addition of net taxes on products on the side of resources in Formula (2); such addition simply does not follow from the general equality between resources and use. It follows from the purely statistical substance of the observed indices, that is, by their definitions and the types of prices in which they are established and published. Economic theory does not pay any attention to such aspects. Here it is statistics which unambiguously defines all properties of the indices entering the formula for balance of resources and the use of goods and services.

Another modification of Formula (2) takes us to the final statistical form of Formula (1): now it is clear what is understood under product (namely, GDP in purchase prices); consumption and expenditure by general government are replaced with an index of final consumption expenditure by households, general government and non-profit institutions serving households; investments with an index of gross capital formation and imports and exports with indices of imports of goods and services and exports of goods and services. All of these indices and their values are found in the national accounts<sup>\*\*\*\*\*</sup>.

<sup>§§§§§</sup> Interval indices are called transactions in national accounts.

<sup>\*\*\*\*\*</sup> More exactly on the account of the national economy and the account of the Rest of the world.

$$GDP = FCE + GCF + (Ex - Im), \quad (4)$$

where  $GDP = (O - IC) + NTP$  is the gross domestic product in purchase prices.

Is Formula (3) a true expression of Formula (1)? We cannot say precisely; but it is the only possible expression, and therefore the only possible "proof" of the validity of the formula derived on a theoretical basis. But, is it really so? Is the statistically expressed identity (4) between resources and the use of GDP a real proof that the theory is true? Perhaps statistics just "adapts itself" to the relationships defined within economic theory. If students are to understand which subject is the decisive one in this relationship between economic theory and statistics, the substance of statistical inference must be explained to them.

The national accounts on which the values of (not only) the above-mentioned indices can be found form a logical (though rather complex at first sight) system of tables and indices. Investigation of source information for the annual national accounts requires rather extensive statistical inference – mainly sample surveys. Before the statistical office publishes the values of major aggregates derived from the established data, a procedure in several stages takes place. At least, in addition to the data acquired from statistical records, there is aggregation of data from administrative and other resources, and also model estimates (where data sources from inference are lacking). Then modifications come, in particular conceptual (methodological<sup>†††††</sup>) adjustments, and adjustments for exhaustiveness (to include legal but uncovered, as well as hidden and illegal parts of the economy). After these demanding and laborious stages, balancing is carried out; in our example, the index values are adapted to comply with Formula (4). The resulting index values in Formula (4) are given by the requirement that the equality between the resources and the use of GDP must hold. Here economic theory is a dominant factor: values of macroeconomic indices are adapted so that the basic balance relationships hold on which national accounts are based<sup>†††††</sup>. Nonetheless, this fact will only be understood by those who know the substance of statistical inference.

Statistics thus adjusts the resulting values of the macroeconomic indices according to the balancing relationships stemming from economic theory; on the other hand, it infringes on these relationships, depending on the valuation of indices in Formula (4). Namely, Formula (4) holds if aggregates are expressed in current prices and "classical" constant prices<sup>§§§§§</sup>, but it does not hold with respect to valuation in chained previous years' prices, reference  $n$ ; in other words, in this case it only holds in years  $n$  and  $n + 1$ . This notion of chained previous years' prices<sup>\*\*\*\*\*</sup> (for simplicity, but incorrectly, sometimes presented by some statistical offices as constant prices, reference  $n$ ) is usually hard to be grasped by the normal user who does not know the statistical substance of this notion. This statistical substance is implied by elementary relationships of index theory.

We can imagine an aggregate value in year  $n + k$  in the previous years' prices chained to the basis of year  $n$  as the given aggregate in year  $n$ , expressed in current prices, multiplied by a sequence of year-to-year Laspeyres chained volume indices. In fact, practical application goes the other way around when coming from valuation in current prices to previous years' prices chained to the basis of year  $n$ : namely, aggregates are deflated in current prices with the aid of Paasche pricing indices. These procedures result in non-additiveness of Formula (4)<sup>†††††</sup>, hence the equality between resources and the GDP use is not valid any more. This is a principal infringement on the relationships defined by economic theory, and it cannot be understood without knowledge of statistics. It is one of the most difficult parts of National Accounts to explain the system of valuation of major aggregates, and especially the chained previous years' prices. Statistical interpretation of this concept is, however, a necessary precondition for students' understanding the data on national accounts, as well as relationships between major aggregate values expressed in different prices.

Let us once again consider Formula (3), which not only expresses the basic balance with respect to goods and services, but also serves as a basis for one entire section of national accounts devoted to description and analysis of the origin and use of goods and services, resulting in the input-output tables. The substance of these tables must be explained on the basis of Formula (3), which holds not only for the national economy as a whole but also for individual products (according to their classification). For each index in Formula (3) we thus get a vector of values, and a matrix in the case of intermediate consumption. Adding entries for industry's added value and production into the intermediate-consumption matrix we get the basic logical structure of the input-output tables (i.e., supply and use tables and symmetric input-output tables). Additional treatment of the contents of the input-output tables (valuations, transfers of by-products, trade margins, transportation margins, and conversion of resource-and-use tables to symmetric tables) would be inconceivable without knowledge of the statistical substance of that notion. In its turn, understanding the statistical basis of the input-output tables is a precondition for coming from descriptions of table structures to analyses based on those tables. At this point, econometricians may take the lecturing floor from statisticians.

Looking for a reply to the question cited in the title of this paper, we have chosen a simple but important balance relationship,

††††† Methodological adjustments are aimed at explaining the differences between the corporations' and national accounts and other sources of data and the methodology of the ESA 1995 Standard (or rather ESA 2010 now).

††††† We deliberately use plural here: the rule of value balancing in compliance with generally defined relationships governs not only Formula (3), but the entire system of national accounts.

§§§§§ Classical constant prices (when goods and services in all observed years are valued by prices valid in the chosen reference year) have now ceased to be used for valuation of macroeconomic indices. Previous year's prices have replaced them.

\*\*\*\*\* Sometimes they are simply called chained prices.

††††††† Except for years  $n$  and  $n + 1$ .

in fact, the first among those a student learns about when studying National Accounts. The entire description and analysis of the origin and use of goods and services is based on the idea that the production is followed on national accounts according to what is produced<sup>\*\*\*\*\*</sup>. From a simple Formula (3), which is based on a balance Formula (1) defined in economic theory, we get as far as the input-output tables – an extensive statistical document; unfortunately, not a very user-friendly one. By looking at individual stages on the way from Formula (1) via Formulae (3) and (4), we tried to demonstrate (on one of the balance relationships that are valid on national accounts) that, without understanding the statistical substance of indices (implied by their definitions, valuation, and methods of inference), students cannot grasp the ideas of the National Accounts, which prevents them from using such ideas in practice. The national accounts represent a very rich resource of information; unfortunately, the extent of the use of such information does not seem to correspond to that fact. One of the reasons is the misleading appearance of complexity and the large scope of this information system; but in many instances also a simplistic method of teaching, which prevents students (who later become potential users) from getting to the statistical aspects of the data presented. If National Accounts are presented to students as a purely economic model without their statistical aspects, students find it difficult to orient themselves in real statistical documents of the national accounts (input-output tables, accounts of sectors, national economy and the rest of the world, and integrated economic accounts); later (in practice) they either grow resigned to using them, or they use them incorrectly. In other words, the subject of National Accounts should be taught by a statistician experienced in both statistical theory and the practice of government statistics; and this subject should only be included after completion of macroeconomics and (at least) basic statistics.

### 3. Conclusions

The authors' experience with many years of teaching show that students are, without basics of statistics, unable to understand National Accounts to an extent that would allow them to make use of all data provided by this system of statistical information. The concept of National Accounts should not only make use of lectures but also tutorials at which students have hands-on experience with the contents of and differences between individual indices and their valuations. It is the only means for to understanding their substance, mutual relationships between index values, and the structure of the resulting documents of national accounts (input-output tables, accounts of sectors, the national economy and the rest of the world, and integrated economic accounts) and to the students' orientation in them. The structure of National Accounts is logical: its logic stems from economic relationships, but is ensured by the statistical basis of the information contained in them. National Accounts as a university subject should therefore be taught by statisticians, that is, within statistical subjects, and should only be included as late as in master studies at universities of economic orientation.

## Abstract

Araştırmada öğretmenlerin okuma güçlüğü yaşayan öğrencilere yönelik yapılması gereken eğitsel uygulamaları belirlemede nicel yöntem kullanılmıştır. Veri toplamada Yurdakal ve Susar Kırmızı (2014) tarafından hazırlanan “Okuma Güçlüğüne İlişkin Eğitsel Uygulamalar Ölçeği (OGİEUÖ)” kullanılmıştır. Ölçekten elde edilen veriler SPSS( Statistical Package for the Social Sciences) 15.0 paket programı ile analiz edilmiştir. Öğretmenlerin okuma güçlüğüne yönelik kullandıkları eğitsel uygulamaların cinsiyet, yaş ve kıdem boyutlarında farklılaşması incelenmiştir. Cinsiyet boyutunda farklılaşmada t-testi, yaş, okutulan sınıf ve kıdem boyutunda farklılaşmada ise tek yönlü varyans analizi (ANOVA) kullanılmıştır. Analiz sonuçlarında farklılaşmaların hangi gruplar arasında belirlemede ise scheffe testi kullanılmıştır. Araştırmanın evrenini, 2013-2014 eğitim-öğretim yılında Denizli ili merkez ve merkez ilçede görev yapmakta olan, tüm ilkokullardaki sınıf öğretmenleri (1., 2. , 3. ve 4. sınıf öğretmenleri) oluşturmaktadır. Evren içinden 359 sınıf öğretmeni örnekleme dahil edilmiştir. Araştırma sonucunda sınıf öğretmenlerinin okuma güçlüğü çeken öğrencilere yönelik eğitsel uygulamaları ile cinsiyet arasında anlamlı bir farklılık olduğu bulgulanmıştır. Bu farkın erkekler lehine olduğu belirlenmiştir. Öğretmenlerin kıdem değişkenleri ile eğitsel uygulamalar arasındaki farklılaşmaya bakıldığında 1-5 yıl çalışan öğretmenlerin, 16 ve üstü yıl çalışan öğretmenlerin ve 6-10 yıl çalışan öğretmenlerin ölçekten alınan puana göre okuma güçlüğüne yönelik uygulanan uygulamalara ilişkin görüşleri 11-15 yıl çalışan öğretmenlere göre daha olumlu olduğu belirlenmiştir. Eğitsel uygulamalar ile yaş arasında ise anlamlı bir farklılığın olmadığı belirlenmiştir. Okutulan sınıf ile ölçekten alınan puanlara göre farklılaşmaya bakıldığında öğretmenlerin okuttıkları sınıf düzeyi ile ölçekten alınan puanlar arasında anlamlı bir farkın olduğu, 1., 2. ve 4. sınıf okutan öğretmenlerin ölçekten aldıkları puanlar 3. Sınıf okutan öğretmenlere göre daha olumlu olduğu bulgulanmıştır.

## 1.Giriş

Günümüz çağı bilgi çağı olup toplumların ve sistemlerin yapısı her gün hızlı bir biçimde değişmektedir. Bireylerin bilgi çağına ayak uydurması için bu değişimlere ayak uydurması gerekmektedir. İçerisinde yaşadığımız toplumun hızla değişen yapısına ayak uydurmanın yolu okumaktan geçmektedir (Yılmaz, 2008). Bu sebepten ötürü günümüz bilgi çağına ayak uydurmanın yolu okuma becerisinden geçmektedir. Okuma becerisi sadece okumaktan ibaret olmayıp okuduğunu anlama, analiz etme ve eleştirme gibi üst düzey becerileri de içermektedir. Okuma alışkanlığı olmayan ve okuduğunu anlayamayan öğrencilerin derslerinde başarılı olması, söz varlığını geliştirmesi, yeni deneyimler kazanması beklenemez (Ünal, 2006: 62). Okumanın bir çok araştırmacı tarafından farklı tanımları yapılmıştır. Demirel (1999: 59) okumayı “bilişsel davranışlarla psiko-motor becerilerin ortak çalışmasıyla, yazılı sembollerden anlam çıkarma etkinliği” olarak tanımlamıştır. Bir başka tanıma göre ise okuma birçok dilsel ve bilişsel becerinin gelişimine katkıda bulunan önemli bir beceridir ( Sylva ve Hurry,1996). Sever (1997,s.12)’e göre okuma etkinliği duygu ve düşüncelerin kavranması, çözümlenmesi ve değerlendirilmesi gibi fizyolojik, zihinsel ve ruhsal yönleri bulunan karmaşık bir süreçtir. Bu tanımlara bakıldığında okumanın basit bir süreç olmadığı okunulan verilerin kavranması, analiz edilmesi, çözümlenmesi ve çözümlenen verilerin eleştirel süzgeçten geçirilerek değerlendirmesi gibi basamakları içeren komplike bir beceri olduğu görülmektedir. Okuma, okuyucunun yalnızca sözcükleri okuması değil; aynı zamanda okuduklarının anlamlarına ulaşması ve eş zamanlı olarak birbirine bağlı birçok görevi yerine getirdiği karmaşık bir süreçtir (Miller ve Schwanenflugel, 2006). Güneş, (2007)’ye göre Okuma süreci yazıların zihinsel kavramlara çevrildiği, anlamlandırıldığı ve beyinde yapılandırıldığı için okuma zihnin gelişimine en büyük katkıyı sağlayan öğrenme alanıdır. Okuma, okuyucunun metni anlamaya uğraştığı, anladıklarını ve ön bilgilerini birleştirerek yeni anlamlar ortaya koymaya çalıştığı, uygun bir ortamda gerçekleşen, okuyucuyla yazar arasındaki bir görüş alış-verişidir (Akyol, 2007: 15). Bütün bu tanımlara bakıldığında okumanın önemi görülmektedir. Okuma sadece eğitim sürecinde değil bireylerin tüm hayat boyu ihtiyaç duyduğu bir beceri olmasından dolayı bu becerinin kazanılması çok önemlidir. özellikle ilköğretim 1. Ve 2. Sınıflarda okuma-yazma öğrenmenin kritik dönemi olması dolayısıyla bu becerinin kazanılması öğrencilerin ileriki hayatlarında başarılı bir eğitim-öğretim hayatı ve etkin bir birey olmasında önemli bir etkiye sahiptir. Bu yönüyle okumanın hayat boyu bir öğrenme kaynağı olarak kullanılması, bir

\* Corresponding author. Tel.: +905448459589

E-mail address: iyurdakal@pau.edu.tr

alışkanlık halini almasını da sağlamaktadır (Balci,2013). Okuma sürecinde algılama, kelime tanıma, anlam bilgisi, cümle diziliş bilgisi, dilsel süreçler ve anlama süreçleri gereklilik arzeder (Kırkkılıç ve Akyol, 2009). Okuma güçlüğü (Disleksi) günümüzde sıklıkla duyduğumuz bir kavram olup birçok araştırmacı tarafından farklı tanımları yapılmıştır. Bireyler için bu kadar yaşamsal öneme sahip okumanın tanımına yönelik birçok görüş vardır. Ancak tanım üzerinde ortak bir görüş birliğine varılmamıştır. Demirel (1999: 59) okumayı “bilişsel davranışlarla psiko-motor becerilerin ortak çalışmasıyla, yazılı sembollerden anlam çıkarma etkinliği” olarak tanımlarken, Özdemir (1983: 12)’e göre okuma, “basılı sözcükleri duyu organları yoluyla algılayıp bunları anlamlandırma, kavrama ve yorumlamaya dayanan zihinsel bir etkinliktir”. okuma, bilişsel davranışlarla psiko-motor becerilerin çalışmasıyla, yazılı sembollerden anlam çıkarma etkinliğidir (Razon, 1980). Bu tanımlara bakıldığında okumanın basit bir beceri olmadığı fiziksel ve bilişsel işlevlerin eşgüdümü ile meydana gelen bir beceri olduğu görülmektedir. Temel okuma becerisinin kavranması ve bu becerilerin günlük yaşama geçirilmesi son derece önemlidir. Bu bakımdan okuma becerisinin 4–15 yaş arasında kazandırılması zorunluluğu ileriki yaşlarda karşılaşılacak güçlüklerin yenilmesinde büyük bir öneme sahiptir (Gülerer ve Batur, 2004). Özellikle ilkököl 1. ve 2. sınıflar okuma becerilerini kazanmada kritik dönemleri oluşturmaktadır. İlk sınıflarda iyi okuyamayan öğrencinin anlatımı zayıf olduğu için ileri sınıflarda kitaplardan gereği gibi yararlanamaz (Avcıoğlu ve Akçamete, 1996). Bu bakımdan ilkököl 1. ve 2. sınıfların okuma becerisini kazanmada kritik döneme sahip olduğu söylenebilir.

İlkokuma yazma öğretiminde her çocuktan aynı düzeyde başarılı olmasını beklemek olanaksızdır. Normal sınıflarda karşılaşılan öğretim sorunları büyük ölçüde çocuğun bireysel farklılıklarına dayanan ve başarı düzeyinde büyük ölçülerde farklılaşmalara yol açan sorunlardır (Yangın ve Sidekli, 2006). Bu farklılaşmaya yol açan sebeplere ise genetik faktörler, ailenin sosyal ve ekonomik yapısı, çevresel faktörler ve çocuktan kaynaklanan bireysel farklılıklar gösterilebilir. Bazı durumlarda öğrencilerin okuma ve yazma süreçlerindeki başarısızlıkları aile ve öğretmenlerin kafasını karıştırabilir. Her ne kadar bu öğrenciler sınıftaki akranları ile aynı düzeyde eğitim alsalar bile akranlarından okuma ve yazma gibi temel becerilerde geride kalırlar. Bu gibi durumlarda ilk bakılması gereken öğrencide okuma güçlüğü olup olup olmadığıdır. Okuma güçlüğü, zekâ düzeyi bakımından normal, öğretim koşulları ve sosyoekonomik düzey bakımından uygun fırsatlara rağmen okumayı öğrenmede yaşanan güçluktur (Bruck, 1988). Bunun dışında sözel ve yazılı dilde gerilikler, sesleri etkin bir şekilde kullanmada ve sıralamada aksaklıklar, temel okuma kuralları ve alfabe ilkelerini çözümleyememe, sözel okumada yavaşlık ve yanlış okumalar, yaşına uygun sözcük kapasitesinin olmaması, öğrendiği kelimeleri düzgün telaffuz edememe, okuma sürecinde kelimeleri atlama, okuduğu metinleri anlayamama, tahtada yazan kelime ya da cümleleri deftere geçirirken hatalar yapma, yavaş veya zayıf bir el yazısı, aynı kelimeleri farklı zamanlarda farklı şekilde seslendirme, ay, hafta veya günleri ezberleyememe ya da yanlış sırayla ezberleme, zamanı söylemede sorunlar yaşama, telefon numaraları gibi önemli sayı veya numaraları unutma, sol ve sağ kavramlarını karıştırma gibi belirtiler okuma güçlüğüünün göstergeleri olabilir.

## 2.Yöntem

Araştırmanın nicel desenle hazırlanmıştır. Araştırmada nicel desenlerden tarama modeli kullanılmıştır. Tarama modeli insanların tutumları, inanışları, değerleri, alışkanlıkları, düşünceleri gibi bilgi türlerini belirlemede kullanılan bir araştırma modelidir (Mcmillan ve Schumacher, 2001). Araştırmada öğretmenlerin okuma güçlüğü yaşayan öğrencilere yönelik yapılması gereken eğitsel uygulamaları belirlemede nicel yöntem kullanılmıştır. Veri toplamada Yurdakal ve Susar Kırmızı (2014) tarafından hazırlanan “okuma güçlüğüne ilişkin eğitsel uygulamalar ölçeği (OGİEUÖ)” kullanılmıştır. Ölçekten elde edilen veriler SPSS( Statistical Package for the Social Sciences) 15.0 paket programı ile analiz edilmiştir. Öğretmenlerin okuma güçlüğüne yönelik kullandıkları eğitsel uygulamaların cinsiyet, yaş ve kıdem boyutlarında farklılaşması incelenmiştir. Cinsiyet boyutunda farklılaşmada t-testi, yaş, okutulan sınıf ve kıdem boyutunda farklılaşmada ise tek yönlü varyans analizi (ANOVA) kullanılmıştır. Analiz sonuçlarında farklılaşmaların hangi gruplar arasında belirlemede ise scheffe testi kullanılmıştır. Denizli ili merkezde görev yapmakta olan 1678 sınıf öğretmeni vardır. Araştırmada evrenin tamamına ulaşamayacağından evrenden bir örneklem kesiti seçilmiştir. Örneklem, belli kurallara göre, belli bir evrenden seçilmiş ve seçildiği evreni temsil yeterliği kabul edilen küçük kümedir. Araştırmalar çoğunlukla örneklem kümeler üzerinde yapılır ve elde edilen sonuçlar ilgili evrenlere genellenir (Karasar, 2005, s.110-111). Araştırmada olasılıklı örnekleme türlerinden basit tesadüfî örnekleme türü kullanılmıştır. Basit tesadüfî örneklemede evreni oluşturan her elemanın örneğe girme şansı eşittir. Dolayısıyla hesaplamalarda da her elemana verilecek ağırlık aynıdır (Arıkan, 2004: 141). Araştırmanın evrenini, 2013-2014 eğitim-öğretim yılında Denizli ili merkez ve merkez ilçede görev yapmakta olan, tüm ilkökullardaki sınıf öğretmenleri (1., 2. , 3. ve 4. sınıf öğretmenleri ) oluşturmaktadır. Evren içinden 359 sınıf öğretmeni örnekleme dahil edilmiştir.

Araştırmaya katılan sınıf öğretmenlerinin cinsiyetine ilişkin bilgiler tablo 1’de gösterilmiştir.

Tablo 1: Sınıf öğretmenlerinin cinsiyetlerine ilişkin tablo

Cinsiyet	N	Yüzde
Bay	164	%45,7
Bayan	195	%54,3
Toplam	359	%100,0

Tabloda görüldüğü gibi öğretmenlerin %45.7'si erkek, %54.3'ü bayandır. Öğretmenlerin 164'ü erkek, 195'i ise bayandır. Tabloda görüldüğü gibi katılımcıların cinsiyete göre dağılımları büyük farklılıklar göstermemektedir.

Araştırmaya katılan sınıf öğretmenlerinin meslekte çalışma yıllarına (Kıdem) ilişkin bilgiler tablo 2'de gösterilmiştir.

Tablo 2: Sınıf öğretmenlerinin çalışma yıllarına ilişkin tablo

Kıdem Yılı	N	Yüzde
1-5	38	%10,6
6-10	41	%11,4
11-15	67	%18,7
16-ve üstü	213	%59,3
Toplam	359	%100,0

Tabloya göre öğretmenlerin büyük bir çoğunluğu 16 ve üstü kıdem yılına sahiptir. Bunun sebebi araştırmanın Denizli merkez ilçelerde yapılması ve bu ilçelerde genellikle kıdemli öğretmenlerin görev yapması olabilir. Tabloya bakıldığında öğretmenlerin 38'i 1-5 kıdem yılına, 41'i 6-10 kıdem yılına, 67'si 11-15 kıdem yılına, 213'ü ise 16 ve üstü kıdem yılına sahiptir. Kıdem yılı 1-5 olan öğretmenler tüm öğretmenlerin %10.6'sını, 6-10 yıl olanlar %11.4'ünü, 11-15 yıl olanlar %18.7'sini, 16 ve üstü olanlar ise %59.3'ünü oluşturmaktadır.

Araştırmaya katılan sınıf öğretmenlerinin yaşlarına ilişkin bilgiler tablo 3'te gösterilmiştir.

Tablo 3: Sınıf öğretmenlerinin yaşlarına ilişkin tablo

Yaş	N	Yüzde
20-30	54	%15,0
31-41	78	%21,7
42-52	184	%51,3
53-ve üstü	43	%12,0
Toplam	359	%100,0

Tabloya bakıldığında 54 öğretmenin 20-30 yaş arasında olduğu (%15.0), 78 öğretmenin 31-41 yaş arasında olduğu (%21.7), 184 öğretmenin 42-52 yaş arasında olduğu (%51.3) ve 43 öğretmenin ise 53 ve üstü yaş arasında olduğu (%12) görülmektedir. Tabloya göre öğretmenlerin büyük bir çoğunluğunun 42-52 yaş arasında olduğu (%51.3) görülmektedir. 20-30 yaş arası öğretmen sayısının az olmasının sebebi merkezde çalışan öğretmenlerin genellikle tecrübeli ve 15 ve üzeri kıdem yılına sahip olması gösterilebilir.

### 3.Bulgular

Öğretmenlerin okuma güçlüğüne yönelik uygulamalarına ilişkin ölçek puanlarının cinsiyete göre farklılaşıp-farklılaşmadığına bağımsız gruplar t testi ile bakılmıştır.

Analiz sürecinde bağımsız gruplar t testini kullanabilmek için dağılımın normal olması gerekmektedir. Dağılımın normal olup olmadığını belirlemek için Kolmogrov-Smirnov testi kullanılmıştır. Örneklem büyüklüğünün 50 ve altı olması durumunda dağılımın normalliğini bulmada Smirnov testi ile 50'nin üstünde olması durumunda ise kolmogrov testi kullanılmaktadır. Araştırmanın örneklemini 50'nin üzerinde olduğundan kolmogrov testinin kullanılması uygundur (Büyüköztürk, 2011).

Tablo 4: Öğretmenler için okuma güçlüğü yaşayan öğrencilere yönelik yapılması gereken eğitsel uygulamalar ölçeğine ait Kolmogorov testi sonuçları

Kolmogorov testi sonuçları			
Statistic	df	Sig.	
Toplam	,143	359	,200

Tabloya bakıldığında kolmogrov değerinin 0.200 olduğu görülmektedir. Dağılımın normalliğine karar vermek için p(Sig.) Değerine bakılmalıdır. Sig. Değeri(0.200) .05'in üzerinde olduğundan dağılım normaldir (Seçer, 2013).

Dağılımın normal olduğu belirlendikten sonra ölçekten alınan puanların cinsiyete göre farklılaşıp farklılaşmadığını belirlemek için bağımsız gruplar t testi kullanılmış olup bağımsız gruplar t testine ilişkin tablo aşağıdadır.

*Tablo 5: Öğretmenler için okuma güçlüğü yaşayan öğrencilere yönelik yapılması gereken eğitsel uygulamalar ölçeğinin sonuçlarının cinsiyete göre farklılaşmasına ilişkin tablo*

Cinsiyet	N	$\bar{X}$	S	sd	t	p
<b>Bay</b>	164	173.80	13.68	357	3.20	0.01
<b>Bayan</b>	195	178.11	11.84			

Tabloya göre öğretmenlerin okuma güçlüğüne ilişkin uygulamaları cinsiyete göre anlamlı farklılık göstermektedir,  $t(357)=3.20$ ,  $p<0.05$  (Büyükbaş et al., 2011; Ekici et al., 2013). Bu sonuçlara göre daha olumludur. Kısaca okuma güçlüğüne yönelik uygulamalara ilişkin ölçek puanları ile cinsiyet arasında anlamlı bir ilişki vardır ve bu ilişki bayanlar lehinedir.

Öğretmenler için okuma güçlüğü yaşayan öğrencilere yönelik yapılması gereken eğitsel uygulamalar ölçeğinden alınan puanların yaşa göre anlamlı farklılık içerip içermediğini belirlemede tek yönlü varyans analizi (ANOVA) kullanılmıştır.

*Tablo 6: Öğretmenler için okuma güçlüğü yaşayan öğrencilere yönelik yapılması gereken eğitsel uygulamalar ölçeğinin yaşlara göre betimsel istatistikler.*

Yaş	N	$\bar{X}$	SS
20-30	54	177.16	13.40
31-41	78	175.71	13.93
42-52	184	176.45	11.68
53- ve üstü	43	174.32	15.23

Tabloda ölçekten alınan puanların betimsel istatistikleri görülmektedir. Ölçekten alınan puanların kıdeme göre manidarlık düzeyini gösteren ANOVA sonuçları tabloda gösterilmiştir.

Tablo 7: Öğretmenler için okuma güçlüğü yaşayan öğrencilere yönelik yapılması gereken eğitsel uygulamalar ölçeğine ilişkin varyanslarının homojenliği

Levene Statistic	df1	df2	Sig.
1,250	3	355	,291

*Tablo 8: Öğretmenler için okuma güçlüğü yaşayan öğrencilere yönelik yapılması gereken eğitsel uygulamalar ölçeğinin sonuçlarının yaşlara göre farklılığına ilişkin ANOVA sonuçları*

	Kareler toplamı	df	Ortalama kareleri	F	Sig.
Gruplar Arası	230,787	3	76,929	,461	,709
Grup İçi	59182,389	355	166,711		
Toplam	59413,175	358			

Tabloya bakıldığında sig değerinin 0,709 olduğu görülmektedir. Buna göre ölçekten alınan puanlar ile öğretmenlerin yaşları arasında anlamlı bir farklılığın olmadığı görülmektedir. ( $p= 0.709$ ,  $P>0.05$ )

Öğretmenler için okuma güçlüğü yaşayan öğrencilere yönelik yapılması gereken eğitsel uygulamalar ölçeğinden alınan puanların kidede göre anlamlı farklılık içerip içermediğini belirlemede tek yönlü varyans analizi (ANOVA) kullanılmıştır.

*Tablo 9: Öğretmenler için okuma güçlüğü yaşayan öğrencilere yönelik yapılması gereken eğitsel uygulamalar ölçeğinin sonuçlarının kidede göre farklılığına ilişkin ANOVA sonuçları*

	Kareler toplamı	df	Ortalama kareleri	F	Sig.
<b>Gruplar Arası</b>	1869,580	3	623,193	3,845	,010
<b>Grup İçi</b>	57543,595	355	162,095		
<b>Toplam</b>	59413,175	358			

Tabloya bakıldığında Sig değerinin 0.010 olduğu görülmektedir. Bu değere göre öğretmenlerin kıdemleri ile ölçekten alınan puanlar arasında anlamlı bir fark olduğu görülmektedir.  $F(3,355)=3.845$ ,  $p<.01$ . Kıdemler arası farklılığın hangi gruplar arasında olduğunu bulmak amacıyla yapılan Scheffe testinin sonuçlarına göre 1-5 yıl çalışan öğretmenler (X=77,6), 6-10 yıl çalışan öğretmenler (X=78,4) ve 11-15 yıl çalışan öğretmenler (X=79,3) arasında anlamlı bir fark olduğu görülmektedir. 11-15 yıl çalışan öğretmenlerin okuma güçlüğüne yönelik uygulanan uygulamalara ilişkin algıları 11-15 yıl çalışan öğretmenlere göre daha olumlu olduğu belirlenmiştir.

Tablo 10. Kıdeme göre farklılaşmaya ilişkin scheffe testi sonuçları

	Kıdem	N	Subset for alpha = .05	
			1	2
Scheffe(a,b)	11-15	67	171,6716	
	1-5	38		176,7368
	16-ve üstü	213	176,8404	176,8404
	6-10	41		179,3171
	Sig.		,198	,761

#### 4.Sonuç

Araştırma sonucunda sınıf öğretmenlerinin okuma güçlüğü çeken öğrencilere yönelik eğitsel uygulamaları ile cinsiyet arasında anlamlı bir farklılık olduğu bulunmuştur. Bu farkın erkekler lehine olduğu belirlenmiştir. Öğretmenlerin kıdem değişkenleri ile eğitsel uygulamalar arasındaki farklılaşmaya bakıldığında 1-5 yıl çalışan öğretmenlerin, 16 ve üstü yıl çalışan öğretmenlerin ve 6-10 yıl çalışan öğretmenlerin ölçekten alınan puana göre okuma güçlüğüne yönelik uygulanan uygulamalara ilişkin görüşleri 11-15 yıl çalışan öğretmenlere göre daha olumlu olduğu belirlenmiştir. Eğitsel uygulamalar ile yaş arasında ise anlamlı bir farklılığın olmadığı belirlenmiştir. Okutulan sınıf ile ölçekten alınan puanlara göre farklılaşmaya bakıldığında öğretmenlerin okuttukları sınıf düzeyi ile ölçekten alınan puanlar arasında anlamlı bir farkın olduğu, 1., 2. ve 4. sınıf okutan öğretmenlerin ölçekten aldıkları puanlar 3. Sınıf okutan öğretmenlere göre daha olumlu olduğu bulunmuştur. Araştırma sonucunda şu öneriler sunulmuştur. MEB sınıf öğretmenlerinin sınıflarında en çok karşılaştıkları sorunlardan olan okuma güçlüğüne ilişkin öğretmenlere hizmet içi eğitim verebilir. YÖK eğitim fakültelerine okuma güçlüğü ile ilgili bir ders koyabilir. MEB ve Üniversiteler işbirliği ile sınıf öğretmenlerine okuma güçlüğüne ilişkin konferans, seminer ya da bilgilendirici eğitimler verilebilir. MEB ilkokullarda sınıfların fiziksel özelliklerini düzenlerken okuma güçlüğü yaşayan öğrencilerde göz önünde bulundurulmalıdır. MEB ilkokullara araç-gereç temin ederken okuma güçlüğü yaşayan öğrencilere yönelik ve onların fiziksel ve bilişsel özelliklerine uygun araç-gereçler temin edebilir. MEB okuma güçlüğü yaşayan öğrencilerin velilerine okuma güçlüğü ile bilgilendirici ve öğrencilere ilişkin okuma-yazma becerisini kolaylaştıracak eğitsel faaliyetler ile ilgili bilgilendirici etkinlikler yapabilir. MEB öğretmenlere, okuma güçlüğü (disleksi) yaşayan öğrencilere yönelik okuma-yazma metodları ve yöntemleri hakkında bilgilendirici eğitimler verebilir. Sınıf öğretmenleri öğrencilerinin okuma güçlüğüne yaşadıkları problemleri belirlemeli ve bunlara uygun yöntem ve stratejileri kullanmalıdır. Okuma güçlüğü yaşayan öğrencilerin sosyal bağlamda yaşadıkları düşünüldüğünde, sınıf öğretmenlerinin bu öğrencilere yönelik işbirlikçi ortamlar yaratması gerekmektedir.

## Abstract

Since problems are essentially parts of life, it is not surprising for students to face problems in their education. Problem solving experiences contribute their personal development. However, we face a balls-up when problems are not solved and people who have similar problems increased. Increasing risky behaviors amongst students such as violence, drug use, sexual abuse, committing crimes, drop outs etc. point out a failure of Turkey in terms of dealing with students' problems. In this regard, this study emphasizes on the importance and configuration of school social work practices which is a recent trend for Turkey.

## 1.Introduction

When school life begins for a child, it will turn into a journey that is going to continue for many years for him or her. Actually, this journey is not only about education but also is a long way which prepares children to years ahead. This process will involve a child's bio-psycho-social development, new friendships, achievements, pleasures and so on. However, only good things will not be involved in this life and school would be the place of and reason for pains, sadness, disappointments, victimhood, offences etc. Problems as an inherent part of life that bother human beings at schools as well.

When considered that a student spend a large part of his or her daytime at school, we can understand that how important the school is in students' life. As an education and study place, schools has an important role in process of socialization by equipping children with knowledge, skills and values for their future.

Education process indeed is established on a base of some expectations for students. It is expected by Turkish national education system that education process make individuals stable and healthy, freethinking, open world-viewed, respectful for human rights, responsible for society, creative and efficient persons (National Education Basic Law, 1973). These are some aims of education and list can be extendable. Is this possible to make such a 'well-designated' person in a world full of problem?

Problems inevitably arise in school life because students keep growing biologically, psychologically and socially as an individual. When problems that faced are solved, the consequent experience will contribute person's development. However, when problems are not solved and the number of people who share similar problems increased, we can understand we face a social problem.

It can be mentioned that a student would face lots of problem in his or her education. These problems can be school-related or not. Family relationships, bad friend groups, low motivation for courses, low self-esteem, bullying, peer pressure, health issues, drop-out of school... All these matters may be the factors of undermining student's education process. Parents, health institutions, social service agencies and of course educational institutions are in the position of taking responsibility for such a young person's development.

Studies conducted in recent years have indicated that most of problems especially in primary and secondary schools need to come up with a solution. In this respect, it is needed to constitute multidisciplinary approach based practices to tackle students'

bio-psycho-social problem and to provide them with supportive services inside and outside the school. Based on this conceptualizing, this study pursues possible acquisitions of social work practices in school settings in Turkey. Yet, Turkey has not a formal social work system and this can be addressed as a new horizon for the years ahead.

## 2.School social work

School social work is a subfield of social work which is specialized for school settings. It focuses on biological, psychological and social factors that impact students' academic performance and general well-being. Solving student problems and giving them supportive services in a teamwork perspective aim to make students' education consistent and progressive (SSWAA, 2014).

School social work practices have a broad perspective on student problems to focus on their social life circumstances as well as their school based conditions. This perspective arises from social work's theoretical base which addresses 'person-in-environment', systems and ecological systems. A person is a whole of different aspects of his or her life. For example, a female student is not only a student as a person. She is also a woman, maybe an adolescent who is getting her sexual identity. She may have two siblings and have lost her father. She can be a good learner but may be an average student. Perhaps, she have low self-confidence although she can be good at public speaking. Person in environment requires to assess people in all their aspects. Systems (or system perspective), explain that human being, for example, is a system whose parts operate coordinately. Therefore, a non-functionality of a parts of system impacts whole system. For instance, if a student has a mental or psychical health problem, this would affect his academic performance or social relations in a negative way. At last, ecological system perspective says that systems are interrelated. In this point, we can define persons, schools, families, peer-groups, neighborhoods as systems. According to ecological system perspective, all these systems which a person interact with are interrelated and influence personal well-being. An accordance is required amongst systems the person touch (Zastrow, 2004; Duyan et al., 2008).

What kind of student issues does social work concern with? In a conceptualization, it can be stated as following (Buyuktopcu, 1989, cited in Aykara, 2010, p. 67):

*Home/family related problems:* Disliking family environment, cultural conflicts, being abused or neglected, doing housework, poverty and so on.

*Incompliance with school requirements:* Irresponsibility, absence, lack of interest, low-academic performance, delinquency, bullying, fighting, sexual harassment and so on.

*Psycho-social problems:* Fears, anxiety, depression, dyslexia, conduct disorders, behavior disorder, anti-sociality, drug use and so on.

*Psychical and mental issues:* Psychical impairments, chronic disease, mental health problems etc.

### 2.1.Social work practices in school settings

A school social worker seek solutions for students' school related problems by taking account of his or her all life conditions. Regarding this goal, social worker employs several professional approaches and techniques. Working with individuals, families, groups and community in social work are basic working levels which have their own special practice techniques.

School social workers give consultation to students about their education life. However, this consultation does not substitute the practice carried out by school 'psychological counseling and guidance teacher'. In current practice, teacher titled as psychological counselor and guide give support to students for their academic achievements, personal development, orientation, school-related problems, education activities etc. When school social worker is involved in this area, he or she will bring additional promotive approaches to enhance school's supportive services. In this regard, it is expected that social worker and school counselor will come together in a team.

Unlike school psychological counselor, school social worker is more interested in students' social life outside the school as well as school based circumstances. Therefore, when psychological and social aspects is considered together better results could be obtained.

School based social work practices bring some advantages from different points of view. Therefore, the works which would be carried out by school social worker can be pointed out as (Yildirim, 2007, p. 440):

- Support students to increase their academic accomplishment,
- Support students psychologically and socially,
- Work with families to get them involved with their children's education,
- Work with families who are in need of economic support, psychological support, better family environment etc.

- Work with community to make better school environment,
- Deal with bullying, peer-pressure, violence and anti-social behaviors in school,
- Deal with tobacco, alcohol and drug use amongst students,
- Conduct group works with students on different issues (e.g. group counseling, group therapy for students show harmful behaviors)
- Carry out extracurricular courses (e.g. training courses, personal development, communication skills, awareness)
- Enable an effective child/young protection approach (preventing child abuse and neglect, unwanted pregnancy, improper sexual behaviors etc.)
- Organize social, cultural, sportive and vocational learning activities.

List can be extendable. Social workers serves every single students and care about them. On the other hand, some specific groups of students such as those who have low academic performance, those who are in need of special education, those who come from low socio-economic background, those who live in an institutional care facility, those who are prone to violence or offence etc. are prior to be made functional. All these works are vital to be practiced at school in these days Turkey is going through. However, these psycho-social aspects of education are undermined or ignored for many years (Duyan et al., 2008, p. 170).

Families are important targets of social work intervention as well. Because a child's world is largely shaped by his or her family. Some families may need to receive social services. Some may have lack of interest in their children's education. Some may be overprotective whereas others are abusive. In this regard, some important works such as giving courses, seminars, home visits, regular meetings, individual interviews would be carried out with families.

### **3.An overview of Turkey's case**

Although school social work is a widespread efficient practice in schools over the European Union and the United States, there is no available services provided by social workers in schools in Turkey. National Education Ministry does not employ social workers for public schools.

There were some efforts to do social work in school settings in the past. In the year 1961, in Istanbul University, students' health, social, cultural and economic problems which was related to their academic and personal development were remarked and some solutions were looked for. From this point of view, a medical-social service unit were established in university in 1966. Psychologists and social workers had been employed in that service unit and service areas had been broadened in time (Tan, 2000 as cited in Ozbesler & Duyan, 2009). Medical-social service facilities were established other universities as well over the years. Nevertheless, this was not actually a school social work practice specialized for school settings.

In the Fifth Five-year Development Plan, which was announced by State Planning Organization in 1983, it had been proposed that guidance and psychological counseling services would have been provided by a school social service unit consisting of psychologist, doctor, counselor and social worker (Duman, 2000, p. 49). However, this planning was not put into practice.

In the year 2001, National Education Ministry put a new legislation into force and stated that social workers will be employed in Counseling and Research Centers over the country. Nonetheless, social workers still were not employed in schools. The limited number of social workers all over the country were an important handicap to be employed in school settings because vast majority of social workers were already employed in other state institutions. Today, social workers are still not involved with school practices.

School social work courses are generally placed in curriculum of social work departments in universities. And also, some of social work undergraduate students do their mandatory final-year internships in a school if they desire.

The latest document that will indicate the establishment of school social work is The Strategy of National Children Rights and Action Plan which comprise the years between 2013-2017. According to this strategy plan, which is announced by Family and Social Policies Ministry, social service units are planning to be set up in all public schools by the year 2016. The rationale for this is stated as "providing needed collaboration between child, family and school management and detecting children who have violence history and support them in a psycho-social way." This projection is the most tangible step so far to make social workers enabled in school settings.

### 3.1. Postgraduate studies about school social work

Academic research studies about school social work in Turkey is really limited. They can be counted on the fingers of one hand. Duman (2000), in her doctoral thesis, focused on school gangs and studied on students who have risks of joining gangs. She reported that some student groups are potentially tend to join such gang groups in terms of certain risk factors. She underlined school social work practices to deal with students' anti-social behaviors. This research report is the only doctoral level study till now.

Aykara (2010) studied on socialization issues of physically handicapped students for her social work master thesis. She researched socialization problems of handicapped student in schools and reasons for these matters. In her report, she addressed school social work for efficient school environment for such students.

In another social work master study, which was carried out Karakaya (2012), it is studied on parent participation in student's education. It is determined that many parents do not involve their children's education and there is no encouraging mechanisms to get them involved. Therefore, she addressed a necessity of social workers in schools as well.

### 4. Conclusion

Existing conditions in Turkey requires school social work policy and practice. Social work comes into prominence with its comprehensive assessment perspective about problems, ability to work outside the school (with families, other institutions, and community), different practice approaches and techniques, predisposition towards co-operation and teamwork, adopted roles (such as mediating, facilitating, advocacy, and mobilize). The aim of social work practices in school settings is to make students' education better in all aspects related to their life. To conclude, it is expected that school social workers will begin to work for students' improvement in a close future.

# Situational triggering factors - adult's "readiness to learn"- connected to certain life-stages and age?

Christin Tønseth

Norwegian University of Science and Technology NTNU. Department of Adult Learning and Counselling. 7491 Trondheim. Norway

---

## Abstract

New research findings concerning adult's participation in learning, supports earlier studies, indicating that participation in adult learning are frequently caused by certain changes or situations in adults lives. Such situations can become situational triggering factors that updates and actualize participation in learning. Theories used to explain such situational triggering factors are often connected to life stage and lifespan theories, indicating that triggering factors for participation in adult learning are connected to certain stages in adult's life and development, closely related to a person's age. Findings presented in this paper indicate that triggering factors not necessary are tightly associated with certain age or within phases in the lifespan.

## 1.Introduction

In articles published in Adult Education Quartely (Jacobs, 1959; Whaley & Whaley, 1967; Elias, 1979; Merriam & Mullins, 1981; Knox, 2002), the concept "readiness to learn" is used in not less than two different ways. One definition deals with the development of the ability to be self-directed in the learning process, while another definition is associated with the "right" time for participation in adult learning and studies (Knowles, 1988; Rubenson, 2000). Both definitions are originally associated with a lifespan perspective, which assumes that certain stages in adults development give rise to situations where the "readiness to learn" is optimal. These stages or certain moments is said to be closely related to age. This paper concerns "the proper time for recruitment and participation in learning" as a definition to the "readiness to learn" concept. In this paper "readiness to learn" refers to how likely a person actively seeks participation in learning activities and the triggering factors that actualize this "readiness".

## 2.Background and assumptions

The topic "readiness to learn" is closely related to motivation and reasons for participation in learning activities; which is a much studied topic in the adult education research field (Cross, 1982; Bandura, 1986; Rubenson, 1976). Although adults often have specific motives and seems to be very motivated for learning (Rubenson, 1976; Cross, 1982), other aspects must also be in place in order to really effectuate these motives (Tønseth, 2011). In order to explain why adults participated in learning activities, Aslanian and Brickell (1980) was testing a hypothesis assuming that transitions, such as job changes, marriage, the arrival of children and retirement, required adults to seek new learning. They found by telephone interview that 83 % of 744 adult learners named some transition in their lives as the motivating factor that caused why adult participate.

In order to explain adult's readiness to learn, lifespan theories developed by Lindeman (1926), Havinghurst (1953, 1972), Erikson (1959), Maslow (1972, 1987) and Knowles (1988, 1989) have been commonly used. All these theories assume that life is divided into phases or stage that is related to age, with certain indicators or happenings occurring at each stage. According to these theories, the exact starting point for participation will be connected to changes or special situation in adult's lives that commonly occurs at a certain age (Havighurst, 1953; Cross, 1982; Levinson, 1978; Knowles, 1988). Havinghurst (1972) identified the developmental tasks associated with different stages of growth that give rise to a person's readiness to learn different things at different times and to create "teachable moments". One of Lindeman's (1926) key assumptions about adult

learners was that adults are motivated to learn when they experience needs and interests that learning will satisfy. Adult's orientation to learning is life-centred, which means that every adult finds themselves in specific situations with respect to work, recreation, family life, community life etc. Situations which call for adjustments (Lindeman, 1926). Also Knowles et al (1998) claimed that adults become ready to learn things they need to know and do in order to cope effectively with real-life situations. Cross' "response-loop model" merges several theories and models about adult learning (Cross, 1982). Dimensions in the model is the individual self-perception, educational attitudes, consideration of the learning importance and goal achievement, life phase/-crises, possibilities and barriers and access to information.

A contradiction to these well known life phase theories is well described, for instance in a report concerning lifelong learning in Norway (Ministry of Education and Research 2007). In this report several statements contradicts the life phase perspective as a foundation for adult participation in learning. *"The development in the modern society is so rapid and it demands for competence is so high, that learning can not longer be limited to certain life-phases. Learning has to take place continuously, in different contexts"* (ibid). A number of researchers have turned to theories of late and post modernity to account for these trends (Edwards, 1997; Bauman, 2005; Field, 2006). For instance Giddens (1991) and Beck (1992), who are reflexive modernisation theorists, suggests that individuals must continually cope with recurrent and complex transitions in life, where learning is actualized.

The focus in this paper is research findings related to certain situational triggering factors that causes recruitment and participation in adult learning, as adult's selves describes it. These findings actualizes the contradiction between lifespan-theories and certain ages as the central trigger, versus new research indicating situational triggers as the most important. The research question is: What are the situational triggering factors that lead to participation in learning among adults? Are such triggering factors always tightened to certain stages in adults lives?

### 3. Life span and age as triggering factors – readiness to learn

The core contribution that life-span development theories gives, are the andragogical principles of adult learning that clarifies and refining adult readiness to learn. The premise of all these theories is that there are certain predictable types of changes that occur throughout an adult's life. Life change is seen as adult's primary driving force for learning. As the core principle of andragogy, adults are most ready to learn when the learning meets an immediate life need, and are most motivated when it fills and internal that need. Predictable changes in adult's life then means that such changes occurs in a certain pattern that one can spot in an actual phase in life as adults mature. Grounded in the premise that certain predictable types of changes occur in an adults life, these changes is seen as triggers to learning need. As a part of such predictable changes, Knowles (1988) identified five andragogical assumptions of the adult learner related to life-phases and age:

- As a person matures, he or she moves from dependency to self-directedness.
- Adults draw on their experiences to aid their learning.
- The learning readiness of adults is closely related to the assumption of new social roles.
- As a person learns new knowledge, he or she wants to apply it immediately in problem solving.
- As a person matures, he or she receives motivation to learn from internal factors.

An essential point in both Knowles (ibid) and Maslows (1987) theory was the assumption that the development stages in our life give rise to the readiness to learn and to teachable moments. Even so, Maslow placed special emphasis on the role of inner safety and not on situational triggering factors.

Perhaps the best known of this group of theories describing the life course, is Levinson's phase theory (1978). Levinson divides adult life into three phases: early adulthood (17-45), middle adulthood (40-60) and late adulthood (60+). Life then consists of alternating periods of stability and transitions. Each era brings with it certain predictable tasks and each transition between eras certain predictable challenges.

Table 1. Levinsons (1978) phases

Developmental period	Age	Task
Early adult transition	17-22	Explore possibilities and make tentative commitments
Entering the adult world	22-29	Create first major life structure
Age 30 transition	29-33	Reassess life structure
Settling down	33-40	Create second life structure
Midlife transition	40-45	Ask "what have I done with my life?"
Entering middle adulthood	45-50	Create new life structure
Age 50 transition	50-55	Minor adjustments to middle life structure
Culmination of middle adulthood	55-60	Build second middle life structure
Late life transition	50-65	Prepare for retirement and old age
Late adulthood	65+	Create late life structure and deal with declines of old age

Another widely known and influential theory is Eriksons (1959) theory of identity development. Erikson proposed that adults' identity develops through resolution eight stages.

Erikson believes that during successful early adolescence, mature time perspective is developed and the young adult acquires self-certainty as opposed to self-consciousness and self-doubt. Young adults come to experiment with different roles (through the first 5 stages). In later adolescence, clear sexual identity - manhood or womanhood - is established. The adolescent seeks leadership and gradually develops a set of ideals (stage 6-7). If these seven psychosocial crises have been successfully resolved, the mature adult develops the peak of adjustment, integrity and independence. The adult has now found a well-defined role and self-concept in life. The adult can be intimate without strain, guilt, regret, or lack of realism; and he is proud of what he/she creates - the children, work or hobbies. If one or more of the earlier psychosocial crises have not been resolved, adults may view their self and their life with disgust and despair (ibid).

These theories are merely descriptive of typical and predictable changes experienced by adults. There is no normative hierarchy intended, so one phase is not better than another. The theories seek merely to describe typical or expected changes. Many of the life-span role development theories fit into this category (Knowles, 1988). When thinking about my life and the many changes I have experienced, many of them seems to be typical for many adults – going to school, studying, setting out a home, attending working life, getting married, having children, death of a parent, etc. But is there some predictable developmental order implied here, or is it simply a sequence of events?

#### **4.Newer theories about triggering factors. Continuous adjustments and lifelong learning.**

Adult learning research as well as policy and practice have been strongly influenced by postmodernism (Field, 2006). Postmodernism has changed our focus, the way of thinking and broadened the domain and sites for learning. The postmodern society is associated with growth in the service industry and new models for production, globalisation and technological growth. In the postmodern society there is an increasing focus on the consumer, on lifestyles and identities (Field, 2006). An increased focus on individual rights, choices and self-realisation has paved the way for lifelong learning as an individual project. It has become an individual responsibility to make adequate provision for the creation and preservation of one's own human capital. Investment in learning and financing, has become primary an individual responsibility (Marginson, 1997).

In times of postmodernity the search for identity represents the struggle to escape from uncertainty (Bauman, 2005). However, identities, especially in the field of practice, are in transition. One reason is the change of policy and public commitment. As Filander (2005) has demonstrated, the transformation of public service into private-like enterprises under a new public management rule has deprived many of a fixed and settled identity as 'public sector benefactors'. As a result of rapid technological, economic, cultural and social change, individuals are constantly faced with transitions in their personal and professional circumstances. Governments exhort their citizens to prepare for a life of permanent adaptation and flexibility. Education in adult life becomes both a resource for individuals seeking to promote their employability and mobility, and at the same time a cause of further uncertainty and risk (Field, 2009).

The occurring growth and fragmentation of the adult education field, and at the same time, new modes of teaching and learning (Jarvis et al, 1998), are also part of the postmodern condition. A characteristic of this condition is described as de-differentiation, i.e. "a general decentring of educational authority, control and provision and the breakdown of clear demarcations between different sectors of education and between education and cognate field" (Usher et al, 1997). The results are "diversified fields of education" (Carr-Hill, Carron & Peart, 2001), which questions the conception of adult education or lifelong learning as a formally constituted field. Since learning now is increasingly recognized as located in a variety and diversity of social practices, these concepts are best understood as metaphors that brings to the fore the boundlessness of learning (Usher et al, 1997). Edwards (1997) has therefore suggested "moorland" as more appropriate, resonant and resourceful in relation to the ongoing processes of globalisation and postmodernity. In this "moorland", learning becomes a continuously ongoing "activity" in every context adults participates. The concept of phases and age-related changes actualising learning can in these circumstances be very difficult to spot.

Knowledge about how the individual interprets the world cannot by itself give an understanding of the readiness to learn. Only when we include structural factors and analyze the interaction between them and the individual conceptual apparatus does an interpretation become possible. Adults' readiness to learn and the barriers preventing it - in its broadest interpretation - can be understood in terms of societal processes and structure, institutional processes and structure and individual consciousness and activity. Applying this to the expectancy-valence paradigm on participation (Rubenson, 1977), one has to take into account the crucial "circumstances" in which expectancy and value get socially constructed. In accordance with Giddens (1994), there is a dualism between structure and agent and it is important to focus also on processes through which a human being as an active agent governs his/her relationship with adult education.

One reason that modernity is so troubling is that institutionalized reflexivity, according to Beck (1992) and Giddens (1991), exposes all social practices and arrangements to doubt and revision. This applies in the private and intimate sphere as much as in the open and public sphere, to family life and lives as much as to work and politics. Change is so pervasive that the self becomes what Giddens calls “a reflexive project”, which must be constantly explored and reconstructed (Giddens, 1991, p.32). In circumstances where the “proportion of life and the proportion of the biography which is open and must be constructed personally is increasing”, individuals must continually produce and re-produce their own biographies (Beck, 1992, p.135).

*“In the individualized society the individual must therefore learning, on pain of permanent disadvantage, to conceive of himself of herself as the center of action, as the planning office with respect to his/her own biography, abilities, orientations, relationships and so on. Under those conditions of a reflexive biography, “society” must be individually manipulated as a “variable” (Beck, 1992, p. 135).*

As an answer to this contradiction to the concept “readiness to learn” and trends towards a more reflexive modernisation perspective, I then assume that; (i) participation in learning activities is no longer so tightened up to situations or happenings related to certain life phases and age in adults lives, but is a result of continuous reflexive practice and adjustments in a rapid changing society. Further I question; (ii) does this means that adults “readiness to learn” merge the demand for continuous adjustments in the knowledge-society?

## 5.Method

The findings are based on qualitative interviews among 25 adults participating in different adult education programs, from short leisure-time courses to longer university educational programs. Included in the interviews there were 6 males and 19 females. The interviews lasted for 1-2 hours. All adults participated in *voluntary* education, and the different education programs were arranged by different adult education organizers and the courses varied from classroom lecture, correspondence course to data based distance education.

Some of the courses were prestigious, in the sense that they had strict requirements in relation to admission and completion. Some courses were structured in a way that they made great demands in terms of being able to work independently and structured. First and foremost the intention with the interviews was to investigate the whole process, from recruitment to finishing the courses. Therefore the participants were interviewed three times during their participation. Adult learning motives, recruitment and choice of courses, organization of everyday life where learning activities are included, support and counselling, financing, mastering and outcomes of adult education where the central themes. In connection to this I also tried to identify and describe life situation and the reasons for picking the actual time for participation. The data material used in this article is a part of the data material used in my doctoral thesis.

Table 2. Selection of respondents. Organizer, course, age, family, previous education and occupation. N = 25

	<i>School/organizer</i>	<i>Course</i>	<i>Age</i>	<i>Family</i>	<i>Earlier education</i> §§§§§§§§	<i>Work</i>

Silvie	Education association	Interior and design	31	Divorced. Two children	Medium Education	Seller
Karin	Education association	Cleaning	38	Family with three children.	Low Education	Cleaner

The qualitative interview material includes 25 respondents. This is acceptable amount. It weakens the material, however, that about half of the interviews were conducted by telephone and then by interviewing people who participated in correspondence courses or Online. Although it was a challenge to achieve the same confidential conversation on the phone, which is achieved face to face, so we were aware of this in interviews and spent time in relation to creating a foundation for a confidential conversation. As in other studies based on voluntary participation, there is a risk that those who join are gifted individuals who like to expose themselves and who are confident in their own abilities to communicate. The interviewees conveyed via the organizers, could also be interviewing people who organizers said could give a positive impression of the course by promoting and providing good references. It may also be that those who volunteered, felt that they had something special they wanted to convey, that they had a special story to tell. Such items include, however, in the general debate about who agree to participate in surveys.

Among the interviewees there is a gender imbalance with more women than men. The average age among the respondents was 37 years and this constitutes a heterogeneous group located in different life situations. Some of them have children they must prioritize time related to, while others have no family obligations. Some are married or having partners, while others are single. Some are employed full-time while others have education and learning as their main occupation. Several of the participants were highly educated from before.

Although the motives for participation often were work related, the participation in learning was a direct result of special life situation were participation in learning was seen as a solution or a mean to change or to repair a problem or a dilemma in life. To create a new life or a new orientation in life was a fundamental goal for nearly all adults.

## 6.Findings

In questioning about adult learning motives, the immediate answers to the question about reasons for participation were mostly related to something they wanted to accomplish related to work; a new job, advancement in currant job or increased salary. I addition to these reasons I also discovered that there often were special situations or occasions in their life's that update and actualized the need for education and learning. All the respondents reported one or several specific events, changes or situations that actualized participation. One important reason was the actual life situation, with children who have grown more independent. This brought more time that they could fill with new activities (Solveig, Tor, Kjellfrid, Berit, Solfrid, Rune, Laila, Sigrid). Divorce and breakups were also reported as a directly cause (Solveig, Silvie, Berit, Rune, Kjellfrid), in addition reorganization and downsizing in the workplace was cited as a direct cause (Rune, Marit, Kathrine, Nils) that made learning relevant. The

triggers that other respondents pointed out was that they had got some sort of financial support (Hege, Christopher, Eilif, Hanne, Karin, Kenneth, Marit B) that they have not had before, they had friends (Marit, Kjersti), relatives (Siv) or coworkers (Ellen, Hilde, Ann, Kathrine) taking the same course and who inspired and influenced them. Retraining due to illness/rehabilitation (Kjersti, Mia and Nils) was also mentioned as another causative factor. Such triggers seemed to be what was needed to start an education or a course that you have had a desire for long or short time. Although there were more women than men in the sample, the women commonly reported changes in the private sphere as triggers, while men reported events or changes related to work as triggers.

#### 6.1. Now it's my turn!!

Time left over after giving priority to the husband or partners career and that one's own children has become more independent, seems to be one of the triggering factor actualizing participation in learning activities which is most connected to life stage and age. Children getting more independent are in some way a predictable change in adult's life, though letting one's own education step aside in favor of the partners career development maybe not always a predictable cause.

Hanne said:

*"To be thirty years old means that one feels more self-confident. I also feels that I much more knowledge than before. Connected to this ... the latest eight years I have been taking care of my kids and my home – nothing else. When my husband had received the education and profession he wanted, I thought .... Now it is my turn in life. I thought that I had the opportunity to do something about my life."*

Hege said:

*"My husband for example, he thinks it's okay for me to take this course and supports me. I have supported him through his education and work – so it's payback time. The kids thought it was a little odd that I should not be at home when they got home as usual, but they learned fast to take care of themselves and to participate in some housework."*

Hege refers to the expectations from her children and her own conscience that dictates her thought that she really should have been more at home and done her "duties" there as usual. The legitimacy of releasing more time for study and put greater demands to the children in the family when mom not always present, is compensated by the fact that she gets full support from her husband. The choice of participation in learning involves that both Hege herself and her family have to change their daily routines. The family gets a little less time together, and some of the practical duties and tasks in their household had to be distributed in a different way than before. She sees this as a positive opportunity to change the distribution of housework and to involve the children in a different way than before. The same release of time in their families is also true for many of the women I interviewed, such as Solveig, Tor, Kjellfrid, Berit, Solfrid, Rune, Laila and Sigrid.

#### 6.2. Divorce – a new starting point

The reason that Solveig joined the Supervisor course was that her husband had moved out. She found out that she had to do something with her life, both in terms of giving her life a new meaning and direction, as well as to demonstrate to her selves and others that she actually managed to stand on her own. To increase confidence in her-selves and make new contacts and friends in a new environment, the course has become a kind of guiding factor. Solveig says:

*"I found that I needed a little more education. Because I really began to work in an early age, while my husband was finishing his education. So when he moved out last year, I found out that now I have to do something for myself too. Then I got hold of the course catalog and began to look there. "*

With the help from friends and a psychologist after the breakup from her boyfriend, she found that more education would be a way to start over and create a more independent life. It was her turn to bet on herself in order to create the basis for a "new" life, with emphasis on security, recognition and autonomy.

Divorce was also the direct cause that Silvie began at her course. She needed some time to think about her life and she came to the conclusion that she wanted to create a new direction in life. For her, the Interior school has been a dream for a long time. She has always been interested in colors, decor, design and inside renovation. Silvie is very clear about her goal by attending the course, and the end she wants to start her own business. She likes to decide and have influence, and she wants to experience

some freedom and flexibility at work. Silvie wants to combine vocational training in cleaning and interior, and offer her services as a consultant in different construction projects, where the combination of interior constructions and effective cleaning is something she believes is a neglected area. Silvie says:

*"It was always a dream I had really. I found that I would reboot after the divorce, and create a new life for me and my children. [...] I have always been very interested in colors, design, interior, and renovation. So I imagined a new opportunity to get a new job and a fresh start somehow."*

She feels that life has taken a new direction that she will exploit and use to their advantage. She will create a separate platform and a "new life".

### *6.3. Job cuts - adjustment with new opportunities*

Rune has a job at the railway company. He has received some signals from management that the tasks he is doing today will not be relevant in a few years. He would thus be redundant and must obtain a new job. He said:

*"I only know that the job I have now gone on a four year time. Then I make sure to get me a slightly different perspective. So in addition to this supervisor course, I read mathematics for high school. I get paid education and I hope maybe to get a severance package with one year of continuing education. I can use it to get myself a new professional platform."*

Because of the lack of formal education, Marit was not allowed to perform all types of duties included in her job performance and therefore she did not get the responsibility that the job demanded. She said:

*"I had to formal educated in relation to the tasks I should do and did in my work."*

She experienced to be at a standstill in the workplace and the boss asked if she would be interested in some more formal education. The employer was very pleased that she took the initiative to participate in this program and decided to pay the course fee. It was several parallel circumstances that together actualized learning for her. The triggering factors for her were that she lacked formal education, she received support from employer and her daughter started training together with the same curriculum and textbooks at another institution. It gave her inspiration and motivation to start. Rune, Marit, Kathrine, Nils also mentioned Job change as the triggering cause that made learning relevant. Other informants mentioned inspiration from friends (Marit, Kjersti), relatives (Siv) or coworkers (Ellen, Hilde, Ann, Kathrine) as triggers.

### *6.4. Health difficulties – adjustments to a new life direction and new possibilities*

Mia has been fully employed ever since she completed basic training 19 years ago. Because of health problems, she could not continue her job and she was in a prolonged sick leave. A new profession where she could work and experience success in spite of betrayal brushes health was needed. She wants to become a consultant and conducting training in organizational culture and organizational psychology.

*"So the health problems really gave me a push in a new direction, and a sudden space where I could think about my life and my opportunities."*

Kjersti had worked as a florist for several years, when her back gave her health problems and caused periods of long-term sick leave. Using counselors at the employment services, she got the opportunity to retrain and considering changing profession. She decided that she would try a more sedentary office job, where her back strain becomes less painful.

*"I hope that this opportunity to new education can help ensure that I stay healthy and that I can contribute and stay in working life much longer."*

### *6.5. Unexpected funding opportunities*

Solveig have been promised to get reimbursed the course costs from her employer. She justifies the employers payment with the relevant skills that she achieves that is related to the job and gives credit to her employer. She says:

*«I have spent much money already on this course. I expect, that my employer reimbursed the costs after application ( ...) Both the colleagues and the boss supports me in several ways. I get the acceptance and the time to study, but there is no on standing cheering.»*

In addition to financial support, motivational support from the work environment and time to study perceived as positive for Solveig. For her, it gives a kind of legitimacy and understanding that she spent some of my time to read. She expects that the employer will pay for the skills the employer would benefit from- that is her triggering factor and her motivation. Also Chris' employer has agreed to fund the course costs. Christopher says:

*" The employer covers the expenses and by that he motivated me to take this course ( ...) I have my own computer at home, but sometimes I can also use the computer at work . ( ...) Not during working hours, but in the evenings. I see that as very positive and supportive and facilitating factors"*

Christopher agreement with the employer means that he can use the computer equipment at work but not use working time to study. He attends a course that is expected to provide an expertise that the employer will have a direct benefit from the event, and thereby experience acceptance and support from employers and colleagues, but at the same time they also experience the pressures and expectations (in order to complete with good results), claims (if not taking the course too fast and not use of working hours) and the promise of reward (such as you get a refund, a new position and/or higher wages). The employer may at times have a less committed worker, who may also want something more absences and more in need of relief at work. The statements show that there are certain expectations that employers should get something in return by investing in employee training and act as supportive way. Other respondents that also pointed out that they had got some sort of financial support was Hege, Eilif, Hanne, Karin, Kenneth and Marit B.

## 7. Discussion

By interviewing adults who participated in different educational courses, I discovered that there often were special circumstances that functioned as triggering factors that made adults take the final step towards participation in different learning activities. Released time and time left over for study, divorce and breakups, reorganization at work, dismissal, illness and financing opportunities was occasions/triggers that in some way demanded new orientation in life and in other ways gave the opportunity to realize a long time interest for learning and education. In one way such triggers forced adult in taking more education even if they are not as motivated, but for some adults it was what was needed to embark an education or a course that they had a desire for a long time. These dichotomy can be related to Knowles book " The modern Practice of Adult Education, From Pedagogy two Andragogy" (1988), where the focus is on individualistic theory with emphasis on intrinsic motivation and autonomous adults, where the individual needs orientation is the basis for adult learning. As opposed to this, the focus directed towards a more radical and Marxist-inspired tradition, where the triggers are related to empowerment and structural triggers that contribute social change, as Giddens (1991) and Beck (1992) pointed out. Mezirow (1991) and his transformational theory also attempts to integrate both the individual and collective/structural orientation. This theory applies primarily to individual learning, which indirectly may have collective change goals (ibid). As I interpret it, we find the various theoretical perspectives linked to the goals of lifelong learning (i) personal fulfillment and development throughout life, (ii) active citizenship and social inclusion and (iii) employment, wealth creation and social change. The triggers mentioned in this study are certainly connected to these goals – for instance can a divorce drive the persons involved towards a new direction in life and to develop themselves as persons through learning and education.

Few triggers mentioned in the sample could directly be connected to a specific age or life- phase. These triggering factors were more related to different events and circumstances occurring in life. Divorce, illness, changes in the workplace is not necessarily predictable and limited age-related changes as a part of Levinsons' (1978) phases. What is more predictable is that small kids are getting older and more self-reliant and that this release more time for learning. This shows that some of the triggering factors may in some way be age and phase related, but that others can be unpredictable and not really related and limited to a certain age and life phases.

The findings show that triggers are often related to transitions in adult's life. A divorce means transition from married to single, two-parent to single parent. From employee to unemployed, from one job to another, from healthy to sick. This transitions all means changes with certain risks and uncertainties, as Beck (1992) emphasizes. One of the most central theories about adults motives for learning are focusing on life-crisis, or particular happenings in adult's lives that makes adults re-value their own lives and life-situation in order to find new solutions or new direction in life (Erikson, 1959 and Levinson's phase theory 1978, 1986). Life situations that create a need to know is also something that Knowles et al (1998) and Havinghurst (1972) emphasized. This perspective is something that (Mezirow, 1991) also emphasize in his transformative learning theory. However Mezirow focused on the learning process and not primary on recruitment to learning activities. Changes in life situations, follows what Mezirow (1991) termed as a disorienting dilemma, which seems to be a catalyst in transformative learning processes. The causal

conditions that leads to transformative learning begin with a disorienting dilemma such as a life event, an adult education experience, or a new or revised life role (Kroth & Boverie, 2000).

In a continuously interaction between individual needs and interests and the environments requirements and expectations, adults seems to be in a state of continuous readiness for acquiring new knowledge. There are transitions and events in life that cause us to question about the world and ourselves and this questioning is fundamental to adult learning (Mezirow, 1991; Jarvis et al, 1998). These events are not necessary linked to a specific life-phase, but is more about reorientation and a reassessment and restructuring throughout life (cf. Edwards, 1997). This suggests that we perhaps should do some rethinking about adults learning, in the way that perhaps adults enter the so-called autonomous stage much earlier than before, while they are young pupils at school and young students at the university. Early in life we learn about our opportunities and requirements in relation to reflexivity (Giddens, 1991; Beck, 1992).

Good relations, healthiness and employment are important for our identity. Fundamental changes in life means identity disorders that one would strive to enhance or reinforce, in order to create safety and security (Beck, 1992). Such changes mean reorientation in life. Today, divorce and partner change are not a strange thing – it happens all the time. So we all need to be more adaptable and willing to change. At the same time we can more freely shape our identity regardless of class, which previously increasingly posed a straitjacket, that could not be changed (Giddens, 1991). The new modernity poses new challenges - but also greater manoeuvrability.

The andragogical theory is based on earlier AE-theories. The AE ideal assumes that individuals take control of their learning, and focus on the reality of limitations in taking control of their own decision-making. In making decisions related to participation, adults will fully determine the learning needs required to achieve their personal goal(s). Knowles (1988) claims that adults become ready to learn when their life situation creates a “need to know”. But as the findings indicate and as Giddens (1991) points out, age will increasingly be less suited to determine the stage of life. It is the individual and his or her situation or life cycle that more commonly determines the individual’s needs and wants.

As an answer to the initially described contradiction I can say that; (i) participation in learning activities is not automatically tightened up to situations or happenings related to certain life phases and age in adults lives, but is also a result of continuous reflexive practice and adjustments in a rapid changing society. This means that adults “readiness to learn” in some extent merges the demand for continuous adjustments in the knowledge-society. Even so, the findings show that there are both individual and structural triggers, related to both to the private and intimate sphere as much as to the open and public work related sphere.

# Skill learning attitudes, satisfaction of curriculum, and vocational self-concept among junior high school students of technical education programs

Ya-Ling Wu <sup>a</sup> Jia-Jen-Hu <sup>b</sup>

<sup>a</sup> Professor, Graduate Institute of Technological and Vocational Education, National Pingtung University of Science & Technology, Pingtung, Taiwan, R. O. C.

<sup>b</sup> Graduate student, Graduate Institute of Technological and Vocational Education, National Pingtung University of Science & Technology, Pingtung, Taiwan, R. O. C.

## Abstract

In Taiwan, an increasing number of junior high school students have been studying in technical education programs rather than general programs. Thus, this study aims to investigate the skill learning attitudes, satisfaction of curriculum, and vocational self-concept among junior high school students of technical education programs as well as the relationships between these variables. In this study, data were collected from a questionnaire survey of 270 Taiwanese junior high school students who study in the technical education programs. Data were analyzed by statistical methods, including t-test, one-way ANOVA, Pearson's product-moment correlation, and multiple stepwise regression analysis. The following are the results of this study:

1. The junior high school students of technical education programs held positive skill learning attitudes while their skill learning motivation was not strong.
2. Most of the junior high school students of technical education programs were satisfied with the curriculum of technical education programs.
3. The junior high school students of technical education programs had moderately high level of vocational self-concept.
4. Skill learning attitudes and satisfaction of curriculum significantly predicted vocational self-concept.

## 1. Introduction

In Taiwan, an increasing number of junior high school students have been studying in technical education programs rather than general programs. Thus, this study aims to investigate the skill learning attitudes, satisfaction of curriculum, and vocational self-concept among junior high school students of technical education programs as well as the relationships between these variables.

## 2. Research hypothesis

Based on the literature review, the model of research hypotheses of this study are shown in Figure 1. Overall, this study aims to test the four hypotheses: H1: The Skill learning attitudes positively influence satisfaction of curriculum; H2: Satisfaction of curriculum positively influences vocational self-concept; H3: The skill learning attitudes positively influence vocational self-concept; H4: Satisfaction of curriculum mediates the skill learning attitudes on vocational self-concept.

Figure 1: Research hypotheses

### 3. Methods

#### 3.1 Participants

For the purposes of the study, a questionnaire survey was used to collect data, and the study population consisted of 270 Taiwanese junior high school students who study in the technical education programs. To collect useful and representative information, a stratified sampling method was used to select 13 junior high schools according to their geographical location, including eastern, northern, central, and southern regions of Taiwan. Of the 13 universities, 4 universities located in the north, 1 in the east, 3 in the center, and 5 in the south were sampled according to the proportion of schools in the four regions. The, a stratified cluster sampling method was used for distributing the questionnaire surveys. Anonymous questionnaires were distributed to 288 participants in the 13 selected schools, and 93.8% (N=270) of the questionnaires were returned and usable. Of the participants, 121 are males (45.0%), and 148 are females (55.0%). Altogether, 69 participants (25.6%) attended the engineering classes of technical education programs, 162 (60.0%) attended the business classes, 224 (83.0%) attended the domestic economy classes, 182 (67.4%) attended the agricultural classes, and 42 (15.6%) attended the marine classes.

#### 3.2 Data collection and analysis

The scales of the study were adapted primarily from various published sources . Each item of the scales was measured on a five-point Likert scale (1=strongly disagree to 5=strongly agree). A pilot study was conducted on all the scales, and the item analysis and principal component analysis via Direct Oblimin rotation were conducted. The Cronbach's  $\alpha$  values for reliability in all scales were higher than 0.82, and the loadings of all items were greater than .50. Thus, all of the scales had good reliability and validity. In this study, SPSS 19.0 was used as the statistic software. Descriptive statistics, one-sample t-test, dependent-sample one-way ANOVA, dependent-sample t-test, and path analysis of multiple regression analysis were employed to analyze the data.

### 4. Results

#### 4.1 Skill learning attitudes

As seen in Table 1, the participants scored 3.10 on the skill learning attitudes scale, higher than the scale's median value (3), which suggests that the Taiwanese junior high school students of technical education programs perceived that they were had moderately appropriate skill learning attitudes. Of the three dimensions, the level of habits of skill learning and mastery of skill learning were higher than the level of motivation for skill learning.

Table 1. Means, standard deviations and dependent-sample one-way ANOVA of the skill learning attitudes (N=270).

Dimensions	M	SD	F	Post hoc comparison
Skill learning attitudes	3.10	0.63	F=7.60**	3>1; 2>1
Motivation for skill learning	2.77	0.90		1. Motivation for skill learning 2. Mastery of skill learning 3. Habits of skill leaning
Mastery of skill learning	3.48	0.71		
Habits of skill leaning	3.71	0.83		

\*\* $p<0.01$

#### 4.2 Satisfaction of curriculum

As seen in Table 2, the participants scored 4.00 on the satisfaction of curriculum scale, higher than the scale's median value (3), which suggests that the Taiwanese junior high school students of technical education programs were moderately satisfied with the technical programs. Of the three dimensions, the level of content was higher than the levels of teaching styles and equipments.

Table 2. Means, standard deviations and dependent-sample one-way ANOVA of satisfaction of curriculum (N=270).

Dimensions	M	SD	F	Post hoc comparison
------------	---	----	---	---------------------

<b>Satisfaction of curriculum</b>	4.00	0.65	F=10.69**	2>1; 2>3
Teaching styles	3.97	0.67		1. Teaching styles
Content	4.10	0.70		2. Content
Equipments	3.96	0.71		3. Equipments

\*\* $p < 0.01$

### 4.3 Vocational Self-concept

As seen in Table 3, the participants scored 3.84 on the vocational self-concept scale, higher than the scale's median value (3), which suggests that the Taiwanese junior high school students of technical education programs had moderately positive level of vocational self-concept. Of the four dimensions, the levels of vocational ability and vocational aspirations were higher than the levels of vocational values and vocational awareness.

Table 3. Means, standard deviations and dependent-sample one-way ANOVA of vocational self-concept ( $N=614$ ).

Dimensions	M	SD	F	Post hoc comparison
<b>Vocational self-concept</b>	3.84	0.69	F=10.30***	1>3,4; 2>3, 4
Vocational ability	3.84	0.79		1. Vocational ability
Vocational aspirations	3.98	0.80		2. Vocational aspirations
Vocational values	3.75	0.79		3. Vocational values
Vocational awareness	3.77	0.78		4. Vocational awareness

\*\*\* $p < 0.001$

### 4.4 The Relationships between the skill learning attitudes, satisfaction of curriculum, and vocational self-concept

This study used path analysis of multiple regression analysis to examine the relationships between the skill learning attitudes, satisfaction of curriculum, and vocational self-concept. The assumptions of the regression model were checked. Because the zero-order correlations coefficient between the independent variables was 0.58, the Variance Inflation Factor (VIF) values were 1.38, and tolerance statistics were 0.65, there was no evidence to suggest that the data suffered from multicollinearity. The Durbin-Watson statistic was also between 1 and 2 (1.88), implying that errors in the regression were independent (Tabachnick & Fidell, 2007). Standardized residuals were examined to detect the presence of outliers. Three cases were determined to have standardized residuals between 2.72 and 2.83. Because none of those four cases had a Cook's distance (a measure of the overall influence of a case on the model) greater than 1 and the sample size was large, none of them had undue influence on the regression model (Field, 2005). The assumptions of normality, linearity, and homoscedasticity were checked by considering standardized residual scatter plots to examine whether the residuals were normally distributed around the predicted scores of self-perceived employability. It was discovered that the residuals had a linear relationship with the predicted scores of self-perceived employability. Overall, all assumptions were therefore met (Tabachnick & Fidell, 2007).

The regression results showed that the skill learning attitudes had a positive effect on the satisfaction of curriculum ( $\beta=0.57$ ), and explained 37% of the variance of the satisfaction of curriculum (Table 4). Additionally, the skill learning attitudes and satisfaction of curriculum both had positive effects on vocational self-concept ( $\beta=0.30$  and  $\beta=0.61$ , respectively), and explained 70% of the variance of vocational self-concept (Table 5).

Table 4. Multiple regression coefficients for the effect of the skill learning attitudes on satisfaction of curriculum ( $N=614$ ).

Predictors	R <sup>2</sup>	F	B	$\beta$
Skill learning attitudes	0.37	299.89***	0.55	0.57

\*\*\* $p < 0.001$

Table 5. Multiple regression coefficients for the effect of the skill learning attitudes and satisfaction of curriculum on vocational self-concept ( $N=614$ ).

Predictors	R <sup>2</sup>	F	B	$\beta$
Skill learning attitudes	0.70	750.01***	0.28	0.30
Satisfaction of curriculum			0.58	0.61

\*\*\* $p < 0.001$

Overall, all of the first three hypotheses concerning the relationships among the variables were supported at the 0.001

significance level (H1: the skill learning attitudes→ satisfaction of curriculum,  $\beta=0.57$ ; H2: satisfaction of curriculum→ vocational self-concept,  $\beta=0.61$ ; H3: the skill learning attitudes →vocational self-concept,  $\beta=0.30$ ). The results showed that, the participants' skill learning attitudes positively affected their satisfaction of curriculum; the participants' satisfaction of curriculum positively affected their vocational self-concept.

In order to investigate whether the indirect effect of skill learning attitudes on vocational self-concept through satisfaction of curriculum was significant, the Sobel test was used in this study (Baron & Kenny, 1986). The test results showed that satisfaction of curriculum significantly mediated the influence of skill learning attitudes on vocational self-concept ( $Z=13.28 \geq 1.96$ ,  $p < 0.001$ ). That is, the fourth hypothesis of the study was supported at the 0.001 significance level (H4: the skill learning attitudes→ satisfaction of curriculum →vocational self-concept). Therefore, all of the analysis results suggested that the skill learning attitudes of the Taiwanese junior high school students of technical education programs both significantly directly and indirectly affected their vocational self-concept vis-à-vis the effect on their satisfaction of curriculum. The relationships among these variables are shown in Figure 2. The estimates of the direct and indirect effects of the skill learning attitudes and satisfaction of curriculum on the vocational self-concept of the Taiwanese junior high school students of technical education programs are shown in Table 6. Of the two predictors, the skill learning attitudes had the greater impact on the vocational self-concept among the Taiwanese junior high school students of technical education programs (estimate=0.65).

Figure 2: Results of testing the hypotheses.

Table 6. Estimates of the direct and indirect effects of the skill learning attitudes and satisfaction of curriculum on vocational self-concept.

Casual path	Direct effect	Indirect effect	Total effect
Satisfaction of curriculum →vocational self-concept	0.61	-	0.61
Skill learning attitudes →vocational self-concept	0.30	$0.57 \times 0.61 = 0.35$	0.65

## 5. Conclusion

This study aims to investigate the skill learning attitudes, satisfaction of curriculum, and vocational self-concept among junior high school students of technical education programs as well as the relationships between these variables. In this study, data were collected from a questionnaire survey of 270 Taiwanese junior high school students who study in the technical education programs. Data were analyzed by statistical methods, including t-test, one-way ANOVA, Pearson's product-moment correlation, and multiple stepwise regression analysis. The following are the results of this study. 1. The junior high school students of technical education programs held positive skill learning attitudes while their skill learning motivation was not strong. 2. Most of the junior high school students of technical education programs were satisfied with the curriculum of technical education programs. 3. The junior high school students of technical education programs had moderately high level of vocational self-concept. 4. Skill learning attitudes and satisfaction of curriculum significantly predicted vocational self-concept.

## Abstract

This paper analyses the social inclusion of young people from the most disadvantaged social strata of the population in a community, in Brazil. Focal interviews were conducted with two groups, protagonists and non protagonists of violence, in two public schools. The analysis indicates the two groups attend different places, have different expectations of leisure, and life activities are also differentiated. Young people not considered protagonists of violence believe in shape their own future and the importance of the school. The protagonists don't. For them, school is just for fun, not to conquer a better future.

## Introduction

The purpose of the paper is to characterize and analyze social inclusion ways of young people in a Brazilian city belonging to the most disadvantaged social strata of the population in their community, schools and leisure spaces.

The research was conducted in an area with large socioeconomic deprivation and high rates of urban violence and criminality. Social indicators of violence and poverty are high. Neighborhoods infrastructure is missing where standard popular housing predominate. Research area is considered one of the most violent areas of the city. During the research it was possible to note that robberies, fights, deaths, police action and drug abuse are common facts. These neighborhoods present high density population along with low socioeconomic index. There are neither green areas nor leisure spaces for the local population. There are several churches and a large number of bars, but few public health clinics and schools. The economic activities are mostly related to petty trading and informal service.

City Schools in the neighborhood attended by young people are the focal point of this research, which we are denominating School 1 and School 2. Both schools serve students in Elementary Cycle II School (5th- 8th grades) and High School students. The building of the School 1 is quite vandalized and has broken walls around and his painting lies dirty and tarred. The school does not cause a good impression given the lack of conservation, the state of abandonment and penury. The building is dark and lacking hygiene. Police action is common within the school. The school shows marks of vandalism and intrusions that are almost on a daily basis. The other school, the School 2, already makes a good impression. The building is very well maintained, clean and free of graffiti. The concern towards the conservation of the school building is constant, however some students eventually spray paint the school which makes it constantly to be painted and repainted. Family breakdown, domestic violence, minor in social risk and without basic health care and nutrition, early access to the labor market and the use of illicit drugs become part of the lives of the students of this school. Facts that are recent history of this institution, although situated in a neighborhood of impoverished urban outskirts that had no previous problems, and it is considered to be a good school.

This study consisted of two groups in each school: one with students considered violence protagonists, which we will call here the GV1 and GV2 as being students of Schools 1 or 2, respectively; and another with students not considered violence protagonists (GNV 1 and GNV2 as the origin is the School 1 or School 2). The GV group was formed from the analysis of the occurrence school records and the statement of the management team. Both boys and girls participate in the groups and their ages ranged from 14 to 17 years old. Focal interviews (GATTI, 2005) with students of these groups aimed to map the locations

E-mail address [leila@rc.unesp.br](mailto:leila@rc.unesp.br)

frequented by them, identify the meaning of becoming part of the community and also the meaning they impute to school and studies. The discursive regularities present in their statements were analyzed and are presented below.

### **The place where they live: neighborhoods and the community**

The typical urban landscapes of impoverished outskirts of Brazilian cities are present in the speech of students interviewed. The poor infrastructure in the region is constantly cited:

They (the city hall) say that they will asphalt our streets but it is all stones (GV2). This neighborhood has nothing working (GNV1). The childcare they were building stopped for a few months. I think that the money ends up. We pay taxes and do not have money for anything. (GNV1).

However, sometimes, interviewed youth individuals from GNV Group attenuate the criticism of City Hall to mention that some local young people damage the existing public works, indicating a process of "naturalization" of the conditions of the neighborhood: Only because of the youths living there. The socioeconomic level do not appear to be an explanation for the precarious situation in which they live and the neighborhoods where they live. However the absence of the Government apparatus in the neighborhoods is noted and faithfully manifested in their statements indicating the non-existence of government people among residents:

They (mayor, politicians) begin and do not end. They are not living in the neighborhood (GNV1). Or mention the presence of illicit drug users and dealers in the neighborhoods:

Interviewer: Tell us how the neighborhood is? It is full of junkies; you go out into the street and you can smell the entire day (GV1).

Interviewer: Smell what? Marijuana (GV1). It's everywhere (GV1)

They concern, as an attempt to solve the problem, the presence of police. For them the absence of any authority of the State in the neighborhood allows dealers to establish their own rules and arrangements for the organization and operation of the site:

Thus, for example, the thief steals your home and you discover who he is, if you are going to beat him it will be bad for you. So the bandit helps you. (GV2).

When asked about their feelings about the neighborhood, youngsters show they like the place. However, public service shortages, insecurity and lack of rule does not stimulate some form of "civic compassion" (SENNETT 2008, p 373.), favoring the formation of complex resigned filiations:

Interviewer: What do you think could be done? You want to change something in the neighborhood? I do, Take these junkies out of our neighborhood. But there's no way. Everywhere is like that, filled with junkies (GV1). They should create a neighborhood to junkies (GV1)

The existence and experiences of common elements in the community that could facilitate aggregation and make the space community filiations is simultaneously the desire of exclusion and / or restriction to the coexistence of other young people. Thus, the relationship with the other kids in the neighborhood seems to go beyond a simultaneous stay.

### **The use of their free time, leisure activities and frequented locations.**

The activities on their free time, distracted with school shifts indicate some heterogeneity: stay home, take charge of household chores, biking, fly kites, go to malls, theaters and churches. Occasionally doing some informal paid work.

In GNV Group activities after school are generally related to the frequency of extracurricular courses such as English and Information technology, sports and cultural activities. In this case, the after school activities make a more explicit purpose of individual formation. Through extra courses they seek access to a labor skill that would leave the precarious state in which they live. Attending to courses where they learn handcrafting, music and sports have a more direct relationship with their leisure and free time. In the other group being at the streets are related to hanging out with friends, wandering and sticking around aimlessly. In both groups access to nightly activities as parties are negotiated with family

Being at the streets with friends are present and part of everyday life, but all the statements suggests a low level of friendships because many youngster of GNV Group say they have no friends . Several of the members of GNV Group, both boys and girls , say they do not like to leave home, have few friends, and that their friends are , in general, their relatives; that the relationship with other young people of the neighborhood is small and that schoolmates hardly become your friends. Therefore, while deepening into the speeches we realized that having few friends seems to be particularly true when the reference are friends who live in the neighborhoods where they live. The friendships seem to be closer to relatives, such as cousins and young residents of other neighborhoods. But such a situation is not characteristic of this group only, as it is also found in the GV group, where we find demonstrations on replacement activities with friends in favor of activities with family.

The youngsters of GNV group, in general, seem to have a more controlled leisure attending a few environments where they may be exposed to violence and crime. However, the prohibition of parents to illicit drug abuse is present in the speech of all the people in both groups. There are, however, in their speeches, an indication of the constant presence and ease of access to legal and illegal drugs. Access to illicit drugs seems to solely depend on their desire:

I do not use. Anyone uses if they want. There is no law that arrests users if you want to use. Because if I come up with a joint

and offer it to others, only smoke who wants. Now if the guys arrive to me and offer me another kind of drug and I do not want to, I do not want it, period. (GV2)

Family interventions appear to be ineffective as prohibitions on drug usage, being more effective in relation to the prohibition of frequented spaces.

The street, the neighborhood, the youngster of other neighborhoods, schools and families are significant in the composition of friendships to activities related to their free time. However, the frequented spaces and leisure activities at this time do not refer, in the interviewees, joint activities indicating only simultaneous and parallel stays. The testimonies of GNV Group, the tendency to isolation or self isolation is remarkable, since it's imposed by them, because parents want them to leave, have fun and make friends. There seems to adopt avoidance logic of other local young people who are seen as drug addicts.

All of this indicates that there is not a common denominator that can match together young people from impoverished neighborhoods. Statements of the youths of the two groups refer the idea of a cluster of people living together your day by day, but do not share it between themselves. Here there is an indication of filiation's complex or affiliation supported by confluent stays more in common space than any other gregarious element. The filiation's complexes in leisure spaces, where the relations of friendship prevail seem to be fluid, short-lasting and permanent.

### **The other group**

The references in the speeches of the other youth groups practically focus on the existence of "junkies" and their ways to stay in their neighborhood, at school and in leisure spaces:

They steal things, even the equipments in the playground they stole. Also steal copper wire to sell and buy "stone"(crack). Another day stole up the wire of school and we lost power for a week (GV1). They disturb us. They usually is messing with others who are on the street (GNV1). It's scary to leave the house, feels like they will do something to harm you. (GNV2).

The junkies are appointed by the members of GNV Groups CNG as justification for not having a friendship in the neighborhood and strengthening the statements about the importance of choosing the places where you go, not attend punk ballads and parties, to choose the companies with whom they hang out, even if it means having few friends.

The daily presence of "junkies" attracts the police in spaces for conviviality: They (junkies) are not afraid of the police. The police are afraid of them, if there is a police car and there is a group of junkies, they do not stop. They pretend you never saw them (GV1). I skipped school classes lesson and they stopped me and my colleague, they body checked and send us away (GV1). Last week, they (the police) came here at school and we were just sitting there. No one was doing anything, but they arrived as if we were a bunch of thug. Made everyone raise their hands up, screaming (GNV1).

The police actions thus appear in the speeches sometimes associated with "junkies", sometimes associated with them and sometimes described with neutrality and sometimes with indignation of the brutality. It is evident; however, between the GV groups an idea that some illegal drugs are tolerable since the routine does not disrupt the boundary or affect other daily tasks, as shown in this dialog:

I smoke drugs in my house, for anyone to see. You have to smoke it for you and not for others. That one only watches television. He just sits there sipping tea (smoking marijuana). Oh the guys here, calling me a junkie Tea is a drug? Tea is tea. (GV2)

The constant depredation that the School 1 is subjected, which is attributed to the junkies of the neighborhood, is highlighted in the speeches criticizing this behavior. Striking-episodes as placing a boy upside down the toilet or hanging in another one in the sports court is counted and recounted. The junkies that are addicts, thugs, hooligans and troublemakers tend to be blamed for the precarious situation of the School 1.

The word junkie comes almost as a category encompassing any kind of addict, employed by drug trafficking or not, that spends their days seeking ways to maintain their addiction. References to other youth groups are sparse. Only the group of young people who attend churches seems to have power to connect to another group.

## The school

The school as a space of confluence for simultaneous stays and reference to the possible formation of friendships has some similarity to the leisure environments traits.

As soon as I entered this school they sometimes smoked (marijuana) in the bathroom. I got to see. Then I never saw anything like that (GNV1). There are only a few using drugs at school (GNV1). In the school, I never saw it (GNV1). There was a boy in the classroom who took the chair, the top of the chair and hit the glass, then the whole damn glass fell on the other side (GNV1). There was a fight with the teachers, sometimes it is a mess here. There was a teacher who hit the boy (GV2).

Thinking of the school as autonomous space, although inserted in the neighborhood is difficult. Thus, interviewees speak of depredations and acts of vandalism committed by young people in school, as shown in this dialogue between students of GV Group at School 1

They broke girl's bathroom. t's people from within the school. Just like last month, people stole the wiring and fans I guess they should call the school police because there's always people jumping the walls, there are people who are on the street and drop bombs inside.

The presence of the police who eventually enter the School 1 is commented, generating controversy and contributing to the confusion rather than border demarcation between the logics of the street and the school:

When I came here I was scared too, had lots of police, lots of drugs, lots of fighting, even with scissors. It was scary. I wanted to get out, but then I got used to it, now I do not go out of here (GNV1).

The eventual presence of police, the fact that the students use drugs, the school being constantly vandalized, approaches the logic that prevails in the streets making it an indistinct spot of the others: When I joined in here they told me: you will die; you will get shot (GNV1). How many days we were in classes and had junkies smoking weed (GNV1)

School / neighborhood / street differentiation is difficult, because the school is perceived to be penetrated by the district and its logics. Students seek, however, to differentiate it by saying that the motivations to act this way in schools stems from specific aspects of the school and not for the lack of family supervision:

I have used drugs within the school, even smoked, used ecstasy. No one realizes, it's just you get smart and be quiet. Interviewer: Why do you use in school? Because we are tired of teachers who only want to send us away (GV2).

Also at School 1 students say:

I think it's because they feel sorrow by teachers, I think they don't like teachers (GV1) because there are lacking teachers every day. Sometime we go to school and come back because there is nobody there (GV1). We go out too early, do not come out right on schedule and there is a lack of teachers to give lessons (GNV1).

However, shortening explanations to organizational factors of the school seems to be insufficient so that students from GNV Groups feel ultimately responsible so they cannot distinguish the specificity of the school against other spaces:

They discuss about which teacher is hotter. They keep saying to teacher to make porn videos. (GNV1) Some teachers leave the classroom crying. There was a student that punctured all four tires of a teacher because he yells so much in class. (GNV1). This way they end up proposing the expulsion of some students of the school in an attempt to preserve, differentiate and rescue it from the logic of the street: You should send all away (GNV1). Expelled from school (GNV1).

From one side there is a negative image of the school which causes even fear to study there and other side the pleasure to be there, to study there because the image of the school should not be confused with the actual facts:

Some of my relatives said they had a mess here, prostitution and drugs. They wanted me to study elsewhere. But I think there is not this kind of thing they say, prostitution, drugs and smoking. Now the bad thing is the mess. It's a bit of overstatement (GNV1).

The logic of the street penetrates the school and tenses relations both at School 1 and School 2, despite the separation in School 2 school district that seems to be more marked, perhaps by the best physical conditions and preservation of the school.

School space differs from the streets or recreation spaces by the specificity that is characteristic of the school; however, their proposals are sometimes mixed up when switching elements. In this picture the teaching ends, particularly among young GV Groups, and do not represent the basis for future life project design. The importance of the school seems to be better preserved for the young protagonists of non-violence. For them, the expectation of a better future is associated with school, but this depends on personal effort. For the youth of GNV Groups the school has an importance in the future life projects that cannot be affronted except in terms of educational quality.

## Final considerations

The neighborhood was established as a site for daily coexistence. Thus, the characteristics and implications that are inherent to living in the neighborhood periphery inhabited by low-income individuals appear regularly in the discursive manifestation. Living in these neighborhoods sometimes evokes moments and desires of self isolation and hinders the development of filiations'

complex or relationship affiliation making it hard to establish shared everyday relationships. This situation divided into confined and unlinked spaces ( SENNETT 2008 , 2004) , hinders the perception of the possibility of political action or exercising any resistance and intervention in this space . Readings and interpretations are prejudiced because daily life occurrences consisting of factors transcending the boundaries of a normal life that could exit the social micro relations as the axis to interpret and explain the world. When considering the possibility of community, even fragile, also lies in the existence of some natural " type of shared understanding ' "and "tacit" " (BAUMAN , 2003 , p.16 ) , the narratives of the participants apparently have not shown some understanding as the reflections are specific and singled

The permanence of the enlarged family image as a strong reference in intimacy relations accentuates the perception of spaces for spending free time extra family to not appear as a catalyst to social integration. The school, recreation spaces and even the neighborhood remains generally as a place for crowded people in concomitant stays, disconnected and without any The school spaces gaining street contours eventually lose its meaning in building life projects. This is the reason why school environment is not composed as a potential breakout point of everyday relationships. As Arendt (2011) says the gradual loss of the school specificity as a privileged space for reflection and also as a material failure to perform such instrumentalization, catalyzes the evanescence of resistance.

Anyway, their statements refer to the idea of a cluster of people living together their day to day, but not sharing it. Young people seem to be shuffling emotions ranging from isolation, taboos and beliefs in personal effort pointing to a non overview so that resistance to living do not extrapolate the individual, summarizing and being channeled for personal effort. There is not a sense of common destiny, shared so that each one will live his life as possible, without the perception of any connection between them. In other words, there are not life experience sharing, but clusters of people, each isolated in their own world, making it difficult to build a sense of community and collectivity. The living resistances do not go beyond the individual. This is the way young people do and become invisible in and for the city.

# Socrates on teaching: looking back to move education forward

Lynda George \*

Faculty of Education, Central Connecticut State University 1615 Stanley Street, New Britain Connecticut 06053, USA

## Abstract

This paper discusses the myriad of pedagogy enacted and/or discussed by Socrates within Plato's dialogues. Methodologies including dialectics, elaboration by example, allegories, analogies, imagery, story telling, recollection, and thoughtful inquiry scattered throughout the dialogues. Educators spend time on "the what" of teaching while "the how" to engage, enlighten, and nurture the love of learning and desire to know is often ignored. This paper provides explicit examples of Socrates teaching and connects his pedagogy to present-day instructional strategies that promote relevance and meaning within the context of contemporary teaching and learning.

## 1. Introduction

Socrates' teaching methods as well as his thoughts on teaching and learning are dispersed throughout Plato's texts. In and of themselves the dialogues are philosophically rich and their meaning has been studied, interpreted, and debated for centuries. It is not the intent of this paper to further such discussion but to address the teaching methods Socrates used as well as his views on teaching and learning and their relevance in the on-going present day debates and deliberation on education paying particular attention to the question: what are the best ways to teach? Plato's use of dialogue, rather than explanation, is a gift that gives us the experience of dialectics. It allows the reader to observe and become a part of the discussion(s). Not only do we see Socrates using dialectics to teach using the method that bears his name but also why it is important. Other teaching methods and strategies are woven throughout the dialogues to promote or nurture insight and understanding through thoughtful inquiry. Socrates also gives an account of his encounters with his teacher Diotima. Her use of teaching strategies is looked at in relation to the thoughts and ideas discussed in other dialogues.

Much time is spent within public schools developing and enacting curriculum while little time is spent on the pedagogical aspect involving the art of teaching. Teachers are telling students what they need to know and textbooks are being read that lead students to answer literal questions asked at the end of each chapter. Thus much time is spent on rote learning with little time spent regarding the understanding that comes from making connections, reasoning, constructing meaning and nurturing thinking. Most public schools and/or school systems have curriculum specialists but not specialists in pedagogy or ways of teaching and learning. The "what" of what needs to be known and support for content is available while the "how" to engage, empower, enlighten, and nurture the love of learning and desire to know is often missing, lost, or has been stolen from the learning experience. Within the United States national and state legislation has led to hyper-accountability and exacerbated the technocratic practice of drill and practice through massive testing and teacher evaluations based on student test results. Socratic pedagogy encourages the love of learning and the desire to know and is thus worthy of our looking at for advice and wisdom.

## 2. Conceptual Framework

This research investigation is a pedagogical content analysis of the ancient primary source texts of Plato. The conceptual frame for the study was to uncover Socrates teaching methods and learning strategies as presented by Plato. Particular attention was given to the works where the focus of the dialogue is between Socrates and students rather than his discussions with peers. Within the study dialectics the technique of question and answer and the definition of dialectics was examined. This led to the uncovering of various teaching methods and strategies strategically woven into the dialogues to promote understanding, further inquiry, and clarity. The means and methods of teaching that nurture learning and curiosity were identified. Attention was also paid regarding present-day ideas and ideals regarding learning such as student empowerment, the enactment of constructivist theory and student engagement.

### 3. Findings and Discussion

An analysis of Socrates' use of various teaching methods and approaches goes from multiple examples exhibiting themselves in any number of texts to specific examples deeply and richly used but once. As one would assume, dialectics was found to be the dominant teaching methodology within the dialogues while other methods and teaching strategies were woven within to promote understanding. Dialectics is also defined and its rationale given by Socrates. Another teaching strategy that occurred multiple times was elaboration by example. Vivid images imbedded within analogies are another strategy often used to make connections, provide clarity, construct knowledge and again promote understanding. The dominant use of metaphor is found in *Theaetetus* (Plato, trans. Jowett) when Socrates likened himself to a midwife. The richly detailed allegory of the cave found in Book VII of Plato's *Republic* (trans. Bloom, 1968) is also vivid imagery. The idea of recollection as it relates dialectics is worth noting. Also worth noting in a discussion on Socrates regarding teaching and learning is his teacher and her teaching methods.

Given that dialectics is the central teaching method with other methods lending support it is appropriate to lead off the discussion of dialectics and its merits with the metaphor that brings understanding to the method. Socrates refers to himself as a midwife of the soul assisting in the birth of ideas within the text of the *Theaetetus* (Plato, trans. Jowett, 1952). Socrates' description of the role and work of the midwife goes beyond present-day understanding of the term and thus an elaboration of what she (the midwife) does, brings more meaning and understanding to the method and enriches our understanding of dialectics. *Theaetetus* tells Socrates that he struggles to answer questions that he has heard Socrates ask. Socrates answers that they are "pangs of labor...something within you which you are bringing to the birth (148e)" and that he can and will assist in their delivery. He further states that not only do midwives assist in labor, they are also past childbearing age but are not barren "because human nature cannot know the mystery of an art without experience (149c)." The importance of experience as the way of knowing is expressed here. The importance of experience as a learning theory has been articulated, discussed and encouraged by distinguished education scholars John Dewey (1938) and Paulo Freire (1970). Yet experiential learning it is rarely mentioned in the debates among legislators and education today. Socrates goes on to say that the midwife has the potions, skills and knowledge to make difficult labor easy as well as if need be cause a miscarriage in the early stages of the pregnancy. She is also said to be a skilled matchmaker with the knowledge to know a good union to produce good offspring. He refers to himself as a midwife of the soul assisting in the birthing and examination of ideas. He expounds on the commonalities and contrasts between the two types of birthing experiences and the need for the midwife/teacher to assist students to bring forth worthy ideas and to rid themselves of phantom ones. The dialogue continues with *Theaetetus* stating that knowledge is perception and Socrates responds: "And now, let us examine together this conception of yours, and see whether it is a true birth or a mere, wind-egg (Plato, trans. Jowett, 1952. 151e)." The subsequent discussion between *Theaetetus* and Socrates enacts the analogy as they discuss the nature of knowledge in which their conceptions of knowledge become phantoms. Socrates and *Theaetetus* come to consensus and agree that perception is not knowledge, as *Theaetetus* first

thought. The dialogue ends with the need to continue the search to understand the nature of knowledge. Socrates' analogy and the subsequent enactment provide the reader with the "what" and "why" of the method in action. The use of metaphor as teaching tool or method helps to build and construct meaning by bridging what is not known or understood with that that is known and understood. Today this approach is referred to as Constructivist theory and again is rarely mentioned in present day debates on teaching and learning. The use and misuse of dialectics in teaching and learning is found in *Philebus* (Plato, trans. Jowett, 1952). Timing is important to ensure learning and the teacher must incorporate the necessary steps to ensure understanding has taken place.

...This, as I was saying, is the way of considering and learning and teaching one another, which the gods have handed down to us. But the wise men of our time are either too quick or too slow in conceiving plurality in unity. Having no method, they make their one and many anyhow, and from unity pass at once to infinity; the intermediate steps never occur to them. And this, I repeat, is what makes the difference between the mere art of disputation and true dialectic (16e-17a).

This statement addressed the fact that dialectics, according to Socrates, is not about arguing, debating or disagreeing. Dialectics is a teaching tool enacted through discussion with reasoning as the means for coming to: an understanding, or a discovery, or the realization that what one thought one knew or believed to be true after deliberation is seen as not true. It is a method of constructing or deconstructing knowledge and understanding. When deliberating on when and how to educate the citizens within the design of the ideal city (Plato, trans. Bloom, 1968) Socrates states "... We have set dialectic above all other studies to be as it were the coping-stone (top) – and that no other higher kind of study could rightly be placed above it...(534e)."

When disputes within the dialogues take place it is important to note that Socrates is speaking with people who purport to know something while Socrates doubts their knowing. This is evident during the discussions Socrates has with Meno and Protagoras in their respective dialogues. When he questions them they appear to care more about winning the argument and proving their point than seeking truth or understanding. On the other hand when Socrates discusses ideas with the youth of Athens they appear to be more willing to question and be led than the adults he speaks to. One might call it manipulation or see it as nurturing thinking, constructing knowledge and/or guided inquiry that will empower the student. An example of this is found in Socrates' conversation with the boy in Meno (Plato, trans Guthrie, 1989). This also serves as an explanation of Socrates' belief that knowledge is within us and only needs guidance to be recollected. Socrates argues that we have this knowledge from prior lives but have forgotten it. He demonstrates this to Meno within the context of a geometry lesson. Socrates questions a boy servant on how to double the size of a square. First the student thinks he knows then discovers that he does not know becoming perplexed but still curious. The two, teacher and student, continue the pursuit by Socrates guiding and not telling the youth the information. It is the bringing out of knowledge not the pouring in which Socrates terms recollection. Learning is achieved through questioning as opposed to didactic instruction. Socrates sets dialectics above all other studies (*Republic*. trans. Bloom, 1968). Within the dialogue *Lysis* (trans. Wright, 1961) the student becomes the teacher when Socrates asks him to remember and repeat what he learned to his friend. Socrates' often recaps or reviews midway or at the end of a dialogue as a means to establish clarity and ensure student understanding.

It is also important to note that within *The Symposium* (trans. Joyce, 1989) Socrates speaks "...of some lessons he was given...by a Mantinea woman called Diotima – a woman who was deeply versed in this (love) and many other fields of knowledge (201d)." He not only speaks of her as his teacher but also credits her with the method that bears his name within the Joyce translation of the Symposium "...I think the easiest way will be to adopt Diotima's own method of inquiry by question and answer (201d)." When it is Socrates' turn to speak he recollects his time spent with her in dialogue speaking both her and his parts. They discuss or study a number of the ideas, which reoccur in other dialogues when he is questioning the youth of Athens. She explains recollection as the coming and going of knowledge. She guides Socrates to an understanding of "right" opinion, the mean between wisdom and ignorance. She uses a myth of Eros to bring a visual imagery of the mean. The dialogue is on love and together they explore the greater and lesser mysteries of love, which embraces and enacts the love of wisdom. The history of Western education would look quite different had Diotima been given the credit and status for influencing Socrates' thinking and his teaching. She would be seen as an historical figure as opposed to her near invisibility brought on by the masculine-centric scholarship of male classicists (George, L., 2007). Socrates used

common everyday situations and images to promote understanding and construct meaning through the use of analogies. To explain that knowledge must be more than perception he has Theatetus imagine the human mind as a block of wax and when images come into our mind the perceptions are imprinted. How long the perception last depends on the density and consistency of the wax. Once the imprint is rubbed the image is forgotten and needs to be reminded in order for it to imprint again. When Socrates asks Meno (Plato, trans. Jowett) what virtue is Meno's response is a list of virtues. Socrates asks him to define the nature of virtue, that which all virtues have in common rather than merely listing the virtues. When Meno continues to reiterate the many instead of the one Socrates likens what he is looking for to a swarm of bees. Bees are different but each has the essence or nature that gives them the name bee. He uses the image of smashing a plate into many pieces and explains that each piece is still a part of the plate. Socrates advocates the use of analogies and visual images when teaching. Within the Republic (Plato, trans. Bloom, 1968) he says: "...listen to the image so you may see still more how greedy I am for images (488a). Socrates uses the phrase by example or an example no less than 30 times within four dialogues where the preponderance of text is between a student and himself (*Theatetus*, *Meno*, *Lysis* and *Phaedrus*). Examples are given when asked to clarify a thought or further elaborate on a point.

The classic use of allegory, within Plato's texts, as the means for teaching is found within Book VII of Plato's Republic (trans. Bloom, 1968). Socrates tells a story using visual images as the means to clarify and promote understanding. It is extremely vivid and active as can be witnessed by the hundreds of drawings and dozens of YouTube interpretations posted on the Internet. The allegory is an approach that builds understanding using prior knowledge reflects the teaching strategy referred to as scaffolding (giving support to the learner as knowledge or understanding is under construction). It is learner-centered in that it employs a variety of approaches to enact learning. Not only do we see the use of allegory as a teaching method but also gain insight into Socrates' interpretation of the problems of an education that lacks understanding, relevance and active engagement. Preceding the allegory Socrates says "...make an image of our nature in its education and want of education, likening it to a condition of the following kind. (514a trans Bloom)." The allegory begins with the image of a dark cave where prisoners are in chains and cannot move. Shadows of images are reflected off the wall from the light of a fire behind them. Due to an echo the naming of images, for the prisoners to learn, are not correct. When one is freed and emerges into the light from the darkness of the cave he at first cannot see. He initially sees only shadows and images reflected in water but in time the true images are seen. When he returns to the cave going from light to dark he stumbles and when he tells of what he has seen and experienced and tells that what they know is not true he is put to death. Following the allegory Socrates equates it to the previous discussion; "...the prison-house is the world of sight, the light of the fire is the sun, and you will not misapprehend me if you interpret the journey upwards to be the ascent of the soul into the intellectual world according to my poor belief, which, at your desire, I have expressed whether rightly or wrongly..." (517b). Much has been written and said about this allegory; interpretations from learned philosophers abound. One may assume that from an educator's perspective learning within the cave is through rote memorization and even that is once removed from truth due to the echo. Socrates concludes this portion of the discussion with an interesting statement that suggests he was speaking to or disagreeing with John Locke who wrote in the 1600s in his *Essay Concerning Human Understanding* that we are born as a blank but receptive slate. More recent behaviorist theory holds that as blank slates knowledge needs to be poured into us. As Socrates put it "...then, if I am right, certain professors of education must be wrong when they say that they can put a knowledge into the soul which was not there before, like sight into blind eyes (Plato, trans. Joyce, 1989. 518).

## Conclusion

Reading the dialogues through the lens of an educator rather than a philosopher, paying particular attention to the relationship between teacher and student brought forth several insights and a renewed sense of the importance of Socrates' teaching methods and strategies. The abundance of images as a way to construct meaning and nurture inquiry was quite overpowering and reinforced the importance of using multiple approaches when teaching to promote and insure understanding. This study supports the use of questioning as a necessary method for educators to enable, empower, and guide student learning. It also brings into consideration the need for educators to take the necessary time to think and question ideas to promote understanding and practice thinking. Teaching that promotes a

love of learning and a desire to know goes beyond the pouring in of knowledge that comes from just lecturing and/or repetitive drill and practice. Socrates has much to say on how to engage, empower and enlighten students. Great teachers don't just know the content of the subject(s) they teach but also know how to make learning meaningful and relevant. Great teachers engage, make the uninterested curious, change the minds of those who think they know but don't, and take the time to enable understanding. Wisdom comes through understanding, an understanding that brings relevance and meaning, leading not only to remembering but also providing the building block for further and deeper learning. Socrates is said to have been a great teacher and looking to his work to uncover his thoughts, ideas and practices provides us with an opportunity to enact experiences that lead to more powerful and successful outcomes for all students.

# Sound art and architecture: New horizons for architecture and urbanism

Justyna Borucka\*

Gdansk University of Technology, Narutowicza 11/12, Gdansk 80-288, Poland

---

## Abstract

The article discusses the crossroad between art and architecture. It sketches out the theoretical and practical aspects of involving art into architecture and multisensory dimensions of space. The analysis is based on examples of innovative experimental activities for architecture: educational projects such as workshops, seminars and courses, combining art and architecture, with special emphasis on sound art, and the consequences of such synergy for the perception of the space. Specifically, it aims to understand how this interdisciplinary approach in architecture can emphasize our understanding of the potential of non-visual aspects of space and stimulate architectural creativity.

## Introduction

What we experience with our bodies and senses differs dramatically from the theoretical concepts of pure space as proposed by scientists. Space can be defined by surfaces, lines, points. But besides this obvious physical nature of the space there exists its character, not measureable as easily – the phenomenal space. Our own human experience of space is quite different from a hypothetical concept of pure space because we are embodied beings and experience our environment with all senses available to us. Prominent philosopher Maurice Merleau-Ponty (1948-2002) points this out and argues that we are all part of that space, we are one with it. Similar statements are expressed by Charles Landry with his remark that *“People are the part of urban story otherwise physical remains the empty shell”* (Landry 2006). This suggests that personal experiences in relations to space uncover sensual nature of architecture.

Sometimes architecture and, more generally, art itself, serves to provide the experience that directs our consciousness towards the world and our sense of self. It also helps us experience ourselves as spiritual and embodied beings. Such was the stipulation of a well-known theoretician and architect, Juhani Pallasmaa (2005). Building upon the phenomenological concepts of philosopher, Merleau-Ponty, Pallasmaa argued: *“Architecture is the art of reconciliation between ourselves and the world, and this mediation takes place through the senses”* (Pallasmaa 2005). His proposal was to interpret architecture in more profound ways, as an expression of our relationship with the world, and not simplistically, as a mere practical, functional aspect of life, providing shelter, workplace, school, and other functions. (Pallasmaa 2005)

The education in the fields of architecture and design should encompass those very complex sensory phenomena of the space and to attempt to pose questions about them and propose solutions. The challenge becomes to introduce such pedagogical practices and educational design strategies that would reflect the profoundly rich space experience.

In order to search for experiential activities to explore above mentioned issues we could turn to art. As Vitruvius mentioned in his groundbreaking work on architectural theory: architecture is a combination of several arts and abilities. (Vitruvius 2001) Today, postmodernity opened relationships with the public which in turn led to a creative dialogue between art and architecture. Cooperation ensued between architects specializing in the designing process, aesthetic discourse and spatial and conceptual issues as well as landscape projects. This model of work has developed in the recent years and scientists are now often working with artists, musicians with architects. (Fernie 2006)

In order to provide a unique perspective and to teach new competencies to architects this project proposes to concentrate on the complex sound environment. This can be done by learning to listen, performing sound and implementing sound to the architecture practice increase sensory sensitivity. Outlined below are specific examples that illustrate practice-based assignments which incorporate using art, with special emphasis on sound art, in experimental activities for architectural education.

## Listen to the sound of the city

*“A sound-walk is an invitation to give our ears priority over other senses”* (Westerkamp 2014, 1974)

The soundwalk "Listen to the City" was the type of excursion focused on listening and was a part of the experimental activity introduced to students within the soundlab during the Light City Sound Workshop in cooperation with the sound artist Krzysztof Topolski. (Fig.1.) (Fig.2.)

a.

b.

Fig. 1. (a) (b) Soundwalk in the Gdansk shipyard

This unique practice stems from the acoustic ecology and soundscape movement. It was initially developed in the 1960s by Canadian composer Raymond Murray Schafer (1977) and his team of researchers and titled: "World Soundscape Project". It focused on creating an increasing acoustic awareness of the sound environment and on exploring the space between art and science and our own presence within it and our experience of it.

Soundscape of the city is constantly changing oscillating between orderly cacophony, sometimes noise and many other sounds communicating information. It is only occasionally when some aggressive noise hovers over the soundscape or as some strange happening silences the environment that we notice just how strange is the sound of silence in the city. Soundwalk experiment was centered on listening, then recording and finally analyzing the acoustic terrain of the city recordings of the soundscape. In its final stage was focused on soundmapping, that is documenting and sketching the sounds into particular terrains of the city, such as the city center as well as the industrial outskirts and suburban areas. Geographic map was overlaid with a symphony of sound created to reflect it.

The methodology of this study consists of the analysis of soundscape: the sound environment of the city. The sound recordings consisted of a broad range of sounds uniquely significant for a given area. Selected recordings were used to create a sophisticated map of the area. It included sound recordings of each of the walks with specific information about the area and the location of the recording. This recording become a sound reference for the geographic map of the city and could serve as a type of soundtrack to the city.

The inspiration for the soundlab comes, among other things, from the 1960s trend of sound ecology, which was promoted starting in mid 1960s of 20th-century by R. Murray Schafer and his research group: "World Soundscape Project." According to him the sound environment is contaminated and the modern western culture is centered on visual aspects while neglecting the importance of the sound perception. The focus on visual perception diminishes the importance of sound, but Schafer's acoustic ecology insists that our environments should in fact be perceived as a piece of music. The idea of sound ecology is centered on the concept of the environment as a musical piece. (Schafer 1977) According to Schafer, analyzing and understanding the soundscape of the environment is a necessary step leading to a conscious process of shaping such an environment. The practice of recording and listening to sound recordings of geographic terrain is an integral part of the artistic process proposed by the composer. It has an important pedagogical aspect. Learning to listen and sound education in general leads to building increased sensitivity and creates a different perspective and competence. It can create more awareness about non -visual values of the space.

## Perform the sound of the city

The second step in this approach was the performance of the sound spectacle – a unique live concert of soundscape of the city. Using the methodology (Fig.3.) and the idea of sound spectacle by the artist Zorka Wollny, this experiment called for utilizing strange and often unexpected instruments and tools including our own bodies.<sup>1</sup>

This work was conducted within the WIRE 2014 - Winter School International Research and Education; Art and Architecture introducing art into architecture and design practice.

The spectacle investigated sensorial aspects and characteristic of the space and was composed to the specific architecture and acoustic environment. The central goal of this workshop was to create a sound of the city and the final composition consisted of a sequence of exercises. The members of the group had to get to know each other and explore their individual personalities. At the same time they were analyzing the qualities and sound capabilities of the space and of their own role within it. The spectacle consisted of personal input of each of the performers and was the final and most important part of this workshop. The performers were inspired by the acoustical sensations of the space and created music and sounds using everyday objects such as their bodies and voices. They were inspired by what they observed in those urban spaces such as the sounds of people talking to each other or walking by or hearing nature and more specific sounds of a bustling urban environment. The culmination of this experimental performance was a transformation of these separate individual sounds into a complete abstract musical piece which represented the sound environment of the city.

The final composition titled the “Sound of the City” was a unique experimental performance. Each audience member could interpret it differently using their own sensory experiences. The emerging non-visual representation of the space and of the architecture of the city was a unique way to stimulate the architectural creativity of the performers as well as to stimulate the audience to look at their environments in a completely different way.

installations

Fig. 4. Experiencing of sound art project within the Narratives Art Festival, Gdansk 2012

### Implementing the sound of the city

Another way of introducing the issue of multi-sensory perception of the space was the creation of a sophisticated online visual and sound representation of the city based on the prior excursions and walks through the city environment. An important part of this stage was incorporating the experiences of the participants in the art city festival attended at the same time and which served as an additional methodological inspiration. (Fig. 4.)

The city was mapped using traditional visual methods but, in addition, a sound map was created to provide unique sound to each separate city section. Each location was additionally represented by films and pictures as well as narratives of personal experiences of those who focused on that particular location. The final product was a unique multidimensional and nontraditional architectural representation of the area with a map as well as soundscapes and individual narratives creating a sophisticated cityscape. (Fig.5.)

Soundwalks and soundmaps document and investigate the city in ways that traditional architectural representations do not. Participants of soundwalks are encouraged to critically assess sounds of the environment and to think about how they contribute to the sonic environments while sound walks provide a unique sonic route to follow along the terrain, and to incorporate sound into their experience of the city. ( Truax 1978)

## Conclusion

The future of architecture depends on the interdisciplinary character of the discipline and the progressive, innovative ways in which it is practiced. This project demonstrates that art provides means to approach architecture in innovative ways. It is using art that we can develop new approaches as well as communicate architectural concepts to a wider audience. Using art to communicate architectural concepts can serve as a feedback loop through which the community can reflect on the evolution of the discipline, provide feedback about the use of space and articulate ideas about architectural design.

The exercises described above represent a highly multidisciplinary approach, linking such disciplines as architecture, arts, electronics, sociology of the city, anthropology and media design. It is based on the assumption that most advanced and promising phenomena are emerging on the very edge of the blurring borders between traditional disciplines. The problem of training new architects is widely discussed within Europe, as for example during panels of the European Association for Architectural Education. It is becoming evident that future practitioners will have to establish their highly-specific competences and strengthen entrepreneurial capabilities to successfully face global challenges. The proposed new kind of educational activities promote new methods for teaching architecture.

Such new methods often focus on processes of understanding and designing the multisensory dimension of public spaces and thus strengthening awareness about their phenomenological characteristics. This approach has been neglected for far too long, and providing new opportunities and design studios may help to change that, and to bring the focus to new innovative ways of architectural design. The future approaches could advance the discipline, and influence better understanding of its contemporary manifestations.

In addition to enriching theoretical foundations such new methods and approaches will help practitioners and students acquire skills in using the advancements of different disciplines in architecture and urban planning. Expected learning outcomes will also provide new directions, unique propositions for broadening existing learning programs in architectural schools by adding to their knowledge about sound art and new technologies and scientific research.

## Abstract

Work-related stress is an imbalance between work-related demand and individual capacity. If not appropriately handled, it may adversely affect individual emotions. Work-related stress is also experienced by academicians in institutions of higher learning due to various aspects. Various measures have been taken by academicians to overcome stress so that it will not adversely affect academic excellence and scholarship. Hence, the aim of this research is to identify the perceptions of academicians regarding their career and to examine the role of the spiritual aspect in managing stress experienced by them. This research is designed as a survey study. 37 out of 108 academicians at the Faculty of Islamic Studies, National University of Malaysia (Universiti Kebangsaan Malaysia) have been randomly selected as study sample. Questionnaires are used as instrument of data collection. The data obtained is analysed using the descriptive statistical technique. Research results find that the respondents' perception of their academic career shows they experience stress due to the burden of heavy workload leading to emotional and physical fatigue, and also whenever they receive new assignments. This research also finds that a spiritual approach may play a role in alleviating stress among academicians.

---

## 1.Introduction

An individual with a career faced with various career challenges may experience work-related stress which negatively affects his work, family and health (Fatimah Omar & Suryani Supardi, 2000). Jaafar Muhammad (1997) has discovered three main causes which potentially create work-related stress. The first cause is the environment factor comprising of economic uncertainty, political instability and technology. Second is the organizational factor which involves organizational structure, organizational politics, role ambiguity, excessive workload, tedium and lack of group support. Third is the personal factor comprising of behaviour, changes in life and role conflict.

In this regard, it is necessary to identify an approach in order to assist academicians in managing work-related stress. Islam proposes a suitable spiritual approach. A spiritual approach may become the inner motivation to induce a more positive attitude towards work and responsibilities in academicians. Thus, motivation is important to an academic career. It is important in the academic world because of the numerous inevitable challenges encountered. These challenges are sometimes easily manageable but at other times can be very difficult to overcome so much so that academicians lose their diligence. Motivation is very important at this point in time and may be likened to a catalyst for spiritual development towards the realization of aspirations and expectations built. Therefore, motivation has to be nurtured, it will not come on its own. Nurturing motivation consistently will increase work motivation and finally make work as something meaningful in life (Friedlander 1966). Work motivation is also important to form a positive attitude and improve work performance (Hung-Wen Lee & Ching-Hsiang Liu 2009; Wijono 1997). A study by Wernimont, et.al (1970) finds that one of the methods which assist in increasing work motivation is to have a versatile employer, a challenging career and participation in decision-making. Besides this, Katzell & Thompson (1990) find that motivation may be increased by job satisfaction, a worker who attains job satisfaction is more

---

\*\*\*\*\* Corresponding author. Tel. : +603-89213505; fax +603-89213152

E-mail address : salhanin@ukm.edu.my

inclined to be more productive. Further, a study by Salasiah et al. (2012) shows that one of methods to increase motivation is to strengthen spiritual relation with God.

Despite the importance of motivation in an academic career, it cannot be denied that sometimes work motivation decreases due to work pressure, such as pressure from the employer who requires academicians to achieve Key Performance Indicator (KPI) even though academicians may not have the ability to do so. Other than that, academicians also feel pressure from students, particularly problematic students who write inferior working papers, from the problem of plagiarism and the problem of less competitive students. A study by Pelletier et.al (2002) shows that academicians actually feel pressure from the top (employer) as well as stress from below (students). This pressure or stress may adversely affect work motivation. Looking at stress as a factor which causes decline in work motivation of academicians, this research is conducted to identify the perceptions of academicians towards their career and to study a spiritual approach in managing work-related stress of academicians in the field of Islamic Studies.

## 2. Purpose of Research

The purpose of this research is to identify the perceptions of academicians concerning their career and to study the spiritual approach in managing stress experienced by academicians in the field of Islamic Studies.

## 3. Research methodology

This research is designed as a survey study. 37 academicians have been selected out of a total population of 108 academicians in the Faculty of Islamic Studies. Selection is done by systematic random sampling. Data is collected using questionnaire consisting of four parts. Part A concerns the background of respondents, Part B relates to the family background of respondents, Parts C, D and E concern the problems they face in increasing work motivation and Part F concerns the methods which assist in work motivation among academicians in the Faculty of Islamic Studies. Data is analysed descriptively and presented in the form of percentage, frequency and mean.

## 4. Research Findings and Discussion

Prior to discussing the spiritual approach in managing stress which may affect work motivation of academicians, it is necessary to first discuss the perceptions of academicians towards their career. The result of analysis based on mean finds that item “My work is never done ” has the highest mean value, i.e., mean =3.00, followed by the item “ I feel very tired spiritually, emotionally and physically after work” (mean=2.86) and “ I feel stressed whenever I get a work assignment”(mean=2.41). This shows that academicians experience work-related stress, particularly, they feel that work is never done, thus causing weariness spiritually, emotionally and physically. Among them are also those who feel stress whenever they get a new work assignment.

Table 1: Academicians' Perceptions of their Career

No.	Perception	Strongly disagree	Disagree	Not sure	Agree	Strongly agree	Mean
1	I feel stressed whenever I get a new work assignment.	6 (16.2%)	16 (43.2%)	10 (27.0%)	4 (10.8%)	1 (2.7%)	2.41
2	My work is never done.	6 (16.2%)	9 (24.3%)	5 (13.5%)	13 (35.1%)	4 (10.8%)	3.00
3	I am bored with my work.	15 (40.5%)	13 (35.1%)	8 (21.6%)	1 (2.7%)	0 (0.0%)	1.86
4	Workload is too much so I prefer to adopt the attitude “so long as I do my work”.	15 (40.5%)	10 (27.0%)	8 (21.6%)	3 (8.1%)	1 (2.7%)	2.05
5	I feel very weary spiritually, emotionally and physically after work.	5 (13.5%)	10 (27.0%)	8 (21.6%)	13 (35.1%)	1 (2.7%)	2.86
6	I feel dissatisfied with my work.	9 (24.3%)	12 (32.4%)	9 (24.3%)	7 (18.9%)	0 (0.0%)	2.38
7	I am frequently moody, irritable and impatient during work.	14 (37.8%)	15 (40.5%)	6 (16.2%)	2 (5.4%)	0 (0.0%)	1.89
8	I frequently feel frustrated during work.	16 (43.2%)	14 (37.8%)	6 (16.2%)	1 (2.7%)	0 (0.0%)	1.78
9	I am thinking to resign or change workplace.	20 (54.1%)	10 (27.0%)	4 (10.8%)	3 (8.1%)	0 (0.0%)	1.73
10	I have no enthusiasm for work.	21 (56.8%)	9 (24.3%)	6 (16.2%)	1 (2.7%)	0 (0.0%)	1.68

In addition, this research also finds that there are academicians who are dissatisfied with their career such as “ I feel dissatisfied with my work ” (mean=2.38), “ Workload is too much so I prefer to adopt the attitude, so long as I do my work ” (mean=2.05 ), “I am frequently moody, irritable and impatient during work” (mean=1.89), “I am bored with my work ” (mean=1.86), “ I frequently feel frustrated during work” (mean = 1.78), “ I feel like resigning or changing workplace” (mean=1.73) and “ I have no enthusiasm to work” (mean=1.68). Even though the mean value obtained is not high, this clearly shows that a minority of academicians are not too happy with their career so that they feel dissatisfied with their career, become less diligent in work, become moody, irritable, bored, lose enthusiasm to do work and think of resigning or changing workplace. All these matters show that academicians experience stress in their academic career.

The perceptions of academicians towards their career seem a little negative leading to the researcher to study the approach taken by them in dealing with stress. The most popular approach is the spiritual approach. This research finds that the spiritual aspect plays an important role in overcoming stress faced by academicians in the field of Islamic Studies at the Faculty of Islamic Studies of UKM. Mean analysis finds that the item with the highest mean is “Contentment with Allah’s providence” (mean=4.84) followed by item “ Keep proper worship (*ibadah*)”, “ Constantly purify the heart from bad traits such as envy, anger and so on” and “Faith in Allah’s help” each with a common mean value (mean=4.81). Then followed by item “Purify the intention to work as worship (*ibadah*)”(mean=4.78) and “Establish night vigil prayers (*qiyam al-lail*)” (mean=4.46).

Briefly, this research finds that the spiritual practices implemented by academicians in dealing with stress are fostering contentment with Allah’s providence, keeping proper worship, purifying the heart from bad traits, having faith in Allah’s help, purifying the intention to work as worship (*ibadah*) and establishing *qiyam al-lail*.

Table 2: Spiritual Practices in Managing Stress

No.	Spiritual Practice	Strongly disagree	Disagree	Not sure	Agree	Strongly agree	Mean
1	Keep proper worship.	0 (0.0%)	0 (0.0%)	1 (2.7%)	5 (13.5%)	31 (83.8%)	4.81
2	Constantly purify the heart from bad traits such as envy, anger, etc	0 (0.0%)	0 (0.0%)	1 (2.7%)	5 (13.5%)	31 (83.8%)	4.81
3	Faith in Allah’s help.	0 (0.0%)	0 (0.0%)	1 (2.7%)	5 (13.5%)	31 (83.8%)	4.81
4	Contentment with Allah’s providence.	0 (0.0%)	0 (0.0%)	1 (2.7%)	4 (10.8%)	32 (86.5%)	4.84
5	Purify intention to work as worship ( <i>ibadah</i> ).	0 (0.0%)	0 (0.0%)	1 (2.7%)	6 (16.2%)	30 (81.1%)	4.78
6	Establish night vigil ( <i>Qiyam al-lail</i> ) prayers	1 (2.7%)	0 (0.0%)	3 (8.1%)	10 (27.0%)	23 (62.2%)	4.46

## 5. Discussion

The spiritual aspect is important to academicians at the Faculty of Islamic Studies, UKM to deal with career stress. Fariza (2005) in her research on stress, finds two forms of implementing the spiritual approach, i.e., through social and personal support. Social support comes from counselors and preachers who guide their souls/psyches to build spiritual strength. In terms of personal support, the self-purification (*tazkiyyah al-nafs*) approach cultivates praiseworthy (*mahmudah*) qualities such as contentment, patience, gratitude and trust in (*tawakkal*) Allah s.w.t.

Research results find that respondents apply spiritual practices such as fostering contentment with Allah’s providence, keeping proper worship (*ibadah*), purifying the heart from bad traits, having faith in Allah’s help, purifying the intention to work as worship (*ibadah*), and establishing night vigil prayers (*qiyam al-lail*) in order to manage career stress as academics. This finding is in line with findings by Graham et al. (2001), Stanley et al. (2011) and Yong et al. (2011) that the spiritual element if applied to a career helps to alleviate stress. The study by Yong et al. (2011) shows that after a spiritual program given to nurses in Korea, stress was reduced and spiritual well-being and leadership value increased. Similarly, the study by Hsiao et al. (2010) finds that the spiritual health of students can be a mechanism for nursing students to manage their stress, to reduce depressive symptoms and to enhance health-promoting behaviours. In addition, Salasiah et al. (2012) in her study finds the same result, i.e., a spiritual approach can alleviate stress experienced by students of Islamic studies and increase their motivation to learn.

There are respondents who keep proper worship to manage stress. This is in accordance with Islamic teachings which encourages Muslims to keep their worship, especially prayers (*solat*) because a slave pleads for God’s help in prayers when he faces difficulties in life (al-Baqarah 2:153). Prayers accompanied by *al-himmah* (inner strength), giving full attention and focus

on Allah including internalizing the significance of what is spoken or done, will bring peace of mind (Al-Ghazali 2000). Besides, prayers give humans the opportunity to personally interact with his Creator. A person may use this opportunity to pour out all his hidden and suppressed feelings from his heart until his burden feels lifted (Che Zarrina Sa'ari 2001; Ayyub 1996). This is reinforced by another study of Salasiah et al. (2014) which finds that through prayers, one may gain happiness. Research results also find that respondents practice "Contentment with Allah's providence" in their approach to alleviate work-related stress. This is in line with Islamic teachings to encourage Muslims to always think good of Allah in every situation and to have full confidence or faith in the wisdom behind any stress that afflicts him (Al-Ghazali 2000). Such feelings and attitude significantly calms one's soul or psyche and helps one to persevere as well as accept any form of challenges in life. In conclusion, research results show that the spiritual approach may be taken as one of the steps in overcoming stress in the world of education.

## 6. Conclusion

This research concludes that work-related stress among academicians, particularly relates to excessive workload, emotional and physical weariness as well as boredom with career. A minority of academicians are not too happy with their career to the extent of losing diligence in work, becoming moody, irritable and bored during work, losing enthusiasm and feeling like resigning or changing workplace. One of the methods to deal with work-related stress is by strengthening spirituality such as being contented with what Allah has given, keeping proper worship (*ibadah*), striving to cleanse the heart from bad or negative traits, putting faith in Allah's help and establishing *qiyam al-lail*. (night vigil prayers). These findings show that work-related stress may be overcome by a spiritual approach.

# Starting and today of the interior architecture education; a comparative research on the models of mimar sinan fine arts university, sanayi-i nefise mekteb-i alisi (former mimar sinan fine arts university) and ecole des beaux arts

Cem DOĞAN<sup>a</sup>, Elif ÖZDOĞLAR<sup>a</sup>

*\*Mimar Sinan Fine Arts University Faculty of Architecture Department of the Interior Architecture Meclis-i Mebusan Cad.No:24 Fındıklı Beyoğlu, İstanbul, Türkiye (Turkey)*

## Abstract

The aim of the research is to examine the education model and architecture and decorative arts programmes formed by taking the “Ecole des Beaux Arts” as model in which Alexander VALLAURY, the founder of the Sanayi i Nefise Mekteb-i Alisi which is the first school that trains certified architect in the Ottoman and Turkish Republic, received education and to compare it with the MSGSÜ Department of Interior architecture. This research covers the France, Ecole des Beaux Arts Department of architecture (approximately 1796-1907), Sanayi-i Nefise Mekteb-i Alisi Departments of Architecture and Decorative Arts (Turkish Republic Education Board published in hijri 1340) and MSGSÜ, Faculty of Architecture, Department of Interior Architecture. For this research, the resource and literature review have been done and the data belonging to the first education model which has been determined to continue till 1930 and regulations and programmes have been examined and the comparisons have been made.

## 1. Introduction

Regarding the family of French origin Levantine architect Alexander Vallaury who was born in 1850 in İstanbul, different information takes place in many resources. It has been said that he took his high school education in İstanbul Saint Joseph French High School which was an institution affiliated to the French Society of Priests ("Frères des Ecoles Chrésiennes") whose foundation was put by Saint Jean-Baptiste de la Salle in the city of Reims of France in the year of 1860. As the foundations of the school building were put in the year of 1857, this seems possible and as the school was evacuated during the First World War, the documents before 1920 got lost. It has been determined during the interview made with the Saint Joseph High School that it will not be possible to verify this due to this reason.

In the 3<sup>rd</sup> November 1839, the Tanzimat Reform which can be considered as the first steps of the democratization and westernization movements in the Ottoman history opened the doors of a new world understanding and this changing process have also affected the design and architectural areas which are open to continuously have metaphor with the social events and agenda. In this period, the parents directed their children to the profession of architecture which they thought that it was promising and Vallaury was also directed to Paris for getting education and he took education that lasted for eight years in M.Cogurt workshop at Ecole Nationale Supérieure des Beaux Arts.

When he returned to İstanbul, the friendship of Vallaury exhibiting his projects, surveying and other works with Osman Hamdi Bey played an important role in the establishment of Sanayi-i Nefise Mektebi. The first building of Sanayi-i Nefise Mektebi, İstanbul Archeology Building Asar-ı Atika (ancient monuments) was the artifact of Alexander Vallaury, and he established the Sanayi Nefise Mektebi Department of Architecture in 1883 with the support of Osman Hamdi Bey and he gave education in the field of Architecture and transferred his experiences to the future generations for 25 years as of its establishment. The Architectural works which were executed by the masters getting education in Hassa Mimarları Ocağı till the 19<sup>th</sup> century before the establishment of the Sanayi-i Nefise Mektebi reached to the undergraduate education level with the opening of the first school that educates certified architect with the establishment of the Sanayi-i Nefise Mektebi. (Yavuz, 1976) Till the new system that Professor Arnold Egli brought, the architecture education was given over the foundation which was formed by Alexander Vallaury and shaped with the Ecole Nationale Supérieure des Beaux Arts ecole. In this context, Vallaury was not only the founder of the Sanayi Nefise Mektebi Department of Architecture, but also he was the creator of the first education model that educated diplomaed architect in Turkey.

## 2. Methodology

For this research, the resource and literature review have been done and the data belonging to the first education model which has been determined to continue till 1930 and regulations and programmes have been examined and the comparisons have been made.

### 3. Results and Discussion

According to Article 19 of the Chapter 3 Education of the Ordinance of Turkish Republic Education Board Sanayi-i Nefise Mekteb-i Alisi (Fine Arts Academy Regulation) which was published in hijri 1340 by İstanbul Matbaa-i Amire, 'The education of the Department of the Decorative Arts is the same with the Education of the Department of Art. The student which finishes only the second grade with the success selects one or two of the expertise sections such as the (1) Decorative embroidery (2) Interior decorations (3) Industrial decoration (4) Frescoes and panels. After the second grade, the exercises of the practice studies of the student are realized over the issues depending on the expertise section on which they select the competitions. Among the students who complete second grade, the (composition) competition is made for four times in every year and the drawing competition is made for four times in every year.'

Table 1

No	Name of the department	Content
1	Embroidery Ornamentation	Shop panels, poster, announcements, door covers, ornamentation... etc.
2	Interior Ornamentation	Interior Ornamentation of the buildings with certain styles, furniture, flooring...etc.
3	Official Industrial Ornamentation	Carpeting and similar fabrics, tiles, wallpaper, pearl, leather and glass and metal artifacts pictures ... etc.
4	Frescoes and Panels	Wall, ceiling and dome ornamentation and theatre decors...etc.

By the Mimar Sinan Fine Arts University, Faculty of Architecture Department of the Interior Architecture, the areas to which the Interior Architects serve are generally listed as follows.

1. They take place in the team realizing the process from the first stages of the space design till the end of the applications (decision making implementation). They determine the dimension and usage data of the space specific furniture (equipments) in the direction of the data obtained and realize their authentic forms.

2. It is a fact that the rearrangement of the interior space is required more frequently than the construction of a new building. They analyze and arrange the new function foreseen in the interior spaces of the buildings whose construction has been completed or to which a new function will be gained other than the old function according to the living and behaviour forms of the people.

3. They determine the interior spaces of the old buildings which are determined as the cultural inheritance or the historical asset and the elements taking place in these places (furniture, building elements etc.). By this way being an intermediary for the adaption and promotion of our traditional art and culture falls within the working area of the interior architects.

In the direction of these definitions, according to Article 19 of the Chapter 3 Education of the Ordinance of Turkish Republic Education Board Sanayi-i Nefise Mekteb-i Alisi (Fine Arts Academy Regulation) which was published in hijri 1340 by İstanbul Matbaa-i Amire, the article that 'The Department of Decorative Arts can be regarded as the starting of the Today's Interior Architecture Education According to the article 4 of the Structuring Chapter 1, 'The certificate of decorator is given to the ones who complete their decorative arts classes with success and obtain the values requested to be gained in the competitions also verifies this.

According to the Article 10 of the Fine Arts Academy Regulation ANNEX Chapter 2 Entrance Exams, the entrance exams of the departments of the Teacher Education in Arts and Decorative Arts are as follows.

Art: Ornament or bust from the plaster models with charcoal drawing. Its duration is 2 hours.

Modelage: Ornament or bust from the plaster models with the Pipeclay. Its duration is 2 hours.

The school administration may not require to take the students to the examination who get the grade corresponding to the very well from the art and modelage in the high school education. For the success in the entrance exams of the departments of the Teacher Education in Arts and Decorative Arts, it is required to get at least grade of five from both courses. Today, the student admission to the Department of the Interior Architecture is still realized with the two stage pattern examination. In the first stage, the figured composition is requested and in the second stage, the drawing of a space composition is requested. However, the pattern is drawn with the pencil instead of the charcoal drawing. The concept of the modelage examination has been abandoned. The art courses in the high school education are not considered and the students who come from the fine arts high schools have the additional score advantage.

Some of the important articles related to the Regulation take place below. In this content, the general result for the whole of the education process has also been compared with the general structures of the Fine Arts Academy and Mimar Sinan Fine Arts University and some articles taking place in the regulation are given places and with the table, the differences and similarities are tried to be explained by also adding the Ecole de Beaux Arts school which was taken as basis from the first education model.

According to the Structuring Chapter 1 Article 5, there is a free workshop-gallery which was added to the school afterward for the purposes of the selecting and separating students for the departments of the school. The ones getting the permission to continue to the free workshop do not have the student rights and they are obliged to act according to the regulation of the school.

According to the Article 6 of the Admission Conditions Chapter 2, the age of the student cannot be less than 15 and more than 25

According to the Article 6 of the Admission Conditions Chapter 2, it is required that the ones that will enter to the department of architecture must be graduates of high school and the ones wanting to enter to other departments must complete the first semester of the high school and secondly, they must be successful in the entrance exam of their department.

According to the Article 9 of the Admission Conditions Chapter 2, the ones who cannot be successful at the courses which are given in one year in the examination at the end of the first year are required to be successful in the second year examinations. The ones cannot be successful at the courses which are given in two or more years in the examination at the end of the first year are taken to the examination over the two year curriculum at the end of the second year. The examination of the course whose education is given in three years is also subjected to the same procedure. The ones who cannot succeed in the one-year courses in two years as of their entrances to the department and the ones who cannot succeed in the two-year courses in three years as of their entrances to the department and the ones who cannot succeed in the three-year courses in their fourth year as of their entrances to the department cannot benefit from the rights and privileges of the academy student afterwards and the financial rewards that they will win in the school competitions are given to the student who comes from them till they succeed in their courses.

According to the Article 11 of the Education Chapter 3, the education of the Fine Arts Academy is theoretical and applied. The examinations of the theoretical courses are made at the end of the education year and the make-up exams are realized at the starting of the forthcoming education year. The examinations of the applied education are realized at the times to be determined with the regulation and generally at the ends of the first and second semester and the competitions which are repeated for four times in a year are even realized at the first and second halves of the first and second semesters. The first semester is from the starting of the October till the fifteenth of the January and the second semester is from the fifteenth of the January to the end of the May.

According to the Article 20 of the Chapter 4 Examination and Competitions, the success grade of the students in the theoretical courses is determined with the scores that they will at the examinations. Their success grade in the applied education is also determined with the competitions and the grades that they will obtain in the competitions and the values to the grades correspond. The grade from ten to zero is given in the examinations.

According to the Article 21 of the Chapter 4 Examinations and Competitions, for passing the class in the departments of the school including the class distinctions, primarily it is required to get the grade of five from every course and secondly, to obtain a score in the amount of two thirds of the total of the full scores of the theoretical courses included to the class education and forming a whole.

According to the Article 22 of the Chapter 4 Examinations and Competitions, the success grades that the student will take from the competitions are as follows.

Admired = 3 value (Appreciated = 3 value)

Very well = 2 value (Excellent = 2 value)

Well = 1 value (Good = 1 value)

Medium = 0.5 value (Medium = 0.5 value)

Weak or Insufficient = (Weak or inadequate =)

When the full score is accepted as 10, the appreciated corresponds to 10, excellent to 9, good to 8, medium to 6-7. The weak or inadequate expresses the rejection.

According to the Article 23 of the Chapter 4 Examinations and Competitions, the artifacts getting the first two ranks in the Competitions and the drawings gained reward in the construction and competence competitions and all artifacts getting the financial rewards become the properties of the school.

According to the Article 24 of the Chapter 5 Examination Board, the Examinations are open to everyone and they are realized before an examination board. The examination board is partially composed of the experts inside the school and partially composed of the experts outside the school. The school principal is also the chairman of the examination board.

According to the Article 14 of the Fine arts Academy Regulation ANNEX Chapter 3 Examinations and Competitions, the student who gets a score of less of five points in a course or who cannot fulfill the grade average even though s/he passes every course is accepted to a make-up exam from a course from which s/he gets less scores.

According to the Article 14 of the Fine arts Academy Regulation ANNEX Chapter 3 Examinations and Competitions, obtaining of a right of entrance to the year-end examinations of a student is dependent on the realization of the following conditions by him/her.

- 1) That the average of the scores that s/he gets from the teachers during the education year as question or duty applied working score must be more than the score of (5)
- 2) That s/he must complete and deliver the duties that the teacher gives within a certain duration
- 3) That his order of attendance to the course or workshop must be stable– namely, stability of the fact that s/he participates to at least two thirds of the course or workshop hours
- 4) That the albums and other drawings belonging to the education must be given to the administration
- 5) S/he must make his/her name registered one day before the examination day.

Table 2

Mimar Sinan Fine Arts University	Ecole de Beaux Arts	Sanayi-i Nefise Mektebi
There is not age limitation sought in the students for entering to the examination	The ages of the students must be between 15-30 for being able to enter the exam	The ages of the students must be between 15-25 for being able to enter the exam
The students cannot benefit from the studentship rights after the first 4 years.	The students can benefit from the studentship rights till the age of 30.	The students cannot benefit from the studentship rights after the first 5 years of his/her education.
If the students cannot graduate in the first four years, they can continue their educations till they graduate. There is no age limitation.	The students are obliged to make 6 clear 6 sketch projects for graduating. However, they can make more projects if they want till the age of 30.	The students can use the workshops till the age of 30 even though they graduate.
The workshops are not open to the usage of the ones other than the school students.	The workshops are open to everybody having age of less than 30 and having French origin regardless of having relations with the school or not.	The workshops are not open to the usage of the ones other than the school students. However, the student candidates can use the free workshop with the permission.
Generally, the competitions are not arranged by the school for the students. The competitions are organized by the sector. The participation is the individual preference of the students. It does not affect the grade or graduation.	With the competitions organized by the school, the highest ranked student is selected. It is required for the grade or the graduation.	The competitions are organized by the school for the students. It is required for the grade or the graduation.
It is required to be a high school graduate.	It is required to be a high school graduate.	It is required to be a high school graduate or to complete the first part of the high school.
The department of the interior architecture is entered with the university examination realized by ÖSYM and dual stages ability examination.	It is entered with the descriptive geometry, history, architectural design, drawing, and mathematics examination.	The decorative arts department is entered with the art and modelage examinations. The school administration may not require to take the student who has obtained the grade corresponding to the very well from the art or modelage in the high school education to the examination.
The attendance obligation for the students is 70% for the theoretical courses and 80% for the applied courses.	There is no attendance obligation for the courses other than the course of Building science.	The student is obliged to prove his/her existence at the school at 9 o'clock in the days other than the holidays. The student who has been determined not to attend the school for ten days during one month without any excuses from the records of the attendance ledger is exposed to one (warning). The student who is exposed to warning for three times during one education year is regarded to resign from the school.
The recommendation letter is not requested.	The recommendation letter is requested.	The recommendation letter is not requested.

There are common courses among the courses in the education model. Today, there are also common courses between the departments and in the post-Republican period, the course of the History of the Atatürk Principles and Revolutions took place the course of History and the history of design took place the course of the history of art. The foreign language information has been added to the pool of the common courses for the purpose of looking to the globalized world from a wide perspective. The course of aesthetics and the courses covering the concept of the aesthetic are still given in the Fine Arts University and they have been removed from the common course pool. Today, the Turkish Language is also among the common courses given. The elective course pool has been formed for the student to develop himself/herself in the direction of his/her knowledge and skills as of the 2<sup>nd</sup> semester. The students from the different departments of the university and department can select courses. Especially, in the art and design, it is very important that the students must graduate as versatile and original individuals. This application or its similar one is not encountered in the Fine Arts Academy Regulation. The common courses and their durations available on the curriculum in the institution of Sanayi-i Nefise Mekteb-i take place below.

Table 3

In the starting of the Interior Architecture education, the courses were annual and even some courses were multi-annual and today, the courses are given for semester in the interior architecture education. The majority of the courses given in the 1<sup>st</sup> grade are based on the hand drawing and general ability for both semesters.

Table 5

1 <sup>st</sup> grade	Sanayi-i Nefise Mektebi Department of Decorative Arts
	Copy Drawing: Ornament, body parts, full body from the plaster models with the charcoal drawing

#### 4. Conclusion

In the general meaning, the hand drawing and the general ability protect their importance in the interior architecture and especially it is the most efficient method in the sketch and thought stage and the possibilities that the technology brings and the possibility to make drawing, design and production in the digital environment have played an important role in the transfer of the weight given to the hand drawing and general ability. The design realized in the digital environment and easiness of the storing and archiving of the designs in the digital environment, being a method saving time, easiness of being exhibited via the digital exhibitions have provided the approval of the advancement of the education in this direction by the academicians and becoming easier of the integration process. The issues such as vocational law is an important step in terms of providing awareness about the law of intellectual and artistic works that prevents the problems such as copying and reproduction that can arise from these easiness by the students even at the education process. The project courses have taken their places as a method of thinking and conveying what you think that forms the most important process of the interior architecture education and gives meaning by combining the design oriented courses with the pattern weighted courses. In the today's world in which the capital gains importance day by day, the building economy has also gained value and making the one to be made with the most appropriate price and the calculation of the cost of the building have gained importance. In the courses such as the Furniture Application workshop, it is aimed that the students reveal projects in the world norms by revealing original designs and they are prepared for the market from the design process to the production process. In this context, in the starting, the interior architecture education was art and design based and today, the data preparing the student to the sector have been added to the interior architecture education on this base. In the starting of the interior architecture education, the production of new decorations was focused and today, the determination of the available issues and the protection methods are dominant in the interior architecture education.

According to the Article 40 of the Fine Arts Academy Regulation ANNEX Chapter 5 Education, the expression that “At the time of giving of the issue of the Decorative Arts Department Competition- which one of the expression styles of –Lavi-Watercolor Painting -Garizay-Kamayo-Oil Painting – mud is requested and the completion duration are determined” is given place. Today, the competitions are organized by the sector and the students participate to the competitions that attract their interests with the free participation.

## Abstract

Developing students' creativity is becoming one of the important goals of educational activities. This interest stems predominantly from the need of various sectors of the economy to train future staff, who will generate new technological solutions, which will be a vital part of the economic future of many parts of the world, including the European Union. The importance of staff creativity for social development is also being increasingly emphasized.

A key role in developing the creativity of students in all ages is played by formal education. Teachers have become responsible for stimulating the creative abilities of students, shaping their personality traits and attitudes conducive to creativity, as well as for teaching students the skills of creative thinking and creative problem solving. School and family environment should "develop skills and install the spring which will elevate the student to a higher level of his development." In order to do this, it is necessary to: take children's work and efforts they put into their own education seriously; elicit the knowledge acquired by students; convey knowledge which is a necessary raw material for creative activity; organize meetings with people whom students can see as excellent role models of creative attitude; and, finally, teach students how to take up efforts and persevere in their work, because creativity requires perseverance and long-term commitment. Therefore, it is worth knowing the inhibitors of creativity and ways to overcome them. This is a challenge parents and teachers have to face up to. It is difficult but not impossible.

## Main text

Developing students' creativity is becoming one of the important goals of educational activities. This interest stems predominantly from the need of various sectors of the economy to train future staff, who will generate new technological solutions, which will be a vital part of the economic future of many parts of the world, including the European Union. The importance of staff creativity for social development is also being increasingly emphasised.

A key role in developing the creativity of students in all ages is played by formal education. Teachers have become responsible for stimulating the creative abilities of students, shaping their personality traits and attitudes conducive to creativity, as well as for teaching students the skills of creative thinking and creative problem solving. Therefore, it is worth knowing the inhibitors of creativity and ways to overcome them. This is a challenge parents and teachers have to face up to. It is difficult but not impossible.

Undoubtedly, creativity opens a lot of doors, presents a lot of opportunities and gives hope. What is creativity, then? According to E. Landau, "Creativity is an attitude that, on the one hand, allows you to find new aspects in the old and familiar, and on the other hand, enables you to face the new and the unfamiliar and process it into a new experience thanks to the knowledge you already have." In other words, creativity is the ability to see something unusual in ordinary and common things and to create something new. It is a skill of thinking outside the box and of effective problem- and task-solving.

Fig. 1. What is creativity?

Source: <http://dzieciacybazar.blogspot.com/>

Next to creativity, there are also other concepts: abilities and interests. A. Gurycka believes that an interest is a mental feature which takes the form of a targeted cognitive activity of certain intensity and manifests itself in selective relation to phenomena surrounding the individual. A. Kamiński associates interests with motivation. They are some sort of an internal engine behind our mental "appetite." Interests stimulate initiative in the field of desire and will, and also activate the intellectual progress.

Both creativity and interests affect human abilities, which are the result of creative thinking and creative actions. Abilities themselves are formed by a number of factors, which are often independent of one another. Figure 2 presents the multifactor model of giftedness.

Figure 2. Multifactor model of giftedness by F. Mönks

Source: Limont, W. (1994). *Synecletics and creative abilities*. Toruń: UMK.

Interests of a child may manifest themselves in many different forms of activity. They develop through play, reading, watching movies, mass media, and contacts with peers, etc. Children learn different behaviours by observing and imitating their family members, other adults and peer environment. If these patterns are inappropriate, the child is in the so-called risk group.

Just as is the case of abilities, the development of interests is also influenced by a variety of factors. They can be divided into two main groups:

- biogenetic factors which include age, sex, abilities and physical development;
- socio-cultural factors which include social environment, socio-economic standing, as well as teaching programme and teaching methods at school.

The fundamental condition for the development of interests is the child's active approach to getting to know the world around him/her. The motto of educators, i.e. of parents and teachers, who want to bring up active and enlightened people, should be: children must get to know the world by themselves – we are just their helpers and guides in the process. Our efforts will have value only if we teach children how to acquire knowledge about the world by themselves, if we arouse their cognitive passion, if we evoke their deep curiosity to know everything and channel their cognitive activity so that they become specialists in certain areas.

Schools consider parents to be excellent partners in the process of shaping children's interests. Their work is particularly valuable, because it can be more individualised, tailored to the capabilities and needs of the child, and, above all, carried out from an early age.

The educational process aimed at the formation of new interests must create opportunities in which features typical of particular interests can manifest themselves and be modified in the desired direction. Therefore, the pattern of each process of interests carried out at school, at home or elsewhere must include the following elements:

1. Identifying a problem which refers to the selected content of particular interests.
2. Giving children tips on how a problem can be solved, i.e. teaching them techniques to solve similar problems, providing them with references to appropriate literature and telling them where to find necessary information.
3. Creating conditions in which children can conduct their independent research in accordance with specific instructions.
4. Taking educational care of the results of children's efforts and making their surroundings aware of the effects they have managed to obtain in their independent work .

The above process should be repeated by teachers and parents many a time until they notice the first signs of a newly-aroused interest. The most important signs are children's questions, i.e. independently formulated problems aimed at further research endeavours. It is then when an educator should limit his own actions in this area and allow the young to independently determine problems and thus mark out a course of their further actions. An educator should also gradually reduce the range of provided instructions, giving children greater freedom of exploration.

Parents or teachers should therefore be able to use problems and questions, not statements and axioms. Instead of serving children with ready-made knowledge, they should prepare them to be able to gain this knowledge by themselves. Instead of formally eliciting the facts children have memorised or skills they have acquired, they should reinforce the research endeavours of children and teenagers, making them want to explore and try more.

The selection and orientation of the youth's interests must be properly synchronised with the entire developing personality and serve to achieve multilateral educational goals. In order to arouse new interests, problems must be formulated so as to incite students' cognitive anxiety and make them work hard before they arrive at solutions. When presenting a problem, it must be selected and formulated in a way which makes it interesting to children, even the youngest ones, and for parents. The answer cannot be a simple reproduction of the already-possessed information; the mere yes/no answer must be impossible. Problems-puzzles make children think. What is important here is the type and range of instructions given to a child before he/she starts his/her independent work, and also determining the conditions and time of the child's independent work aimed at solving problems initially presented by a parent. It is worth noting that creating conditions which are favourable to children's independent work is the best way to shape their interests .

Parents who want their child to have particular interests must necessarily find time and place in their domestic schedule and enable children to pursue their passions. If it is completely impossible in the house, if parents do not feel sufficiently prepared for this type of contact with the child, or if they do not have the time, they have to provide the child with access to institutions that can take on the responsibility for shaping children's interests.

It is extremely important to create an atmosphere of respect for the child's efforts.

A good way to develop creativity is drawing/painting; it also enhances the child-parent communication. However, it should be noted that the manner of drawing interpretation should be discussed with a psychologist.

Activities which might seem dull at first might also turn out to be very creative. One of them is being bored. Studies confirm that children who are allowed to do nothing from time to time are the most imaginative and creative. A child needs to feel bored at first to discover new layers of creativity .

In order to develop creativity in a child, it is necessary to create opportunities for action, for creative problem-solving and for discovering new things. Children learn to memorise and use facts.

Below, there are a few tips on how to help a child develop his/her creativity:

1. Do not suggest ready-made solutions. Let your children try new things, make mistakes and reach the essence of the problem on their own. Let your children create their world by themselves! When giving your children toys they have not seen before, do not show them how to play with them right away. Let them work out their own ways to play with them.
2. Allow your children to ask questions and ask questions yourself. Questions are a prelude to creative thinking. An ability to ask the right questions makes it easier to find the answer. Questions are signs of curiosity about the world around us and problems. If you want your children to develop their creative thinking, ask unconventional questions, e.g. What does a rose smell like? or How many flavours does a vegetable salad have? If you don't know the answer to some questions, just admit you don't know and check.
3. Read. All of us know that images served by TV do not stimulate imagination. But the opposite is true for reading books. Although it is obvious, we often forget about it, being busy with our everyday routines. However, during our spring walks or on our way back home from a kindergarten or school, we might look up at the sky and try to guess if a cloud we see is a lamb, or maybe a bear. Ask your child to tell you what he/she considered the most interesting during today's classes, what questions he/she asked and why.

4. Inspire and reward. Children need motivation and support to play in a creative way, that is why you should not criticise their ideas even if you know they are not the best ones. Let your little ones find it out by themselves and look for other solutions. Show your interest in what your children are doing. Appreciate their efforts.

5. Support. If your child has an unusual hobby and collects some knick-knacks, e.g. bottle caps or little stones, do not criticise it even if you think it is unnecessary. Let him or her do it. Praise your child when he/she is doing something that is difficult for him/her.

6. Stimulate all senses. Remember to stimulate the development of all the child's senses (vision, hearing, touch and taste) during play. Make the play broaden your child's horizons .

The second half of the twentieth century, and, more specifically, its last decades have brought a new look at the methods of children and youth education. The pedagogy of creativity became triumphant and was possible only with the active cooperation between students and teachers. Interesting views on the education of a small child were presented by prominent musicians and educators of the 20th century – Emil Jaques-Dalcroze, Carl Orff and Zoltan Kodaly. They proposed pedagogical methods focused on activeness, creative expression and freedom of imagination. They emphasised that the best results are achieved when learning goes hand in hand with experience and one's own actions .

How can teachers help students develop their creativity?

Here are some practical tips:

1. Let creativity be one of the objectives of education! Prepare classes which value creativity.

2. Designate space for creativity. During some of the classes, you can prepare a special table for creative discussions, a stage to play out some topics in the form of drama, or a colourful area on the floor where students can or have to break certain patterns, etc.

3. Join or form a special programme aimed at developing the skills of creative thinking! Such programmes (e.g. Odyssey of the Mind, EXPLORY) enable young people to meet and compete in finding solutions in a creative manner.

4. Try to engage students' emotions. Studies show that the most motivating situations for the development of creativity are the ones which stimulate emotions. Think about topics which are important for your local community, e.g. how to effectively help the elderly and those who are lonely.

5. While solving problems, use scientifically verified and globally applied models of creative thinking, e.g. the Osborne-Parnes model. These types of models have a very strict structure and, at the same time, encourage free thinking.

6. During group discussions, praise creative students. Creative people often diverge from the main topic, digress and ask seemingly unrelated questions. Write down questions asked by such students and show them that you appreciate them. Find time to answer those questions.

7. Think to what extent tasks you give your students require the two types of thinking which are necessary for creativity. It is important to maintain the right balance between coming up with many potential answers to a specific problem with the use of free associations and remote connections, and logical analysis and selection of the best solution.

8. Create a principle of freedom in expressing one's views. Students should feel safe and have the courage to express their opinions, which are often diverse and mutually exclusive. Be open to the coexistence of diversity.

9. Tolerate mistakes. Only those who do not learn do not make mistakes. If you want your students to learn a lot, they should have the opportunity to err and to draw meaningful conclusions from their mistakes.

10. Set aside time for questions and free exploration. During certain classes, you should set aside time for the so-called brainstorming when students can develop their curiosity and ability to question the status quo.

11. Give students space for independent thinking. Let them take responsibility for their learning process. Provide them with clearly formulated goal and access to sources. You will be surprised to see how good they are at accomplishing the assigned tasks!

12. Find ways to connect different subjects. Creativity often occurs at the interface of different fields by associating distant facts. Find ways to connect e.g. Music with Maths, Arts with History, Dance with Geography, etc.

13. Be a role model of creative behaviour. Show your students that you are open to the new and the unknown.

14. Get inspired by existing resources. There are a lot of materials about supporting and fostering creativity at school. Surf the Internet to find books on this subject; join the programme which develops creativity at schools .

In both teachers' and parents' work, it is important to motivate children to learn and be creative.

Motivation is a regulatory process which controls the behaviour so that it leads to a specific effect (goal), boosts the energy to act and directs it to a specific target. Motivation organises individual reactions into an integrated pattern and maintains the individual's activeness until the conditions which triggered the motivation become changed. The strength of motivation depends on the extent to which the goal is attractive and to which one believes he is capable of achieving that goal. A motivational process gets initiated if there is motivational tension and if a person is particularly sensitive to the stimuli able to reduce this tension .

According to Maslow's theory, there is a positive desire to grow and to meet our various needs in every one of us. Human needs create a permanent hierarchy, which determines the order in which they are fulfilled. Needs which are higher in the hierarchy actualise only when one fulfils the needs on the lower level (which are more basic) .

M. V. Covington compares learning to a game with complicated rules determining the way prizes are distributed. He distinguishes between two types of motivation: race of skills and a game of equal opportunities. Race of skills is not necessarily the motivation to learn, but to compete with others in order to maintain the reputation of a gifted child with advanced skills, or the motivation based on the fear that others will do better. According to the author, these kinds of motivation have a detrimental effect on children, because they draw them away from real successes, eliminate the desire to make attempts and promote hurtful comparisons with others.

M. V. Covington proposes a positive kind of motivation to learn – a game of equal opportunities. There are five rules of equality that are conducive to excellent results achieved by a child:

- ensuring equal access to rewards;
- rewarding achievement and curiosity;
- appreciating many different skills;
- offering alternative motivations;
- proposing tasks which are engaging enough for a child to work.

The list of questions formulated by the British Office for Standards in Education (OFSTED), quoted by Robert Fisher, is a potential source of inspiration for teachers interested in stimulating the creativity of their students.

Factors which curb the creative approach are sometimes called "inhibitors"; obstacles or barriers to creativity. The complex nature of school barriers to creativity is a direct result of the complexity of the school environment, which in turn stems from the interaction of psychological, social and cultural factors present at school and, finally, from the complexity of the school as an institution. Creative potential of students is inhibited because of the education system, the way the school itself is organized as an institution, the adopted teaching methods, teachers and students themselves, conditions (physical and financial) associated with their actions, psycho-social relations between those who participate in school life, and the whole atmosphere at school and the school's organizational culture.

The below-mentioned barriers co-occur in the school environment or condition one another. These include:

- immanent barriers - related to the goals and tasks presented at school, and to the features of school as an institution;
- barriers associated with the content and methods of teaching and education;
- personal barriers - associated with the person of the teacher and student;
- barriers associated with the conditions of the physical school environment of the student's activity.

School barriers to creativity, even the ones which are firmly rooted in the tradition of school education, are not an insurmountable obstacle. They may inspire us to change our perception of school education. In order for this to happen, however, the change must occur at the level of "needs." What needs to change is the way we think about the meaning of creativity in human life and about the value of creative activity in the development of the student. We must start to perceive the "need" to develop creative potential as a vital goal of school education.

School and family environment should "develop skills and install the spring which will elevate the student to a higher level of his development." In order to do this, it is necessary to: take children's work and efforts they put into their own education seriously; elicit the knowledge acquired by students; convey knowledge which is a necessary raw material for creative activity; organize meetings with people whom students can see as excellent role models of creative attitude; and, finally, teach students how to take up efforts and persevere in their work, because creativity requires perseverance and long-term commitment.

---

## Abstract

A qualitative approach was employed with 5 steps: (1) a study of environment in tutoring management of high schools in the sensitive areas of southernmost provinces, including the SWOT analysis and the Balanced Scorecard framework, (2) an analysis and synthesis to set the goals of the project, (3) a specification of strategic framework for distance learning system development, (4) a strategic plan developed from a strategic framework, and (5) a proposal of model and strategic plan of high school students academic achievement high school in the sensitive areas.

---

## 1.Introduction

Upper-secondary education takes significant roles in academic preparation of students for their further study in tertiary education, which includes providing students with grounding in the subjects required for the university entrance examination and the basis for their university courses. The key factors affecting the quality of education system in the southernmost areas of Thailand are the unrest situation and the education system of Islamic private schools. The Islamic private schools' curriculum covering both general education and religious education inevitably result in the students' insufficient time for general education as compared to learning periods of students in non-Islamic secondary schools. It leads the students in the southernmost regions obtain low learning achievement scores which are below national standards. In order to solve such a problem, technology integration in distance learning, in which the internet network serves as a medium of communication and instruction between teachers and learners, learners and learners, and learners and specialist teachers, anywhere and anytime, is introduced to assist the education management of the schools in the southernmost areas. As a result, students will get more opportunities and equal access in learning, and be able to exchange ideas and share knowledge among one another more rapidly, which then helps develop a learning society.

In the information age and knowledge-based society, students' competencies in new areas that need to be promoted are: (1) reflection, (2) inquiry, (3) technology use, and (4) knowledge construction (Atisabda, 2003). Technology innovation plays an important part in creating more learning environments that have no limits on time and places. The effective new learning environment consists of 4 elements: (1) learner-centered approach, (2) knowledge-centered approach, (3) community-centered approach, and (4) assessment-centered approach (Riel, 2002 and Atisabda, 2003).

The strategic management is the process of internal and external environments analysis to establish strategic plan and goals. The strategic management process consists of three stages: strategy formulation, strategy implementation and strategy evaluation. The strategy formulation includes developing a vision and mission, identifying an organization's opportunity and threats, determining the internal strengths and weaknesses (David, 2005, Wheelen and Hunger, 2002, Pakaphaswiwat, 1998, Decharin, 2001). Based on Kaplan and Norton's strategic management (2004), the Balanced Scorecard is a tool for describing strategies for creating value. It includes: financial perspective, customer perspective, internal perspective, and learning & growth perspective.

Thus, this study is to develop the strategies for distance learning with the purposes of increasing academic achievement of high school students in risk areas of the southernmost provinces of Thailand, preparing students for their further study in higher education, creating new learning environments in knowledge-based society, and promoting learning based on the new learning concept.

## 2.Objectives of Study

1. To examine the current state and problems in providing distance learning for the upper secondary school students in risk areas of the southernmost provinces of Thailand.
2. To study the guidelines for distance learning with the aim of increasing academic achievement of the high school students in risk areas of the southernmost provinces of Thailand.
3. To develop strategies for distance learning with the purpose of increasing academic achievement of the high school students in risk areas of the southernmost provinces of Thailand.

## 3.Research Methodology

The research procedure consists of five steps:

- Step 1: Examine environments in upper-secondary education management in risk areas in the southernmost area;
  - 1.1 Analyze external factors including opportunities and threats
  - 1.2 Analyze internal factors including strengths and weaknesses
- Step 2: Analyze and synthesize data in order to determine goals and visions
- Step 3: Identify strategic issues for the development of distance learning system for the upper secondary education in risk areas in the southernmost area;
- Step 4: Formulate the strategic plan based on strategic issues
  - 4.1 Construct the draft strategies
  - 4.2 Evaluate and examine the strategies
- Step 5: The strategies obtained were analyzed, summarized, and reviewed by a connoisseurship.

## 4. Findings

Four strategic frameworks were applied based on the Balanced Scorecard for the strategic planning of the distance learning to increase academic achievement of

high school students in risk area of the southernmost of Thailand (Kaplan and Norton, 2004; Tayler , 2007; Aljardeli, Kadeli, & Levy-Tadjine, 2012; Banwet & Deshmush, 2006).

- 1. Human resources:** teachers, resource persons, full-time teachers in schools in the risk areas
- 2. Customers:** students in risk areas in the southernmost provinces who are the target group
- 3. Curriculum and instruction, instructional media and information technology:** curriculum design for supplementary teaching, learning management process, the utilization of instructional media and technology, and learning innovation
- 4. Internal process:** the management of distance learning media centers, and terminal schools

### SWOT Analysis

**Strengths:** Some students showed readiness in learning. Most teachers were able to attract students' interests and make students enjoy learning experiences through their good teaching methods and techniques. Technology innovation played an important part in enhancing learning. Regarding school management, the target schools showed interest and agreed to cooperate on the research project.

**Weaknesses:** Some students had low learning achievement and lacked basic knowledge, motivation, and technology literacy whereas teachers lacked good skills in teaching lower average students and in technology literacy. There was the gap between university instructors and students. Some instructional media became outdated. Concerning the management, it was found that mixing students of various education levels in the same classroom affected the instructional management, the location of distance learning media centers were not suitable, and there were coordination problems between the supplementary learning center and the terminal schools.

**Opportunities:** The communities' economic strengths were good. Regarded as the special region, the southernmost areas which border countries attaining some forms of advancement in education got good cooperation from many organizations. As located in the risk areas, such border provinces received strong support for solving any problems.

**Threats:** Different economic backgrounds affected the participation in activities of teachers and students. The unrest situation in the south also had an impact on the organizing of in-depth activities for developing teachers and students. Moreover, the location of the southernmost provinces proved an obstacle to the field trips/activities in such risk areas.

The strategic frameworks and strategies for distance learning were designed and developed, with the approval of connoisseurs, the research findings were as follows:

## **Human Resources**

### *Objectives*

- To enable teachers to acquire content literacy,
- To enable teachers to acquire technology literacy,
- To enable teachers to understand and apply new instructional approaches.

### *Strategies*

- Seek collaboration with Tutoring schools in developing teachers' tutoring techniques,
- Develop a procedure for the selection of full-time teachers and mentor teachers,
- Promote the cooperation with neighboring countries in enhancing teachers' academic skills development,
- Provide teachers with training in technology innovations for instruction,
- Promote the cooperation between the hub school and terminal schools,
- Organize training programs for staff of the terminal schools regularly,
- Provide teachers with training programs to enhance their skills in teaching students with low academic achievement,
- Encourage teachers to conduct classroom researches,
- Promote the cooperation among schools in order to share knowledge and experiences.

## **Customers**

### *Objectives*

- To increase learners' academic achievement,
- To change students' attitudes towards learning.

### *Strategies*

- Develop a model of tutoring approaches by focusing on the student-centered approach,
- Develop a model of learner grouping,
- Promote collaboration with the tutoring schools in organizing the instructional management in some units in order to generate learning motivation and motivation for students,
  - Develop achievement motivation in students participating in the project,
  - Promote a peer learning approaches (Share knowledge + Share experiences + Share success)
  - Enhance students' learning experiences until their graduation and offer encouragement to students obtaining good academic achievement scores in a form of rewards.

## **Curriculum/ Instruction/ Instructional Media and Information Technology**

### *Objectives*

- To organize suitable instructional approaches in classroom,
- To develop teachers' instructional skills with the utilization of appropriate instructional media and technology innovations.

### *Strategies*

- Implement the integrated instructional approaches, tutoring approaches, and drill & practice approaches,
- Organize both synchronous learning and asynchronous learning for students,
- Develop appropriate technology for learning,
- Develop instructional media and technology promoting distance learning,
- Promote collaboration with the distance learning media center in sharing instructional media with the terminal classrooms,
- Encourage cooperation with the tutoring schools in the support for instructional media, teacher development, and the development of innovative tutoring system.

## **Internal Process/ Management**

### *Objectives*

- To develop classroom management system,
- Promote the cooperation between the hub school and the terminal schools.

### *Strategies*

- Grouping students in tutoring classroom based on their levels of prior knowledge/ class levels,
- Put the proactive public relations of tutoring projects in practices,
- Develop a system for classroom management,
- Organize activities promoting collaboration between the hub school and the terminal schools,
- Collaborate with terminal schools in setting tutoring schedules suitable for the schools.

## 5. Discussions

Human resource development, one of the strategies, was found to be congruent with Prasit Sangpinit's study (2004) indicating problems of organizing distance general education, particularly the ones concerning teachers at community learning centers, who still lacked knowledge in how to use technology and instructional media necessary for the teaching and learning management. Instructional materials were insufficient. The teachers expressed their needs in the development of knowledge of curriculum content, teaching skills, and techniques for learning process, as well as innovation and technologies contributing to the effectiveness of teaching. Consequently, based on the problems founded in the studies, the researchers promoted the teacher development in several aspects including providing the teachers at the community learning centers with training programs to enhance their knowledge of the curriculum and instruction as well as the utilization of instructional media, conducting group seminars on techniques for the management of distance learning activities, organizing field trips, and supervising and monitoring the process. After the project, the target group gained knowledge and showed readiness in applying what they had learned and trained for their instruction. It could be concluded that the collaboration of related personnel, particularly teaching staff, was necessary for the human resource development.

The customer strategies were congruent with the findings of Nattapat Wungsrikeaw (2001) who conducted the comparative study of academic achievement on 10th grade students using satellite distance learning media with continuity activities between individual, group of three students, and group of five students. The group of three and five could empower learning more than individual learning. In addition, it was compatible with the concept of creating new learning environments to support effective teaching and learning which focused on learning-centered approach, knowledge-centered approach, community-centered approach, and assessment-centered approach (Riel, 2000 and Atisabda, 2003).

It was found that the strategies on curriculum and instruction, and instructional media and information technology complied with the two studies conducted by Orachorn Janchai (2011) and Pimporn Fonglum (2012). In Orachorn Janchai's research on the development of lower average students' competency by using remedial instruction, data from behavioral observation and students' academic achievement showed the students' higher learning achievement scores, more eagerness in learning, and the increase in their competency after participating in remedial teaching. Similarly, Pimporn Fonglum indicated problems of the instruction concerning the students and the teachers were students' lack of prior knowledge, skills and interest in learning. Besides, the teachers' being strict in classroom, stressful learning atmosphere, no instructional media used in teaching, the teachers' inability to attract students' interest in learning and give clear explanations of the lessons were listed as common problems of learning and teaching. The organizing of remedial instruction once a week was recommended in Fonglum's work. It was also important to create the new learning environments enhancing the students' competencies in such areas as reflection, inquiry, technology-use, and knowledge construction (Atisabda, 2003).

Moreover, strategies on internal process and management corresponded with the previous studies conducted by Kidanan Malithong (2005), Non-formal Education Department (1996) and Somsit Jitstaporn (2002). Malithong made a remark about the timing of interaction in distance learning and suggested that distance learning could be organized in two ways: asynchronous distance learning and synchronous distance learning occurring when the teachers and their students interact in different places but during the same time. In Non-formal Education Department's research, the necessity and advantages of detailed lesson plans and advance preparation of teachers and students at end schools were clearly stated. According to Jitstaporn, when being assigned to do some tasks, students with different learning styles and personalities performed different learning interaction. The observation about students' interaction was made by tracking students' records on the website developed by the researcher as they worked on the tasks assigned throughout the course. Therefore, it was necessary for teachers to be aware of students' learning styles and personalities when organizing learning activities and giving assignments to students.

## 6. Conclusion

The quality of education in the risk areas of southernmost provinces of Thailand need to be improved in order to support these students to continue their studies in higher education. Technology of distance learning can be an important tool to support and strengthen teaching and learning. The strategies for distance learning to increase academic achievement of high school students in risk areas of the southernmost of Thailand will serve as the guidelines for enhancing the education quality of public schools, private schools, and Islamic private schools, as well as promoting students' readiness in their further higher education through the use of distance learning technology, strategies encouraging a new approach to learning, and learning network.

---

## Abstract

Information Communication and Technology (ICT) is widely accepted as a strategic advantage in raising school quality and standards for students in the 21st century. Indicators were systematically reviewed from major resources according to practices and ICT competencies standards. Six areas of strategic plan include management, infrastructure, teaching, learning process, environment and communities' cooperation. Benchmarking process finds a gap between best practices schools and primary schools in Catholic (Layman) Schools Administration Club Bangkok Arch Diocese (C.L.S.A.). Finally a set of strategic plans and activities were proposed to a group of primary Catholic school administrators.

---

## 1. Introduction

Information Communication and Technology (ICT) is a critical tool to developing 21<sup>st</sup> century skills for students. Twenty-first century skills are categorized into 3 core competencies. First, learning and innovation skills focus on communication and collaboration, creativity and innovation, and critical thinking and problem-solving skills. Second, information, media and technology skills, and third-life and career skills are the essential skills for students to learn in this era. The aim of this study is to provide educators and school stakeholders with ICT indicators and best practices in ICT integration to guide design ICT school policies and strategic plans.

Much research proves that ICT integration helps improve student learning skills. Kang, Heo & Kim, 2011 discuss the benefits of using ICT for teaching and learning as follows: First, to enhance teaching and learning; second, to provide more productivity in administration work; and third, to expand students' knowledge. Jeffrey R. Stowell, 2011 supports the use of technology in the classroom for encouraging teachers to use technologies to increase efficiency and reinforce new learning processes to students. In addition, ICT promotes the shift to a child-centered environment, and focuses on life-long learning when used appropriately. Joke Voogt and Natalie Roblin, 2010 present the conceptual framework of ICT integration in students' learning. It shows that ICT plays a role in the way students learn, as well as in practices and outcomes.

Thai Ministry of Education realizes the impact of globalization and technical advancement on Thai education. Therefore, the Thai Ministry of Education conducted new Basic Education Curriculum B.E.2551 (A.D.2008). This national core curriculum provides significant support for the use of technology in school. The goals are to enhance students' knowledge and create a learning community, along with life-long learning skills, which are a part of 21st century skills. In addition, the key elements of Thailand's 3<sup>rd</sup> ICT Master Plan for Education B.E 2554-2556 (A.D.2011-2013) are equality of access, use of ICT for lifelong learning, and ICT's contribution to wisdom and a learning-focused society. Moreover, preparing students for the globalized world is one of the schools' commitments.

There is no doubt of ICT value in education, but questions arise about how to best utilize and maximize the potential of ICT to help prepare students in 21<sup>st</sup> century. The finding will help students successfully learn the skills that they need to have today. Therefore, the purpose of this study is to develop ICT integration standards in schools level for the 21st century skills, find the best practices of ICT integration, and develop strategies of ICT integration.

Development of indicators for ICT integration in school level is the key to not only monitor and evaluate the success of ICT integration, but also be a direction of future policies.(W.J.Pelgrum,2001) Furthermore, it helps raise school standards. ICT indicators were developed by considering three sources: ICT standards, ICT competencies, and indicators for ICT integration at different levels.

Benchmarking Process is used as a tool to measure the gap between best practices school and primary school in the Catholic (Layman) School Administration Club Bangkok Arch Diocese. The findings of the study will apply to development of a strategy to effectively support and promote ICT integration into the teaching and learning process.

## 2. Method

This study is a descriptive research using survey studies to collect data. Documentary analysis and content analysis were applied to summarize and synthesize ICT indicators. Cooperative benchmarking is used to compare and exchange information with the best practice school and primary schools in Catholic (Layman) Schools Administration Club Bangkok Arch Diocese (C.L.S.A.). The results of the benchmarking process will help formulating ICT strategies. TOWS Matrix is an analysis of the strengths and weaknesses of the organization environment from the results of the SWOT Analysis.

### 2.1 Literature review

Documents were systematically reviewed from 3 major themes accordingly, practices, ICT skills and competencies standards and ICT indicators from differences levels. 12 following references were selected to gather information about ICT indicators in worldwide perspective, which were conducted by both domestic and international organizations.

1. Evaluation report of ICT model school in ICT School in Thailand project. Bureau of Education Innovation Development under controls of Office of the Basic Education Commission of Thailand
2. Information Communication and Technology (ICT) Standard in Thai basic education level. Ministry of Education
3. Executive Summary of research and development of ICT in indicators education (Information and Communication Technology Center. Office of the Permanent Secretary, Ministry of Education, B.E 2556) .
4. Guide to external assessment three (B.E 2554-2558), the basic education. Office for National Education Standards and Quality Assessment (Public Organization)
5. Obstacles to the integration of ICT in education: results from a worldwide educational assessment (W.J. Pelgrum, 2001)
6. Proposed set of indicators for ICT in education (UNESCO Bangkok,2003) UNESCO (2003). Performance indicators for ICT in education. Bangkok: UNESCO
7. Core Indicators for monitoring and evaluation studies in ICTs for education (Robert B. Kozma and Daniel A. Wagner)
8. Pedagogy and ICT use in school around the world Chapter 4: School Practices and Conditions for Pedagogy and ICT (Willem Pelgrum, 2008)
9. Study on indicators of ICT in primary and secondary Education (IIPSE) Executive Summary, 2009 the European Commission, Directorate General Education and Culture.
10. Core ICT indicators, 2010 by Partnership on Measuring ICT for Development
11. Projects for the use of information and communication technologies in education (Eugenio Severin C.,2010)

12. Propagation & level: Factors influencing in the ICT composite index at the school level, 2013 by Hiroyuki Aoki, JaMee Kim, WonGyu Lee

### Results of synthesis of the ICT indicators for primary school

There are 4 domestic and 8 international documents. Only 4 domestic documents or 25% of the total number of literature review were selected because of the relevant issues to ICT integration and implementation in school levels.

**Table 1**

Synthesis of ICT indicators

Indicators	Total finding	Selected indicators
School Management		
1.1 Policy and Development Plan	25	5
1.2 the capital budget	32	6
1.3 the monitoring and evaluation	6	6
Indicators	Total finding	Selected indicators
1.4 Legal framework	4	3
1.5 ICT competencies standard for administrators	60	22
Infrastructure		
2.1 ICT Infrastructure and equipment	38	10
2.2 Software and database systems	17	8
2.3 Network	42	9
2.4 maintenance	4	2
Instruction		
3.1 curriculum	53	24
3.2 teaching support	7	11
3.3 Teacher development	32	6
3.4 ICT competencies standard for teacher	92	26
Learning process		
4.1 ICT integration	80	43
4.2 ICT competencies standard for students	24	24
Learning Resource		
5.1 School website	15	4
5.2 learning Resource Management and	13	6
6. Communities' cooperation	19	9
TOTAL	563	224(40%)

Note: Percentage involved rounding data

The finding of 12 analysis references yielded to a total of 563 indicators which could be subsumed into 6 standards in 18 categories.

**Table 2**

ICT integration indicators

Standards	Indicators
School Management(5)	1.1 Policy and Development Plan 1.2 the capital budget 1.3 the monitoring and evaluation 1.4 Legal framework 1.5 ICT competencies standard for administrators
Infrastructure (4)	2.1 ICT Infrastructure and equipment 2.2 Software and database systems 2.3 Network 2.4 maintenance
Instruction(4)	3.1 curriculum 3.2 teaching support 3.3 Teacher development 3.4 ICT competencies standard for teacher
Learning process(2)	4.1 ICT integration 4.2 ICT competencies standard for students.
Learning Resource(2)	5.1 School website 5.2 learning Resource Management and
Communities' cooperation	

## 2.2 Benchmarking Process

Benchmarking in education is used to improve the quality and standards of education. Many educators utilize it as a shortcut way for pushing education reform by learning and comparing with the best practices successful school reform of their experiences and key successful factors. (Jackson, 2000 and Kelly, 2001) The benchmarking in this study is following these steps: First, development of ICT integration indicators to measure and evaluate progress toward school achievement. Second, conducting gap analysis to identify differences between the best practice school and primary schools in Catholic (Layman) Schools Administration Club Bangkok Arch Diocese (C.L.S.A.). The results will be a guideline for ICT strategic formulation.

## 2.3 Strategic development

TOWS Matrix is a tool to formulate strategies. TOWS Matrix simply stands for treats, opportunities weaknesses and strengths. (Wheelen and Hunger, 2004) TOWS Matrix will help to determine the scope and explanation of each strategy which includes school management, ICT infrastructure, instruction, learning process, ICT resources and communities' cooperation.

## Strategic Result

## 3. Conclusion

In the era which technology becomes a critical part of empower students learning process. It is a school's commitment to ensure to utilize and maximize the potential of ICT for develops 21<sup>st</sup> century skills to all students. ICT integration indicators and strategies plan, the result of this study will be a tool to monitor, evaluate and push the school reform in the quickly way. Furthermore, it will be a guideline for school administrators to set strategic plan in order to raise school quality and standard for students in the 21st century.

## Abstract

This article aims at analyzing student assistance policy in Brazilian public universities. According to the National Plan of Student Assistance, conditions of staying at university must be offered to needy students. It is about the social rights issue of the higher education policy, considering the access and conditions for students to remain at the university. The National Program of Student Assistance - PNAES aims at extending the conditions of permanence of national public institutions students, allocating financial resources destined to provide a series of actions of assistance to students such as: scholarships, housing, food, transport, physical and mental health, and accessibility for disabled students.

## 1. Introduction

The reform of higher education in courses in Brazil is a greater process of redevelopment of State Capital under neoliberal aegis.

Neoliberalism occurs in different ways and countries all around the world. While Thatcher and Regan were implanting the neoliberal politic in England and in the USA in the 80's, in Brazil, there was a democratic movement in answer to a long dictatorship from 1964 to 1985 which culminated with the progressive Federal Constitution of 1988.

With the election of Fernando Collor de Melo and subsequently, Fernando Henrique Cardoso- FHC (1995-2002), the country joins the liberal reforms which were developed by the Lula Government (2003-2010) and the Dilma Government (2012-2014) with a few peculiar characteristics.

In the case of educational politics, the changes in the legislation still happen in the period of regulation of the social right to education guaranteed in the Federal Constitution. The first complementary law proposal was routed to the Chambers in 1988. After many discussions and participation in many social movements, the first proposal, which was more democratic, was approved, the Law of Guidelines and Basis of National Education- LDBEN, including the varied education levels: Basic Education (which includes preschool, primary school, and high school) and Higher Education.

During the Lula Government (2003-2010), as a result of the Executive Reform of the Higher Education Group (GERES) work, a law project was proposed to regulate the university reform, from a set of regulations, interim measures, and promulgated decrees during the Lula Government, setting continuum for the defense of reforms started by the previous government.

In the set of regulations that composes the Brazilian higher education, the Plan for Educational Development (PDE) <sup>\*\*\*\*\*</sup> proposition stands out among the others. It was approved by the Lula Government on April 24, 2007 with the intent of aligning education with the Economic Acceleration Project (PAC) <sup>+++++</sup>. The PDE received much criticism for not being built in a democratic way, going in the opposite direction of historic movements like the political processes of definition by the Law of Guidelines and Basis for National Education (Law n. 10.172/01) in which there was intense social participation.

The PDE presents proposals with basic and higher education. Regarding higher education, the PDE understood as its guidelines:

i) the expansion of job openings, considered unacceptable that just 11% of young people between the ages of 18 and 24 have access to this educational level; ii) quality guarantee, it is not necessary just to increase, it is necessary to increase with quality; iii) promote social inclusion by education, reducing our history of waste of talents, considering that it is proven that we have creative and talented young people who have been systematically excluded by a filter of economic nature; IV) territorial ordination, allowing that quality education be accessible in more remote regions of the country; v) social and economic development, making higher education the key element, whether formatter of highly qualified human resources or whether indispensable part in the scientific-technologic production, in the integration and formation of the Nation. (BRAZIL, 2007, p. 26).

In order to attend to the above objectives foreseen by the PED, the following programs were proposed: Program for the Restructuring and Expansion of Federal Universities (REUNI); National Program for Student Assistance (PNAES); Financing Fund for Higher Education Students (FIES), University for Everyone Program (PROUNI), and the National Evaluation of Higher Education System (SINAES), which are the main programs structured by the proposal of expansion and democratization that marked the Lula Government.

This article will concentrate on the analysis of the National Program for Student Assistance (PENAES).

### *1.1. The political access to permanency to Higher Education in Brazil*

Historically, Higher Education in Brazil was marked by access of an elite group. Brazil was a colony of Portugal between 1500 and 1822. During this period the access to Higher Education was possible only for the children of elite colonial who could cover the costs of studies at the royal court, Lisboa. Between 1772 and 1808, six hundred and eight Brazilians studied at Coimbra University, most of who ended up choosing scientific careers like philosophy or mathematics.

With the independence of Brazil from Portugal, the first Brazilian Constitution, granted by Pedro I in 1824, had an item destined to education, inspiring the idea of a national education system. According to the Constitution, the Empire must have primary schools, gymnasiums, and universities. However, these precepts were never fulfilled.

This was just an organization of capitalism during the era of monopoly from the 1930's an acceleration of the industrialization process associated to the organization of the State as the centralizer, which emphasized the organization process of higher education in the country and offered real possibilities for the emergence of Universities.

Concerning the expansion process of higher education, it began in the 1970's, due to the increasing demand of this teaching level, a phenomena associated to the demand for human resources enabled to attend to the demands coming from the economic modernization lived by the country.

From the 1990's the expansion intensifies, being mostly offered by private Higher Education Institutes. Thus, the process named "democratization" of educational opportunities in higher education was confused with the mere and trampled massification of enrollments <sup>+++++</sup>, being distorted by the supply of paid Higher Education.

The policy of expansion of Higher Education was an action that gave visibility and legitimacy to the Lula Government, which one of his objectives was to attend to the challenge placed by the PNE (2001-2010): *a) Provide, until the end of the decade, the*

---

\*\*\*\*\* The presidential decrees that gave origin to the PDE were: 6.093/07 (deals with the organization of the Alphabetized Brazil Program); 6.094/07 (deals with the implementation of Committed Goals All for Education); 6.095/07 (established guidelines for the constitution of Federal Institutions of Education, Science, and Technology- Ifet); and 6.096/07 (institutes the Program for the Restructuring and Expansion of Federal Universities Reuni).

+++++ According to Ghiraldelli (2009, p. 251): "The basic idea of PAC was to become a program capable of preparing the country's infrastructure for growth that should come from the tributary and political reform, pulled by Strong governmental support in social projects. The Plan of Education Development (PED) was considered, then, the PAC of Education.

\*\*\*\*\* Sguissard (2004) identified two steps in the expansion of higher education: from 1964 to 1994 and from 1994 to 2006. At the beginning of the first step (military regime) there was a predominance of enrollments in public education, which was inverted in the beginning of the 70's. At the end of the 70's, there was 41.6% of enrollments in public education and 58.4% in the private sector. In the corresponding period of redemocratization (1994-2006) the system showed merely vegative growth. In 1980, there was 882 IES in the country and in 1995 only 12 institutions were aggregated to the system, counting the growth of 1.36% during that time. During the FHC Government, there was a significant rise in the openings in the private sector. According to data from the 2007 Higher Education Census, between 1996 and 2007, 1287 new IES were created which increased the number of enrollments to 5,880,381 students in 2007. However, this growth was due mostly to private IES, which had 74.6% of the enrollments. With the legal preview at the LDBEN in 1996 the University Centers as an academic organization, realized that greatest number of enrollments were in the smaller institutions (89% of Private Institutions).

offer for higher education to, 30% of the age group of 18 to 24 years old, and b) Establish a policy of Expansion that decreases the inequalities of the current offers among the different regions in the country. (BRAZIL, 2001, p. 43).

In a way, the Lula Government continued the expansion process initiated by the FHC Government, allowing that the private realm could continue expanding<sup>ssssssss</sup>. However, it advances to provide the expansion and internalization of the federal network of higher education.

The Program of Expansion of Public Higher Education/ EXPANDIR (2003-2006), the Program for Restructuring and Expansion of Federal Universities (REUNI), and the Integration of Professional and Technological Federal Institutions, were the main programs that marked the federal higher education.

Table 1. Expansion of the Federal Network of Higher Education 2003-2014

Source: Sesu/MEC

From 2008, the actions of the EXPANDIR Program occurred concomitantly with the action of the Program of Restructuring and Expansion of Federal Universities Program (REUNI), approved by the Decree nº6.096/2007. REUNI presented as a justification the goal for supply expansion of higher education. Its objective was to “create conditions for the extension of access and permanency in higher education at undergraduate level, for the better use of the physical infrastructure and existing human resources in the federal universities”. REUNI’s goal is to elevate the rate of average conclusion of the undergraduate courses to ninety percent and the relation of (classroom) undergraduate students per professor to eighteen until the end of the five years from the beginning of each plan.

In a way, REUNI ,characterized as a management contract, which lays down rigid targets for counterpart receiving. The logic of financing through contracts was a FHC project, in which the debates about the management contracts were directly related to the transformation of the IFES in public foundations of private rights or social organizations. (AMARAL, 2003, p.118). For this author, the proposals were “a true university anti-autonomy , to obligate the institutions, upon management contract, to reach goals determined in a negotiation in which there is clearly a more fragile side in the confrontation with the government: the institutions themselves” (AMARAL, 2013 p.132 apud CISLACHI e SILVA).

According to Ferreira (2012, p.465) a few aspects of REUNI, in relation to the increase in night job openings, the reduction of evasion, occupation of idle vacancies, the academic restructuring, were measures already adopted by the Fernando Henrique Cardoso Government and recommended by the World Bank (1995) which pass through the standpoint of rationalization of management and optimization of costs, and were maintained during the Lula Government.

The expansion promotes the rise in internalization of the number of vacancies, but not alone does it guarantee the access to historically excluded groups, being necessary the supply of other complementary actions. In this respect, it was also proposed the National High School Exam (ENEM)<sup>\*\*\*\*\*</sup>, the Unified Selection System (SISU), and the most recent vacancy reserve for students deriving from private high schools, black, or indigenous (Decree nº 7,824, October 11, 2012).

Over time, ENEM has suffered changes in its applications, also becoming a way to access higher education. At first a few institutions, mostly private ones, started using it as a way to access their selection process. However, with the institution of PROUNI, the exam became notorious as a way to access since participation in ENEM started being mandatory criteria. From

<sup>ssssssss</sup> In 2003 there were 1,859 higher education institutions in the country and in 2012 the number reached 2,416.

<sup>\*\*\*\*\*</sup> The National High School Exam (ENEM) was created in 1998. At the time the goal was to evaluate high school graduates, integrated the Evaluation of Basic Education System (SAEB). ENEM and SISU altered the selection mechanisms, unifying the process. In a way, these changes have made possible greater mobility to students and the possibility in competing for vacancies in any university in the country. However, it continues based on meritocratic aspects.

2009, ENEM started being used as a way to get into Federal Public Institutions, which gradually will become the only entry procedure. Along with ENEM, SISU emerged, as a computerized system to select candidates according to their grade on ENEM.

Other than guaranteeing access, it was necessary to think of strategies that could guarantee the permanence and conclusion of students inserted into higher education. The permanence policy of Higher Education adopted by the Lula Government and followed by the Dilma Government isn't characterized as a single policy. It is carried out by programs that attend public and private institutions with different strategies<sup>8</sup> inclining towards a focused and privatist model, characteristic of the neoliberal State model in force.

### *1.2 The National Student Assistance Program*

To make the permanence of poor students inserted in federal institutions of higher education possible, The National Student Assistance Program was proposed, initially outlined through the Regulatory Ordinance MEC n°39 from December 12, 2007, and later on, transformed into The National Student Assistance Program by the Decree n°7,234 from July 19, 2010.

Even though the action offered from PNAES are the same offered historically by the Higher Education Institutions (university restaurant, living, attention to health actions, and even scholarships) gain a new impulse with the intensification of financing promoted by PNAES.

PNAES composes a group of actions that seek "democratization" of access and permanence of poor students in higher education and it should consider the necessity to encourage equality of opportunities, contribute for an improvement of academic performance and act, preventively, in the situations of retention and drop outs arising from insufficient financial conditions.

The program has as objectives: I- democratize the permanence conditions as IFES; II- minimize the effect of social and regional inequality in the permanence and conclusion of Higher Education; III- reduce the retention and drop out fees; and, IV- contribute to the promoting of social inclusion by education.

According to the decree, the student assistance actions should be developed by the Universities and Federal Institutes, in a way that is articulated with the teaching activities, research, and extension, only to the students enrolled in classroom undergraduate courses, in the following areas: student living, food, transportation, health attention, digital inclusion, culture, sports, daycare, pedagogic support, and access, participation, of students with learning disabilities, global disorders of development, high skills, and giftedness.

The decree is clear in defining as competencies of the Universities and Federal Institutions the creation of criteria and selection mechanisms; "requirements for social assistance perception"; and, "PNAES evaluation mechanisms"; according to the particularities. However, it indicates that the services and benefits be offered "mainly to students coming from public schools of basic education or with a family income per capita of up till one and half of the minimum wage, without loss of the other requirements held by the federal institutions of higher education" and "undergraduate students", preferably on their first degree.

Cislaghi e Silva (2012, p.499) call attention to PNAES's last goal, which reinforced the student assistance as a "strategy to spread the idea of the possibility of social growth and reach social cohesion by the promises of education". It also shows that there were significant changes between the Plan and Program approved by the decree. It was identified that in the second criteria included, it was focused and extremely degraded for student assistance, lowering the autonomy of universities in relation to the definition of criteria consistent to their reality.

Menezes (2012, p.74) points out that the student assistance in the IFES didn't have as a mark just PNAES, but "the program contributed strongly to reconfigure their actions and insert them in the organizational structure of federal universities."

In relation to the financing destined to student assistance during this decade, it was not evident in the legislation in force, documents that covered and designated resources to cover the costs of student assistance programs. To the contrary, there was a movement for denying the leaders in providing resources for student assistance. This is evident by the promulgation of LDB in 1996, which is registered in article 71, subsection IV, the State's lack of responsibility with the student assistance financing.

However, the decree that created PNAES started to foresee the financial funding for the financing of student assistance actions, by means of financial funding directly with IFES. The costs of the program occur due to budget appropriation annually consigned by the Ministry of Education or the federal institutions of higher education "being of the obligation of the Executive Power to combine the quantity of beneficiaries to the existing budget appropriations".

The distribution of PNAES resources among the IFES is achieved on the basis of the "PNAES Headquarters". These headquarters were defined in the 46<sup>th</sup> Fonaprace Meeting held in October 2009 in Belo Horizonte/MG. The objective was to define the budget headquarters that could guarantee the continuity of specific resources towards student assistance, "since the

---

<sup>8</sup> To attend to the students inserted in the network of private higher education the following programs were proposed: University for Everyone Program (PROUNI): created by the Provisional Measure n°213/2004 and posteriorly converted to Law n° 11,096, January 13, 2005, and FIES, and the implementation of the Student Financing Fund (FIES) which suffered alterations and with the new rules made possible solidarity bail, in such a way that the students are each other's guarantors in small groups, increased the dead line for paying off debts which rose to being twice the duration of the course, with the dead line of 6 months for beginning to pay the loan. From 2005, financing for partial scholarships was granted, benefitted from a 50% PROUNI scholarship. Currently, financing is also granted for students who find themselves in the situation of complementary scholarship holders, that is, PROUNI students who have a benefit of 25% on tuition. Caixa Econômica Federal is the financing entity for FIES.

current model promoted distortions in the student profile, to establish different weights in various courses, especially in those with greater social prestige” (FONAPRACE, 2012, p.33) The headquarters use as a basis for calculating the data in reference to the indicator “students equivalent of education”\*\*\*\*\* of the Data Integration Platform of IFES (PINGIFES) 2011.

Graph 01 – Evolution of PNAES Resources from 2008 until 2013.

Source: MEC, 2012.

Silveira (2012) showed in his research the actions foreseen by the main lines of PNAES are in organization by the 63 Federal Institutions of Higher Education, mirrored by the 26 Brazilian states and the Federal District. In general, he identified that the main actions undertaken are: student living, daycare, and food, whether by means of the own university facilities (student houses or university restaurant) or by financial aid, called Permanence Scholarship by most institutions; transportation, offered by student cards or financial help, health actions, sports, and culture.

Graph 2- Benefits attended by PNAES 2008-2011

Source: Sisu/Mec

Graph II shows the exponential growth of quantitative benefits given in the order of approximately 544%. It should be emphasized that the students may be benefitted from more than one kind of assistance.

It is observed, from the implanting of PNAES the scholarship option as a strategy to attending most of PNAES’s 11 acting lines. This option characterizes PNAES as a focused program, which hinders the universalization of student assistance by means of increasing the infrastructure, the fight for the free ass, and consequently, for the universalization of these actions and extension of rights. Furthermore, the option of scholarship supply, food, and living for example, in detriment of building restaurants and student living, reinforces the idea of market and individualism: in other words, with the scholarship, the student consumes in an isolated manner.

\*\*\*\*\* “Indicator that seeks to portray the total number of students enrolled in an IFES from the calculation that seeks to match students with courses that are differentiated: cost level, standard duration time and efficiency in graduating its participants, using itself as a mathematic model which includes a range of constants and variable, therefore aiming to portray the number of comparable students among all the courses and IFES taken into consideration”. (MEC, 2014).

Individualism is also reinforced to the extent that the student user the student assistance actions starts being charged as the only one responsible for his academic yield as a condition to maintain the benefits. This action takes the responsibility away from the University of rethinking elements such as teacher training, curriculum, methodologies, structure, among others.

## Conclusion

This article analyzes the Nation Student Assistance Program, developed from the expansion policy of Higher Education adopted by Brazil, with the goal of attending to the challenge placed by the National Education Plan- PNE of enrolling in the higher education 30% of the population of the age group between 18 and 24 until 2011, and that 40% were in public higher education institutions.

Reinforcing the democratization speech of higher education, public, free, and of quality, policies and programs were implanted and implemented to make access possible to higher education, especially to young people and workers.

The study showed that the National Student Assistance Program configured itself as a governmental strategy, by means of allocating the financial resources passed directly to the Universities and Federal Institutes; aims to offer actions that make permanence and course conclusion possible for poor students. This way, it ensures that socially excluded groups from university have their right to education integrally answered because the increase in vacancies and the creation of access strategies by themselves do not guarantee that economically vulnerable students conclude their studies.

Democratization of Higher Education means that the process that makes this education level accessible to all social classes, especially the groups which were historically excluded from this access, reaches a system of universal action. The Higher Education in Brazil was historically marked by its elite access. From the 1970's an expansion process has begun, arising from the increased demand for this teaching level, a phenomena associated to the demands of human resources enabled to attend to the demands coming from economic modernization . Since 1990, this expansion intensified, being primarily offered by private Higher Education Institutions. Therefore, the process named "democratization of educational opportunities in higher education" is confused with the massification of enrollments.

The expansion of vacancies is a historic revindication of social movements, and therefore, all the programs that have this goal, are able to receive much adhesion from Brazilian society. Nonetheless, the expansion proposed is based on standards required by capitalism, materialized in the proposals agreed upon from the World Bank.

Analyzed from the standpoint of social rights, on one side the government attends old revindications of society for greater access to higher education, free teaching, and quality and student assistance for those who depend on concrete actions to continue studying. On the hand, the government also attends to the financial and investor capital in higher education.

The article shows that, other than guaranteeing access, it was necessary to think of strategies that could guarantee permanence and conclusion of students inserted in higher education. Hence, student assistance gained a new status from 2008, with the National Student Assistance Plan, and posteriorly with the transformation of the National Student Assistance Plan, by Decree nº 7,234/2010. Even though the actions offered from PNAES are practically the same historically offered by Higher Education Institutes (university restaurant, living, actions of health attention, and even scholarships) , they gain a new impulse from the intensification of financing and restructuring of teams acquiring characteristics inherent to social policies in neoliberal times.

## Abstract

The purpose of the current study was to present preliminary results of an impact study of school climate and bullying in Ontario, Canada, following the adoption of Bill 13 – The Accepting Schools Act. Student perceptions of school climate and bullying were examined on the basis of two variables: the perception of elementary and secondary school students in regards to the school climate as well as their perceptions of their lived bullying behaviours in their schools. The goal was to present individual viewpoints (in this first phase, the students), as to their participation in the school setting as well as whether they have been affected by bullying. More specifically, this study examined how students felt in regards to school climate and bullying behaviours that could occur in their schools, in the wake of Bill 13.

## Introduction

Bullying amongst peers is a problematic issue that concerns schools around the globe. The devastating impact of bullying on young lives has caused this issue to be at the forefront of educational policy development and implementation. Student examinations of the school climate and reports of lived bullying behaviours are often utilized as the basis for bullying prevention and intervention measures undertaken in school settings. Over the years, in fact, administrators, teachers, and other professionals who interact with students have increasingly attempted to promote and implement legislature to target bullying prevention and intervention endeavours in schools by studying student reports of bullying behaviours through school climate surveys. The purpose of the current study was to present the preliminary results, namely the quantitative results of a mixed-methods study pertaining to student perceptions of school climate and lived bullying behaviours.

### *Ontario Bullying Intervention and Prevention*

The nature of bullying prevention and intervention endeavours in Ontario, Canada, has evolved significantly throughout the years. In 2009, a whole-school progressive discipline approach was put into action. Progressive discipline focuses on promoting positive student behaviour while preventing unacceptable behaviour, providing early intervention as well as appropriate consequences according to the context of bullying situations. Recently, the Ontario Ministry of Education (OME) has adopted Bill 13 – The Accepting Schools Act (ASA), which has influenced the nature of measures undertaken by school boards to counter bullying. The ASA provides a legal framework for countering school bullying which is, as mentioned, consistent with the progressive discipline agenda. Consequently, every school board in Ontario and, by extension, every school, is required to have in place a bullying prevention and intervention policy. The Ontario Ministry of Education has since published PPM 144 (OME, 2012) as a model policy and framework that school boards must respect in their individual policy development. One of the requirements of this model policy is for every school in Ontario to administer school climate surveys for students, parents, teachers, administrators and other adults who interact with students in school. As school boards oversee the governance of groupings of schools that vary in terms of their geographical location, religious orientation (catholic or public) as well as language (French or English), they are given flexibility in adapting PPM 144 to their individual needs. This study examines the state of affairs of bullying in French language Ontario schools from the students' perspectives by utilizing school climate survey data obtained from some Ontario school boards.

### *1.2.1. School Climate*

The connection between the school climate and the prevalence of bullying behaviours in schools is widely established by research (Coloroso, 2010; Debardieux et al., 2012). This viewpoint is shared by the Ontario Ministry of Education (OME, 2009a; 2012), which considers that the notion of the school climate refers to the quality of lived experiences, namely the way that the school code of conduct is applied in the school environment and the extent of student participation in the school setting. This could entail goals, values, interpersonal relationships, teaching and learning practices and the organizational structure of school life. It should be noted that the school climate survey utilized in the current study (OME, 2009b) considers the following elements: whether students feel safe and well-treated at school; their perceived cause of mistreatment where applicable; their feelings of belonging to the school community; and finally, their global perception of the school environment. In sum, the term 'school climate' is often utilized to discuss all aspects of the school environment and considers bullying prevention and intervention from a whole-school perspective.

### *1.2.2 Bullying and Bullying Behaviours*

In order to understand student perceptions of the bullying behaviours that they experience, it is important to briefly define what constitutes bullying, and how it is discerned from other aggressive behaviours. While there is no consensus from the scientific community as to a universal definition of this phenomenon, there is some agreement in terms of its general characteristics. Researchers have, for example, commonly identified bullying as occurring in interpersonal relationships, and involving an imbalance of power between the individuals involved (Coloroso, 2010; Rigby, 2008). Moreover, Olweus (1993), a pioneer bullying researcher, sustains that bullying typically involves negative actions repeated over time, though that stance has come under scrutiny with the onset of cyberbullying and the impact of isolated harmful acts, especially when they occur online and are, to date, nearly impossible to eradicate (Roberge, 2012; Shariff, 2008).

Researchers additionally identify different types of bullying behaviours, including physical bullying (hitting, damaging or stealing property), verbal bullying (threats, offensive comments), relational bullying (spreading rumours, excluding someone from a group), cyber-bullying (using technology or social media as a means to bully) or bullying for reasons or religion, ethnicity, culture, socioeconomic status, sexual orientation, and various other real or perceived differences (Olweus, 1993; Rigby, 2008; Roberge, 2012). Rigby (2008) indicates that verbal bullying is the most frequently reported form of bullying, closely followed by physical or relational bullying. He notes that cyberbullying is increasingly reported, and that a Canadian study uncovered the fact that approximately 25% of students had reported having been victims of cyberbullying.

The prevalence of bullying in schools typically varies considerably and is therefore difficult to generalize (Rigby, 2008). The Canadian Institute of Health Research (2012) reports that as many as one in three students state that they have been victims of bullying. Studies have commonly shown that bullying is at its highest point during the junior/intermediate grades (between grades 4 to 10), which is attributed to the transition between divisions that necessitates the navigation between different peer groups (Swearer, Espelage & Napolitano, 2009). Furthermore, research has shown that bullying between peers occurs most frequently at school, namely on the way to and from school or in areas such as hallways, staircases, cafeteria, in the schoolyard, or other areas where there is little or no adult supervision (Blaya, 2003; Coloroso, 2010; St-Germain, 2003).

The reporting of bullying behaviours is another notable dimension that was examined in the school climate surveys administered in the current study. Numerous studies have indicated that a significant amount of bullying that occurs in schools is unreported (Hanish & Guerra, 2000; Mishna & Alaggia, 2005; Safe@School Provincial Initiative, 2012). The reasons for not reporting an incident of bullying could include the fear of reprisal, the belief that no action will be taken, or, in the case of cyberbullying, the fear of losing access to technological privileges (Coloroso, 2010; Safe@School Provincial Initiative, 2012). In support, Dube (1997) indicates that, in terms of lived experiences at school, many students perceive that the bullying that they have experienced would be or has been underestimated by adults in the school setting. Some studies have shown that a substantial number of students witness bullying without intervening (Pepler, Craig, O'Connell, Atlas & Charach, 2004), but that when peer intervention occurs the bullying is likelier to cease (Carra, 2009). In this case, peers play a significant role in bullying incidents by having the power to reinforce the role of the victim or of the aggressor (Pepler, Craig, O'Connell, Atlas & Charach, 2004).

## *1.3 Method*

In order to collect data from participants, a School Climate Survey (OME, 2009b) developed by the Ontario Ministry of Education and regionally adapted was utilized. The survey employs a sliding scale where respondents must note their degree of appreciation of a series of levels for calibrated criteria. The survey also contains open questions. The information gathered on the surveys was regrouped into categories that were most representative of the literature findings presented in the previous section. The interpretation of data was conducted in a holistic perspective and considered that what is perceived, felt, lived by students is important and revelatory in examining the school climate and the presence of school bullying.

Two French language school boards in Ontario provided their school climate survey student data for the purposes of this study, which resulted in survey responses from 32 elementary schools and 8 secondary schools, and amounted to 3073 individual

student responses. The process of collecting data from student participants is noteworthy. Some administrators strove for 100% participation of students in their schools. As such, students who were absent on the day that the surveys were administered were surveyed upon their return. Moreover, prior to completing the school climate surveys, most students participated in an information session in order to better grasp the definition of bullying, to understand the different types of bullying that exist, and to discern bullying from other behaviours such as teasing or naturally occurring conflict between peers. The final result was 87.27% participation in one school board, and 100% student participation in the other.

#### 1.4. Results

##### 1.4.1. Student Perceptions of the School Climate

The results of the quantitative phase of this study present student perceptions of the quality of the school climate in terms of their lived experiences at school. Table 1 tabularizes, more specifically, how students feel they are treated at school, whether they feel comfortable at school, their perception of the way that rules, regulations and school codes of conduct are applied, as well as their perception of the cause of being mistreated when it occurs, as well as their global appreciation of the school climate.

Table I. Mean Percentages of Student Perceptions of School Climate Characteristics

1.1 Feeling Safe at School	Grades 4-6 (Junior)	Grades 7-12 (Intermediate/Senior)
Students who generally feel safe at school, who generally enjoy being at school and who feel that the learning environment is generally pleasant.	91	94
Students who generally feel welcome at school	88	89
Students who generally feel that they are treated fairly by adults in their school	89	88
Students who generally feel that the student code of conduct/policy is applied equitably in their school	88	88
1.2. Feeling Unsafe or Mistreated at School	Grades 4-6 (Junior)	Grades 7-12 (Intermediate/Senior)
Students who feel uneasy or mistreated at school	42	38
1.3. Perception of the Cause of Mistreatment	Grades 4-6 (Junior)	Grades 7-12 (Intermediate/Senior)
Physical appearance (ex. physical disability, etc.)	43	56
Language	10	10
Culture and race/aboriginal roots	14	18
Religious beliefs	9	10.8
1.4 Global Appreciation of the School Climate	Grades 4-6 (Junior)	Grades 7-12 (Intermediate/Senior)
Always feels well at school	45	41
Often feels well at school	41	43
Sometimes feels well at school	12	13
Never feels well at school	2	2

##### 1.4.2. Student Perceptions of Bullying Behaviors in their School

The next section of the school climate survey studied student perception of the prevalence and of the different facets of bullying incidents and of their strategies for reacting to bullying either as victims of as witnesses of bullying. Table 2 represents student perceptions of the bullying that they perceive to experience at school.

Table II. Mean Percentages of Student Perceptions of Extent of School Bullying Behaviors

2.1 Prevalence and Forms of Bullying – Victims of Bullying	Grades 4-6 (Junior)	Grades 7-12 (Intermediate/Senior)
--	---------------------	--------------------------------------

Physical Bullying :		
a) never		
b) once or twice	66	81
c) regularly	19	11
d) unaware of having been victimized	5	3
	7	5
Verbal Bullying :		
a) never		
b) once or twice	50	61
c) regularly	32	23
d) unaware of having been victimized	12	10
	6	5
Social Bullying :		
a) never		
b) once or twice	66	71
c) regularly	30	17
d) unaware of having been victimized	6	7
	8	6
Cyberbullying		
a) never		
b) once or twice	82	83
c) regularly	6	8
d) unaware of having been victimized	2	3
	9	6
Did not witness bullying		
	45	46.6
2.2 Reactions to Bullying		
Did not report the bullying		
	21	28
Reported to school principal/ vice-principal		
	16	15
Reported to a teacher		
	30	15
Reported to another staff member		
	29	12
Reported to his/her parents		
	34	27
Reported to a peer		
	41	41
2.3 Witnessing Bullying		
	Grades 4-6	Grades 7-12
Witnessed bullying		
	55	54
2.4 Areas where Bullying Occurs		
	Grades 4-6 (Junior)	Grades 7-12 (Intermediate/Senior)
On the school bus		
	12	8
Upon arriving/leaving school grounds		
	5	4
In the classroom		
	10	8
In hallways		
	7	8
In restrooms		
	7	5
In the gymnasium or change rooms		
	10	9
In the school yard		
	19	7
In the cafeteria		
	2	5

### 1.5. Interpretation of Results

The objective of the Ontario Ministry of Education's (2009b) School Climate Survey is to gather information from schools in terms of equity and inclusive education. The first section of the survey examined how students feel at school, whether they feel accepted and comfortable during activities and while participating in sports or clubs within their schools.

#### 1.5.1. School Climate

#### *1.5.1.1. Positive Elements of the School Climate*

The viewpoints gathered largely suggest that students have an extremely favourable appreciation of the quality of their school life and of the welcoming climate of their school. They indicate that they feel well, or mostly feel well in their school in general and in the classroom. As such, school appears to be a welcoming place where they feel safe everywhere in the school environment. Furthermore, students maintain that they feel that they are treated equitably by adults and confirm that the school code of conduct is applied fairly. This validation of the school and of the adults who intervene amongst students is present for both younger students and senior students. Conversely, the perception of a positive school climate such as in the current study has been identified as potentially serving as a safeguard barrier against bullying behaviours, and could also reduce stress and enhance academic performance (Loukas, Suzuki & Horton, 2006; Swearer, Espelage, Vaillancourt & Hymel, 2010). This would suggest that reports of bullying behaviours should be relatively low, as was the case in the current study.

#### *1.5.1.2. Limitations of the School Climate*

A certain proportion of students do not share the general favourable opinion of the school climate, but rather express sometimes feeling mistreated at school. The reason that is most frequently evoked to explain the cause of mistreatment is their physical appearance. Language, culture, race and religious beliefs are evoked in a minor proportion. Extant research confirms personality traits of victims and perpetrators of bullying, as well as the victim's reaction to the bullying, as common reasons for bullying (Coloroso, 2010; Rigby, 2008; Zapf & Einarsen, 2011). This finding must be interpreted with caution and does not suggest that students who report feeling mistreated are necessarily automatically victims of bullying. Mistreatment could include perceiving that teachers are not listening to them, feeling judged without knowing the reason, or generally feeling mistreated without attributing a definite cause to these feelings.

#### *1.5.1.3. Global Appreciation of the School Climate*

In order to globally apprehend the multiplicity of facets of the school climate as perceived by the students, the surveys also sought to determine the students' global appreciation of their school. Results suggest that a significant majority of students have a highly favourable appreciation of the school climate. Past studies of this nature have shown varied student perceptions of their school climate (Loukas, Suzuki, & Horton, 2006; Safe@School Provincial Initiative, 2012).

### *1.5.2. Student Perceptions of Lived Bullying Behaviours*

Following a detailed presentation of types and forms of bullying, the second portion of the school climate survey represents student perceptions of the prevalence of bullying in their school.

#### *1.5.2.1. Victim Experiences of Prevalence and Types of Lived Bullying*

The most frequently reported types of bullying experienced by students since the beginning of the school year are, from most to least reported, as follows: verbal bullying, physical bullying, social bullying and cyberbullying. Safe@School Provincial Initiative (2012) reports that verbal bullying is generally the most common type of bullying experienced by students. Nevertheless, notwithstanding the type of reported bullying behaviour, it is notable that students in the current study more frequently report having been victimized once or twice since the beginning of the school year, than having been regularly victimized. In the absence of repetition of the bullying behaviour, one could then question whether the incidents reported by students as having occurred only once or twice constituted bullying or isolated conflict between peers. This could also suggest that, given the quality of the school climate of the schools surveyed in the current study, the bullying was promptly addressed and ceased after the intervention. These findings are also consistent with existing research, in terms of the fact that bullying experiences often occur regularly for only a small number of students, or even in areas that are confronted with grave socioeconomic issues (Debarbieux & Blaya, 2008; Gottfredson, 2001; Shaw, 2004).

#### *1.5.2.2. Reacting to Bullying Behaviours*

Another section of the survey focussed on the existence of bullying in schools and on different ways to react once it occurs. An interesting finding was that younger students are slightly less likely to report bullying. This is contradicted by some researchers. For example, Debarbieux et al. (2012) postulate that, as children grow, develop, and evolve, their relationships with figures of authority are increasingly perceived negatively, which could account for the reluctance to report bullying to a trusted adult in the school setting as students enter their teenaged years. Conversely, in the current study, junior, intermediate and senior students more frequently report bullying to family members and friends than to teaching staff or the school administration. This likelihood to report could also be linked to the quality of the school climate as demonstrated by the survey results of the current study.

### 1.5.2.3. Areas Where Bullying Occurs

At first glance, the reported areas where bullying occurs are consistent with research findings in this regard. In fact, for students in grades 4 to 6, bullying most often occurs in the school yard and on school buses, whereas students in grades 7 to 12 report that bullying most often occurs in varied areas. This finding is supported by numerous researchers, who suggest that bullying most often occurs where there is little or no adult supervision (Coloroso, 2010; Rigby, 2008).

### 1.6. Discussion and Conclusion

By highlighting the viewpoints of the individuals on the front lines of lived experiences in the school setting, namely the students, this study frames bullying in schools for students in grades 4 to 6 and 7 to 12. The methodological challenges of utilizing surveys, especially with young participants, must not be underestimated. The normative, relative and subjective dimensions of school bullying must be taken into account when interpreting this survey data. Given the fact that the participants in this study were currently attending elementary and secondary school, the results therefore reveal the state of affairs of bullying as reported by the individuals who interact in schools. The subjective experience of students is perceived as resulting from interactions with others, with bullying being the outcome of an interactive process. According to Strauss (1990), this process of building meaning of bullying as the evolution of representations of the types of bullying and of their breadth, are nurtured by logic of actions of the different individuals involved in the situation. As such, the perception of feeling safe, as the perception of feeling victimized by others rests on the experience of interaction with others, which is linked to an interpretation of the whole of particular problems at school, and therefore linked to a particular context. Bullying then becomes meaningful for students through their lived experiences.

In conclusion, numerous searchers highlight the fact that the quality of the school climate largely influences student academic performance, well-being, and personal and social development (Coloroso, 2010; Loukas, Suzuki & Horton, 2006; Swearer, Espelage, Vaillancourt & Hymel, 2010). Feeling safe and free from bullying at school is an integral part of the school climate. The schools surveyed in the current study appear to have made significant gains in this regard. Future research which gathers insight into teacher, parent and administrators' perspectives of school bullying, through similar school climate surveys and qualitative interviews, will provide more comprehensive insight into bullying behaviors in these schools.

## Abstract

The present study investigated differences between disadvantaged and resilient students in terms of sense of belonging, as measured in PISA 2012. To this end, a segmentation method was employed to define student segments differing in ratios of resilient students. Results indicated that there is a relationship between academic resiliency and sense of belonging. While the relationship between resiliency and the some predictors seemed to be varying, there are some predictors with direct relationships with academic resiliency.

## 1. Introduction

Among the aspects making the students ‘disadvantaged’ in their educational experiences and lives are bad family structures, school resources, low socio-economic status (SES) and etc. Of these, especially low SES has a key effect on the achievement of students (Kalender & Berberoglu, 2009; Yayan & Berberoglu, 2004; Caldas & Bankston, 1997, 2001; Rumberger & Willms as cited in Caldas and Bankston, 2001; Baker, Goesling and Letendre, 2002; Schoon, et al., 2003; Alspaugh, 1996; Jencks et al., 1972). Similarly, according to the Coleman Report on equality and educational opportunity (Coleman et al., 1966), socio-economically advantaged group of students perform better than students who are disadvantaged.

However, there is a group of students getting good achievement levels although they are in the disadvantaged group, whom we can call academically resilient. In the literature, although there is not one universal explanation, resilience is a term which is explained as a process consisting of three aspects, the first is a chaotic, and risky environment or adversity, and the second is successful coping abilities and positive adaptation systems against those adversities (Masten & Reed, 2002; Rutter, 1990, 1999; Doll & Lyon, 1998; Garmezy, Masten & Tellegen, 1984; Luthar & Cicchetti, 2000; Wolin and Wolin, 1993), and the third is a heightened likelihood of school success and other accomplishments in life thanks to the coping mechanisms (Wang, Haertel, & Walberg, 1994).

When looking at disadvantaged students that are successful within countries, resilient students’ performance is high even when compared to their more advantaged peers in spite of their adversities (OECD, 2011). What makes them outperform even the advantaged ones is the mechanisms they develop to lessen the effects of above aspects. Studies (Garmezy, 1991; Masten and Coatsworth, 1998; Rutter, 1987; Werner & Smith, 1992; Beauvais & Oetting, 1999; Greene & Conrad, 2002) grouped the protective factors or coping mechanism by three, which are personal characteristics (e.g. intelligence, temperament, internal locus of control, and autonomy), family related factors (e.g. support from family members) or qualities and external support systems or aspects of wider social context (e.g. teacher support or school environment).

Hanson and Austin (2003) reported that the students who have higher resiliency have higher achievement levels in schools. Also there are reported findings that academic resilience does not only improve students’ achievement at school (Martin, 2002; Finn & Rock, 1997; Rouse, 2001; Waxman & Huang, 1996), but also it provides several positive outcomes in their life like stronger social relations, less emotional and behavioral problems and alike. Furthermore, being resilient in their academic life is among the few factors which let them exit the low-SES cycle (Hout and Beller, 2006). Now that through this way they can protect themselves and their future generations from low SES and have the chance to be among the advantaged group by beating the odds, it is crucial that the disadvantaged students learn to deal with their problems and improve their academic skills (Alva, 1991).

Among the protective factors which can be developed at schools is sense of belonging, which, as a psychological term, could be described as a pervasive human concern to establish and maintain relatedness to others (Kohut, 1977). A similar description is

that sense of belonging is the experience of personal involvement in a system or environment so that persons feel themselves to be an integral part of that system or environment, which is considered to be a part of human mental health (Hagerty et al., 1992). More specifically, sense of belonging have two defining attributes; one is the experience of being valued, needed, or important with respect to other people, groups, or environments; and the other is the experience of fitting in or being congruent with other people, groups, or environments through shared or complementary characteristics. (Hagerty et al., 1992)

According to Maslow (1962), the need of belonging is a feeling which has to be satisfied before other needs and expectations could be fulfilled. When adapted to school environment and student psychology, it could be argued that the sense of belonging is a need of students which should be satisfied before they can move on studying and being resilient.

Goodenow and Grady (1993) defined sense of belonging to school as the extent to which students feel personally accepted, respected, included, and supported in the school social environment so that their educational participation would not be limited (Finn, 1989) and would not lead to dropping out of high school (Fine, 1991) and as a result, it would lead to commitment to schooling (Kagan, 1990). Albert (1991) coined a simple formula of three Cs to express sense of belonging; consisting of 'connect' which stands for connecting with others; 'capable' which stands for letting them feel capable; and 'contribute' which stands for the students' contribution to feel belonging. Sense of belonging to school is, in a few words, about having friends in class, interacting with peers, participating in class, and obtaining good grades in the examinations (Williams & Downing, 1998). In other words, sense of belonging has a direct relationship to motivation, student effort, and academic achievement. (Goodenow, 1991)

Wang, Haertel, and Wahlberg (1994) argued that academic resilience could be developed through interventions which enhance the learning, develop students' talents and competencies, and they (1998) described the roles of educators in promoting children's educational resilience; sense of belonging was presented as an important ingredient in any educational program for children at risk of academic failure. Finn (1989) argues that students' sense of a close connection with their schools is a critical factor in school achievement. Students who identify with their schools have an internalized sense of belonging; that is, they feel they are a part of the school community and that school constitutes an important aspect of their own experience. Students who feel this way are more likely to value and pursue academic or school-relevant goals and thus are more likely to participate in the classroom. Voekl (1997) found that school identification was significantly correlated with achievement test scores. School climate is thus a critical factor in reducing academic failure.

Students who are more actively feel belonging to school earn higher grades, score higher on standardized tests of achievement, and show better personal adjustment to school (Skinner & Belmont, 1993). They are also more resilient (Finn & Rock, 1997). If schools can strengthen the sense of school belonging, it should, in turn, result in increased academic achievement.

It is important to understand the ways in which schools can foster resilience in students. Beginning in the 1970's, researchers sought to find answers to this question. Rutter (1987) identified four main protective processes or methods that foster resilience:

- Reduce negative outcomes by altering the risk or child's exposure to the risk
- Reduce negative chain reactions following risk exposure
- Establish and maintain self-esteem and self-efficacy
- Open up opportunities to acquire skills and invest in prosocial activities.

Schools can foster resilience through any combination of these four processes (Benard, 1993). For example, schools can reduce negative outcomes by providing free/reduced meal programs, providing access to school-based health clinics, providing clothing and other basic needs, and providing links to community resources. Schools can reduce negative chain reactions following risk exposure by having smaller classes, implementing programs that developing mentoring programs, and offering additional tutoring or counselling. Schools can foster self-esteem and self-efficacy in students by setting up classroom environments so that students can experience success and feel a sense of control over aspects of their environment. Finally, schools can provide opportunities for students to acquire skills and engage in prosocial activities by offering a range of extracurricular activities, mentoring programs, and tutoring options.

One of the most comprehensive data sets comes from Programme for International Student Assessment (PISA) conducted by Organization for Economic Co-operation and Development (OECD). The assessment examines how well 15-year-old students are able to use the knowledge and skills they have gained to solve standardized tasks in reading, mathematics and science as they approach the end of secondary school. It also collects contextual information about the students, their families and their schools (OECD, 2011). Approximately 6% of students across its member countries are defined as resilient by OECD. Preliminary results on PISA 2012 show that, disadvantaged students in countries where SES is lower received lower scores not only in mathematics but also in some other dimensions such as engagement, drive, and motivation. On the other hand, resilient students can get higher scores both in mathematics and other dimensions. Accordingly, OECD suggests that putting efforts to increase disadvantaged students' performance through additional instruction be a key priority for policy makers of the low SES countries (2013). Sense of belonging is of special importance in that unlike socio-economic disadvantages, it can be increased by active role of teachers and administrators.

Turkey was among the top 8 countries that had the highest resilient student ratios (OECD, 2013). Around 45% of the disadvantaged Turkish students are resilient. Therefore, it can be said that Turkey constitutes a good example to study resilient students. In a study on PISA 2009, it was shown that while resilient ones generally went up to 3<sup>rd</sup> proficiency level, most of the disadvantaged students reached only 2<sup>nd</sup> level (Findik & Kavak, 2013).

In the present study, indicators of students' sense of belonging were investigated in terms of their ability to differentiate resilient students from disadvantaged students. To this end, student subgroups differing in sense of belonging were defined using a segmentation method.

## 2.Method

### 2.1.Data set and sample

In PISA 2012, Turkish data were collected from 4848 15-year old students from 12 statistical regions and 13 school types through student questionnaires and literacy tests. To define disadvantaged and resilient students, the index of ESCS (economic, social and cultural status) index was used. This index is computed for each participant country by OECD using several variables such as parental occupation, the highest level of parental education, and an index of home possessions related to family wealth, home educational resources and possessions related to "classical" culture in the family home.

Disadvantaged students were defined as those who were at the bottom quarter based on ESCS (n=900). Among them, students who were at the highest proficiency quarter were labeled as resilient based on one of the plausible variable for reading literacy, PV1READ (n=300). Reading proficiency levels of disadvantaged and resilient students were 3 (mean score 410) and 5 (mean score 583), respectively.

### 2.2.Analyses

In PISA 2012, sense of belonging was assessed with 9 indicators: "I feel like an outsider (or left out of things) at school", "I make friends easily at school", "I feel like I belong at school", "I feel awkward and out of place in my school", "Other students seem to like me", "I feel lonely at school", "I feel happy at school", "Things are ideal in my school", and "I am satisfied with my school" (1: Strongly agree to 4: Strongly disagree).

To create subgroups of students, Chi-squared Automatic Interaction Detector (CHAID) analysis (Sonquist and Morgan, 1964), a non-parametric data reduction method, was employed. By this way, student segments varying in ratio of disadvantaged and resilient were defined. CHAID method produces a visual tree so that it is possible to assess significance of the predictors.

## 3.Results

Due to the missing data in the set, CHAID analysis was conducted using 588 (instead of 900) disadvantaged and 200 (instead of 300) resilient students and this whole group was segmented. CHAID analysis produced the tree in Figure 1. Tree was defined using out of 9 predictor variables of sense of belonging. In the tree, disadvantaged and resilient students were coded with 1 and 2, respectively. Ratios of disadvantaged and resilient students in the whole body were 74.6% and 25.4%, respectively.

The most significant predictor was selected as "Other students seem to like me". And then, "I feel lonely at school" and "Things are ideal in my school" were selected to create second-levels clusters. And last, "I feel like I belong at school", "I make friends easily at school" and "I feel happy at school" were the variables on the third-layer. As a result of the CHAID analysis, 10 terminal nodes were created and 4 of them (nodes 10, 12, 15 and 17) included larger number of resilient students than the whole body held (25.4%).

Node 10 included students who feel "Liked by Other students", don't 'Feel Lonely at School' and feel "Belong at School"; Node 12 those who agree "Liked by Other students", "Things are Ideal at School", and "Belong at School"; Node 15 those who agree "Liked by Other students", disagree "Things are Ideal at School", and "Make Friends Easily" and Students who disagree "Liked by Other students", agree and disagree "Feel Lonely at School", disagree "Feel Happy at School" constituted Node 17.

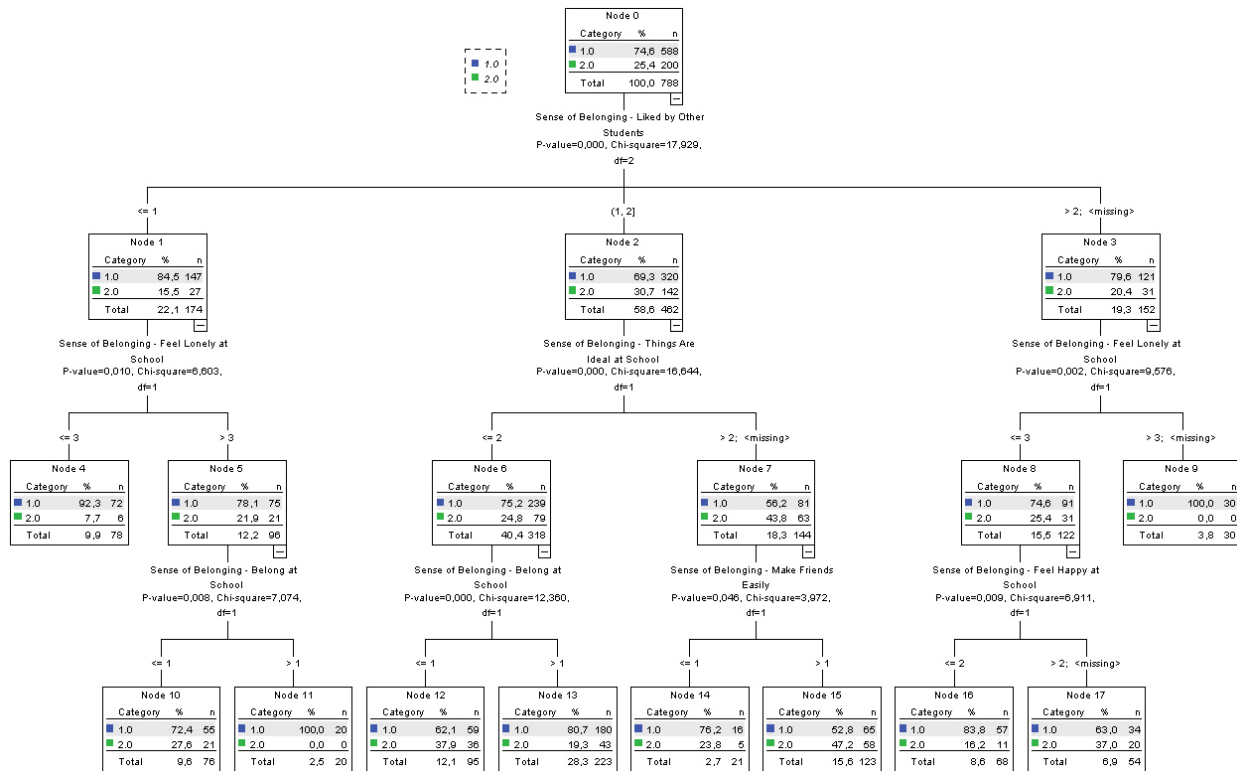

Figure 1. CHAID Tree

#### 4. Discussion and Conclusion

Results of the present study indicated that there is a relationship between sense of belonging and being resilient. Some of the predictors used in CHAID analysis were found to be strongly associated with group membership to disadvantaged/resilient.

The relationship between resiliency and the predictor, “Other students seem to like me”, seemed to be varying. Student segment with higher resiliency included both low and high agreement with this predictor. In other words, whether students are liked by others or not, they can be academically resilient. Similarly, the other predictor, “Feel lonely at school”, was observed to have varying relationship with resiliency. Both low and high agreement can create academic achievement among disadvantaged students. On the other hand, “Belonging to the school” was found to have higher degree of agreement for resilient students. Furthermore, segments with students who were cannot “Make friends easily” and “Feel unhappy at school” included mostly resilient students.

The predictors identified as a result of the CHAID analysis could be used to increase ratio of resilient students among disadvantaged students. As mentioned earlier in the paper, such an increase could be related not only to academic achievement, but also to some other positive outcomes such as stronger social relations, less emotional and behavioral problems and alike, as stated by Finn and Rock (1997), Rouse (2001), and Waxman and Huang (1996). Also increasing the ratio of resilient students via increasing their sense of belonging may provide them with a way to let them exit the low-SES cycle (Hout and Beller, 2006).

Despite the significant findings, it is hard to discriminate if disadvantaged students become academically resilient because they have no friends, fell lonely etc. or they have no friends, fell lonely, not happy because they are successful. Experimental studies are suggested to investigate cause-and-effect structure of this relationship.

Results revealed by the present study highlight the importance of school on student achievement. Teacher and administrators could be actors to increase sense of belonging, which cannot be provided by students’ low-SES families.

# Student teachers evaluating and assessing *SCRATCH* in the Applied Linguistics classroom

Clarisa Garcia Quan\*

University of Guam, Division of English & Applied Linguistics, UOG Station, Mangilao, Guam 96923

---

## Abstract

For the past four years, students and student teachers taking applied linguistics at the University of Guam were required to design class projects using *SCRATCH*, a free downloadable program from MIT. Their projects had to integrate principles of second language teaching/learning or other subfields of applied linguistics into their projects. In 2012 and 2013, students integrated their computer projects into their lesson plans for elementary, middle, or high school students. This presentation will propose criteria for evaluating students' computer projects and summarize students' assessments of and comments about, using MIT's *SCRATCH* program in foreign language and content area teaching.

## 1. Background of the study

In the 21<sup>st</sup> century, technology has become such a vital part of almost everyone's lives that effective educators must make it an integral part of their lessons and lesson plans as well. Just as mobile devices like Androids, iPads and iPhones have become part and parcel of students' common everyday conveniences, every cutting-edge educator must make computers and technology part and parcel of their teaching. They must find ways to make technology contribute to better teaching and better learning. The programming tool *SCRATCH* is an example of a promising classroom tool. In the past four Fall semesters, students of Applied Linguistics (LN400/G) at the University of Guam were required to design *SCRATCH* computer projects for possible use in the classroom, for students of different ages and levels of competency. After becoming familiar with second language learning/acquisition theories, applied linguistics students were required to think of ways to integrate *SCRATCH* into possible classroom lessons in foreign language teaching and other content areas. They were told that their projects had to reflect their creativity, imagination, (multi-) cultural / ethnic sensitivity, and teaching ability.

What is *SCRATCH*? *SCRATCH* is a relatively simple programming language that enables anyone to do graphics, animation, interactive games, music – the possibilities are endless. The *SCRATCH* Program consists of a sprite (and other) characters, & a list of commands that can be added to a project to say and or do whatever is to be taught. All commands are listed along the side of the program in the form of puzzle-like pieces that can be added to the script. Developed by MIT Media Lab's Lifelong Kindergarten Group (2004, 2013), with support from organizations and businesses like the National Science Foundation, Microsoft, Google, and Intel, *SCRATCH* was designed to stimulate and encourage anyone interested, from children to adults, not only to think critically, logically and creatively, but also to work collaboratively. Posted sample programs and tutorials on the net can be invaluable to those who wish to learn using the program. Fall 2010, 2011, and 2012 applied linguistics students used *SCRATCH* Version 1.4; Fall 2013 students used the new *Scratch* 2.0 version. It was hoped that the new version would take care of the difficulties students had with the earlier version.

*SCRATCH* is an attractive option for educators because it gives student-teachers a chance to learn doing hands-on basic programming as well as apply the theories they have learned in class, to actual lessons that put those theories to the student

E-mail address: risaquan@gmail.com

and classroom test. Most importantly, it is free: anyone can download it from the net. Even though the program was originally intended for younger learners to learn basic programming, I wanted to see what university students of applied linguistics could do with this MIT-generated program, to help their present and future students with the acquisition of a second language, or the learning of content areas (Quan 2013, q.v.).

Applied Linguistics at the University of Guam (LN400G) is a one-semester, 3-month undergraduate/graduate course that ESL, and English-language/linguistics track majors must take. It is an optional course for other education majors. Although the course surveys the main subfields of Applied Linguistics, the first half of the semester covers second language acquisition theories, e.g., Cross-linguistic Influence or CLI (Kellerman 1995, Odlin 2003) –the weak version that remains from the controversial Contrastive Analysis Hypothesis (Lado 1957); Krashen’s (1981,1982,1983, 1985, 1997) theory with its bundle of five hypotheses – Monitor, Acquisition vs. Learning, Affective Filter, Input i+1, and Natural Order Hypotheses; Cognitive Theory (McLaughlin 1987, Scovel 1999, R. Ellis 1997); Social Constructivist Theories (Long 1996, 2003); Inter/Intralanguage/Fossilization Theories (Selinker & Lamendella 1979, Long 2003), and Eckman’s (1981, 2004) Markedness Differential Hypothesis from Universal Theory (Chomsky(an), and language universals and typology (Greenberg, Ferguson, 1978).

## 2.Communicative competence

A previous paper (Quan 2013) proposed a model of the relationship between L2Acquisition theories and communicative classroom methods in the applied linguistics class projects based on Hymes’ (1974) notion of “communicative competence”:

H.D. Brown (2007) enumerated some characteristics of an ideal communicative language teaching classroom (cf. Hymes 1972 on communicative competence). They include the need for the following: a) cultural, social, as well as linguistic competence; b) authenticity and functionality in lesson design; c) the necessity of sometimes sacrificing grammatical accuracy for fluency, or “getting the point across” for successful communication, especially in the early stages; d) the need to develop students’ ability to actually be able to function in real-life situations, in the target language setting, beyond the classroom. To his list, I added another: the need for positive rapport between students and between students and the teacher, to facilitate language learning/acquisition in the foreign language classroom.

The first year of the SCRATCH 1.4 project in the Applied Linguistics classroom was exploratory and collaborative, with each group of 3 or 4 students submitting one project. In the second and third Fall semesters, every student was required to program his or her own project, although students were encouraged to work in groups to help each other out, or for “knowers” to help others. A student from the previous year was invited to speak to the class, give advice, and answer questions about the program. This knower-helping-novices approach apparently helped students a lot. In Fall 2013, students used the newest version of Scratch (2.0) in their projects and submitted individual projects.

## 3.Criteria for assessment

Criteria for evaluating students’ projects have been developed. They involve examining how the individual projects tie in with the theories of foreign language acquisition and communicative learning methods. Issues addressed are the following:

- **The theory or hypothesis behind the project**
  - Reasons for choosing a particular project or topic**
  - The L2Learning theory / hypothesis or communicative learning method that “jives” or matches with the program design or that the design addresses**
  - The “closeness of fit” between the project, the course content, and the course learning objectives as stated in the LN400G Applied Linguistics course outline and syllabus**
- **Use of the Scratch Program**
  - The simplicity/complexity of the programming project: mastery or lack thereof?**

The time spent to plan, design, write, organize the program itself  
 Online Tutorials that inspired and or helped with the project  
 The planning vs. the execution: any technical problems with the program or content?  
 Audience and Purpose: consistent from beginning to end of program?  
 Feedback from classmates: were suggestions and comments taken in to account in the final project?

• **Execution and Communicative Goals in the Classroom**

User-friendliness of the program for the intended audience  
 Ease of learning content  
 The project: Task based? Goal oriented?  
 Cultural sensitivity and awareness of social rules beyond grammar or declarative knowledge

Grade and level-appropriateness of activities (content, inputting responses) with regards to the intended audience

The purpose of the project/lesson: Accomplished?

Assessment: is it included in the project? Or separate?

Integration between the project, lesson plan, PowerPoint (& other tools), and Assessment (whichever is applicable).

• **Adjustability and Modifiability**

With the basic design of the program remaining unchanged, can the lesson content be modified for use in subjects or other content areas?  
 Should the project be modified, expanded, or improved for future use? How?  
 Can the same program be used and or modified to teach multi-level and multi-age students?  
 Any bugs? Any glaring problems that should be addressed?

#### 4. Student Feedback

Students, in turn, evaluated the value of Scratch in their final papers. Their comments are summarized in Table 1 and Table 2 below.

Table 1. UOG Applied Linguistics students' evaluations of *Scratch 1.4*, from 2010-2012

STUDENTS' POSITIVE COMMENTS	STUDENTS' NEGATIVE COMMENTS
1. Fun!	1. Very time consuming
2. Great learning experience	2. Not easy to learn in the beginning
3. A useful tool for educators who want a different teaching method in the classroom	3. Hard to coordinate sounds, movements
4. A creative alternative to Powerpoint, lectures, chalkboards, with the teacher talking all the time!	4. Takes a few days to learn and feel comfortable with program
5. Allows teachers to be very creative	5. UTube video tutorials were too basic
6. Middle and high school students can use Scratch to do presentations, create games themselves, have fun!	6. Commands are hard to learn; challenging for teachers who are not programming-savvy!
7. No limit as to what it can do	7. Takes a lot of patience and time that teachers may not have
8. A useful tool for ESL/EFL students as well as native speakers	8. What if classrooms don't have computers? What if students don't have computers at home?

Students' suggestions for improving *SCRATCH 1.4* included the following:

- **Make it more user-friendly because colorful and inviting interface belies the complexity of the scripts needed to make a functional product**
- **Simplify the tabs: there are too many tabs and dozens of options: hard to know where to start to move a sprite from points A to B- so simplify the commands!**
- **Simplify complex terms that are hard for ordinary people to translate to layman's terms**
- **Make tutorial more user-friendly!**

Fall 2013 students, after using *SCRATCH*'s new version 2.0 that came out in May 2013, gave narrative evaluations given in the table below:

Table 2. UOG Applied Linguistics students' evaluations of the new *Scratch 2.0* in Fall 2013

STUDENTS' POSITIVE COMMENTS	STUDENTS' NEGATIVE COMMENTS
1. Fun, interactive; keeps kids engaged	1. Time-consuming
2. An inspiring tool that promotes learning	2. Confusing and intimidating in the beginning, especially for those starting from "scratch"!
3. A versatile tool for teaching anything, not just Scratch	3. Must coordinate sounds, movements, conversation bubbles to

	minimize overlaps and interference
4. Availability of tutorials, as well as sprite library for resources	4. Takes a few hours to a few days to learn and feel comfortable with the program
5. Ease of recording audio material	5. Even minor editing entails watching the entire presentation from the beginning, to coordinate timing and esthetics
6. A good tool for incorporating technology into the classroom	6. Hard to coordinate sounds, sprites, backgrounds, functions
7. Scratch 2.0 has tutorials for every one of its 10 steps posted on the website	7. Program lacks a conventional playback method; “snapping” feature was annoying
8. A useful program for teachers and students of all ages	8. Problems with costumes tabs that enlarge the characters; must restart the program to fix the problem – a waste of time
9. Can integrate any outside photo, figure, or drawing into the program	9. Can speech bubbles be automatically prevented from covering other characters’ features?
10. Availability of sample programs from the website and UTube to help with programming and ideas	10. A minor editing change in the program entails replaying the entire presentation from the beginning
11. Questions, concerns, problems not addressed by the Scratch website are Google-able.	11. Program’s tutorial voice sounded bored and boring. Can it be made to sound more enthusiastic?

Fall 2013 students’ suggestions and comments included the following:

- **Design a more interactive and thorough tutorial that comes with *Scratch*: use *Scratch* to teach *Scratch* for hands-on experience with the program.**
- **Design the program to reach older learners not previously exposed to technology; program must attract older learners too, who may not be as tech-savvy.**
- **Students must have pre planned and prepared scripts, dialogues, audio files, video files, sprites, and backgrounds written down before starting the programming, in order to coordinate the “fun” of learning programming, the teaching methodology of the lesson, the theories of Second Language Acquisition that apply, and the focus/content of the project.**

## 5. Conclusion

For students, the process of designing the *SCRATCH* project is not linear. Based on four years’ observation, the steps for many student teachers appear to be: a) Downloading Scratch (1.4 from 2010 to 2012; 2.0 for 2013); b) Tinkering with the program itself to figure out its basic mechanics; c) Looking at tutorials that come with the program itself for familiarization; d) Playing with, manipulating very simple programs; e) Planning, designing their personal project: audience, purpose, method, content, characters, layout, backgrounds: sounds, colors, plot (if applicable); f) Looking for possible tutorials and other sample programs from the Scratch website, YouTube, or Google that loosely match what students aim to do; g) Writing the program; h) Looking for sample programs again to see how their program matches the sample programs and to figure out how to make necessary modifications and corrections; i) editing, correcting, modifying, simplifying, adding on; j) going back and forth between (f), (g) (h) (i) (b,c,d,e may be included as well) as many times as possible; k) changing or scrapping the planned program if necessary and starting over again; l) running the program as many times as possible to test how well it runs; m) presenting the project at the University of Guam’s Annual Regional Language Arts Conference; n) running the program in class; o) making necessary changes based on teacher and classmate feedback before turning the project and its write-up; p) fitting the project into an actual lesson plan.

Applied Linguistics students at the University of Guam will continue using *SCRATCH* in their projects and will continue presenting them at the university’s annual language arts conference. The versatility and the timely upgrading of the program to make it more user-friendly for children and adults place it in the cutting edge of basic programming and teaching. *Scratch* is one of the tools that teachers can use to enhance and reinforce language learning as well as learning in the other content areas. Its simplicity is its strength because it makes the program accessible to those without any previous background in programming. Its “cartoon” characters make it (and therefore also the process of programming) less intimidating to children and adults alike.

However, among issues to be addressed are copyrighted materials. If teachers use Disney or Star Wars characters in their projects, for example, what do copyright laws require? What are the possible negative consequences if they were to post these projects online, for example? Do they have to invent their own characters instead of borrowing characters the audience is already familiar with, like Princess Leah, Hello Kitty, or Dora the Explorer?

## Abstract

Research has shown that more often than not beliefs rather than knowledge are major determinants in pedagogical decisions that teachers make in the classroom (Doudin, Pons, Martin & Lafortune, 2003). Self-perceptions appear to be strongly influenced by students' relationship with mathematical contents and students' perceptions about their own ability to master these contents. The importance of self-perceptions, beliefs and pre-conceptions in decision making leads to this question: does student teachers' self-perception of their mathematical competence influence their conceptions about mathematics teaching? To answer this question we compared the results obtained from two questionnaires administered to student teachers. The first questionnaire focused on conceptions about teaching mathematics while the second focused on self-perceptions in mathematics. This paper analyzes in the context of Boyer's Dialectical reconstruction of knowledge model (Boyer & Mailloux, 2012) the links between student teachers' conceptions about mathematics education and their perceptions of their own mathematical skills.

## Introduction

The self-concept emerges from various perceptions that the individual has of himself, but also in comparison with others, in a specific situation in a given environment (Ruel, 1987). In mathematics, the concept of self influences the perception of the student's skills in this discipline and can be positive or negative, realistic or unrealistic (Palascio, Lafortune, 2000). Several studies show that scientific knowledge, though often well assimilated, often has little effect on beliefs and assumptions; that students are strongly influenced by their relationship with a-priori mathematical content, concepts and beliefs gradually built on the teaching and learning of mathematics and that the development of skills in the teaching of mathematics in primary school requires a deconstruction of beliefs, ideas and perceptions.

We thought that Boyer's Reconstruction of knowledge model (Boyer 2001; Boyer, Mailloux 2006) implemented within the framework of the courses in mathematical didactic for primary education could influence the self-perception that students have of themselves in mathematics and therefore their skills in teaching mathematics in primary education.

Although our data show little change in students' perceptions towards mathematics, the analysis of mathematical journals suggests that interventions based on the model of the reconstruction of knowledge may have the potential to positively influence the perception students have of themselves in mathematics (Boyer, Mailloux, 2012). Self-perception would not be fixed once and for all but would evolve by our encounters and experiences.

The present study describes the evolution of student-teachers' conceptions of mathematics education and their self-perception in mathematics before and after the implementation of a teaching approach based on the dialectical reconstruction of knowledge model (Boyer, 2001). This study also determines if there is a relationship between students' self-perception in mathematics and their conception of mathematics education.

## Problematic

Future teachers registered in the primary education program show major difficulties in integrating their mathematical knowledge and their didactic knowledge in teaching mathematics (Wilkins and Brand, 2004; Morin, 2003; Cavey, 2002). Students are strongly influenced by their relationship with the a priori mathematical content, concepts and beliefs gradually built on the teaching and learning of mathematics (Holt-Raynolds, 1992, Goodman, 1988). It seems that over the years, they have built a rather negative perception of themselves in mathematics. Research shows that people with poor self-esteem rarely attend

E-mail address: jean-claude.boyer@uqo.ca

uncertain paths and engage in ways known. This protective attitude towards self-concept limits the opportunities for learning and self-actualization. (Viau, 1995). We thought that a training device for reconstruction of knowledge should positively influence the perception of students in mathematics, make themselves more competent (Boyer, Mailloux, 2012), influence their conception about mathematic teaching and subsequently their decision, their behavior and their choice of educational activities in the classroom.

Research shows links between self-perception in mathematic and conceptions on learning and teaching mathematics. Students’ motivation and learning are influenced by the personal qualities of teachers and by the classroom climate they create (Mailloux, 1987). Teachers' attitudes, beliefs and expectations regarding mathematics, teaching and learning, structure their planning, their decisions, their overall practice and, therefore, their effects. If the teacher sees mathematics as interesting, pleasant and useful, students are likely to develop more positive attitudes towards math. A teacher who develops confidence in its capabilities becomes more open and more inclined to question his practice (Gattuso, 1993).

### The reconstruction model of knowledge

The reconstruction model of knowledge, illustrated in Figure 1, consists of three steps: updating and clarifying the experiential knowledge; appropriation of theoretical instruments (scientific knowledge) to properly symbolize experiential knowledge and restructuring the perceptual field using these instruments.

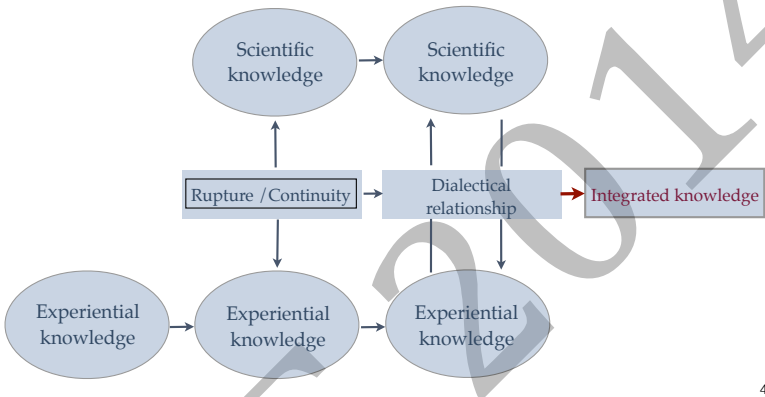

Fig. 1. The Dialectical Reconstruction of Knowledge Model (Boyer, 2001)

Figure 2 shows an alignment of the four principles used in the training to the three stages of the reconstruction model of knowledge.

These four principles are exploited in the training device: the training precedes the development and consequently, the learner starts with his own representations to learning situations of “co-constructions”. Therefore resolution of problems and group work are essential in training; mediation processes by the teacher or his peers are necessary to the extent that they are located in the proximal zone of development and that consciousness of its learning by metacognition is fundamental.

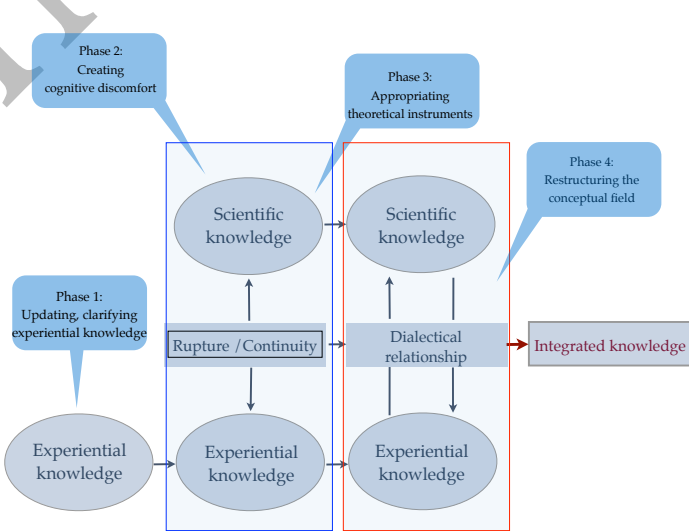

Fig. 2. Links between the four principles used in the training system and the reconstruction of knowledge model (Boyer, Mailloux 2012).

Subsequently, the students present and justify their processes and solutions. By participating in these discussions, students gain an awareness of increasingly sharp object learning. It is actually a form of assessment where they update the implications of "knowledge rebuilt" in the didactic action. The mathematical journal students must write allows them to list the most significant learnings and new knowledge and work on a reflective analysis.

## Research questions

Two research questions emerge. Does the implementation of the dialectical reconstruction of knowledge model and its teaching device influence students' self-perceptions in mathematics and their conception of mathematics education? Is there a link between students' self-perception in mathematics and their conception about mathematics education?

## Methodology

To answer this question, we administered two questionnaires to 48 first year student-teachers enrolled in primary school education; one on conceptions about mathematics teaching and learning and a questionnaire on self-perceptions in mathematics. The questionnaires were first administered at the beginning of the first trimester followed by the implementation of the teaching approach: learning and teaching activities; three weeks internship; more learning and teaching activities. The second administration of the questionnaires was done at the end of the second trimester.

To study the students' conceptions, they were asked to complete a questionnaire on their views about mathematics teaching (Gattuso, 1993). This is a questionnaire of 50 statements preceded by the statement "To teach math, the teacher must". The students were asked to choose up to ten statements that, according to them corresponded closely to their conception of mathematics teaching.

For the self-perception questionnaire, we used an Osgood type questionnaire (scale of 1 to 7) with 33 pairs of adjectives taken from texts written by students describing their attitude towards mathematics. Examples: neglecting / conscientious; lazy / worker; insouciant / applied. A score over 4 was considered as positive self-perception and a score less than 4, was considered as negative self-perception. To compile and review the results, we grouped the pairs of adjectives under five themes: methods of work, attitude, motivation, affect, and competence.

## Results

As shown in table 1 students seem to have a positive self-perception of their working methods but see themselves as rather passive while doing mathematics. Self-perception in mathematics is rather positive before and after the first methods course. This seems to confirm the pertinence of our problematic, namely that "perceptions of students towards learning and teaching are well established at the beginning of the teacher education program and that these perceptions seem particularly robust to change.

The pair of adjectives (statements) that gets the lowest score in each of the model's three steps is that concerning competitiveness. The guided social constructivist approach could explain this situation since cooperation is encouraged by the teaching approach.

Even if the students do not seem enthusiastic when it comes to mathematics they seem more motivated after the first course of mathematics education. They do not feel secure when it comes to mathematics; they perceive themselves as being overwhelmed.

Table 1. Self-perception of the students regarding their working methods

Statements	A	B
Neglecting/conscientious	5.23	6.23
Undisciplined/disciplined	5.62	6.08
Lazy/worker	5.69	6.08
Inconstant/perseverant	5.69	5.92
Passive/active	5.08	5.00
Cheater/honest	5.23	6.62
Straggler/assiduous (school work)	5.62	6.31
Disordered/ordered	5.69	5.92
Lax/perfectionist	5.69	5.77
Careless/applied	5.08	6.00
Competitive/non-competitive	5.23	4.77
Averages	5.57	5.58

After the first course in mathematics education students seem to think that they have good working methods, that they are more motivated and valued in mathematics. It seems that the reconstruction of their knowledge in mathematics undermines students' sense of competence even if they perceive themselves as having good working methods.

Table 2 shows student attitude towards mathematics. We can see that their attitude towards mathematics is rather positive but they perceive themselves as not participating much in mathematical activities and as being much less attentive after one course on teaching mathematics. These results are disturbing by the fact that active participation and attentiveness are strongly encouraged during classes. On the other hand they perceive themselves as being serious and "present" while doing mathematics.

Table 2: self-perception of the students' attitude towards mathematics

Statements	A	B
Absent/present	5.54	6.23
Distracted/attentive	5.08	5.15
Mute/participant	5.31	4.92
Non studious/studious	5.85	5.54
Light/serious	5.77	5.54
Averages	5.51	5.48

Table 3 shows that students do not seem enthusiastic when it comes to mathematics. Their interest in mathematics increases while their self-perception of being ambitious and encouraged in mathematics increases slightly. Except for the fact that they see themselves forced or compelled to do math, they maintain their motivation after one course of mathematics education.

Table 3: self-perception of the students' motivation towards mathematics

Statements	A	B
Disinterested/interested	4.77	5.46
Bored/interested	4.69	5.38
Disgusted/enthusiastic	4.23	4.85
Bound/free	5.31	4.77
Discouraged/encouraged	4.62	5.08
Unambitious/ambitious	5.62	5.69
Unmotivated/motivated	5.08	5.46
Averages	4.62	5.08

Table 4 shows that students do not feel very secured or able when it comes to mathematics. The teaching device does not seem to create an environment that increases the students' sense of "security" in mathematics. Students' perception of being valorised in mathematics increases while their perception of being revolted diminishes slightly.

Table 4: self-perception of the student's affect

Statements	A	B
Disgusted/attracted	4.62	4.69
Lost/able	5.00	4.85
Insecure/secure	4.31	4.23
Revolted/conformist	5.08	5.38
Devalorized/valorized	4.62	5.00
Defeatist/optimist	5.00	5.85
Averages	4.77	5.00

Table 5 shows that students do not perceive themselves very competent in mathematics and they see themselves less competent after one course in mathematics teaching. The results show an increase in the students' perception of competence after the first course.

Table 5: self-perception of the student's competence

Statements	A	B
« Dumb »/clever	4.38	4.69
Incapable/capable	5.46	5.54
Unsatisfied/satisfied	5.00	5.46
Saphead/bright	5.23	5.31
Averages	5.02	5.25

Table 6 shows self-perceptions averages for all items on the questionnaire before and after the implementation of the teaching device. The differences between A and B for all self-perception categories are not significant.

Table 6: self-perceptions, global results

	A	B
Averages	4.38	4.69

There is a small positive increase in the self-perception categories of motivation, competence, affect and attitude that could indicate a possible trend. There is no difference in self-perception of working habits.

As described above, the reconstruction of knowledge model involves a last step that consists in securing the experiential knowledge and scientific knowledge. It is important to avoid parallelism of the two types of knowledge. According to Boyer's model, experiential knowledge must integrate scientific knowledge to stimulate the construction of integrated knowledge and ensure a strong didactical expertise. In this paper, two types of data are briefly presented to illustrate the potential of the model to encourage this integration: statements that were chosen at least 20% more often after the first didactic course and statements that

have experienced the largest decrease in the percentage of students' choices before and after the first didactic course.

Table 7 presents the statements that were chosen by at least 20% more students before and after the first didactic course. The first three statements: "Encourage students to discuss, share mathematical ideas", "Present mathematics through real life situations" and "Let the students free to use the methods of their choice to solve a problem" have received an increase of 70.3% and 60% from respondents after the first course. The other four statements showed a significant increase in the percentage of choices. Students place more emphasis on discussions of ideas, the use of real life situations and placing students in discovery and exploration situations. They tend to be more intent on encouraging students to develop and use their own problem methods. They also seem to be more concerned by their future students understanding of mathematical objects.

Table 7: Conceptions evolution before and after the first course, positive deviations of more than 20%

Statements	Before	After
Encourage students to discuss, exchange ideas on mathematics	27.8	88.9
Present mathematics from real situations	44.4	72.2
Let the students free to use the methods of their choice to solve a problem	22.2	61.1
Provide students with the necessary resources and equipment	16.7	50.0
Place students in situations of exploration and discovery	44.4	72.2
Question students to verify their understanding.	33.3	55.6

Many statements were much likely to be ignored by students after the first didactic course. Table 8 shows the statements that have experienced the largest decrease in the percentage of students' choices before and after the first didactic course. The statement "Point out student's mistakes" is no longer selected after the first didactics course.

The results show that statements promoting a teaching style emphasizing directivity have been rejected at each stage of the research and that students pay little attention to these items throughout their training. We note that before the implementation of the dialectical reconstruction of knowledge model the selected statements are mostly those that highlight the qualities and skills of the teacher. Indeed, the experiential knowledge of student tends to emphasise dynamic presentations, the importance of giving clear explanations and the need for students to practice mathematical techniques.

Table 8: Conceptions evolution before and after the first course, negative deviations of more than 20%

Statements	Before	After
Point out student's mistakes	15.38	0
Build learning activities	33.3	16.7
Decide on the appropriate pedagogical approach to the course and student's learning profile	33.3	16.7
Use a textbook and supplementing it with enhanced activities	33.3	5.6
Provide demonstrations for students	33.3	16.7
Make student practice the techniques learned in class with appropriate exercises	38.9	11.1
Give explanations to students	38.9	11.1
Provide clear and precise teaching	38.9	11.1
Ensure that students master calculation techniques	22.2	5.6

After the course of mathematic teaching, students grant more importance to mathematics exchanges, the use of questioning to ensure understanding and the use of resources and manipulatives. This illustrates a break between experiential knowledge and scientific knowledge.

This decrease in the importance given to statements on a more traditional teaching approach seems to reflect the assimilation of scientific knowledge worked on during the first didactics course on mathematics learning and teaching. Students seem to live the passage from of a transmissive approach to teaching mathematics to a social constructivist approach.

The third and final stage of the reconstruction of knowledge model being a process of integration of experiential knowledge and scientific knowledge, students become aware of the reconstruction of knowledge that takes shape as scientific knowledge reshuffles experiential knowledge. Students then build explanations of the contents of initial intuitions, reformulate the questions

from a new angle and update the implications of this “rebuilt knowledge” through action learning. Students seem to gain a new perspective on mathematics, learning and teaching. The attitude is changed and the conceptions they have of teaching mathematics are transformed and clarified. The researchers observed this phenomenon towards the end of the first didactic course. Students’ conceptions about mathematic teaching seem to evolve during the first didactics course and the first teaching practice internship.

The preliminary analysis reveals a shift of attention from the role of the teacher to the role of the student, from a teacher centered point of view to a student centered point of view. Students seem to move from a lecture approach to a guided approach where the students actually do the math. The researchers also observed that the students tend to use problem situations in preparing lessons more often and that the problems become more articulated.

Although we have noticed a change in the conceptions of student teachers on mathematics teaching after the first didactics course, no relationships were found between self-perception in mathematics and the evolution of conceptions about mathematics teaching. It seems that self-perceptions in mathematics does not influence the development of mathematic learning and teaching conceptions during the implementation of the teaching device based on the reconstruction of learning model.

## Conclusion

The implementation of the teaching approach based on the reconstruction of knowledge model contributes in developing more complex beliefs about the teaching and learning of mathematics. It also contributes albeit modestly to positive changes in the perception that students have of themselves in mathematics.

The differences between the results before and after the implementation of the dialectical reconstruction of knowledge model for all self-perception categories are not significant. Nevertheless there is a small positive increase in the self-perception categories of motivation, competence, affect and attitude that could indicate a possible trend. There is no difference in self-perception of working habits.

The statements chosen for the conceptions on teaching are those that highlight the qualities and skills of the teacher (dynamic presentations, practice techniques, clear explanations) before the implementation of the dialectical reconstruction of knowledge model in the first didactics course. After the first course students seem to experience the passage from a transmissive approach to an increasingly socioconstructivist approach. The appropriation of theoretical instruments seems, at first glance, well established at the end of the first didactics course. The symbolization of the experiential knowledge by theoretical instruments will probably develop during the second didactic course.

No relationship was found between self-perception in mathematics and conceptions about mathematics teaching. It seems that self-perceptions in mathematics does not influence the development of mathematic learning and teaching conceptions during the implementation of the teaching device based on the reconstruction of learning model. This confirms that conceptions about mathematics teaching and self-perceptions of students towards mathematics are well established at the beginning of the training and that they seem particularly difficult to change.

# Students of social pedagogy and intergenerational solidarity

Jana Kitlinska\*

*Tomas Bata University in Zlin, Faculty of Humanities, 761 01 Zlin, Czech Republic*

---

## Abstract

The purpose of the article is to present the intergenerational solidarity as fundamental for the achievement of a society for all ages, a major prerequisite for social cohesion and a foundation of formal public welfare and informal care systems. A sample of research was included students who study Social Pedagogy (as holders of the specified values). For the comparison was used tool and selected results of the Flash Eurobarometer 269, titled "Intergenerational Solidarity".

## 1. Introduction to the issue of intergenerational solidarity

Intergenerational solidarity is a multidimensional phenomenon. "All societies exhibit intergenerational solidarity, as core element of intergenerational relationships, which bonds generations that share common interests, feelings of affections and affinity, reciprocity, mutual care, and protection (Cruz-Saco, Zelenev, 2011, p. 10)". The need for the reflection of this topic becomes even more crucial in a period of social changes associated with population ageing.

The rate of population ageing has greatly accelerated, and this will increase pressure on the society. There are a number of aspects which definitely belong to the field of intergenerational solidarity and to which social scientists might usefully contribute. Donati (In Malinvaud, ed., 2002, p. 57) commented that while many old issues (such as family poverty, multi-problem families, etc.) persist, a new scenario of difficulties has appeared: the ceaseless worsening of generational relation. He introduced issues such are: another form and roles of family, imbalance in the distribution of resources (to young people or to older people?), children and youth are increasingly isolated from the adults who constitute their principal socializing agents (the cultural transmission from one generation to the other is losing ground), and that social welfare systems have shown themselves as lacking a real orientation to the links between generations. While contract across generations and age groups represents the norms operating at the micro and macro levels of social structure in a given socio-historical context (Bengston, Oyama, 2007).

As a first politics response was during the 1970s led to the convening in 1982 of the first-ever World Assembly on Ageing in Vienna, Austria. European first relevant document was European Commission communication entitled Towards a society for all ages in 1999, expressively subtitled Promoting prosperity and intergenerational solidarity. This document was prepared for occasion of International Year of Older Persons, 1999: Activities and legacies (it was under the auspices of the United Nations). This document represented a step forward in the conceptual framework of a society for all, 2012 age. This vision is one that has been embraced around the world. The need to respond to the current and expected demographic changes resulted to Assembly of the United Nations in 2002 in Madrid. For example the Madrid International Plan of Action on Ageing (2002), states that solidarity between generations at all levels — in families, communities and nations — is fundamental for the achievement of a society for all ages, a major prerequisite for social cohesion and a foundation of formal public welfare and informal care systems (UN, 2013). Czech government followed the Madrid Plan and published a program of preparation for the aging population (Kitlinská, 2012). It was followed by a National Action Plan to support positive aging for the years 2013 to 2017. The latest national document in which deals with the issue of intergenerational solidarity is the Social Inclusion Strategy 2014 - 2020.

Intergenerational solidarity can therefore be seen as a social equaliser, in which each party exchanges with the other to obtain what they lack (Active aging report, 2011). All generations should be included in the debate and policy-making. Intergenerational solidarity can by solve in different policy frameworks. Various policy areas can help to provide an environment where the contribution of everyone could be valued and everyone could be empowered to play a part.

Current (demographic) evolution in developed countries is very challenging not only for the economic development, but also for their social system. And it raises the question of quality of life— both for senior citizens and for the younger generation who must bear the burden of an inverted age pyramid (Active aging report, 2011). The challenges are traditionally sketched out in two contrasting ways. According to European Union (2010): 1) there is a concern about the financial sustainability of public welfare systems, which are affected adversely by a rising share of older age population. 2) there is a importance of fiscal prudence in public spending, it is also considered imperative that European social welfare systems continue to provide adequate retirement incomes and sufficient basic social services, such as health and social care, in old age. (EU, 2010) Intergenerational solidarity is not a one-way relationship between the active young population and inactive older people (Active aging report, 2011).

To the above is needed a mechanism for supporting mutually beneficial exchanges, both monetary and non-monetary, between generations. These exchanges are too often seen as one way: younger workers paying taxes to support older workers' pension benefits and healthcare costs. But the exchanges, in fact, go in both directions. Forwards, towards younger generations, are investments in infrastructure, innovation and environmental protection. Backwards, to older generations, are pensions and public and family care for older people. The family and the government are the best institutions to ensure this intergenerational exchange works. (OECD, 2011)

Cruz-Saco and Zelenev (2011) says, that the relationship between intergenerational solidarity and social cohesiveness is one of a circular causality, as more solidarity results in more cohesiveness and vice versa, allowing conflicts and tensions to be minimized. So perhaps the simplest definition of intergenerational solidarity is "social cohesion between generations" (Bengston, Oyama, 2007). Intergenerational solidarity is widely understood as social cohesion between generations. Most frequently, however, it refers to relations between the younger and older generations of those living, including child-parent relationships, social participation of elderly people and children in communities, affordability of pensions and care of the elderly (UN, 2013).

It must be noted that the body of research relating to intergenerational approaches to community building and social cohesion outside the family is still limited Hatton-Yeo (In Sanchez, ed., 2007). Hatton-Yeo cited Pain, that existing work can be divided into 4 interconnected areas: a) issues of transfer and transmission between generations, b) a focus on personal relationships and the amount and nature and implications of contact between the generations, in most cases who are related, c) a smaller amount of work examining issues of personal identity, d) a burgeoning concern with the evaluation of intergenerational policy and practice.

Our research's objects are the opinions on extra-familial intergenerational relationship. Specifically, we are interested in the views of the young generation who are in preparation for the profession of social pedagogue.

## **2. Why social pedagogues?**

Young people are sometimes overlooked. However their contributions can be and are significant. Educational institutions and advocates of quality of life have an important role to play in connecting generations and providing opportunities for dialogue among generations. Especially young people who are prepared to qualified teaching staff in the field of social pedagogy in the field of education and social services.

Samples of research were included students who study Social Pedagogy (as holders of the specified values). Consequently, social pedagogues work within a range of different settings, from early years through adulthood to working with disadvantaged adult groups as well as older people. To define the subject of social pedagogy could be a very difficult task. Different countries have different cultures and social issues. Thus the view on social pedagogy differs from country to country. This discipline is based on the ideas of sociology, social work, pedagogy, philosophy and some other practical sciences. Social pedagogic theory builders draw upon social and educational perspectives, particularly, when these vistas enlighten each other (Paul, 2013, p. 3).

This paper deals with relatively new field of study of social pedagogy, which has begun to realize in the Czech Republic since mid-1990s. Social Pedagogy is an academic discipline concerned with the theory and practice of holistic education and care. Czech social pedagogues usually study at the university level (there is also possibility to study at the college where they will get a DiS. degree). The academics in Czech Republic separate Social Pedagogy from the social work and they look at them as at two separate disciplines. Social pedagogy can be studied in many places in the country. Tomas Bata University in Zlín (Czech Republic) offers social pedagogy as bachelor study programme (standard length of study is 3 years) and after finishing bachelor degree offers master programme (standard length of study is 2 years), newly doctoral programme. This field of the study is presented on web: Field of study subjects have an interdisciplinary character and are structured so that afflicted the basic problems that the social educator currently meets in society. Emphasis is placed on experiential learning, is practical activities of students in seminars and exercises. The acquired knowledge and skills students will develop and validate the practices in school and social organizations. Graduates after graduation are able to control the operation of school or social organizations to create educational and social projects, implement comprehensive educational and social activities, and to relevant educational and social research. ([www.utb.cz](http://www.utb.cz))

Paul (2013) distinguishes aim of activity in included areas: In social policy is crucial a labour market orientation for social integration. For social workers is important social disadvantage and exclusion orientation, with emphasis on support through self-help. And for social pedagogues is key developing the personal and palliating conflict boundaries by nurturing individual potential and achievement. From actor's perspective is empowerment of individuals in their setting (can be paternalistic and educationalist), preconceived notions of the good individual and the good society.

### 3. Methodology

The aim of the research was to identify and describe the opinions of students of study programme Social pedagogy in Zlín on selected aspects of intergenerational solidarity. With regard to the stated aim and the research problem, a quantitative research strategy, method and a technique of survey data collection were chosen. It was elected a quantitative approach to research. The objective of this methodology is to gather data on attitudes, opinions, impressions and beliefs of human subjects. Quantitative research is about asking people for their opinions in a structured way so that you can produce hard facts and statistics. The object of the collection of census data is to accurately describe basic information about a population at a particular point in time. The objective of this descriptive research is to map the terrain of a specific phenomenon - intergenerational solidarity. It is very difficult to measure intergenerational solidarity (OECD, 2011). It was used tool and selected results of the Flash Eurobarometer 269, titled "Intergenerational Solidarity" (European Commission, 2009). The Flash Eurobarometer 269 is useful in understanding intergenerational relationships and how different generations view each other. The Flash Eurobarometer Intergenerational solidarity (Flash No 269) was conducted in 2009 in order to examine EU citizens' opinions about: a) existing relations between the younger and older generations, b) costs of an ageing population – particularly in terms of pensions and elderly care, c) the need for pension and social security reforms, d) ways in which older people contribute to society – financially and in a broader way, e) existing possibilities for autonomous living for elderly EU citizens, f) the provision of elderly care and support by social services, g) the role of public authorities in promoting intergenerational solidarity. The results provide the current status of intergenerational solidarity across 27 EU countries; provide perceptions on this matter of about 27,000 Europeans across all EU Member States. The questionnaire prepared for this survey was translated in national language(s) for each country of survey. The form of the questionnaire for the Czech Republic (Country Specific Questionnaire Czech Republic) was used for our research. Our research presents here only the key results.

The first step in population sampling was identifying the population which the researcher wishes to learn more about. The population was defined in keeping with the objectives of the research. The target population was the entire group a researcher was interested in; the group about which the researcher wishes to draw conclusions: all students who study branch of study Social pedagogy at Tomas Bata University in Zlín, full time form of study. Method of sampling selection was intentional sampling. Intentional sampling methods are non-probabilistic procedures that select a group of individuals for a sample with the purpose of meeting specific prescribed criteria. Specific criteria for this research: branch of study (qualification and expertise in the field of social solidarity), full time form of study (age of respondent represent young generation). This research represents only students at Tomas Bata University in Zlín, because there are no data on the number of student of the branch of study social pedagogy in the Czech Republic.

The sampling consists of 219 respondents who were students of social pedagogy and one incomplete questionnaire was excluded. Age structure of the students varies from 19 to 28 years old. 214 of the students (98%) were younger or same aged 24 years old and 5 respondents (2%) were older than 24 years old. In Flash Eurobarometer 269 were included 3 871 respondents (14%) from 15 to 24 years old. If we compare gender structure of our sampling there were 195 women (89%) and 24 men (11%).

### 4. Results

#### 4.1 Relations between the different generations

More than 71% of the students of social pedagogy agree that *young people and older people do not easily agree on what is best for society* (16% strongly agree and 55,7% somewhat agree). Less than one third of the students disagree (somewhat disagree 16,9%, strongly disagree 7,8%). Compared to EU respondents of Flash Eurobarometer 269 - most strongly agree 28% and 41% somewhat agree.

Nearly 90% of the students disagreed that *older people are a burden on society* (63% strongly disagree, 26,9% somewhat disagree. No one strongly agreed and only 7,3% somewhat agreed. These are better results than in EU (85% disagree, 14% agree).

Slight majority of respondents agreed that *the media exaggerates the risk of a conflict between generations* (EU 61%). 6,8% of the students strongly agree and 46,6% somewhat agree. On the other hand more than one third disagree with this statement (5,5% strongly, 29,2% somewhat). About 12% were not able answer this question.

11% strongly agreed, and another 37,9% somewhat agreed that *because there will be higher numbers of older voters, political decision-makers will pay less attention to the needs of young people*. This is more than in Eurobarometer (14% strongly agreed, 29% somewhat agree). Majority of the students disagree (51%) but compared to EU, only 8,7% of the students strongly disagreed with this statement (EU 20%).

Important difference was found between Eurobarometer and the students in the statement *that older people work until a later age, fewer jobs will be available for younger people*. Similar proportion (26% EU, 27,4% the students) strongly agree, but 45,2% of the students somewhat agree compared to 30% of respondents of EU. 23,3% of the students of social pedagogy disagree (18,7% somewhat disagree, 4,6% strongly disagree).

Compared to EU (53%) are only 29,2% of the students persuaded *that older women are at a greater risk of falling into poverty than older men in their country* (5,5% strongly agree, 23,7% somewhat agree). About one third disagree (27,4% somewhat disagree, 5,5% strong disagree). 37,9% of our respondents had no opinion on the topic or did not know what to answer.

Only one in ten students agreed that *companies which mostly employ young people perform better than those that employ people of a different (older) age*. This is lower number compared to EU (25%). On the other hand more than 58% of the students disagreed (EU 70%). 42,5% of the students somewhat disagree and 16% strongly disagree. Significant number of the students did not respond (30%).

#### 4.2 Affordability of pensions and elderly care; the need for pension reforms

The students most frequently agreed that *in coming decades, governments will no longer be able to pay for pensions and care for older people* (31% strong agree, 45% somewhat agree). This is 76%, compared to 58% in EU. Approximately 3 in 10 respondents of EU disagreed, and only 1 in 10 students disagreed. 13,7% of the students had no opinion on the topic or did not know what to answer.

Over 71% of the students responded that *people in employment will be increasingly reluctant to pay taxes and social contributions to support older people*. Specifically 20,5% strong agree and 50,7% somewhat agree. Slight half of EU Eurobarometer's respondents agreed (52%). Significant difference is between respondents who disagreed (42% EU, 13,7% of the students). 12,3% of the students somewhat disagree and 1,7% strong disagree (16% EU). A certain percentage of the students did not respond (15,1%).

The total level of agreement for the statement that *government's expenditure on young people and on education is too little, in comparison with the amount spent on older people*, ranged from 46% in EU to 36,1% in our research (11% strong agree, 25,1% somewhat agree). Roughly the same difference is in disagreement (EU 43%, the students 32,5%). The disagreement of the students is split into 27,9% somewhat disagree and 5% strong disagree. Also significant part of the students (31,1%) did not answer.

Almost half of respondents in EU (48%) agree that *older people accept that major pension reforms are needed to the ease the burden on working-age people* but only 23,7% of student also agree (2,7% strong agree, 21% somewhat agree). Similar results are in the area of disagreement (39% EU, 43,8% the students). But once again considerable part of the students (32,4%) has no opinion on the topic or did not know what to answer.

Huge percentage of Eurobarometer's respondents (84%) said that *their country's government must make much more money available for pensions and care for the elderly*. Also 7 in 10 the students agreed with this statement (16,9% strong agreed, 52,1% somewhat agreed). Only 14% in EU and 18,3% of the students chose strong disagree (10% and 14,2% respectively) or somewhat disagree (4% and 4,1% respectively).

There is a consensus in the statement that *government should make it easier for older people to continue working beyond their normal retirement age (if they so desire)*. In the EU agree 66% and 60,7% of the students (13,7% strong agree, 47% somewhat agree). Nearly one third of the students (31,5%) disagree with this statement (19,6% somewhat disagree, 11,9% strong disagree). 7,8% of student did not respond.

#### 4.3 Autonomous living for the elderly, elderly care and support by social services

The level of agreement regarding the statement that *doctors, nurses and professional carers in the respondent's country are sufficiently well trained to care for the special needs of older people* was 64 % in EU (25% strongly agree, somewhat agree 38%) and 54,4% by the students (7,8% strongly agree, 46,6% somewhat agree). Similar figures are about disagreement (29% EU, 29, 7% the students) but the students rather somewhat disagree 25,1% than strongly disagree (4,6%).

About 25% EU Eurobarometer's respondents agree that *people who have a responsibility of care for older family members at home receive good support from social services* but only 1 in 10 of the students agree. The total level of disagreement reached 65% in the EU and 74,8% by the students. Almost 15% of the students did not respond.

The next question compared the responses about statement that *in our country there are sufficient social services to support frail older people so that they can stay in their own home*. Most than one third of EU respondents (35%) agree but only 22,3% of the students agree. Majority somewhat or strongly disagreed with the statement (59% EU, 68,5% of the students).

In sum 8 in 10 respondents expressed agreement than *many frail older people cannot live autonomously because their homes are not adapted to meet their needs*. Dates of the Eurobarometer shows 49% strongly agree and 35% somewhat agree. 24,2% of the students strongly agree and 57,5% somewhat agree. Only about 11% of all respondents disagreed with the statement (11% EU, 11,5% of the students).

The results for the statement that *older people would contribute much more to society if they could more easily move around* are significantly different. 78% of Eurobarometer's respondents somewhat (40%) or strongly (38%) agreed with this statement but less than half of the students agreed with this proposition (somewhat agree 36,5%, strongly agreed 6,4%). Over 37% of the students disagreed and 20% did not know what to answer.

#### 4.4 The role of public authorities in promoting intergenerational solidarity

There is an interesting overview if we compare agreeably answers to the question *if schools should promote better relations between young and old*. In total 89% of EU and 87,3% of the students agree but strongly agree (56% EU, 27,9% the students) and somewhat agree (33% EU, 59,4 the students). About 1 in 10 respondents disagree (EU 9%, the students 10%).

Only a tiny 3,2% of the students agree that *government does a good job in promoting a better understanding between young and old*. This is really a small number compared to 27% in EU. More than 79% of the participating students somewhat disagree (35% in EU) and 35,6% strongly disagree (29% in EU). About 17,4% of the students has no opinion on the topic or did

not know what to answer.

There is a wide agreement among the students (92%) that *local authorities should support associations and initiatives that foster stronger relations between young and older people*. Strongly agree 22,4% of the students (54% EU) and somewhat agree 60,7% (38% EU). About 12% of the students expressed disagreement (6% in EU).

## 5. Conclusion

At the beginning of this century, in many countries all over the world, families and children have come to face new dilemmas related to the lack of intergenerational solidarity and intergenerational equity (Donati In Malinvaud, ed., 2002, p. 55).

The paper deals with some aspects of intergenerational solidarity, which are most often mentioned with regard to social policy. The research part of the paper was focused on students of social pedagogy. This student represents young generation and also a potential objects and/or participants of social policy. The respondents of the sampling were students of social pedagogy at Thomas Bata University in Zlín. Although for data collection was used a questionnaire utilized in the international survey (Eurobarometer), we can not say, that there was measured the rate of intergenerational solidarity by target group. But some ideas about the statements can build elementary overview about perception of some aspects.

It can be noted that the students of social pedagogy expressed a certain level of solidarity but the solidarity was influenced by possible threat of different generation. The students felt that the state should be the most responsible player about intergeneration issue but about the actual realisation are sceptical. The student as a further social professional rather negatively assesses the preparedness of the system of social services in the field of intergenerational care. According to students schools and communities should have the greatest responsibility as a natural environment.

We should find a ways how to present the intergenerational themes to students, professionals and general public to realize that not only age distant generations could be mutually beneficial. After all intergenerational solidarity can be seen as a desirable value in itself: when generations have a positive view of one another or there is consensus between generations on the way forward (OECD, 2011).

The purpose of this paper is not to present an exhaustive inventory of the issue nor to list all interesting initiatives existing in this area, but to initiate discussions with all relevant actors. We believe that this paper should be the impulse that can wake interest about this theme.

## Abstract

Our contribution offers an insight into current results of successive qualitative studies. The first study conducted in 2012 is focusing on life strategies of Roma people in Slovakia, with educational strategies included. The next study conducted in 2014 is dedicated to Roma people's perception of personal crisis and strain situations. The results of this study have not been published yet. Approximately 50 interviews will be analyses in our contribution.

The qualitative study titled "Social support and satisfaction with social network perceived in Roma communities" is a part of the research project supported by VEGA: No. 1/0206/13 (Scientific Grant Agency of the Ministry of Education, Science, Research and Sport of the Slovak Republic).

## 1.Introduction

Poverty is a serious social problem and it has its own individual form. It has a great influence on decision-making, deprives the person of his freedom and possibilities, it has a serious impact on his present, future, goals and overall success. Sen (1983) defines poverty as a deprivation of capability which is based on indicators for the freedom of individuals to live a life that would be of value. We can include health, nutrition and education to the basic needs (Nussbaum 2000, Alkire 1998, Desai 1995). The concept of social exclusion offers a broader understanding of social deprivation and mechanisms, which lead to it and at the same time prevent any counteraction. Many authors are trying to define this concept (e.g. Abrahamson, 1995, Atkinson, 1998, 2000, Berghman, 1995, Mareš, 2000, Džambazovič, 2004 and others). They agree on the fact that social exclusion is the result of unequal access of individuals or groups of the population to basic resources of society, it also means the denial of possibilities to participate in society and this is reflected in a number of dimensions, which can be identified and characterized in specific geographical areas.

Despite extensive quantitative research of social deprivation and living conditions, we know relatively little about its subjective perception, definition and management. We know even less about some parts of the population, which are less accessible for researchers – for example homeless people, people who come from orphanages, Roma who live in socially excluded communities. How do these people perceive their own life situation? What causes their discontent? What worries them? What makes them happy? What is important for them?

The so-called subjective concepts of poverty are based on the reflection of one's own life situation and experience. There are many methods and indicators based on subjective testimony of respondents – from a simple question to complex mathematical indicators, which determine the subjective perception of poverty (Džambazovič, 2004, p. 12). Their basis consists of subjective statements, past experiences, expectations, emotions and opinions of respondents (Mareš, 1999).

The authors of this paper were also interested in the subjective Evaluation of their situation by people, who are considered to be socially deprived according to objective indicators. They focused on a particular ethnic group of the Roma, which is (not only) in Slovakia, considered to be one of the poorest.

### 1.1. Roma in Slovakia

The Roma have been living in Europe since the middle ages and the earliest mention in the territory of Slovakia is from the year 1322.

They are among the most numerous ethnic minorities and their status is officially recognised as a national minority. Approximately 403 thousand Roma live currently in Slovakia (Atlas rómskych komunit na Slovensku, 2013) dispersed in different types of communities.

Table 1. Typology of Roma communities in Slovakia.

Typology of Roma communities	Brief characterization
Living dispersed among the majority population	46,5 % Roma from the whole Roma population. Their living conditions are diverse, but they share most similarities with the majority population.
Levels in municipal and urban areas	Urban units inhabited primarily by Roma located mainly within a municipality (e.g. streets, neighborhoods, etc.). 12.9% of the total Roma population in Slovakia live here.
On the periphery of municipal areas ( villages, towns)	Urban units located on periphery of villages and towns (with no spatial separation from areas inhabited by the majority of the population). 23.8% of the total Roma population in Slovakia.
Remote locations (segregated)	Often several miles away from the "parent" municipality, or separated by a natural or artificial barrier (e.g. river, railway). The poorest and highest-risk conditions. 17.0% of all Roma in Slovakia live in segregated communities (68 540 people).

Source: Atlas rómskych komunit na Slovensku, 2013

### 1.2. Social deprivation of Roma

Although this statement cannot be generalised, it is true, that a high percentage of Roma live in poorer conditions than the majority population. The majority of authors agree, that Roma are in a worse situation, than any other population group in Slovakia. Absolute poverty is typical for some residents of poor excluded Roma settlements and it is transferred intergenerationally and is connected to social exclusion (including spatial segregation) and living in appalling conditions. Poverty is generally considered to be a crisis situation. Life in a segregated and socially weak community means, among other things, very limited contact with the "outside" world. The findings of several studies (e.g.. Radičová 2001, Rusnáková 2009) suggests that the residents of such communities do not compare their life situation with anyone outside of the community and their definition of poverty and wealth is reflected only from the local point of view. Poverty is associated with absolute deprivation (absence of food, absence housing) and from this, their own assessment of their situation unfolds. *"I am satisfied, if only my roof didn't have a leak. Some people here have it worse."* Said one respondent, who lives in an overcrowded shack by the woods.

## 2. Subjective evaluation of one's own life situation (qualitative research)

The authors of the paper were interested whether the inhabitants of the socially deprived Roma communities consider their conditions adverse and how they define poverty. How would who is born and lives only in an environment of absolute poverty coupled with the social exclusion and segregation interpret his situation? What does he consider to be a burden and a crisis? Does the type of a community and its rate of segregation affect the subjective definition of a crisis?

We tried to get answers to the previous questions through the means of qualitative interviews within the project VEGA 1/0206/13. We approached 50 residents of all types of Roma communities (as indicated in table Roma communities) in two regional districts of the Slovak Republic. The research was carried out at the beginning of 2014, and its results have not been published anywhere yet.

## 2.1. Briefly on the results

The majority of respondents is quite satisfied with their life, regardless of the community and the conditions therein. Satisfaction was expressed even by those respondents who live in overcrowded dwellings, without basic essentials (connection to water, bathrooms, furniture, etc.). Most commonly they are unhappy with housing (quality, size, location and essentials) and the regular absence of cash (there are periods when they don't even have money for basic food). Such situations are considered to be annoying, but they are not "insurmountable problems" – they always somehow manage to survive, "somehow solve it." They realize that they are living scantily, but they can handle it, and somehow they manage to survive. Respondents who live in the vicinity of the majority of the population were more critical. Even though they live in relatively better conditions. Employed Roma expressed greater dissatisfaction with their lives – who, despite all their efforts have to fight deprivation and debts. Even so they enjoy and value their jobs and they have a desire to keep them.

An explanation could be a "learned" modesty. Most of the Roma are living in the same place for long periods of time, their life does not undergo any major changes (and they do not expect them) and so they had "time" to adapt to these conditions, which were considered unmanageable by most interviewers.

Only part of the respondents addressed the issues associated with poverty or poor living conditions when asked about their troubles. Several respondents reacted to a more specific question from the interviewer (e.g. Are you worried about the way you live?) Nevertheless, a large proportion of respondents experience the situation, in which they don't have anything to eat on a regular basis. In such a case, they use the option of debt (to relatives and acquaintances or non-banking institutions) they purchase food in local stores on "debt", the cook from what they have left in their reserves. Several respondents said that they have nothing left but to "starve". Some have mentioned the problems associated with the dwelling (heating, lack of drinking water or electricity).

Why haven't all Respondents identified their living conditions as adverse? One of the possible reasons was offered by Jaro (Roma activist living among non-Roma). "They live in poverty throughout their lives and know nothing else. These generations no more have experience with employment and those, which had, slowly die out. They actually got used to it and know nothing else."

They mentioned stressful situations such as:

- Situations associated with diseases, injuries, and associated complications (surgery, hospitalization)
- The death of family members or other loved ones
- Troubles with children (e.g., truancy, poor discipline)
- Conflicts within the family and in the neighbourhoods
- One respondent mentioned a particular situation linked to "modern slavery". Her partner was the victim of a scam and had to work for free abroad, received beatings and was denied freedom. After some time he fled (without any personal documents and without any money) and returned home.

What makes them most happy is having children (their own children, grandchildren and children of relatives). But also a family (other family members, joyous events, etc.). Own health and also health of other family members was of great importance to the respondents. Good health is considered a positive trait. Conversely, negative situations are often associated with diseases and injuries. They compare their situation with families in the neighborhood – hence their assessment is affected by the quality of life in the community. The segregated a community is, the more limited knowledge of standards beyond the community they have. Each respondent knows someone who "is doing even worse". *"We are not poor or rich."* is a typical sentence. Even Roma living among the majority are not willing to compare their conditions with non-Roma neighbours. Non-Roma have work, have it easier in life (access to the labour market, education, heritage from their ancestors, contacts and acquaintances, etc.) and thus, cannot be compared with them. *"Our parents came from the colonies, had nothing, had to start from scratch. They (non-Roma) inherited houses, money, fields, and forests. They could afford to go to school, and didn't have to worry about anyone but themselves..."*

They see their future as uncertain and unclear. *"I prefer not to think about the future."* They want to have a better life, but often, they do not know what and how they could change. It would be good to have a job and to have enough to live and have a better housing. Some would like to move out of poor areas. However they do not expect any major changes in their lives for the future. Many respondents expressed a clear helplessness. The more active Roma, who have a job – but they are disappointed that they did not have the resources to have "a better life" for example in the form of being able to move out, from the community to a better environment, the elimination of debts, improved housing.

The lack of planning for the future and adapting to changes in life, which would counter their poverty and the presence of strategies aimed at the survival "here and now" may be regarded as essential (and to some extent even rational) as a consequence of poverty. Scant opportunities to actively induce changes do not give a lot of space for future planning. Surviving „day by day" is one of the characteristics of poor and socially excluded communities.

Table 2. Quotes from interviews.

---

"The hardest thing is when you don't have anything to give the children to eat, you spend everything, and you don't have nothing to put in their mouth." (Jozef, a segregated Community)

"We live modestly, just like everyone else. I would like to work somewhere, but I can't, so I do not know how to change the situation, so we could live a better life..." (Jano, community on the outskirts of the village)

"Maybe some clothes, if it were better, it would look better. We always have to wear the same old clothes, which were given to us by others, and so on". (Jano, community on the outskirts of the village)

"Some people have it even worse. We always have enough to eat. And when we don't have money, we go buy things on debt or we borrow money from someone. We are not poor because if we were, we would not have anything to eat." (Mária, living among the non-Roma)

"I am among the poorest of our village. I work, but even so, it is not enough. Often we do not have basic supplies." (Denisa, living among the non-Roma)

---

### 3. Education as one of the strategies to counteract poverty

Education is generally considered as an effective resource which can be used to improve one's way of living. For example Burawoy (2000) allocates education as a skill in his system theory of assets. A well-known fact is that socio-economic background of the family has a substantial impact on success in school and at the same time on educational aspirations. The lack of opportunities in the present and weak prospects for the future affect goals related to education. Education as a strategy is mainly utilized by families, which already are educated. Poor families anticipate that education will bring them an improvement of the quality of their lives (Rochovská 2011).

The level of educational attainment among the Roma is significantly lower than that of majority population and the lack of vocational training and qualifications is referred to as one of the primary reasons for their poor implementation on the labour market (and of all the consequences of unemployment and low income).

How do poor Roma perceive education and what importance do they attribute to it? Do they see education as an opportunity for positive change? The authors of this paper are also focused on these questions in one of the presented qualitative research projects (research project VEGA 1/0596/10 Life strategies of residents in poor and socially excluded Roma communities).

#### 3.1. Briefly on the results

Part of the Roma does not have a clear stance to the significance of education. On one hand, they recognize that, it is important for the labour market (*"they won't give you a job anywhere without school now days"*). On the other hand, not even education beats the obstacles they encounter. Society has prejudices against the Roma (as well as employers), there is a high unemployment rate, the lack of contact with people, who could grant them access to jobs. However, when asked about the education of their children, their answers show similarity: education is important, it can be a means to get the job, those who are educated know how to better establish themselves in society, has a better relationship with the majority (e.g. offices, at work ...).

There is some inconsistency on the subject of what school the Roma should choose for their children. Parents often make decisions on further studies of their children on the basis of distance of the school and costs of the study (they refuse expensive scopes, where students need expensive equipment).

The following text illustrates the diversity of their views on the focus and the level of education for Roma.

- Branch of studies with highest demand on the labor market.
- School has no sense for Roma – even with it, they will not get established into the labor market and they will never be accepted by the majority.
- Spatially least remote schools (because of traveling costs).
- Financially least demanding branches of study (where they do not need to buy expensive tools).
- Any education is good. Always better than without it.
- Craft unions (best suited for Roma).
- The higher the education, the better.
- Roma need people with higher education.

### 4. Conclusion

Action against poverty and social exclusion is one of the main goals for the European Union and at the same time, is a struggle for human dignity. Research has a great significance here. It helps understanding the reasons and consequence of poverty, understanding the current situation and the effect of social programs. This research should also be the first step to which others will follow, focused on practical and systematic help to the poor. Ondrejkoš wrote: "...poverty includes the categorical

imperative and we can not be satisfied by mere description, analysis of the causes and consequences of, or an explanation the form of fate or personal fault." (Ondrejko, 2006, p. 10).

Respondents do not see a lot of possibilities for positive change in their lives. In many of the interviews "helplessness" and resignation was present. They don't have enough resources and opportunities emerging from poverty. Adaptation to environmental conditions appears to be rational, as an "emergency" strategy. On the other hand, however, this strategy is an obstacle to the establishment of a positive change. Limit external conditions impact subjective perception and bring, among other things, a lack of initiative from people with social disadvantages. Approaches, which are focused on activation of poor communities are embedded in social sciences. We also know approaches which emphasise the need for reforming the society which puts some groups in a disadvantageous situation.

The process of change has to be a result of a complex approach and a sincere interest in helping the poor. Education can be a good choice to avert poverty – if it will become a part of complex and systematic changes. The respondents themselves consider it as one of the favourable strategies but even this is limited by deficiency (primarily financial).

## Abstract

This theoretical paper discusses changes on teacher's subjectivity based on two Freudian's concepts: sublimation and psychoneurosis. It aims to identify how the subjectivity of teachers working at the Amazonia's universities are being modified due to the new educational policies' demands, which state new tasks to their everyday life in addition to older duties. With this new configuration teachers experience conflicts between the levels of satisfaction aimed and obtained with their labor. Instead of sublimation, psychoneurosis can take place. Possible solutions regarding this issue were discussed by Theodor Adorno when he states what should be considered as a human possibility, on the same path as Freud announced in his book "Civilization and its discontents" (1929).

## 1.Introduction.

The human's condition as a rational being that has consciousness makes it possible to their history development. The activities human beings develop, in an attempt to assure survival, change along the time and improve not only the reality but also themselves. Besides the actions humans perform, they establish relationships among them in order to satisfy material and immaterial needs. These needs seem to have two principal origins: pleasure or necessity.

Despite of the fact that work belongs to the necessity sphere to guarantee survival it can be associated with pleasure once such energy is canalized to it. And in truth, it occurs. Freud (1929) classified this as an important psychological mechanism because it allows us to reach out the highest social and cultural aims. The mental labor such as teach may require this pattern of organization. We apply a *quantum* of happiness to whatever we consider necessity. It becomes possible as an alternative from the impossibility of living for pleasure exclusively.

Following this path, objectivity and subjectivity are both constituent and constituted by men. Their activity changes the external and inner nature, displaying in them an identity by which they recognize themselves while they are also recognized in the same way. Humans are materialized upon their actions. As social and historical beings, they are able to determine the ways to follow. The question then would be, does it occur?

This discussion will arise two contradictory points of view. The first of them has to do with, the assumption that individuals' freedom of choice exists, allowing them to drive pleasure in direction to non sexual *objects* or targets. In this case, sublimation takes place, as it is the means by how the libidinal energy is applied to or guided towards cultural activities, allowing men to contribute in the valorization of several social objects. This condition seems to be restricted to the subjectivity field.

According to Freud (1929):

"Another method of guarding against pain is by using the libido-displacements that our mental equipment allows of, by which it gains so greatly in flexibility. The task is then one of transferring the instinctual aims into such directions that **they cannot be frustrated by the outer world**. Sublimation of the instincts works as an aid in this. Its success is greatest when a man knows how to strengthen sufficiently his capacity for obtaining pleasure from mental and intellectual work. **Fate has little power against him then.**" (Freud, 1929:9 <http://www2.winchester.ac.uk/edstudies/courses/level%20two%20sem%20two/Freud-Civil-Disc.pdf>, 06.05.2014) (**Our marks**)

---

\* Corresponding author. Tel.:351 226 079 700; fax: 351 226 079 725

E-mail address: rosimeguins@fpce.up.pt

The second point regards the situation in which this possibility is not present and the individual has to suppress libido displacement. The 'sexual' content is repressed or forgotten causing *trauma*. Such renunciation may product serious disturbances and suffering should takes place.

Freud pointed some difficulties to sublimation occurrence:

"The weak point of this method, however, is that it is not generally applicable; it is only available to a few. It presupposes special gifts and dispositions which are not very commonly found. **And even to these few ones who have it, it does not assure complete protection against suffering**; it gives invulnerable armour against the arrows of fate, and it usually fails when a man's own body becomes a source of suffering to him." (*idem*) (**our marks**)

The objectivity cannot be dissolved or suppressed. It exists and deals with the subjectivity. One may ask if we have this freedom of choice. In an affirmative case, does the option for cultural and social aims assure they will be reached? If not, what consequences should result from the happiness renunciation in favor to collective goods that do not take place?

This is what we intend to discuss. Our major interest consists on a comprehension of the psychological experience teachers have in consequence of the changes that take place at their work. Various studies are conducted considering many factors involved with the adoption of the new Brazilians' policies applied to higher education. Sguissardi and Silva Junior discuss some of these impacts like the reduction of educational finances (2006), the intensification of the teachers' routine of the work even causing teachers' disease (2009).

The theoretical basis was selected considering Freud and Adorno contributions to the critique of culture. The authors' effort to elaborate a comprehensive theory of the impact that took place in Europe under a deep transformation process is taken with the intention to find possible arguments to clear up some aspects of this present question.

To give evidence for the relevance of Adorno's think today, Pucci points that only dialectic thought may catch the inner phenomena contradictions which reproduce in the microcosm the social totality dynamic. Such possibility implies not only interpretation of the reality but the necessary transformation of the real. In Adorno's words: "it is superfluous to search a pragmatic conception in which praxis and theory run into each other as it occurs in dialectic"(Adorno,1931:129. <http://pt.scribd.com/doc/138023188/Adorno-The-Actuality-of-Philosophy> 26.05.2014).

## 2. Teacher's work and its dimensions

Only technical reasons are considered in order to separate these unified aspects. Subjectivity and objectivity are intrinsically mixed, as we will see. In the educational area it is imperative to take both of them into account. The concrete conditions need to be faced by those ones considered personal.

Teachers have a singular condition while compared with other professionals. They have to maintain proximity from their students, in order to know them - their capacity, difficulties-, and at the same time, they need to keep a certain distance to avoid bias toward someone.

The products of their work have two dimensions: direct and indirect results. The knowledge transfer and the learner pose these dimensions as obligations. When the learner (subject) is in contact with the knowledge (object), it is expected the occurrence of some changes. These processes can be observed and measured more objectively. However, there are changes that take time to occur. In such a case, we can consider that the learner is transformed into an object, as the teacher's actions (subject) affect them.

These two dimensions constitute the goal of teacher's work but the education is supposed to be more important than the information that feeds this formation process. Indeed, no one should be left apart, it could be thought as a continuum. The quality present in the first dimension has an impact on the second. In fact, the practice of teaching is based on this assumption.

More recently, we are experiencing changes in the educational area in many countries, including Brazil. In order to adapt to the new demands of democratization in this field, the number of universities admissions increased enormously. This fact is very positive and needs the adoption of important actions in order to promote education with quality.

## 2.1. Objectivity's aspects.

Unfortunately, we can observe some difficulties in this process of expanding the educational system. One of them refers to the lack of teachers required to attend the increasing number of the students that reach the universities. There is an insufficient quantity of teachers to face the great demand of students. For this reason, classrooms are overloaded. The consequences are negatives for both teaching and learning.

The illustration of this situation can be shown clearer by numbers. The Federal University of Rio de Janeiro, one of Brazil's greatest universities had in 2012, 51,500 students ([www.ufrj.br/docs/lai/ufrjemnumeros.2012.pdf](http://www.ufrj.br/docs/lai/ufrjemnumeros.2012.pdf), 08.05.2014), while there were 4,600 teachers only (<http://odia.ig.com.br/noticia/educacao/2013-05-07/ufrj-perdeu-456-docentes-em-quatro-anos.html>, 08.05.2014).

On the other hand, at the Amazonian Region, The Federal University of Pará registered 46,207 students as we can see in the Tables 1 and 2, but only 2.310 teachers, as Table 3 shows. ([www.ufpaemnumeros.ufpa.br](http://www.ufpaemnumeros.ufpa.br), 08.05.2014).

Table 1 – Number of undergraduate students by place in 2012.

The example we decided to select involves two institutions placed in different regions. Our purpose is to show that these represent extreme situations, separated not only by physical distances, but also by several peculiar conditions, although they are required to achieve the same results. Beyond the numbers, there are conditions that must be considered as significant differences.

With the adoption of universal criteria teachers are submitted to standard evaluations which results determine various contingences: stay or leave a post graduation program, promote higher steps in career or retain the actual education. For the last case, it is necessary to mention that the higher the level, the higher the salary earned.

Beyond ranking, this process increases the volume of tasks teachers have to assume. Regular classes, guidance of students and research were the trivial procedures. To write books was a practice, not an obligation. Now, everyone is asked to write papers and publish them in an indexed scientific periodic journal or magazine. These products are better evaluated than books in a procedure for which the quantity is considered instead of quality once again.

The attendance of graduation and post graduation levels also creates the necessity to lead all students to conclude their courses. The entrance of new students depends on the number of those that reach the end and earn a degree. Financial resources given to the institution from the government are basically conditioned by the same results. Teachers feel the responsibility on their shoulders.

To accomplish all of these duties much more time has been necessary. Actually, it seems that work has taken the entire life. The technological advances help to dissipate the limits of space and time therefore, they do not exist anymore. As a consequence, teachers have a real feeling that private life was taken abate for the public one.

Work was intensified in a real and virtual space, intensifying the time spent within it. And the major consequence that the intensification of work brings is the feeling that it is endless. At the same time intensification of work takes place, it increases the feeling that nothing has been done. There is always something else to be done.

Facing such situation, it is not difficult for us to anticipate some effects.

## *2.2. Subjectivity's aspects.*

It is already said that to be responsible for an individual education should be considered the most important task teachers have. Education implies changes and the knowledge enables transformations in both teachers and students. As teachers transform students, they are transformed too, once they transfer part of themselves to their learners.

However, this kind of procedure cannot be directly measured or observed in a short time. As teachers mediate the process that can be considered endless, they need to develop immediate activities to assure they can contribute for a future and better condition.

The quality required to develop their work is the principal condition to promote better education. If the number of students is doubled in each classroom while more activities are added to the previous ones, the quality of teachers' work tends to decline.

When the secondary tasks acquire status of being "fundamental" the problem increases. Previously, classes and dealing with students took the major attention of teachers. They were required to prepare their 'pupils' to produce a final paper at the end of their courses (an action called orientation in Brazil), usually a monographic work to conclude graduation or either a dissertation and thesis to obtain a master's or PhD's degree, respectively. All these tasks were measured by the same scale of value. Now, only classes are effectively considered to fill the schedule of demands. It does not matter how many students are being under orientation, teachers have to attend a minimum number of classes to get their activities approved in the evaluation instances. Here again, we observe that teaching is considered more important than supervising final assignments.

The evaluation's instances are externals to the universities. In Brazil there are two institutions which carry out the evaluation procedures: the Coordination of Research in Higher Education (CAPES), and the National Council on Research (CNPq). They are responsible for the establishment of criteria and rules to be adopted in all of the Brazilian institutions of higher education. The universities' autonomy disappears and heteronomy takes place.

In a country with continental dimensions and contrasts, the pattern measures seem to be unfair. As a consequence, a great number of teachers do not obtain success in accomplishing what is expected for them. Pressure, anxiety, delusion and frustration are feelings related to this condition.

Sublimation is no longer possible. The individual submitted to a very stressing life fails to displace pleasure towards the action that only produces suffering.

"The complicated structure of our mental apparatus admits, however, of a whole series of other kinds of influence. The gratification of instincts is happiness, but when the outer world lets us starve, refuses us satisfaction of our needs, they become the cause of very great suffering. So the hope is born that by influencing these impulses one may escape some measure of suffering. This type of defense against pain no longer relates to the sensory apparatus; it seeks to control the internal sources of our needs themselves." (FREUD, 1929: 9.

<http://www2.winchester.ac.uk/edstudies/courses/level%20two%20sem%20two/Freud-Civil-disc.pdf> ,)

Even the submission to such demands in order to attend the expectation of evaluation agencies does not guarantee a satisfactory condition. The reason is that each time a higher level of demands occurs, it stimulates competition, individualism and isolation. In extreme case, it may produce narcissism if the ego is submitted to high levels of demands that can produce a greatest repression carried by psychoneurosis, specially the narcissistic type.

According to Freud: "A strong egoism is a protection against falling ill, but in that last resort we must begin to love in order not to fall ill, and we are bound to fall ill if, in consequence of frustration, we are not able to love". (1914: 85.) Since the external work becomes a threat to the individual happiness, the exit is to find pleasure in internal activities.

Teachers acknowledge that behavior patterns changed. The students' failure means the teachers' failure. For this reason, the educational democratization to approve students is stimulated. It does not indicate that teachers are pleased with themselves. The capacity present on them to evaluate their actions and the results makes teachers feel dissatisfied with their work. The insufficient rewards obtained from the students' education lead teachers to concentrate their efforts in direction of tasks that can provide better consequences.

It involves over-evaluation of activities that were considered means to reach their aim. To publish papers, guide a great number of students, coordinate or integrate groups of research are the substitute's goals. Probably this short time goals earned value over the personal ones while only they can guarantee immediate reward for their efforts.

Each of those activities is correspondent to a number in a quantitative scale of evaluation. The highest the mark obtained, it makes teacher stand out in the intellectual scene. The numbers are the external reinforcements that assure distinction and proud as intrinsic values.

Cooperation has no place in this work environment because hierarchy does not accept it definitely. Then narcissism has the favorable conditions to be established. It works as a barrier to external causes of suffering. Freud contributes to understand the limits of this procedure:

"...and this seems most important of all, it is impossible to ignore the extent to which civilization is built up on renunciation of instinctual gratifications, the degree to which the existence of civilization presupposes the non-gratification (suppression, repression, or something else?) of powerful instinctual urgencies. This cultural privation dominates the whole field of social relations between human beings; we know already that it is the cause of the antagonism against which all civilization has to fight. It sets hard tasks for our scientific work, too; we have a great deal to explain here. It is not easy to understand how it can become possible to withhold satisfaction from an instinct. Nor is it by any means without risk to do so; if the deprivation is not made good economically, one may be certain of producing serious disorders". (FREUD, 1929, p.18. <http://www2.winchester.ac.uk/edstudies/courses/level%20two%20sem%20two/Freud-Civil-Disc.pdf>, 10.05.2014)

We can imagine a battle between the individual and the culture, in spite of this latter one being considered a human production itself. The power of culture submits the individuals and it is hard for them to get freedom from it. The possibility of this condition is taken from the proper individual. The sexual energy, libido, is the drive that feeds on communal life with the intention to maintain its members jointed on a libidinal relationship, using all the ways available.

Obviously, a similar mechanism is required to repress aggressive instinct. In this way, the superego assumes the interdiction function, and through the ego-ideal supervises the ego aspirations. Ego-ideal is an "...agency of the personality resulting from the together narcissism (idealization of the ego) and identification with the parents, with their substitutes, or the collective ideals. As a distinctive agency, the ego-ideal constitutes a model to which the subject attempts to conform". (Laplanche & Pontallis, 1973:144. The Language of Psycho-analysis, Karmac books, 1973, <http://books.google.es/books?hl=ptPT&id=DCpokE8C2WgC&q=Ego+ideal#v=snippet&q=Ego%20ideal&f=false>, 13.05.2014)

Freudian Psycho-analysis is an important apparatus to evidence how, from its origin to now, the civilization process is set in a domination model which limit, if not repress, the search of any alternative to oppose it. Even though Freud's principal interest was a scientific one, to develop a mental disturbs' theory, it is possible to see behind this a-history position an hesitation, but it also reveals the history, social and political bases in which individuals are conformed in the society.

Adorno returns to Freud's concepts to develop his Culture Industry Theory. The author calls attention to the propaganda of freedom hidden in "the industrial procedure in which the selfsame is reproduced through time – the very allegory of high capitalism which demonstrate its dominating character even when it appropriates its necessity as the freedom of play". (Adorno, 1991:61, 1 <http://www.public.iastate.edu/~carlos/607/readings/adorno.pdf>, 11.05.2014).

As rational beings we need to exercise self-reflection to raise our awareness of this condition.

"For intellectuals, unswerving isolation is the only form in which they can vouchsafe a measure of solidarity. All of the playing along, all of the humanity of interaction and participation is the mere mask of the tacit acceptance of inhumanity. One should be united with the suffering of human beings: the smallest step to their joys is one towards the hardening of suffering." (ADORNO, 1944. Part 1. Aphorism 5, <http://www.marxists.org/reference/archive/adorno/1951/mm/ch01.htm>, 13.05.2014)

### 3. Brief considerations.

A demand of adaptation to such difficult conditions is an attempt to deny the conflicts existing between the work aim and the work results. Considered as a general evil, the current process is only out for the immediate identification of the individuals with the social institution models that had appropriated their forms of behavior along the way.

Sublimation is substituted to obtain some pleasure which the majority, identified with its weakness, attaches to a particular, as a sample of the majority, an impression of belonging to such collective. At the same time, this effect allows the transfers of collective power and greatness to the individuals. Such identification proceeded from exterior and for this reason processed out of the individual dynamic, abolishing the awareness of the genuine emotion, the proper impulse that must be presented.

As the culture industry denies for individuals the possibilities of pleasure and satisfaction, it increases the abandoned and helpless experience and forces false identification with the social totality that only in this way could take place.

Even though teachers, while members of a social institution are, at the same time, subjects and objects, a favorable situation to reproduce domination, the same conditions should allow them to resist against it. While teachers are under the influence of the production logics, they keep on going despite being affected with their action. That may presuppose contradiction what may contribute for occurrence of the critical analyses of the reality.

A critic that breaks with the model that attacks subjectivity by objectivity elaborations, that intends to give to the individual the well succeed impression, has to be arisen. Because, in reality, those who get involved in it became individuals abandoned from their own expression. They are involved with a culture that does not exist anymore, that changed themselves into a pulsional object of perversions made by culture industry with its broken promise to promote satisfaction.

The relevance of this attitude is to put in evidence the paper of public policies to be oriented toward an education as an education of human beings and values. An education that could be able to change the reality towards of the proper humanity's benefits.

## Subtypes of Readers and Spellers in Second Grade Children

Susanne Seifert+++++, Lisa Paleczek, Susanne Schwab, Norbert  
Tanzer, and Barbara Gasteiger-Klicpera

University of Graz, Merangasse 70/2, 8010 Graz

## Abstract

In primary school classrooms, teachers face a tremendous diversity concerning reading and spelling abilities. In the present study, decoding, reading comprehension and spelling abilities at the beginning of second grade (377 children) served as a basis for a clustering process. 5 different subtypes of readers and spellers were revealed (outliers were excluded). Further analyses showed that the 5 clusters also differed in other abilities (active and passive vocabulary, grammar, cognitive abilities) and demographic variables (age, children's first language). Furthermore, the distribution of the clusters was examined and 18 out of the 21 studied classrooms showed all clusters. The results are discussed in the light of the challenges that such heterogeneity means for teachers.

## 1. Introduction

In our society, reading and spelling are competencies needed to master most challenges in everyday life. Reading competence refers to the ability to analyze and comprehend written words and texts (Klicpera, Schabmann, & Gasteiger-Klicpera, 2010). For an efficient reading process, different subordinated skills have to be synchronized. According to the simple view of reading (e.g., Hoover & Gough, 1990), two different abilities are necessary for effective reading comprehension: *decoding* and *linguistic comprehension*. For grasping the meaning of texts, both abilities are needed. The simple view of reading claims that in the first years of school, decoding and linguistic comprehension are only weakly related, whereas later on, linguistic comprehension has a greater impact on reading comprehension than decoding. During the first school years, decoding is the first skill to develop. This is the ability to transform printed letters (graphemes) and letter strings into a phonetic code (phonemes) (Perfetti, 1985). This decoding process, which becomes increasingly automatized, is referred to as the non-lexical route. As a parallel cognitive process, the direct lexical route develops: At the beginning of reading acquisition, only some small words and parts of words are stored in an orthographic mental lexicon and therefore can be looked up fast. Later on, the number of words in the lexicon increases and more complex and longer words can be decoded at a glance. These two routes (lexical and non-lexical) are necessary for a successful reading process (Coltheart, 1981). The growing use of the lexical route gradually increases reading speed and fluency (Klicpera, Schabmann, & Gasteiger-Klicpera, 2010). The fast lexical word reading is a prerequisite for reading comprehension. This ability provides readers with the opportunity to understand written words and texts and to gain information from texts.

Models of reading and writing development assume a close interdependence between the development of reading and spelling skills (e.g., Frith, 1985). Spelling is the ability to convert spoken language (phonemes) into graphemes. It is assumed that especially in the first grades, spelling and reading skills are closely related (Cunningham & Stanovich, 1993). This close interdependence is obvious when looking at the definition of dyslexia. Developmental dyslexia is often described as an overall impairment of reading and spelling abilities independent of and unrelated to other cognitive abilities (International Dyslexia Association, USA: Lyon, Shaywitz, & Shaywitz, 2003; Rose Review, Great Britain: Rose, 2009). Nevertheless, research (e.g., Moll & Landerl, 2009; Schabmann & Schmidt, 2010) shows that reading and spelling abilities can be impaired independently of each other. The same is true for the different skills necessary for reading competence: Impairments can be restricted to reading comprehension alone (poor comprehenders) or decoding deficits alone (poor decoders) (e.g., Nation, 2005; Stothard & Hulme, 1992; Yuill & Oakhill, 1991). As such, each child might show distinct ability levels for all three different skills (decoding, reading comprehension, and spelling).

From the beginning of the first grade, children start their reading acquisition with very different preconditions. While some children show nearly comparable ability levels in reading and spelling during the development of reading and spelling skills, many children are better in one ability but lag behind in the other abilities. When failing to meet the basic requirements in one of the reading and spelling abilities, children can easily fall behind. Once children are at risk concerning these reading and spelling

*E-mail address:* Susanne.seifert@uni-graz.at.

abilities, general failure in all academic subjects may result since these two abilities are fundamental for nearly all subjects. Such insufficient reading skills represent a significant problem in Austria: About 16% of fourth graders are identified to be at risk (e.g., Schabmann, Landerl, Bruneorth, & Schmidt, 2012). Besides this at-risk group, it can be assumed that there is also a big diversity in reading and spelling abilities in unimpaired children.

Diversity in ability levels of reading and spelling skills is often quite challenging in the classroom. On the one hand, teachers should identify the above mentioned at-risk students as early as possible and provide individual learning support to ensure that they are able to catch up with the other students in class (e.g., Helf & Cooke, 2011; Rose, 2006; Swanson, 1999; Torgesen, 2005). On the other hand, teachers also need to create the best learning conditions for children with average and above average abilities. In addition to the different levels in reading and spelling abilities, teachers encounter two more challenges: For the last few years, based on the UN Convention on the Rights of Persons with Disabilities, inclusion of children with special educational needs within regular school settings has become a declared objective (United Nations, 2006). Therefore, the heterogeneity in classrooms is rising (Statistik Austria, 2014). Further factors that increase classroom diversity are differences in cultural and linguistic background (Herzog-Punzenberger & Schnell, 2012; Schwab et al., 2013). Nowadays, nearly one in 4 children in Austrian primary schools does not speak German as first language (school year 2012/13; Statistik Austria, 2014). If the classroom consists of many children whose first language is different from the language of instruction, teachers often have to deal with deficits in vocabulary, too. The aim to promote all children in the classroom and respond to all children's needs becomes more difficult to reach when, besides the challenges already mentioned, language deficits have to be addressed as well. In addition, children with a different first language are not the only ones who show a lack in language abilities concerning the language of instruction (Schabmann et al., 2010).

The purpose of the present study is to examine this heterogeneity through revealing different subtypes of readers and spellers in second grade classrooms.

## 2. Method

### 2.1 Participants

The data used in the present study was collected at the beginning of the second grade as part of a larger intervention study (LARS - Language And Reading Skills, see also Schwab & Gasteiger-Klicpera, 2013; Schwab, Seifert, & Gasteiger-Klicpera, 2013; Schwab, Seifert, & Gasteiger-Klicpera, submitted; Seifert, Schwab, & Gasteiger-Klicpera, 2014). Only classes with a higher percentage (30% or more) of students with German as a second language (GL2) were included. The resulting sample consisted of 377 children (180 boys and 197 girls) from 21 classes in 8 primary schools in Styria, a federal state of Austria. The children were between 7 and 9 years old ( $M = 7.78$ ;  $SD = 0.44$ ). About half of the children (51.2%) were native German speakers (i.e., German as a first language – GL1). The remaining children (48.8%) spoke German as a second language (GL2). These GL2 students spoke about 21 different L1 languages (most frequent languages: Albanian, Chechen, Bosnian, Croatian, and Turkish).

### 2.2 Instruments

To examine the reading (decoding, reading comprehension) and spelling abilities, three standardized tests were used. The assessment of the language abilities was conducted via a vocabulary and a grammar test. In addition, overall cognitive abilities were tested with the German version of the Cultural Fair Intelligence Test (CFT-1; Cattell, Weiß, & Osterland, 1997). Demographical data included information about the children's age, gender, first language, and status of special educational needs (SEN) and was collected through teacher questionnaires.

The *Salzburg Reading and Spelling Test* (SLRT II; Moll & Landerl, 2010) consists of a Reading Decoding Test and a Spelling Test. For the purpose of the present study, only the Decoding Test of the SLRT was used. It is an individual reading test that assesses decoding with the subscales Word Decoding (read words aloud) and Non-word Decoding (read non-words aloud). According to the manual, the retest reliability for the Decoding Test ranges from .90 to .98.

Reading comprehension was tested with the *Reading Comprehension Test for First to Sixth Graders* (ELFE 1-6; Lenhard & Schneider, 2006). This test assesses reading comprehension with three subscales: Word, Sentence and Text Comprehension. The internal consistency of the subscales ranges from .92 to .97. In the present study, only the subscales Word Comprehension (underlining one of four words that matches a picture) and Sentence Comprehension (underlining one of five words that fits in the sentence) were used.

Spelling skills were tested with the *Hamburg Spelling Test* (HSP 1-9; May, 2002). This test assesses the spelling of words and small sentences after verbal presentation and provides the interpretation on word level (number of correctly spelled words) as well as grapheme level (number of correctly spelled graphemes). For the present study, the number of correct graphemes was used for further analyses because they offer more precise information.

Vocabulary knowledge was measured with the short form of the *Vocabulary and Word Finding Test for 6 to 10 Year Olds* (WWT 6-10; Glück, 2007;  $\alpha = .84$ ) with two subscales: Active and Passive Vocabulary. For the Active Vocabulary subscale, single pictures have to be named. Due to the assumption that a word that is actively known is also known passively, only those

words which were not known when testing with the Active Vocabulary subscale were tested afterwards with the Passive Vocabulary subscale (pointing to one of four pictures that fits the word announced by the tester).

Grammar skills (active, not passive knowledge) were measured with a modified version of the Grammar Subtest of the *Potsdam-Illinois Test for Psycholinguistic Abilities* (P-ITPA: Esser, Wyszkon, Ballaschk, & Hansch, 2010). The reliability was .89. Within this Grammar Test, children had to answer questions regarding pictures that ought to evoke different grammar structures.

### 2.3 Statistical Analyses

Subtypes of readers and spellers in second grade were identified through a hierarchical cluster analysis using Ward's method with squared Euclidean distance measure. Decoding, reading comprehension and spelling were included in the cluster analysis. To make the metric of all variables comparable, raw scores were converted to T-scores ( $M = 50$ ,  $SD = 10$ ). Due to the high correlation (see Table 1 in bold) between the two subscales for reading comprehension as well as the two subscales for decoding, only one subscale per ability was included. Because of their lower correlation to the other tests (see Table 1), the subscales Non-word Decoding and Word Comprehension were chosen. ANOVAs were conducted to reveal differences between the clusters in the variables that were not included in the cluster analysis (i.e., language and cognitive abilities). For identifying differences in demographic variables, Chi-square tests were conducted. All statistical analyses were conducted with SPSS 20.0 for Windows (IBM Corp., Armonk, NY).

Table 1. Inter-correlations of decoding, reading comprehension, and spelling abilities.

	Decoding Word Decoding	Non-word Decoding	Reading Comprehension Word Comprehension	Sentence Comprehension	Spelling
Decoding					
Word Decoding		<b>.89**</b>	.73**	.77**	.51**
Non-word Decoding			<b>.65**</b>	<b>.67**</b>	<b>.49**</b>

### 3. Results

The dendrogram of the hierarchical cluster analysis revealed six distinguishable clusters. Five big clusters consisted of 55 to 97 children, whereas one small cluster contained only eight children (2.1% of the sample). By taking a closer look, it became obvious that this small cluster consisted of a group of outliers. The children in this cluster had special educational needs (SEN), showed insufficient language skills, or their cognitive abilities were below average ( $IQ < 70$ ). As the tests were not constructed and evaluated for students with such impairments, it is unclear if their test results are valid. All of the children in this cluster showed very weak abilities in decoding ( $T = 26.7$ ), reading comprehension ( $T = 34.55$ ) and in spelling abilities ( $T = 5.07$ ) compared to the rest of the sample (with average T-values). Therefore, this cluster was not included in any further analyses.

Table 2 shows the distribution of the remaining five clusters within each class. In each class, at least four of the five clusters exist. Only three classes (Classes 6, 16 and 17) have just four clusters, all the other 18 classes consist of the five clusters. However, in three classes (Classes 1, 3 and 16), one Cluster is overrepresented (see Table 2 in bold).

Figure 1 shows the profiles of the other five clusters for the three abilities used in the cluster analysis (decoding, reading comprehension and spelling). Mean T-values (calculated within the present sample) are shown for each cluster separately. Cluster 2 shows the group with the highest reading abilities (both in decoding and reading comprehension) and their spelling abilities are in the upper average. Clusters 5 and 1 partly resemble each other: Children in those two clusters all achieved average scores in all tests. However, by looking closer, differences in the specific abilities can be found. The main difference between these two clusters is found with regard to spelling, where Cluster 5 children reached upper-average scores and outperform Cluster 1 children. In decoding and reading comprehension, another difference is found. While Cluster 5 shows better decoding abilities, Cluster 1 shows better reading comprehension skills. Moreover, the upper-average scores in reading comprehension skills in Cluster 1 represent the best ability in this group. Cluster 4 reveals a group of children with lower-average abilities in decoding and even worse performance in reading comprehension. In addition, Cluster 4 is the group with the lowest spelling abilities. In comparison to Cluster 4, Cluster 3 shows better spelling abilities (average range) but represents the group with the lowest scores for decoding and reading comprehension (see also Table 3).

Figure 1. Mean

T-scores and standard deviations of decoding (subscale Non-word Decoding), reading comprehension (subscale Word Comprehension) and spelling for the five clusters. T-scores:  $M=50$ ,  $SD=10$  (Standardized within the present sample). Average abilities are defined as within one standard deviation above or below the mean ( $40 < T < 60$ ).

Table 2. Distribution of children in classes by cluster.

Class	Cluster 1 (percentage)	Cluster 2 (percentage)	Cluster 3 (percentage)	Cluster 4 (percentage)	Cluster 5 (percentage)	Class Size (n)
1	6.3%	6.3%	18.8 %	6.3%	<b>62.5%</b>	16

21	33.3%	14.3%	14.3%	19%	19%	21
<b>Cluster Sizes (n / percentage)</b>						<b>N</b>
88 / 23.8%						369
58 / 15.7%						
55 / 14.9%						
71 / 19.2%						
97 / 26.3%						

**Bold:** more than 50% of the children in class in one cluster

After clustering, variance analyses were conducted to test if the five clusters also differ in variables not used in the cluster analysis, namely, language skills (active and passive vocabulary, grammar), cognitive abilities, and age. The clusters differ significantly in their language abilities ( $F_{4,368}=13.699$ ,  $p<.001$ ,  $\eta^2=.131$ ). As can be seen in Table 3, Cluster 4 always showed the poorest language skills (both in active/ passive vocabulary and in grammar). Cluster 2 always showed the best language skills. Clusters 1, 3 and 5 are nearly comparable in their language abilities. Similar results were found for cognitive abilities ( $F_{4,368}=8.546$ ,  $p<.001$ ,  $\eta^2=.088$ ) Cluster 2 shows significantly higher cognitive abilities than all other clusters whereas the others do not differ from each other. Figure 2 visualizes the differences between the clusters in language and cognitive abilities. Age differences ( $F_{4,368}=4.109$ ,  $p<.01$ ,  $\eta^2=.043$ ) were significant only between Cluster 5 and Cluster 1. Cluster 5 children are significantly younger than their Cluster 1 peers.

Figure 2. Mean

T-scores and standard deviations of language abilities (subscales Active and Passive Vocabulary, Grammar) and cognitive abilities for the five clusters. Cognitive abilities are age-normed; all other abilities are standardized within the present sample.

Table 3. Means, standard deviations and Scheffé tests between the five clusters for decoding, reading comprehension, spelling, active and passive vocabulary, grammar and cognitive abilities.

Scale	Subscale	Cluster 1 M (SD)	Cluster 2 M (SD)	Cluster 3 M (SD)	Cluster 4 M (SD)	Cluster 5 M (SD)	Scheffé significant differences ( $p < .05$ )
Decoding (T-scores)	Non-word Decoding <sup>a</sup>	49.58 (6.23)	64.82 (6.79)	37.25 (4.03)	47.69 (4.30)	52.37 (4.58)	<sup>c</sup>
	Word Decoding <sup>b</sup>	48.96 (5.69)	66.4 (8.74)	38.9 (4.36)	44.59 (5.06)	51.39 (4.66)	<sup>c</sup>
Reading Comprehension (T-scores)	Word Comprehension <sup>a</sup>	55.33 (4.36)	64.24 (8.5)	39.44 (3.87)	42.14 (5.07)	49.66 (5.05)	<sup>c</sup>
	Sentence Comprehension <sup>b</sup>	50.71 (7.24)	65.46 (8.44)	40.57 (4.1)	43.43 (4.87)	50.27 (6.25)	<sup>c</sup>
Spelling <sup>a</sup> (T-scores)		49.07 (4.49)	57.14 (4.97)	48.16 (6.8)	43.74 (5.45)	55.9 (3.91)	<sup>c</sup>
Vocabulary (T-scores)	Active Vocabulary	51.64 (10.29)	56.79 (8.8)	48.6 (8.72)	45.46 (8.94)	48.57 (9.57)	4<1<2 (5=3)<2
	Passive Vocabulary	51.31 (9.44)	55.39 (7.44)	49.95 (8.63)	45.23 (11.1)	49.1 (10.06)	4<(1=2) (5=3)<2
Grammar (T-scores)		50.81 (9.88)	56.35 (6.96)	49.19 (8.58)	44.21 (11.12)	50.17 (9.18)	4<(3=5=1)<2
Cognitive Abilities (IQ age norm)		95.49 (14.4)	102.81 (15.59)	92.95 (11.24)	89.37 (12.6)	93.44 (12.27)	(4=3=5=1)<2

<sup>a</sup>Variables used for cluster analysis.

<sup>b</sup>Due to their high inter-correlations, only one subscale of each test was included in the clustering process.

<sup>c</sup>Due to the inclusion in the clustering process or the high correlation to variables included, no variance analyses and no Scheffé tests were conducted.

The five clusters also differed in demographic variables (see Table 4). Overall Chi-square tests were used to analyze the differences between the clusters concerning the number of girls/boys and GL1/GL2 children. If there was an overall difference, additional Chi-square tests with Bonferroni correction were conducted to find out which clusters differ from each other. With respect to gender, an overall difference ( $\chi^2_{4, 369}=11.582$ ;  $p < .05$ ) was found, but no significant differences between cluster pairs could be established after Bonferroni correction. With respect to GL1/GL2, a significant difference was found ( $\chi^2_{4, 369}=12.86$ ,  $p < .05$ ). Even after Bonferroni correction, significant differences were found between Cluster 2 and Cluster 4 ( $\chi^2_{1, 129}=11.617$ ,  $p < .01$ ) as well as between Cluster 2 and Cluster 5 ( $\chi^2_{1, 155}=6.82$ ,  $p < .01$ ). More specifically, there were more GL2 children in Cluster 4 and Cluster 5 than there were in Cluster 2.

Table 4. Means and standard deviations in the five clusters for age; distribution of gender and language (GL1/GL2) by cluster.

Variable	Cluster 1	Cluster 2	Cluster 3	Cluster 4	Cluster 5	post-hoc significant differences

#### 4. Discussion

The present study aimed to identify subtypes in a sample of 377 second graders, tested at the beginning of the school year. A cluster analysis of reading and spelling abilities was conducted and six different clusters were identified. As shown in the cluster analysis, developmental levels of decoding, reading comprehension and spelling differ between the children. After excluding an outlier cluster with eight children, five clusters remained. The remaining five clusters did show different profiles in the children's reading and spelling abilities. The three larger Clusters, 5, 1 and 4, showed average scores in all three abilities. Cluster 5 was the one with the most children ( $n=97$ ). Those children's spelling abilities were better than their reading abilities (decoding and reading comprehension). However, their decoding was still better than their reading comprehension. In Cluster 1 ( $n=88$ ), decoding and spelling were nearly comparable. However, their reading comprehension was better developed and represents the best ability. Cluster 4 ( $n=71$ ) consisted of children whose decoding was better than their reading comprehension and spelling, respectively.

Above-average abilities and therefore remarkably good reading abilities were only shown by Cluster 2 ( $n=58$ ). The means of decoding and reading comprehension scores were above average. Additionally, their spelling was also in the upper average range. Therefore, Cluster 2 was the best group in all three abilities. In contrast, Cluster 3, the smallest group ( $n=55$ ), showed below-average reading comprehension and decoding skills. Surprisingly, Cluster 3 children's spelling was average and even higher than in Cluster 4 children. With Cluster 3, a group with particularly weak reading abilities (decoding and reading comprehension) was identified. Since spelling is not affected in this group, the impairment shown in these children is restricted to reading abilities. These findings support previous research results concerning the possibility of isolated impairments in either reading abilities or spelling abilities (e.g., Moll & Landerl, 2009; Schabmann & Schmidt, 2010).

Comparing the group of best readers (Cluster 2) to the group of poorest readers (Cluster 3), their mean in the decoding subscale Non-word Decoding was more than 2.5 standard deviations above the mean of Cluster 3. In the reading comprehension subscale Word Comprehension, the difference was nearly 2.5 standard deviations. However, in terms of spelling, no notable differences between all clusters could be found. Spelling was within the average in all clusters. Even comparing the best spellers (Cluster 2) to the poorest spellers (Cluster 4), the distance of their mean scores was less than 1.5 standard deviations. Therefore, the differences in reading abilities (both decoding and reading comprehension) are a lot higher than they are in spelling. As a conclusion, the children in our sample vary more distinctly in reading than in spelling abilities. Thus, teachers of the present sample probably encounter a bigger challenge when teaching reading than when teaching spelling. On the one hand, teachers have to deal with children that outperform others in reading, and on the other hand, there is a group of children who still struggle with basic reading acquisition.

None of the examined school classes showed fewer than four clusters. Therefore, all classes can be described as being heterogeneous. In every class, there were children of Cluster 1 and Cluster 2. Only three classes (Classes 6, 16 and 17) contained only four clusters while one cluster was missing (Clusters 5, 3 and 4, respectively). In three classes (Classes 1, 3 and 16), one of the clusters was overrepresented (Clusters 5, 1 and 2, respectively). In Class 16, the overrepresentation of Cluster 2 children combined with the non-existence of Cluster 3 resulted in a rather homogeneous class with a lot of skilled readers and spellers. In all the other classes, no such homogeneous picture was present. There, the variety of clusters results in great heterogeneity. This heterogeneity can not only be described as having good and poor readers or spellers in a classroom. It needs to be looked at in a more differentiated way. Some children are quite good at spelling but weak in reading at the same time. This pattern can also be found the other way round. In order to offer high quality support for each child, teachers have to individually define the child's challenges and then assist him or her in a tailored way.

The language (vocabulary and grammar) and cognitive abilities do not vary much between the five examined clusters. However, some interesting differences should be addressed: Cluster 2, the group with above-average reading abilities, outperformed all the other groups in language abilities. In addition, Cluster 2 was the only group that showed significantly higher cognitive abilities compared to all the other clusters. Cluster 4, one of the two worst-performing groups, also showed the lowest language abilities. Clusters 1, 3 and 5 do not differ from each other in their language abilities.

A lot of studies have shown that language skills are highly inter-connected with reading skills (e.g., Catts, Fey, Zhang & Tomblin, 1999; Muter, Hulme, Snowling, & Stevenson, 2004). Especially reading comprehension seems to be highly correlated with oral language skills, in particular when reading starts to develop (Storch & Whitehurst, 2002). Research has shown that both aspects of language skills, vocabulary (Oullette, 2006; Perfetti, 2010) and grammatical knowledge (Nation, Clarke, Marshall, & Durand, 2004), are related to reading. Therefore, it is not surprising that Cluster 2 children showed the best language abilities. Besides, the good test results in decoding and reading comprehension in Cluster 2 can also be explained by the higher cognitive abilities, as it is known that cognitive abilities in the first grades are highly correlated to reading and spelling (Bowey, 1995).

Concerning demographic variables, a difference was revealed in terms of the percentage of children with GL2 in the various clusters. Clusters 4 and 5 consisted of significantly more children with GL2 than there were in Cluster 2. Both clusters (4 and 5) showed better decoding compared to reading comprehension. This finding goes along with the results of a recently conducted

meta-analysis (Melby-Lervag & Lervag, 2013). This study revealed that L2-learners in general show deficits in reading comprehension, but are nearly as good as L1-learners in decoding. Besides, Cluster 4 has the greatest number of children with GL2. This group also showed the lowest language abilities. These weak language abilities can probably be explained by the high proportion of children with GL2. Second language learners often struggle with the language of instruction (David, 2010). Furthermore, the group with the best reading and language abilities (Cluster 2) had few GL2 children. These findings highlight once more that children with a different first language than the language of instruction have a higher risk of struggling with reading problems than children who are taught in their mother tongue (EU High Level Group of Experts on Literacy, 2012).

In the present study, some limitations have to be addressed. First, our sample does not represent regular classroom composition as only classes with more than 30% of GL2 students were examined. This restriction also influences the representativeness of the socioeconomic background. Therefore, the results cannot be generalized to all classroom settings. Second, the students were nested in different classes that were nested in different schools. Hence, a multilevel approach would be advantageous for analyzing effects that are caused by class-related factors (e.g., teacher behavior, classroom composition) or school-related factors (e.g., urban vs. rural areas) rather than looking merely at different characteristics on the student level. Nevertheless, the present study demonstrates that teachers encounter a large variability in reading and spelling abilities in their classrooms.

## 5. Conclusion

This study has revealed that for reading, well-analyzed differentiation within the classroom is indispensable. In addition, not only good and weak readers should be addressed. On the contrary, in order to foster each child's development adequately, teachers really need to bear in mind the broad range of individual abilities that exist in the classroom. Thus, teachers need to be trained to adequately meet these challenges and consequently to react to and support students individually. A special focus should be put on second language learners, as these children in particular are at high risk of developing reading and spelling difficulties. Further investigations will have to be conducted to examine the linguistic situations of these children at home to better understand their development.

## Abstract

This paper emphasizes the problems in e-learning environments with special focus on professors' role in providing quality of learning outcomes. Furthermore, we focus on professor level of information literacy and its role and importance in providing learnability of system and proactivity of students. In student centred learning environments we need to provide the same level of conditions needed in achieving learning outcomes. Therefore we analyse predictors that mediators in e-learning process (teachers) need to provide in order to create, evaluate, disseminate and distribute learning materials and instructions. In this paper we analyse an e-learning system with 3636 users and 238 courses on a higher education level (professional graduate and undergraduate study). Over the past nine years we have reached high level of e-learning technology use but still facing with students' dissatisfaction and lack of motivation stemmed by quantity and quality of course contents. In previous papers we have written about the conducted research on student information literacy tested on the Moodle platform in two higher educational institutions in Croatia. In these papers and other relevant research we have noticed student dissatisfaction with e-learning moderators (teachers). Moreover, in annual quality assurance questionnaires students recognized the same problem; namely, most of the teachers do not provide the expected level of information competences related to the course content needs. The students pointed out that their motivation is in correlation with teacher motivation and their contribution to the e-learning class and using technology in general. Our analyses show that more than 2/3 of teachers do not update their class with new information about the field they teach and ignore student interests in an e-learning process. In this paper we analyse predictors to problems with mediators and their perception of lifelong learning importance and their teaching approach to digital natives in the web 2.0 environments.

## 1. Introduction

Croatian College of Business and Management „Baltazar Adam Krčelić“ was founded in 2001 and today, with more than 3.000 students graduated and 2.700 enrolled, is one of the biggest business schools in Croatia. The College employs more than 100 lecturers, majority of them are professionals coming from the business and public sector, and a large number of eminent external experts from the academia. In 2005 we have implemented e-learning system based on LMS platform Moodle (baltazar.vspu.hr). In past 9 years of its implementation and development we organize blended learning on 238 courses of 6 study programmes. Development of e-learning system over the past years has been mainly focused on developing organization, process of motivating teachers to use LMS, development and distribution of teaching materials (especially for part time students) and teaching support in general. At the moment more than 90% of teachers use e-learning system compared with beginning of the implementation process in 2005 when it was less than 10%. Today we are facing with obvious decline of interest and motivation for teaching in e-learning environment.

Our College annually provides teachers trainings on how to use LMS Moodle, educate and provide young assistants as teachers' support for technology usage with intent to succeed expected level of e-learning environment. In this paper, we describe problems we are facing with, present data and conclusions for further research.

We have conducted an online survey and asked teachers (N:42) what do they think about the e-learning system, its capabilities, but also about their motivation factor and most importantly do they encourage students enough for active participation for learning in electronic environment. Also, we asked the students (N:405) by parallel survey what do they think about the content, quality and features in provided courses and their motivation factor for learning in e-learning environments. In order to check the veracity of statements obtained by the teachers, we conducted an analysis of e-learning system Baltazar contents on 238 e-courses. Results of this analysis show a large discrepancy and the low level of motivation and inaction on both sides. In order to reach some answers we used relevant literature and researches in order to problematize issues and possible causes for these results.

## **2. Context: education in digital age**

According to Prensky, the most fundamental cause of the decline of education is that “today’s students are no longer people our educational system was designed to teach” (Prensky, 2001, p. 1). The reason for this lies in the fact that today’s students grow up in a digital age, i.e. they spent their lives using computers, video games, digital music players, video cams, smart phones, etc. Due to this digital environment, they “think and process information fundamentally differently from their predecessors” (Prensky, 2001, p. 1). This new generation of students, so called Digital Natives (as “native speakers” of the digital language), receive information really fast, prefer parallel process, multitask, random access, instant gratification, frequent rewards and they function best when networked. On the other hand, their teachers or Digital Immigrants (those who were not born in the digital world) have very often little appreciation or understanding for the way Digital Natives function and for new skills they acquired.

Therefore, the rapid diffusion of the Internet and growing importance of new information and communication technologies in educational context have essentially affected the ways people (should) teach and learn. As a result, today’s students find it very hard to follow instructions of their teachers which were designed for student from some ‘other time’. Since it is very unlikely that Digital Natives will go backward, Prensky concludes that today’s teachers have to reconsider both their methodology and their teaching content. Basically, they have to confront new teaching and learning methods and to reconsider their traditional learning style where a teacher was the center of learning. Additionally, all indicators show that it is highly possible that e-learning will become the mainstream of learning in the future. As some studies show (Lin, Chen, & Nien, 2014), e-learning strategy is superior to the traditional learning methods with respect to students’ motivation. Furthermore, technology mediated-learning environment has also advantages like study flexibility, broader accessibility, no time and space limitation, individual approach, use of multimedia, more active teaching style, etc. (Lin, Chen, & Nien, 2014). However, these potential advantages will not be actualized if teachers will not invest into their professional development regarding the usage of these new technologies.

In practice, e-learning mainly relies on few teachers who have necessary computer skills to create and perform their e-learning courses, while the rest are still hesitating and using technology capabilities in very limited scope. Hence, the main question is what are the problems that hinder teachers in performing their e-learning courses and what would be the incentives or motivating factors that will encourage HE teachers to involve in e-learning? Some recent studies show that in order to predict teachers’ acceptance and usage of e-learning, it is necessary to explore teachers’ beliefs, attitudes and motivation toward e-learning environment (Chien, Kao, Yeh, & Lin, 2012) (Luo, Chen, & Hsieh, 2011) (Sorebo, Halvari, Gulli, & Kristiansen, 2009).

## **3. Focus on instructional design**

In the e-learning environment the focus should not be on the implementation of the delivery system, but on instructional design which would include development of instructional materials and activities, and their evaluation. Merrill lists five principles of instruction which relate to problem centered and effective instruction. According to these principles, learning is promoted when learners are engaged in solving real-world problems, when existing knowledge is activated as a foundation for new knowledge, when new knowledge is demonstrated to the learner and applied by the learner, and when new knowledge is integrated into the learner’s world (Merrill, 2002). On the other hand, the aim of instructional design should also be to improve students’ motivation. Hence, the most important task of the teachers is to create conceptual framework that would include both, motivational concepts and successful instructional design strategy (Barger & Byrd, 2011).

Since today’s education focuses on student centered learning, teachers need to think about how to foster proactivity and motivation of students in an e-learning environment. Although motivation is personal, complex phenomena, teachers should find the ways to intervene into this sphere. With regard to students’ motivation, factors that affect student’s decision to pursue a goal or perform a task can be intrinsic or personal and extrinsic or non-personal. According to Keller’s ARCS model, motivational design refers to the process of arranging resources and procedures to bring about changes in motivation” (Keller, 2006), and it can be applied in broad variety of cases. By Keller an instructional design should not be only efficient (refers to economy in the use of instructional time, materials, and other resources), but should also be effective. The effective means that it should include strategies, principles, and processes for making instructions appealing, i.e. more intrinsically interesting (Keller, 2006). Hence, the ultimate goal of motivational design should be to foster intrinsic motivation of students. The logical question is how to make instructions more appealing by keeping the desired level of teaching outcomes? If we accept Prensky’s argument that the 21<sup>st</sup> century students must be engaged in the 21<sup>st</sup> century way (Prensky, 2006), the effective solution could be the use of LMS since options it provides are more appealing to students than traditional methods of teaching.

## **4. Motivation as key factor of successful usage of LMS**

There is a great number of studies that have concentrated on students’ attitudes and motivation toward e-learning, but there were comparatively fewer studies that have focused on factors which are related to motivation and attitudes of teachers. Regarding the problems of motivation in performing e-learning courses, integrated expectancy model considers both personal and institutional factors as playing an important role (Luo, Chen, & Hsieh, 2011). Personal would be internal motivation of

teachers, while institutional is related to policies brought by the institution (school) that would support higher involvement in e-learning activities.

In their study, Chien, et al (2012) examines teachers' attitudes and motivation toward web-based professional development by using Technology Acceptance Model (TAM). According to TAM, belief of individuals determine their attitude towards using of technology, attitude foster their intention to use it, while intention influences the decision of actual technology use (Chien, Kao, Yeh, & Lin, 2012). The main conclusion of this study is that teachers with higher motivation have more positive attitudes toward web-based professional development, i.e. motivation plays a pivotal role in creating positive attitudes of teachers towards web-based professional development (Chien, Kao, Yeh, & Lin, 2012). However, there is still a question how to increase motivation of teachers? One of the crucial factors could be personal professional development and self-fulfillment. According to Maslow, the highest level in the hierarchy of needs belongs to self-fulfillment or self-actualization (Maslow, 1943). Applied to the sphere of work, this need will cover following aspects: challenging job, creative task demand, advancement opportunity and achievement in work. If we find plausible hypothesis which says that proficiency in using new technologies in education will become condition sine qua non of education, then this same proficiency becomes condition sine qua non of professional realization of teachers in the future. Therefore, in order to realize self-fulfillment in teachers' profession in a digital age, teachers should invest into their knowledge and skills which would enable them to actively participate in future education, which could be one of the strongest internal motivational drive.

However, motivation toward teachers' active engagement into e-learning should come from institutional level as well. One example could be some sort of training or assistance that will help teachers to become more confident and independent in using e-learning systems. As Luo et al stress out, "e-learning curricula can be successfully completed only with strong policy" (Luo, Chen, & Hsieh, 2011, p. 84), meaning that HE institutions should have a plan for e-learning seminars which will enable to their teachers to learn how to produce e-learning courses. Therefore, a successful e-learning environment demands as its precondition an e-learning friendly institutional environment. Therefore, it is necessary to build e-learning facilities and to provide training courses for both, creation and design of e-learning materials and for performance and management of e-learning classes. Faculty policy should also encourage teachers to use e-learning and to assist them in the search of best methods which will motivate students. However, taking both these factors, personal and institutional, into consideration will provide us with a broader perspective when examining motivational factors that could foster proactivity in e-learning environment.

Finally, there are teachers who belong to digital immigrants and who are not experienced and proficient in e-learning or in new technologies in general and who quite often express doubts about the effectiveness of e-learning. As some studies show, level of perceived e-learning competence is crucial for development of usefulness beliefs and of intrinsic e-learning motivation (Sorebo, Halvari, Gulli, & Kristiansen, 2009). On the other hand, there are also teachers who are motivated to use e-learning systems and who find it as a very practical tool in reaching their teaching outcomes, but who are using it in a limited scope. Basically, somebody may think that he or she is using e-learning system, but the problem is to which degree and with which effect. Namely, there is a question of work performance, students' satisfaction with it, efficiency in terms of expected and desired teaching outcomes, etc. Hence, it is necessary to stress out that there is a difference between creation and design of efficient e-learning material and the limited use of e-learning system.

As an important complementary investment to e-learning technology, several authors indicate the activation of e-learning training and support as necessary in developing e-learning competences and skills (Sorebo, Halvari, Gulli, & Kristiansen, 2009) (Lin, Chen, & Nien, 2014). Moreover, e-learning is not only efficient tool for students' learning, but also an opportunity where teachers could realize their own professional skills and work on their professional development, i.e. to use e-learning as a motivation for their self-fulfillment.

Provided results of conducted survey show seemingly satisfaction with usage, possibilities and outcomes of e-learning from both sides. On the other hand, standard deviation indicates inconsistency of respondents answers (Table 1 and 2). Our assumption is that this kind of questionnaire cannot get credible results since opinion of teachers about the efficiency and success of e-learning courses was based on their knowledge and experience in technology use. Its more about their perception that they are successful in moderating e-learning than it could be seen in analyses of course content. Content analysis of their e-courses, for which they claim that they foster creativity and proactivity of students, shows the low level of the amount of teaching material and content (see Table 3).

Table 1. Aside questions from conducted online survey on teachers

Professors responds (N:42)	Strongly disagree	Disagree	Neutral	Agree	Strongly agree	SD
I am motivated to use an e-learning system Baltazar.	2 (5%)	4 (11%)	5 (13%)	3 (8%)	24 (63%)	1,298
E-learning class should be organized and designed to foster creativity.	5 (13%)	2 (5%)	2 (5%)	4 (10%)	26 (67%)	1,454
In evaluation of student activities I evaluate and foster creativity	5 (12%)	3 (7%)	4 (9%)	7 (17%)	23 (55%)	1,430
The methods I use in my e-learning class encourage creation of new ideas, concepts, problem solving and facilitate new connections between existing and future knowledge.	7 (19%)	2 (5%)	2 (5%)	10 (26%)	17 (45%)	1,536

Creativity and proactivity of students can be encouraged through e-learning system Baltazar.	4 (11%)	9 (24%)	5 (14 %)	7 (19%)	12 (32%)	1,440
--	---------	---------	----------	---------	----------	-------

Table 2 Aside questions from conducted online survey on students

Students' responds (N:405)	Strongly disagree	Disagree	Neutral	Agree	Strongly agree	SD
Teachers motivate us to use e-learning system Baltazar.	34 (8%)	43 (11%)	18 (5%)	187 (46%)	123 (30%)	1,220
I consider e-learning system Baltazar as useful support for teaching and learning process.	3 (1%)	15 (3%)	11 (3%)	105 (26%)	271 (67%)	0,784
Online courses are organized on creative and structured way and they are in accordance with learning outcomes and course syllabus.	24 (6%)	50 (12%)	32 (8%)	191 (48%)	105 (26%)	1,148
E-learning system Baltazar has acceptable number of interactive instructions.	40 (10%)	66 (16%)	47 (12%)	172 (42%)	80 (20%)	1,251

Information on weekly base	58,90 %
Case studies for teamwork problem solving	98,63 %
Wikis	98,63 %
E-mail contact and office hours	63,70 %

## 5. Importance of information literacy

Today's students live in a world where the access to information is easier and faster than ever. On the other hand, they also live in a world with an overabundance of information, which demands plenty of skills that would enable them to orientate in this informational jungle. According to Secker, "to assume that because information is available on the web, people will have the skills and knowledge to find, access and use it effectively is naïve" (Secker, 2008). Basically, the easy access to information does not imply knowledge. The main problem is that "information comes to individuals in unfiltered formats, raising questions about its authenticity, validity, and reliability" (The Association of College and Research Libraries, 2014). According to Breivik (2005), despite their familiarity with new information gathering tools or search engines like Google, today's students are far less prepared to do research, to assess reliability and relevance of information and to think critically when faced with information at their disposal. This problem is characterized as the "Access Paradox" referring to a disproportion of amount of information and users' skill to find what they need (Secker, 2008). Hence, Breivik concludes that "to be prepared for the 21st century, today's student need to be information literate" (Breivik, 2005, p. 22-23).

The Association of College and Research Libraries defines an information literate individual as a person who is able to determine the extent of information needed, to access the needed information effectively and efficiently, to evaluate information and its sources critically, to incorporate selected information into one's knowledge base, to use information effectively to accomplish a specific purpose, and to understand the economic, legal, and social issues surrounding the use of information, and access and use information ethically and legally (The Association of College and Research Libraries, 2014). However, all of these skills students must be taught, meaning that the most of responsibility for developing these skills belongs to higher education. According to Breivik, in order to develop students' information literacy skills, efforts should be made at the institutional, program, and classroom levels. At the institutional level, information literacy skill should be regarded as a core competency for all graduates, and as such should be incorporated into the general education curriculum. Following curriculum, each program should determine specific skills which are required in discipline. Finally, teachers in classroom should design their classes in a way that will facilitate students' mastering of the required skills (Breivik, 2005).

However, the most of studies on information literacy is related to education of students, while much less attention is paid to professional development of teachers. According to Probert, "the principles and goals of information literacy are not widely understood, supported or practiced by the teaching profession" (Probert, 2009, p. 26). On the one hand, there is a question of teachers' understanding or awareness of the need of development of information literacy skills among their students. On the other hand, in order to effectively teach students to become information literate, teachers should also possess skills required for teaching information literacy. As Secker stresses, "crucial area must be the information literacy levels of staff who are responsible for the development and implementation of e-learning" (Secker, 2008). Hence, where needed, initiative to raise awareness about the importance of information literacy skills development should come from the institutional level. Furthermore, additional effort should be made regarding teachers' professional development in information literacy in a sense that they should have a possibility to be trained properly, which requires some sort of strategic planning from the side of schools. According to Secker, "engaging with academic staff to develop their own skills also makes them more likely to see the value of building these skills into their courses for students" (Secker, 2008).

## 6. Conclusion

Seeking for the factors of teachers and students motivation and conditions for achieving successful e-learning, we have analyzed different parameters. Two of them were online questionnaires, one for teachers and one for students. Questions were aimed to get the answers whether they find their e-courses successful, interesting and do they encourage creativity. In general, responses of both confirmed positive.

On the other hand, the standard deviation of their responses indicated inconsistency in the answers, and we started with a detailed analysis of the content of all courses in the LMS Baltazar.

The data indicate that the performance of e-courses is considered as publication of anything that has to do with the educational process, such as test results etc. moreover e-learning system has turned into nothing more than a common repository.

We conclude that LMS capabilities are not used sufficiently; qualitatively and quantitatively and neither teachers nor students are aware of that.

Authors also conclude that the impetus for higher performance of e-learning firstly should come from institutions (Institutional policy), precise requirements, mandatory training and permanent content measuring of e-courses and its performance.

Secondly, we should work to encourage internal motivation of teachers to be more active in LMS use and also develop the consciousness of their professional habilitation through teaching in electronic environments.

Professional habilitation of HE teachers should obligate investment in eight key competences for lifelong learning according to 2006 EU legislation and in particular we consider important permanently foster of information literacy skills development and awareness of its importance.

## Abstract

Teaching is not only a systemic and learning-oriented action but also the core of teachers' professional assessment. Thus, the problem statement of our study was to analyse the relations Foreign Language Teachers established between teaching, supervision and appraisal of professional performance through classroom observation.

Through qualitative research, the prevailing supervisory perspective of teaching Foreign Languages, based on continuing professional development, reflective practices and peer relationship, proved the importance of both innovative teaching practices and a continuing assessment of performance over the two legally-imposed formal moments of classroom observation per evaluation cycle, at the time this research was conducted.

## 1. Introduction

As a systemic exercise with distinctive features (PME, 2010a), the action of teaching comes close to the perspective of the teacher looked upon as someone “who teaches not only because he/she knows, but because he/she knows how to teach” (Roldão, 2007a, p.101, translation by the authors), whilst making use of complex processes such as the transformation of curricular knowledge and syllabus adaptation. The internalization of knowledge by the students occurs when the teacher masters subject areas, both theoretical and scientific knowledge as well as technical, pedagogical and didactic areas, filled with continued questioning of the teaching action (Roldão, 2007a).

From a broader perspective, the internalization of knowledge by students should also take into account a thorough and permanent training aimed at suitably qualified individuals, who will be ideally fully prepared to act and react not only in the most diverse contexts of a multilingual and multicultural Europe but also worldwide. As a result, the knowledge passed on to students by their teachers should be of a continuous, multidimensional, modular and lifelong nature (CEFR, 2001).

## 2. Teaching specifics

In terms of theoretical framework, we analysed diverse perspectives of the teaching concept in the scope of the teaching performance and this fact led us to its dual transitivity. Given that the transitivity of the action of teaching lies in “the intentional construction of the passage or the promotion of internalization of something by the other” (Roldão, 2004, p. 97, translation by the authors), two different perspectives are assigned to the action of teaching: on one hand, the teacher teaches the learner contents, which the latter, depending on his/her capabilities and effort, will have to absorb. In this situation, the teacher is a “professional of knowledge more than of a function” (Roldão, 2004, p. 98, translation by the authors), whose action “is widely intransitive regarding the student” (Roldão, 2004, p. 98, translation by the authors), however, it is transitive as far as knowledge is concerned. On the other hand, the teacher is also a mediator between knowledge and the learner. Consequently, his/her role is characterized by a “double transitivity – the teacher is the one who teaches not only something, but something to someone” (Roldão, 2004, p. 98, translation by the authors).

In order to meet the demands of the teaching role and taking into account the centrality of the action of teaching within the development of the teaching and learning areas, teaching is necessarily associated with both specific knowledge and a growing assertion of the teacher as a “professional of education with the specific task of teaching, by making use of professional knowledge, supported by research and shared reflection upon educational practice” (PME, 2001, p.5570, translation by the authors). Therefore, we conclude that the action of teaching is at the centre of teacher's performance and defines the core of the

teaching profession. From this approach emerges the need for evaluation and systematic observation with the purpose of assessing performance.

In the scope of the teaching and learning areas, the appraisal of the teaching performance by peers should enhance scientific and pedagogical components significantly, whilst focusing on the pedagogical work in the classroom. As a consequence, this turns the reconciliation of the formative and summative dimensions in a single professional of education, who is both a supervisor and a peer evaluator (Vieira, Moreira, Barbosa, Paiva & Fernandes, 2010), and the evaluation between peers into the most difficult tasks for a teacher to perform (Alarcão & Tavares, 2003).

According to Oliveira-Formosinho (2002a), 2002b) and Alarcão & Tavares (2003) quoted by Formosinho, Machado & Oliveira-Formosinho (2010), the scenario of supervision which emphasizes “the supporting roles, listening, active collaboration on agreed goals through contracts, involvement in daily educational activities and reflected experimentation through action that seeks to respond to the identified problem” (p.107, translation by the authors), should be the one in which the appraisal of teachers’ performance, regulated by self-and one-on-one peer supervision, overcomes individual interests and aims at collective change, based on the monitoring of teaching practices and teacher support (Vieira *et al.*, 2010).

### 3. Methodological framework

A research was conducted in a public secondary school in the northern region of Portugal. The participants were fifteen *Foreign Language Teachers* whose teaching subjects were namely French, English and Spanish and were subjected to classroom observations by their peers in the 2010-2011 school year. Through the survey technique, we aimed at:

- Identifying foreign language teachers’ conceptions about the action of teaching;
- Knowing the curricular teaching practices in terms of planning, implementation and evaluation of teaching activities that Foreign Language teachers claim to develop;

- Understanding foreign language teachers' perspectives on *appraisal of teachers' performance*;
- Identifying possible indicators (enablers/ constraints) that these teachers associate with supervision in the context of classroom observation.

The adopted research methodology was the *case study*, whose nature is essentially qualitative and necessarily subjective. In this case, individuals experience reality in different ways. Thus, if the teacher's way of teaching is a reflex of the subjective reality, beliefs, thoughts and professional perspectives, the action of teaching will be based precisely on such subjective thoughts, beliefs and perspectives. In this sense, the knowledge of both educational and educative contexts of the participating teachers of this study is consistent with a qualitative approach, insofar it aims at the understanding of "individuals, personal constructs, negotiated meaning" (Opie & Sikes, 2004, p. 08), since what is considered important in both an interpretive and qualitative paradigm is self-interpretation and representation of the individuals' experiences (Opie & Sikes, 2004).

Following our methodological options, the survey was the technique chosen for data collection. This both internal and external instrument was validated previously and passed to fifteen Foreign Language Teachers that had been teaching at a public secondary and third cycle school in the school year 2010/2011. These teachers underwent classroom observation and / or played the role of supervisors / peer evaluators in the scope of the appraisal of teachers' performance. The data obtained from the questionnaire were statistically analysed using SPSS - 17.0 version.

The questionnaire, in which the participants were asked to express their degree of agreement and disagreement, the frequency of the stated actions and answer a multiple-choice exercise, required us to "build a set of alternative answers to this question specifically" (Hill, 2009, p.121, translation by the authors). Furthermore, the Likert scale was chosen to help teachers express their levels of agreement or disagreement in each statement. Finally, we also used the technique of observation and document analysis to complement and enhance our research.

## 4. Findings

The survey was divided into three main parts, in an attempt to ease the reading and interpretation of the different results. These parts were: personal and professional characterization of the participant teachers; Teaching action and Supervision in the context of teachers' appraisal of performance.

### 4.1. Participants' personal and professional characterization

Regarding the personal and professional characteristics of the participating teachers, whose average ages were 44 years, the data from the questionnaire enabled us to conclude that the female sex was predominant (93%), all teachers were bachelors, three of them had post-graduated studies and six teachers were holders of an academic Master's degree. The majority of teachers (87%) are the so-called *career teachers* and 73% of teachers have been teaching for at least nineteen years, which reveals some professional stability.

As far as the variable *Role in the appraisal of teacher performance* is concerned, four teachers were peer evaluators (27%), whilst all the other participants were only evaluated teachers (73%). The teachers, who were observed in classroom for the appraisal of their performance, were: a teacher of Spanish; seven teachers of French and seven teachers of English.

### 4.2. The teaching action

Concerning the teaching action and the teachers' professional experience, the participant teachers were asked to express their degree of agreement or disagreement with each statement. The results are shown in Table 1:

Table 1. Teachers' perceptions towards the teaching action.

Teaching...	Strongly disagree	Partially disagree	Undecided	Partially agree	Strongly agree
...is to profess knowledge.	1	0	1	6	7
...assumes the intention to produce learning by the student.	0	0	1	7	7
...is to pass on knowledge.	0	1	1	6	7
...aims at facilitating the construction and appropriation of knowledge by the student.	0	0	0	5	10
...implies mastery of subject area knowledge.	0	0	0	5	10
...involves the reconstruction of the curriculum taking into account the students' contexts.	0	1	1	6	7
...implies necessarily the effectiveness of learning by the student.	0	0	0	4	11

The given answers express mostly the partial and strong agreement with the provided statements, which confirms the complexity of the teaching action. This complexity is present in the passing on of “knowledge that one possesses” (Roldão *et al.*, 2009, p.142, translation by the authors) and that the teacher openly declares. It is also directly linked to an intention of “promoting learning and appropriation of knowledge by others” (Roldão *et al.*, 2009, p.142, translation by the authors). However, corroborating Vieira *et al.* (2010), teaching is not only about knowledge, but also “to think, to encourage students to identify and solve problems, helping them create habits of thought and action” (p.59, translation by the authors).

From the participants’ point of view, the teaching action still aims at facilitating the construction and appropriation of knowledge by the students and, according to Roldão (2007b), this happens whenever the teacher “organizes and structures a set of actions that lead others to learn. This is (...) what defines teaching” (p.36, translation by the authors). However, *Teaching* also requires the mastery of subject knowledge based on both theoretical and scientific basis, which is inherent to the teaching function (Roldão *et al.*, 2009), i.e. the possession of specific knowledge that derives from the breath of professional skills considered necessary to good teaching performance (Roldão, 2007b; Roldão *et al.*, 2009).

The majority of the participant teachers agreed strongly that *Teaching* necessarily implies the internalization of knowledge by the students. However, and once more in corroboration with Roldão’s theoretical perspective (2004), the teacher intentionally teaches topics to the learner, which the latter, according to his/her abilities and effort, will have to learn. As a result, the intention to teach does not necessarily imply an effective outcome as the teacher’s action “towards the student is largely intransitive” (Roldão, 2004, p.98, translation by the authors), despite being transitive towards the subject knowledge. In addition, we aimed at characterizing the everyday curriculum practices that participants have claimed to implement in their classrooms. Therefore, teachers were asked to estimate the frequency with which, in the planning, realisation and regulation of school activities, they put into practice each of the listed activities, bearing in mind that “[t]he individual or collaborative setting (...) includes metacognitive tasks such as planning, monitoring and evaluation, central to the development of self-determination and social responsibility” (Vieira *et al.*, 2010, p.24, translation by the authors).

As a result of this research and as far as the flexible and open activities at the planning stage are concerned, we concluded that teachers generally take into consideration the purposes of the contents they teach and their performance. They also do regular collaborative work with their peers; adapt the planning of indoor activities to the students’ contexts and characteristics as well as the monitoring and redirection of educational activities as a way of contributing to the improvement of educational results, as required by legal regulations.

Regarding the analysis of the realisation of the school activities, it can be inferred that the participant teachers contextualize learning very frequently in an environment of mutual respect and interaction through “effective management of communication processes and interactions in the classroom” (PME, 2010a, p.52301, translation by the authors).

The participant teachers also affirmed to foster learner autonomy and pair work using the Information and Communication Technologies, which are technically adapted to students, and value the processes of teaching and learning. However, it is also worth mentioning that, when carrying out school activities, the teachers seldom articulate curricular subjects, perhaps due to unfamiliarity with the curriculum of other subjects, which can owe itself to the lack of a collaborative culture. Finally, this non-promotion of inter - relationships among the different areas of knowledge affects, in Goodson’s perspective (1997), not only the processes of teaching and student learning but also contributes to a fragmented view of knowledge .

As far as the evaluation of the teaching activities is concerned, the participant teachers stated that they regulate student learning through self-assessment practices, which implies according to legislation, “the analysis of educational activities and its reorientation towards improvement on teaching and its outcomes” (PME, 2010a, p.52301, translation by the authors) , i.e. the monitoring of teaching and learning (Vieira, 1993;Vieira *et al.*, 2010) .The lower frequency in the use of diagnostic evaluation each time a new unit is started, means that teachers perform diagnostic activities less frequently when compared to other practices of assessing learning.

Figari (1996) agrees that the diagnostic activities should precede action and be predictive, as long as they identify the needs to be met and diagnose problems. According to Stufflebeam (1980), those activities constitute an assessment of contextual nature.

### 4.3. Supervision in the context of the Appraisal of Teachers’ Performance

In the following stage, we intended to understand the perspectives of the participant Foreign Language Teachers about the Appraisal of Teachers’ Performance, with reference to supervision as shown in Table no 2.

Table 2. Perspectives about the Appraisal of Teachers’ Performance.

In my opinion, the appraisal of teachers’ performance...	Strongly disagree	Partially disagree	Undecided	Partially agree	Strongly agree
...is the only way to progress in my career.	4	2	3	3	3
...provides teacher growth beyond the current level of performance.	2	3	2	8	0
...is a formality without consequences in the improvement of teacher practice.	1	5	1	7	1
...is an instrument of control of teaching at school.	1	2	1	9	2

...causes the relationship between the evaluated teacher and the peer evaluator to be hierarchical.	1	5	1	6	2
...rewards merit and dignifies the teaching profession.	5	3	3	4	0
...fosters the reflection upon practices as a way of improving teacher performance.	0	3	0	8	4
...makes value judgments about the overall quality of teacher competences.	1	1	2	8	3
...contributes to teachers' professional development.	1	3	2	8	1
...is an opportunity to take risks and experiment with new methods of teaching.	1	4	3	5	2
...increases the competitiveness among peers.	0	1	2	6	6
...makes use of data collection based on individual criteria.	2	3	3	6	1
...is merely a bureaucratic ritual.	1	2	3	3	6
...promotes collaborative work.	3	1	1	8	2
...contributes to the identification and resolution of problems.	1	1	4	7	2
...aims at school development.	1	4	4	6	0
...enables identification of professional needs.	1	2	3	8	1
...recognizes the complex and multidimensional nature of the teaching action.	0	5	4	4	2
...makes use of data collection based on standardized criteria.	0	1	4	10	0
...causes the relationship between the evaluated teacher and the peer evaluator to be non-hierarchical and reciprocal.	0	1	4	9	1

Thus, the participants' perspectives about the appraisal of their performance were somehow divided: on one hand, the appraisal of teachers' performance was perceived as the only way of career progression, i.e., six participants agreed partial and strongly with this view, whilst, on the other hand, six participants disagreed proportionally. This reveals that for six participants, professional development aimed at progression doesn't owe itself solely to the appraisal of teachers' performance. On the other hand, eight teachers partially agreed with the fact that the appraisal of teachers' performance fosters professional development, while seven teachers agreed partially with the fact that the appraisal of teachers' performance does not improve pedagogical practices. This means that as far as innovation and change in practices are concerned, the majority of participants does not recognize any impact of the appraisal of teachers' performance on their teaching practices.

It is also worth mentioning that the majority of participants partially agreed with the idea that the appraisal of teachers' performance seems to act as an instrument of control of teaching at school, leading the teachers to "an administrative role of control where efficiency and productivity are the watchword" (Formosinho, Machado & Oliveira - Formosinho 2010, p.140, translation by the authors), as far as accountability and professional as well as bureaucratic control of the appraisal of teachers' performance are concerned (Formosinho, Machado & Oliveira - Formosinho, 2010).

Furthermore, eight teachers partially and strongly agreed with the fact that the relationship between the evaluated teacher and the peer evaluator is hierarchical from an evaluative perspective. On the other hand, ten teachers agreed that this relationship was nonhierarchical from a supervisory point of view. This discrepancy between two opposite positions might have to do with the experiences teachers went through during their formal appraisal. However and according to Vieira (1993), this kind of non-hierarchical relationship may lead to professional development with the objective of improving teaching practices.

Eleven teachers out of fifteen considered that the appraisal of teachers' performance allows the making of value judgments over *Teacher Performance* and, according to nine teachers, the appraisal of teachers' performance contributes to their professional development. Additionally, seven teachers saw it as an opportunity to try out new practices. In a consistent manner, twelve teachers considered that the appraisal of teachers' performance increases the competitiveness among peers, which is reinforced by the idea that, despite the effective collaboration among peers to provide equality in the situation in which supervisor and evaluator are the same person, "one cannot help pointing out the difficulty to put fully into practice this ethical imperative between peers" (Vieira *et al.*, 2010, p.130, translation by the authors).

Another reason for this might be the fact that the percentages to access the highest marks in the Portuguese grading system allow career progression to only 20 % and 5 % of the evaluated teachers respectively (PME, 2010a; 2010b). On the other hand, most teachers agreed with the fact that the appraisal of teachers' performance is merely a bureaucratic ritual. This fact seems to be in accordance with a summative perspective of the appraisal that Formosinho, Machado & Oliveira-Formosinho (2010) consider to "involve a tension between development and professional accountability, professional supervision and bureaucratic control" (p.110, translation by the authors).

From the obtained results, it was possible to infer that the participants' perspectives are supervisory in some aspects, but tend to an evaluative perspective of supervision in others. For instance, the supervisory perspective of appraisal of teachers' performance seems to prevail upon the evaluative one, as far as the teacher's professional development and experimentation of new practices are concerned.

Consequently, the moments of reflection upon pedagogical practices between the evaluated teacher and the peer evaluator are predominantly on a one-on-one basis in the appraisal of teachers' performance process and aim at promoting the teachers' professional development. Besides, they also foster the making of value judgments on the teaching performance, despite the use of mostly standardized data collection criteria. These criteria were set up by the Portuguese Ministry of Education and Science and based on four dimensions of the teaching performance, being the dimension of *development of teaching and learning* the one we based this study on. The data collection criteria may also affect the appraisal of teacher's performance in the classroom, from the moment the teaching action is subjected to value judgments by the peer evaluator. Finally, the competitiveness factor between peers from an outcome perspective and in opposition to collaborative work in a supervisory perspective, may owe itself to the individual experiences teachers had undergone during their formal assessment. To sum up, the appraisal of teachers' performance does not seem to dignify these participants' teaching work.

At last, it was our purpose to identify possible indicators, both positive and negative, that teachers of Foreign Languages and Cultures associated with supervision in the context of classroom observation. The positive and negative aspects reported by the participant teachers were as follows:

Fig.1. Positive aspects of supervision.  
Fig. 2. Negative aspects of supervision.

The three positive qualities of supervision most referred to by the participant teachers were: *Promotion of reflection and questioning practices* (27 %), which can be justified by the teachers' perceptions of supervision of the teaching practices, seen as a monitoring process of the practice "through reflection and experimentation procedures" (Vieira, 1993, p.11, translation by the authors); supervision based on *constructive criticism* (24%), which can be characterized as dialogic, democratic, bi-directional, of shared responsibility and metacognitive in order to enhance learning. Besides, it can also improve the appraisal of teachers' performance as, from Stenhouse's point of view (2003), "only the critical function serves the transformation of practice" (p.20, translation by the authors) and finally, the participants pointed out the *sharing of practices and experiences* (20%) which leads to "shared reflection upon educational practice" (PME, 2001, p.5570, translation by the authors) within the group that teaches the same subject. As a result, the majority of our sample revealed a high level of agreement on these three options, completing 71 % of the given answers.

As far as the negative aspects of supervision are concerned, pie chart no 2. presents the following results: *reduced impact* [of supervision] *on curricular practices*; *reduced number of observed lessons* and *artificiality* were pointed out by 18% of the participant teachers each. Teachers recognized that supervision had little visible impact on their practices during the formal appraisal of their performance. Furthermore, they also admitted that the number of lessons observed by their peers had been clearly insufficient and endowed with artificiality, since only a higher number of continuous classroom observations of the teaching practices would be able to provide a self-, more rigorous and thorough analysis of the teaching performances, as well as of the appropriateness of continuing or replacing the observed aspect in the classroom (Reis, 2011). As a result, the artificiality of the appraisal process seems to derive from the fact that the participant teachers were legally forced to go through it. In the end, our sample reveals the same degree of agreement on the three most mentioned options, completing 54% of the given answers.

## 5. Conclusions

In accordance with our findings, we believe in the importance of fostering innovation and change in curricular practices by knowing those practices systematically and in depth as well as their facts and constraints, so that the appraisal of teachers' performance can take place naturally, continuously and less bureaucratically. We also suggest that teachers promote students' active participation and involvement in curricular activities, so that the teaching action can fulfill its function and achieve its ultimate goal— Learning.

Finally, teachers' career progression should take place beyond the two formal moments of appraisal of performance, so that the teachers wouldn't see it as a bureaucratic and standardized ritual. From the moment it is neither perceived as sufficient for innovation and improvement of teaching practices nor blended with moments of reflection, the appraisal of teachers'

performance has to involve necessarily more formal and informal moments of observation of teaching practices, as a means to help enhance the participant teachers' perceptions about their own appraisal, generally perceived as an artificial process of regulation.

Finally and despite not being compulsory for all teachers, the two formal and legally-imposed moments of classroom observation that occur every two school years, have proved to be clearly insufficient to reverse the idea that the appraisal of teachers' performance does not dignify the teaching profession.

## Abstract

The paper explores the use of Internet and social media in practical language teaching and learning. Nowadays there are many ICT applications and tools that can be used for language educational purposes but teachers should be able to select which one really make the learning process more effective.

The paper is divided into four sections. The introduction is followed by presentation of new interactive tools for practicing oral production and interaction in foreign language that were created within the framework of the SpeakApps project. The project was funded by the European Commission within the Lifelong Learning Programme with its main purpose being to provide holistic ICT-based services and pedagogies to practice oral competencies online.

Next section addresses the practical use of the Internet resources for developing writing and reading skills. As the conclusion the scenario of foreign language lesson with the use of ICT is provided as a sample. The scenario was designed for students who are learning Polish as a foreign language but can be easily adopted to teaching any other language.

## 1. Introduction

We live in the era of progressive digitalization. The newest technologies can be found in almost all the areas of human activities: private, social and educational ones. A new generation of students starts academic education; they do not know the world devoid of the access to the global network. Therefore, it is more and more noticeable that we need to include new technologies in the process of foreign language teaching. Many researchers studying language teaching agree with the motto offered by Turula (2010: 59): *If you can't beat them – join them*, stating that “if our students – digital natives – already exist and function successfully in virtual reality we should educate them in their natural environment instead of trying to invite them to lessons in our world”.

Skillfully applied multimedia can play a huge role in the process of teaching and learning. They enable the learners to discover selected fragments of reality available online; they help develop cognitive skills and, at the same time, are sources of new information and skills. That is why they have important functions from the didactic perspective: cognitive, educational and didactic (Wenta 2004:377). Wenta pays also attention to motivating roles of applying multimedia in the learning and teaching process:

*Activities converting the reality, including iconic and symbolic reality, are a particular function of information media as they enable comprehensive activation of learners in the process of information support, which can contribute to the increase in educational efficiency. It is connected with the fact that the learners have to perform both intellectual and manual activities in order to acquire the skills because modern educational media are usually interactive and require active participation in the form of searching for information and intellectual processing (Wenta 2004: 378).*

Owing to Internet we can also access an enormous number of various written and oral texts at differentiated communication levels: from interpersonal, group and institutional to mass communication. It is particularly important because, as U. Żydek-Bednarczuk (2005:13) writes “Each communication level has its own theories and also creates specific texts. [...] At each communication level there are differentiated utterances”.

E-mail address: [adriana.prizel-kania@uj.edu.pl](mailto:adriana.prizel-kania@uj.edu.pl)

This article is aimed at presenting the possibilities of developing language skills with the use of multimedia, and particularly Internet, which *being a communication channel integrates all other communication channels – both mass and interpersonal communication – and constitutes the restoration of communication channels that exist and are used in natural and social environment as well as offers new, undiscovered so far communication channels that are characterized by new features resulting from the environmental properties they exist in* (Drzewińska 2008). The description of practical Internet application in language education shall be presented on the example of Polish as a foreign language teaching; however, the proposed methodological and technical solutions shall be certainly used also in didactics of other foreign languages.

When we think about foreign language teaching we mean mastering language skills with sustainable development of grammar and lexical competencies. According to surveys carried among 150 foreigners learning Polish language the most important skills are as follows: speaking (84% respondents assert the skill as “very important”) and listening comprehension (75% respondents said it was “very important”). The following skills are marked as follows: reading and writing (66% and 45% respondents valued them as “very important”, respectively). The research was planned and carried within the SpeakApps project implemented since January 2011 in the Center of Polish Language and Culture in the World by the Jagiellonian University in cooperation with the following universities: Barcelona (Universitat Oberta de Catalunya), Ireland (Dublin City University), Finland (University of Jyväskylä) and Holland (Rijksuniversiteit Groningen). The SpeakApps project has been created for foreign language learners who want to master their communication skills with respect to speaking and listening comprehension as well as for teachers who like to apply the newest solutions in their work offered by Information and Communication Technologies.

## **2. Langblog, Videochat and Tandem – new opportunities for developing speaking and listening comprehension skills**

Speaking is one of the most important skills when we learn foreign language. Speaking is also one of the hardest skill to put into practice because of complexity of speaking process. This section explores the use of those interactive tools for practicing oral production and interaction in foreign language that were created within the framework of the SpeakApps project. The project was funded by the European Commission within the Lifelong Learning Programme with its main purpose being to provide holistic ICT-based services and pedagogies to practice oral competencies online (more information about project can be found on the website: [www.speakapps.eu](http://www.speakapps.eu)).

Within the SpeakApps project there are tools for interactive teaching: LangBlog, Videochat and Tandem. The tools let teachers introduce differentiated activities that help improve production skills and oral interaction. They can be used for individual work (LangBlog), for pair work (Tandem) and for group activities (Videochat). LangBlog is a tool enabling the learners to directly record their statements in video or audio format, share them on the platform as well as listen to and comment on the materials shared by their friends from the group. As other tools it can be used both during online and traditional courses as a medium supporting the development of oral communication skills. In order to encourage students to use LangBlog teachers should prepare such tasks that require from the students recording oral statements and listening to files shared by the other learners. The tasks can be long-term, e.g. systematic sharing of impressions related to their daily life in Poland – students can in this way, for example, recommend good restaurants; talk about cultural events they participated in; make plans for going together to the cinema or theatre; share their recommendations for interesting places or where to do cheap shopping... The list of possibilities is probably unlimited. Students eagerly share their recommendations and listen to and comment on suggestions of other learners because the proposed range of issues is consistent with their interests and needs. LangBlog is also an excellent support for students who prepare to take the speaking part of certificate exams at the selected advancement level. Students can record their speeches on topics included in materials elaborated by teachers as examples of exam topics. Therefore, the teacher can offer adequate support while the student can listen to the recording for many times, find mistakes, correct them, evaluate and, thus, improve the language skills individually.

A tool devoted to the development of interaction and mediation skills is Tandem designed for pair work. The applied technology enables designing activities with information gap, activities consisting in the choice of the best variants or “find the difference” also online. The characteristic feature of such activities is the need to prepare two versions of complementary materials. Students working in Tandem obtain two specially prepared sets of materials, e.g. pictures with several differences or sets of graphic materials that need to be arranged in a determined sequence pursuant to determined criteria (the materials can include for example photos presenting various ecological disasters and the learners have to arrange them from the most to the least dangerous in their opinion).

The third tool is Videochat, i.e. videoconference that enables synchronic communication of up to 6 people. With the use of Videochat it is possible to introduce various discussions, organize role playing, prepare projects or discuss the contents of articles, audio recordings or video materials. It should be also added that the use of the tools enables the access to the enormous database which is Internet. Therefore, it is possible to share links to interesting articles, radio programmes, podcasts, films, commercials or photos that stimulate communication. Links can be shared by teachers as well as students. Offering the learners an opportunity of sharing their own materials is a step in the direction of learner-oriented teaching. In the case of mastering speaking skills it is especially important because the main motivation for speaking is, first of all, communication need connected with functioning in a given language environment, and secondly, internal self-expression need.

The primary advantage of LangBlog, Videochat and Tandem tools is the possibility of integrating the tools with local educational platforms. At present they are integrated with a Moodle platform and that is how lexical and grammar activities and tasks aimed at mastering communication skills are fully integrated. Prepared tools are the answer to the needs of students and teachers who are involved in language education online. So far foreign language learners online did not have so many opportunities of developing speaking skills as learners in the target language country. Now the gap is filled by SpeakApps tools.

The created tools are also exceptionally valuable supplementary tools or even supplementary tools for traditional classes, first of all, because it is possible to plan activities developing oral communication skills as homework. Technological solutions enable the consolidation of speaking skills which are easily forgotten. The recording and repeated listening to own speeches lead to self-evaluation of the learners' progress while teachers can provide students with adequate support.

### **3. Hypertexts, webquests and blogs – the development of reading and writing skills online**

Another skill that can be efficiently developed online in this way is reading. As Komorowska writes (1999:186):

*Reading is the only skill that can be successfully trained alone by the learner. Therefore, reading is the most efficient support for mastering all the other skills as in the process of reading the newly acquired words, expressions and structures are repeated and memorized.*

Internet creates additional opportunities for developing the skill because it is a source of countless texts from all the areas and fields, of differentiated styles, functions and addressees. By using online resources learners deal with hypertexts, i.e. texts divided into fragments interconnected by various references. References are in other words hyperlinks that distinguish hypertext from traditional texts. Nonlinear text structure means that there is not a predetermined sequence of reading and the readers themselves determine which fragments of the text they want to read and when. As P. Szerszeń notices (2011:28) the structure of texts online reinforces autonomous decisions of learners as they are forced to undertake decisions while reading. "In this way learners are required not only to manage the navigation of the hypertext structure but also, first of all, the ability to find the required information, process it, organize data, create terms and, frequently, use symbols."

WebQuest activities, becoming more and more popular in foreign language teaching, consist in collecting necessary information and solving problems. Learners get involved in a team task and the main, and practically the only source of information are online resources. P. Szerszeń (2010:56) underlines the role of mastering the skills of fast and efficient search for information in foreign language and processing and using it for various purposes. An example of such a task can be planning a few day trip to another city. The learners are given guidelines as for what kind of information they need to collect – the topics include transportation, accommodation, meals, tourist attractions taking into account individual interests and interests of their friends. Thus, the search scope assumes reading various texts and the application of various reading types. Learners may therefore use both selective reading (consisting in the search for specific information and, in consequence, the selection of crucial and less important information), global reading (with the purpose of general understanding of the text) and detailed reading (detailed understanding of the entire text), and at the same time use various strategies (Lipińska & Seretny 2005: 194). Apart from local (detailed), global and metacognitive strategies characteristic also for printed texts, navigation strategies are also important here (Konishi 2003). The strategies include as follows:

- navigating to other pages,
- opening several articles in various bookmarks and shifting from one to another,
- using internal search engines on websites,

- using shortcut keys.

It is worth mentioning that skilful navigation of Internet websites can have an impact on the task completion time and efficiency (Bucko 2010: 36). Finding necessary information to a large extent depends on properly formulated search terms in the search engine and the selection of adequate keywords. It is connected with another skill which can be successfully developed with the use of multimedia. Before we present examples of activities related to the construction of written texts it is worth thinking for a while about the stage just before writing, i.e. grammar and vocabulary exercises. Also in this area the newest technologies can be useful, especially online learning platforms which allow learners to access various types of online exercises. Chudak (2003:58) points out six primary advantages of the application of interactive exercises during language classes:

- learners receive feedback with respect to each answer, which is not always possible during traditional classes,
- learners cannot check the solution before completing the activity so there is no risk they cheat while doing the task,
- wrong answers are accompanied by comments and additional directions which facilitate the correction,
- learners can use any type of information or support that can be helpful while solving the tasks,
- usually after the completion of the work it is possible to get acquainted with the statistics of errors and further analysis, learners can work in accordance with their needs and capabilities.

The first thought about the form of using Internet for developing writing skills is e-mail – correspondence between students or between students and a teacher is an excellent opportunity to create written texts of various length. Examples of the application of the tool can be stories written together (in this case Google Docs application can be even more useful) where individual learners write the subsequent fragments of one story. The resulting text can be analyzed together in the classroom, introducing necessary corrections with respect to grammar, style, vocabulary and composition.

Also writing a blog can be used for educational purposes. Learners at more advanced levels can in this way share their impressions from the stay in Poland. Their posts and observations are also an interesting starting point for the discussion on cultural and traditional differences, which boosts intercultural sensitiveness.

Another valuable method of improving and consolidating skills in foreign language is creating websites. These are long-term projects that require lots of work; however, they are of great value. The subject of the project can be connected with cultural or historical differences in the country of the language the learners are studying. Thanks to many templates of websites where placing information resembles using word processing learners can focus on language content and the form of the created website. Examples of such activities include, among others, “Subjective map of Krakow” created as a summary of a project implemented at all the advancement levels during a 6-week course of the Summer School of the Jagiellonian University in 2010 (<http://poprzednia.uj.edu.pl/SL/mapa/>). The presentation of work results in an attractive form that is additionally documented is exceptionally valuable also as a positive motivation for further education.

#### **4. Example of a scenario for using ICT and social media**

Topic: How to find a good job in Poland?

1. Students read a hypertext selected by the teacher and devoted to the situation on the employment market in Poland.
2. Learners complete various vocabulary exercises on the Moodle platform.
3. Students complete the “Vocational preferences” test (<http://testy-zawodowe.pl/testy/preferencje-zawodowe>).
4. Each student records a short speech (about 2 minutes) entitled “*For me the most important thing in work is...*” and comments on three selected speeches shared by other students from the group (Langblog).
5. Learners edit their profiles on a Polish business portal, e.g. Goldenline <http://www.goldenline.pl/>.
6. Students search for information on “How to write a good cover letter” and using Videochat together prepare a cover letter template.
7. Students complete exercises that develop competencies of creating and editing texts on the Moodle platform.
8. Learners search for a recording/film explaining how to get prepared for the job interview and on that basis they elaborate a “Guide” (a circulating document of Google Docs type).
9. Students search for an offer to match their needs on a selected Polish employment portal, e.g. <http://www.pracuj.pl/>

<http://infopraca.com.pl/>

10. Learners write a cover letter in response to the selected job opening and send it via e-mail.

11. In pairs students role-play a job interview (Tandem).

In the scenario presented above there are several activities developing language skills based on technological solutions discussed in this paper. However, the basis for language development are multimedia texts and files available on the Internet which is the treasury of plentiful information as well as global information garbage. The ability to search and select necessary data becomes one of necessary skills, which is also underlined by authors of *Common European Framework of References for Languages* (2001), distinguishing from the learning skills within the framework of general competencies important heuristic skills, such as searching, understanding and providing information with the use of materials in foreign language as well as the ability to use new technologies.

# Survey and drawing representation of architecture and environment: different teaching approach for architects and engineers.

Giulia Pellegri

*Department of Architectural Sciences, Polytechnic School, University of Genoa, Stradone Sant'Agostino 37, Genoa 16123, Italy*

---

## Abstract

The project of knowledge is articulated through various techniques of digital representation through direct and indirect surveys, site and architecture direct observation, reading and manipulation of images, comparison between historical and actual maps, with the aim to critically consider the project as an action in progress in place and time through evaluations of possible future scenarios, especially through digital three-dimensional representations. This paper puts into evidence the need to approach in different forms of teaching different forms of teaching Survey and Representation of architecture and the Environment at the Polytechnic School of Genoa diversified for the courses of Architecture and Civil and Environmental Engineering. The interdisciplinary approach is essential and at the same time determining the educational aims : planning, intended as a deep change in relations between the visual and historical memory of the place and the image that the territory acquires by the "new", requires a capacity for critical reading of the natural and anthropic landscapes in order to provide knowledge, through a stratified description of places.

The courses develop a central theme articulated for topics studied from groups of students, all centered on the matter of the architectonic, urban and territorial representation, comparing the different techniques of the traditional sketch and the contemporary figurative languages (*the project drawing and its performance is addressed through the analysis of a path that highlights the potential conformation and representation of new digital tools. Topics:* • *Representation and modeling of architecture in the era of digital media.* • *New means of communication and creativity in the representation of contemporary architecture. We analyze the theoretical principles of topological surfaces, of hypersurfaces, and architecture of transarchitettura liquid up to design experiments and experiences of these concepts* ) according to different levels of knowledge

## 1. Architecture Survey

The figure of the Professor of drawing Representation, at the University of Architecture and Engineering involves a capacity of synthesis of intrinsic and extrinsic characteristics of the discipline of Draw and Survey targeted to different purposes of professional education and training. The Faculty of Architecture in Genoa, Italy, from 2013 sees its transformation into the Polytechnic School (Architecture-Engineering) with the intent to train a professional who has an intellectual and cultural humanistic, and scientific-technical background, in order to be able to develop a plan at the different scales (building, restoration of historic heritage, landscape, etc..) from an in-depth knowledge of complex, cultural, environmental, technical and procedural issues. In relation to the objectives set out in Directive 36/2005/CEE (ex Directives 85/384/EEC and 86/17/EEC 85/14/CEE) the students of the Polytechnic School – Architecture acquire competences about: Design activities related to architectural design refers to different scales from a single building, to the relationship between the spaces, the city, the region and the environment structure, as well as on the existing intervention project, historical and/or modern; the possession of the principal terms of the theoretical lines of the architectural debate in contemporary culture; an adequate mastery of the history of architecture as a fundamental element of the interpretation of the past and of the cultural and methodological basis from the point of view of the signs and meanings; the preparation in the area of techniques of representation and communication as a tool for understanding and modeling in order to understand the project of the physical space. I personally teach at the laboratory of Drawing Representation and at the course of infographic representation in the first year, in order to immediately provide the student with the necessary tools for the proper conduct of expression of the disciplines of the project. For this professional figure the role of the discipline of survey is not only a mere geometric and metric data measuring, but it is a form of knowledge aimed to the architectural project, conservation and restoration approach. During the course of drawing representation special importance is given to the freehand Drawing from life as a first approach to the study of direct and indirect Architectural Survey Project.

E-mail address: pellegri@arch.unige.it

The phase of survey campaign is necessary after a series of lectures on ARCHITECTURAL Draw. The fundamental aspect of the architectural draw is the "reduction" to two-dimensional form of the three-dimensional space of architecture, through appropriate reduction scales. The "Concept of architectural draw" already includes, from antiquity, drawing of all aspects of the process of understanding, planning and communicating architecture planning and of all those addressed to the representation of the existing (survey drawings) to the different purposes of conservation / restauration and study of architecture (treaties, manuals, collections of drawings).

When we talk about architectural draw, we are referring to the drawing as a tool for the architecture, to represent it, and to do it, describing it towards all other possible draws, which tend to other purposes. It is therefore not only the subject to characterize this type of architectural drawing representation, and differentiate it from the architecture design (subject to architectural) and from the scenographic one. It is quite the architectural intention, manifested before the choice of the subject of what we wanted to represent or highlight; then the method of representation, the technique of execution, sometimes by certain conventions, and above all, at the end, to give to the survey and draw the architectural character.

The graphs of architectural draw can be classified into two main types: extrinsic and intrinsic classification.

The extrinsic classification consists of several categories:

1. Depending on the purpose: studies on sites and surveys, through proportioned measurement, or with accuracy, by instruments; sketches and drawings of the project, ranging from the study of the architectural sketches, graphs of plants, sections, elevations, axonometric, perspective, architectural, structural, technological and decorative details (the same survey procedure); perspective views; fantasies; architectural visions;
2. Depending on the method of representation: central projection or perspective drawings, isometric drawings, orthographic projection drawings (plants, facades, sections);
3. Depending on the scale of reduction of the drawing, in the three reading scales: design detail or particular (from scale 1:1 to true, to a scale of 1:25); overall design of individual buildings (scale 1:50, 1:100); design of urban areas and urban structures (scales 1:200, 1:500, 1:1000) and urban, and environmental cartography (scale 1:2000, 1:5000, 1:10,000).
4. Depending on the instrumentation: design with precision tools (squares, rulers, calipers ...); freehand drawings; CAD drawing (the computer aided design);
5. Depending on the technique: just outline drawings, in light and dark, in colour.

The classification intrinsic divided into two categories the architectural drawings, depending on the intention of the architect or engineer rather than an artist: Expressive drawings or Technical Drawings

With these premise the Survey Drawing is the set of operations to determine the shape and size of a building, through a series of drawings (plans, sections, elevations, details), which allow to bring as many features of a building, then a knowledge as widely as possible, including historical-critical documents Archives, and the state of preservation, the fundamental basis for decisions to be taken regarding the building itself. Therefore, a more real "operation knowledge," criticism, which is not a mere drawing representation.

The class' lectures and seminars, will all aim to the comprehension and mastery of the volumetric, spatial, and contextual meaning of the studied objects – both existing and in progress ones. Different kinds of processing are in use: -traditional freehand drawings (sketches, outlines, perspective drawings, axonometric) -bi-dimensional-graphic drawings prepared with traditional methods (orthogonal and axonometric projections) -computer-aid drawings (CAD systems) -tri-dimensional graphical processing (3D) -the rendering process, for both surveys and planning drawings. A complete contextualization of the studied object is addressed by analyzing not only the metric, geometric, and figurative aspects, but also its historic and critic ones, because students will always have to evaluate his/her proposals within the context of the already existing environment, thus compare his/her graphic works with it.

On this basis, the teaching for the architect sees the representation of Surveying Architectural direct and indirect (laser-scanner photogrammetry - photorectifier) aimed to the survey of detail, starting with the free-hand drawing and continuing with the more sophisticated digital representations.

The approach to the actual topic of the relation between the idea and the graphic representation of an idea to the planning level has radically changed compared to the past, really it just apparently denies the memory of the primary slight knowledge of the design meant like draw of the real; it is going away from the consolidated graphical languages that it is believed to have removed the traditional languages, but is just the relation with the history of the graphical –planning representation that allow us to perceive this great change in the perception of the spaces, quite denying the real spaces and trespassing in the cyberspace, enjoying our age, of the ability to create a space "beyond". Fundamental for the understanding of new "means" it turns out to be the analysis of an iter that leaves from the theoretical principles of architecture of the superficial topologic, of the hypersurfaces, the transarchitecture and the liquid architecture until the experiences and to the project experimentations of such concepts. The direct survey, the drawing from life, the investigation by the panoramic to detail are the early steps of analysis aimed to the study of the Survey and after of the Colour Project of painted facades. The composite architectural facade was created as an expression of the lexical composition of the aggregation highlighting the architectural building elements and their interconnections.

From drawing to wire, the yield of shapes, surfaces, contours and tones and textures through graphics, up to a constant enrichment of their baggage of signs and techniques, everything becomes essential to understand an architectural detail, the relationship between architecture and urban configuration or landscape. Drawing from life, visualization criticism, communication, but this obvious assertion is precisely the most difficult to achieve, because, after a long time, you buy the

powers of observation and execution and the readiness of reading actually that allow you to translate the observed reality in an image rich in meaning and can convey to those who view the drawing, the relationship established between reality and draftsman. Just as a subjective model of reality always different and changing, drawing from life is the result of a complex set of shape analysis, for immediate application of geometric concepts, evaluation tonal character selection, knowledge of graphic techniques and, of course, of critical consciousness. In practice drawing from life allows us to observe how things change depending on the brightness, the distance from the point of view and proximity to other elements; allows us to understand that the signs are never an end in themselves, and that doing the technique must not prevail on observation and transcription of meanings. The images acquired during the photographic survey are altered by computer graphics systems with photo-rectifier first and then with shields contrast, the study of tone, of colorimetric curves in order to identify the different color tones.

## 2.Engineering Survey

My cultural background is strongly linked to the world of architecture and When I was asked to teach a course on Infographics Representation of the Environment as part of the Master of Science Degree in Civil and Environmental Engineering, the first question that I asked myself was that relating to the aims and objectives proposed by the degree course. The objective of CL3 is to prepare students to construction and maintenance of civil works design, infrastructure and equipment; design, planning and management of works and control systems, and monitoring the environment and territory; the assessment of the environmental impacts of plans and works, and then to assess their compatibility with the surrounding environment; management and control of the services of companies operating in the fields of civil and environmental engineering.

In particular, the CL3 in Civil and Environmental Engineering has the goal of providing adequate knowledge of methodological and operational aspects of the engineering sciences, both in general and specifically in relation to those of civil engineering, environmental and land; ability to identify, formulate and solve civil engineering problems and environmental (structural and geotechnical problems of civil construction, industrial and infrastructure by addressing the issues of their impact on the environment, problems related to the planning and design of works to defend the territory; problems related to the design, construction and operation of control systems and environmental monitoring) using up to date methods, techniques and tools; knowledge and understanding of their professional and ethical responsibilities.

On the basis of these proposals, I organized the training course in theoretical and practical lessons that could combine the perspectives of the general to the specific course of representation. Representing the Environment and Territory starts from a vast knowledge base, the student confronts issues dealing with a complex system of factors that interact with each other, several factors that contribute to the final formation of the object of study: Planning and Environment.

Starting from the general, then the representation methods of cartography, from its origins to today, from the definitions of territory, environment, landscape, tracing and analyzing critically the main issues of national and international debate, we were able to deal with issues relating to the representation. Drawing means communicating through drawing, signs, symbols, images, and the rational composition of the final drawing graphics; the deconstruction of information and detail is the foundation of critical knowledge of a portion of territory, the same that will make the student able to unite and coordinate all information collected according to a logic immediate communication.

The aim of the course is was to provide a specific preparation, which prepare the student to correctly describe with photographic images and their digital computer processing the architecture, urban and regional environments.

The course acts as a tool for investigation of issues related to reading, understanding and representation of urban space and territory in order to design, conservation, restoration and recovery. The introduction to the technical tools at our disposal (CAD-GIS-Surveying complex hypertext systems) is directed towards a stratified description of the places that takes care of all the complicating and uncertainty factors that can find a dense form of expression and communication. The operation of detection and the choice of levels of analysis and survey, of the scale representation, the forms of the landscape drawing is, in itself, the first step of a critical operation that led to a multiplication of points of view for the realization of communication drawings related to the peculiarities of the places. Complex and articulated systems able to incorporate, justifiably, types, shapes and multiple codes adapting to the evolution of territory and aiming to identify generative rules and processing which contributes to carry out a task as descriptive fundamental premise of structured project assessment and territory planning. The course develops a central articulated theme performed individually for sub-groups that are formed within the course, all centered on the question of representation of urban and regional planning in modern and contemporary art, with a focus on contemporary figurative languages that are structured according to different levels of knowledge: historical notes on the fundamentals of technical and expressive technical Drawing; Introduction to photogrammetry and photographic techniques to taken on the basis of the approach routes of the sites under study (general principles, photogrammetric survey, the photogrammetric, photointerpretation, orthophotomaps, satellite photos); Inspections related to the topic of investigation of the course through routes by land and sea;

- Practical exercises with individual computer workstations for the deepening of the trials of different imaging techniques (Autocad 2011 - Adobe Photoshop Sketch-Up - Perspective Rectifier);

- Photographic Processing (graphic simulation with digital instrumentation).

As the basis there are the theoretical and application knowledge of the drawing representation of space as the context of the environment and the ability to use the design as a tool of investigation and interpretation of the laws governing the formal structure of the elements of the territorial and environmental factors. Through lectures I teach the aims of the urban survey

related to the historical tradition of Italian by the explanation of : methods and tools for the survey and analysis of the environmental context ( the relationship between the natural and built environment, the reference cartography, the importance of environmental data and the definition of its qualitative values); methods and instruments for urban survey trough urban cartography of reference, the importance of qualitative and quantitative data of urban areas, the coding systems, critical reading of the urban fabric of the city center (training and later stages of growth), the reading of vegetation, the cataloging of data and compilation of technical-descriptive summary; The relationship between environment reading and project.

Essential to the proper approach for this type of research is was the seminar of the theoretical approach to critical reflection on: urban responsibility of the project also through the study of the territory (the geomorphological characteristics, development elevation, hydrography, climate, exposure, natural and anthropogenic, roads and infrastructure ; Analysis of visibility: a study of mapping with the observation points from the coast and from internal routes with the identification of the prominent elements, incongruous and congruous.

The active conservation and redevelopment of places require interventions to integrate the objectives of preserving the historical and socio-economic landscape with the revitalization and improvement of the existing conditions in compliance with the specific regulations and guidelines at European and national levels: The European Landscape Convention, 2000; The European Charter for Sustainable Tourism (sustainable), 2000; The National Strategic Plan for Rural Development - Rural Development Program 2007/2013; Global Conference on the Urban Future, Berlin in 2000; Municipal Code of 2004 (DL 22. 1., 2004, n. 42) Municipal Plan for Cultural Heritage and Landscape subject to protection and the study for the definition of the discipline of landscape. Analysis and detection of environmental landscape values of the non-urban territory of Genoa, 1997.

Fundamental for the understanding of the relations between architecture and environment is the 3d studies of the territory and of the settlement (AutoCAD and Sketch Up)

During the lessons in the computer lab tutorial videos are viewed online in the original language with application examples of specific items of use of the program.

Survey and analysis of the landscape , is conducted following a method characterized by three types of approach CHRONOLOGY-STRUCTURAL-PERCEPTUAL:

1.chronological analysis History and layering of events and speeches; survey of the evolutionary tracks; identifying overlapping and permanence. This first phase of the investigation provides the study and analysis of the effect of permanence of resources in the area: both agricultural areas, rural and coastal areas that urbanization, large equipment and infrastructure, with the identification of land and areas subject to pressure.

2. structural Analysis : Mass point of survey instruments designed to identify and compare the status quo with respect to natural and human systems. Natural System: Geomorphology, Hydrology, Vegetation, position, geological indicators, main ridges, river network. Anthropic System: settlement (rationalize data relating to Urban, peri-urban, industrial, rural, cultural, infrastructure; system of green (Open spaces, green areas, historic parks and gardens) and the agricultural system (systems of agricultural landscape, land use , water systems management)

3.Visual-perceptual analysis : perceptual , social and cultural Characters,: preeminent value characters, Emergencies visual points of imbalance. Visual planes, scenic spots: areas and scenic routes, visual variety paintings, openings visual, obstructions visual Visual pictures: beauty scenic, natural areas, main routes, historical and cultural identity; isolated elements, beauty of the whole, accessibility.

Il corso si articola in lezioni teoriche (30 ore) e in esercitazioni pratiche (30 ore) di tipo sia tradizionale che informatico. Le esercitazioni pratiche sviluppano in elaborati grafici, visite esterne ed elaborazioni al calcolatore alcuni temi degli argomenti di lezione, secondo un processo di apprendimento continuo e coordinato tra teoria e applicazioni.

The course consists of lectures (30 hours) and practical exercises (30 hours) at the pc stations. The practical exercises develop into drawings, external visits and elaborations to the computer some of the themes of the topics of the lesson, according to a process of continuous learning and coordinated between theory and applications.

### Abstract

Working on my graduate thesis I started to study the important link between animal cruelty and interpersonal violence with the real hope to develop in my country, Italy, a new kind of education which will be able to develop in children the awareness of the importance to protect every form of life, both human and non human.

Animals as victims are in the same position of women and children because they are in the group called "weak subjects".

Perpetrators of violence, in the major number of cases think that they are strong in abusing the weaker.

In the last years in Italy the "Femminicidio" crimes increased so much that Italian society can't continue to ignore the influence of gender informal education on children and teens.

Macho men are not the future, they must become the past. We need a new model of man, and to develop it, we need education of new generation of boys and girls.

Many clues gave me an intuition: if we want to break the circle of violence we must introduce a new model.

The historical idea of virility in men prevents them to show empathy toward other living creatures and this improves the skill of violent attitude.

A violent person is violent against every subject weaker than him, because violence is not strength, violence is an habitus and as habitus we have as educators the resources to change it and to improve the social appeal of some values: protection vs prevarication, care vs damage, real man vs violent man.

My research confirmed my intuition about the need of construction of a social shared idea of a real and strong man as a man who is compassionate toward the weaker and who feels the moral imperative to protect the weaker, but also a man who is ready to fight for the good of a weaker life as animal life is.

If our children grow up thinking that killing or abuse of an animal is a funny or not relevant thing, also the violence against other humans will haven't the seriousness that it must have.

For this and many other motivations I am researching about the link between social shared Virility idea and cruelty on animals, children and women.

My first data confirm this supposed link and its evidence: the need to educate boys to become "kind men" and girls to want "kind man" as partners.

To realize this ideal man we must start from the childhood, this is the only way to develop the social acceptance of this new kind of masculinity.

**Keywords:** verility, gender education, emphaty, violence, animals, women, femminicidio.

## **Introduzione**

L'argomento della mia ricerca di dottorato si inserisce nell'ampio settore di studio conosciuto in ambito anglosassone e statunitense come: THE LINK (Sorcinelli, 2012).

Il legame, la connessione tra violenza agita nei confronti degli animali non umani e violenza consequenziale agita nei confronti degli animali umani dallo stesso individuo/soggetto/persona.

(tre differenti termini che sono altamente controversi e spesso sono collegati in modo avventato a correnti di pensiero o filosofiche tra le quali non vorrei in questo momento della ricerca decidere).

Ho così deciso di svolgere uno studio pilota, i risultati del mio studio vanno ad inserirsi in quello che risulta essere uno "buco nero" nello stato dell'arte e della ricerca di quel settore disciplinare definibile come: Human Animal interaction. Studiando questo tipo di argomenti una domanda cominciò a farsi strada nella mia mente: e se ci fosse un legame tra desensibilizzazione verso la violenza su animali e socializzazione di genere? Ci sono legami tra il mito della virilità insensibile e la desensibilizzazione alla violenza contro gli animali?

## **Ipotesi e domanda di ricerca:**

Le ricerche in ambito psicologico e criminologico svolte dagli anni settanta in poi in territorio statunitense e anglosassone hanno fatto emergere l'esistenza di un particolare legame, definito "The link" (Sorcinelli, Manganaro, Tettamanti 2012 e Ascione 1999, 2000, 2007), tra la propensione a compiere atti violenti ed abusi su animali nell'età infantile e adolescenziale e la propensione a compiere atti antisociali violenti nel corso dell'età adulta.

Essendoci in letteratura una ampia analisi sulle proprietà di trasferibilità dell'empatia (Ascione 2007, Bellingreri 2005) e avendo trovato cenni in diverse discipline fin dalle più antiche riflessioni degli intellettuali che sono i fondatori della cultura umana, si è iniziato a notare la capacità dell'empatia di essere non solo intraspecifica ma anche interspecifica. È nel collegare questi due riferimenti, la relazione tra violenza su animali compiuta e successiva violenza su esseri umani (Merz-Perez e Heide 2004), e la trasferibilità tra soggetti diversi non solo per sesso, razza, cultura ma anche per specie della capacità empatica, che affiora la mia domanda di ricerca.

Se come le ricerche svolte sembrano farci notare, il legame tra violenza su animali e violenza su esseri umani si basa su una sorta di propedeuticità della prima alla seconda allora la violenza sugli animali merita molta attenzione scientifica potendo assumere un ruolo di "campanello di allarme" (Blazina, Boyra, Shen-Miller, 2011) in uno sviluppo dell'individuo che risulta essere malsano e potenzialmente pericoloso.

1\_ sarebbero interessati educatori, forze dell'ordine e genitori ad avere un incontro informativo su questi temi? Se sì a posteriori mi piacerebbe raccogliere qualche impressione da questi tre diversi gruppi.

2\_ il legame tra insensibilità appresa e violenza a scopo di affermazione sociale è emerso nell'indagine esplorativa svolta qualche mese fa, molto interessante sarebbe l'indagare la possibile relazione tra affermazione di virilità ed appartenenza al genere maschile e violenza su animali, donne e bambini. Guerriero VS Cacciatore

## **Framework teorico e stato dell'arte**

Di seguito presento un panorama generale e molto ridotto visto le necessità di concisione che caratterizzano questa

relazione.

Nel corso degli ultimi cinque anni ho studiato, letto, visionato una ampissima gamma di materiali sui temi affini al mio argomento di ricerca, oserei affermare di aver esplorato la quasi totalità degli studi sulla materia di riferimento. Mi accingo ora a presentare alcuni tra i più significativi ed esplicativi passi di quegli autori che hanno e stanno guidando il mio percorso di indagine.

Studiando i lavori di Ascione (1999, 2000, 2005, 2007), Arluke (1996, 2004, 2006) e Lookwood (1998) ed anche altri studiosi ho iniziato ad interessarmi della relazione che intercorre tra una condotta di vita antisociale violenta e l'aver assistito e perpetrato violenza sugli animali nell'infanzia e nell'adolescenza. La mancata sensibilità verso un essere vivente è un fattore predittivo di un mancato o difettoso processo di crescita emozionale e relazionale. La ricerca psicologica (Muratori, Miller) ci offre alcune evidenze inconfutabili prima fra tutte quella secondo la quale nessun bambino nasce cattivo: tutti nasciamo in un contesto e l'ambiente relazionale che ci accoglie alla nascita e che ci accompagna nella crescita possiede delle incredibili potenzialità di indirizzare e di coltivare le nostre attitudini innate. Un ambiente familiare malsano, o violento porta un bambino a crescere in modo incompleto e a predisporlo ad una condotta di vita a rischio.

La letteratura scientifica e i risultati emersi dagli studi iniziati dagli anni '70 (Kellert e Felthous, 1987, Manning e Serpell 1994) e che tutt'oggi continuano, sottolineano e ben descrivono l'interconnessione esistente tra violenza domestica, violenza su minori e violenza su animali (Linzey 2009). Questo nesso lega le categorie deboli all'interno della famiglia (e della società) in modo indissolubile. Donne, bambini e animali sono i tre soggetti deboli per eccellenza presenti in famiglia. È sufficiente che anche solo uno di questi tre soggetti sia vittima di violenze, maltrattamenti o abusi, per rintracciarne anche negli altri i segni.

Per quanto importante non è sufficiente scoprire i contesti di violenza ed intervenire per farli cessare, infatti all'interno di un contesto familiare violento dove donne, bambini ed animali (Walker 1984) soffrono accade che questa esperienza di vita venga interiorizzata dal bambino e riproposta nel corso della crescita come modello appreso. Si parla a questo riguardo di due tipologie di reazioni alla violenza vissuta in famiglia dai bambini: l'impotenza appresa (ci si immedesima nel ruolo di vittima) e la violenza appresa (ci si immedesima nel ruolo del carnefice).

Il particolare che mi ha intriga al punto da decidere di svolgerci una ricerca di dottorato è stato quel legame ancora per larga misura celato e non esplicitato da alcuno studio che lega genere e risposta alla violenza. La particolare relazione tra l'impotenza appresa e il genere femminile e di converso tra la violenza e il genere maschile, sembra portare in sé il germe di una connotazione sociale ed educativa informale che lega il genere alla reazione seguente la violenza subita in famiglia.

Da tutti gli studi condotti con lo scopo di indagare quanto l'aver incrudelito su animali nel corso dell'infanzia e dell'adolescenza possa essere considerato una "red flag", (Frick 1993) un sintomo di pericolosità sociale futura (Linzey 2009, Wright e Hensley 2003), risulta chiara una spaccatura a livello del genere. I bambini/adolescenti maschi incrudeliscono in frequenza nettamente maggiore su animali rispetto a quanto fanno le bambine/adolescenti femmine (Pagani 2002).

### **Lo "studio pilota"**

A questo punto della ricerca ho deciso di svolgere uno studio pilota per andare a verificare la presenza di tale relazione in contesto italiano considerato che dati e ricerche sono stati svolti tutti in contesti di natura anglofona.

Non trovando esperienze già presenti metodologicamente in letteratura ho dovuto costruire autonomamente lo strumento di raccolta dati. Nel mese di maggio 2013 ho così composto un questionario breve, esplicito e di semplicità quasi estrema. L'intento era quello di vedere se esplicitamente la percezione della violenza su animale fosse considerata più o meno importante, grave e/o riprovevole a seconda dell'appartenenza di genere.

Per questa indagine preliminare ho scelto un campione di convenienza, campione di poco meno di mille ragazzi frequentanti le scuole secondarie di primo grado che hanno accettato di partecipare (alcune non hanno accettato a causa di tempi limitati e impegni del programma già troppo affollati) nella provincia di Belluno, la mia provincia di residenza. L'area scelta è stata questa solo ed unicamente per una comodità geografica ero in cura.

### **Lo strumento di raccolta dati e l'analisi**

Il questionario da me costruito è stato volontariamente composto di poche e semplici domande, senza considerare l'elemento rischioso della desiderabilità sociale proprio perché mi interessava ottenere una visione anche sottostimata del fenomeno, volevo raccogliere solo i dati più palesi, una scrematura molto grossolana.

Dieci domande molto semplici, a risposta chiusa senza la possibilità di aggiungere alcun commento o precisazione.

Non è stato necessario calcolare la significabilità dei dati perché senza volerlo hanno risposto al questionario esattamente 50% maschi e 50% femmine e essendo le mie analisi tutte basate sulla differenza di genere i risultati sarebbero stati sempre e comunque significativi.

L'analisi dei dati è stata affidata ad una elaborazione esterna tramite un software online che mi ha permesso di raccogliere i risultati in tempi brevi e senza errori.

### **Il campione**

Il campione di riferimento è stato un campione di convenienza per la collocazione geografica.

834 rispondenti appartenenti a 7 diverse scuole secondarie di primo grado della provincia, le scuole sono state così divise, 3 di queste site in aree più centrali della provincia e 4 nelle aree più montane. Il range d'età va dagli 11 ai 13 anni, 417 sono femmine e 417 sono maschi.

### **Discussione risultati studio pilota**

Procedendo con ordine si dovrebbe quindi aver chiarito dalla letteratura presentata la relazione che intercorre tra: violenze sui soggetti deboli della famiglia, interiorizzazione del ruolo di vittima o carnefice e riproposizione dello stesso nel corso della vita adulta. La domanda che mi viene sempre fatta a questo punto del ragionamento è:

La ricerca fin qui porta una evidenza interessante perché ha reso chiaro come interiorizzare nel corso dell'infanzia l'abilità socio-emotiva di provare empatia verso l'animale (Marchesini 1994) sia una sorta di fondamento sul quale costruire e far crescere la capacità di provare empatia anche verso gli umani, e in special modo verso quegli esseri viventi più deboli.

Riflettendo sul caso italiano ho individuato quello che a mio parere potrebbe essere il problema di centrale importanza: il problema della cura dei più deboli è delegato prevalentemente alle figure di sesso femminile e secondo questo principio la compassione è una peculiarità prettamente femminile.

Nelle diverse ricerche di cui si può leggere nei lavori di Ascione (2000, 2007) emerge in modo rilevante come le violenze su animali vengano compiute prevalentemente da bambini/adolescenti di sesso maschile, e inoltre come spesso la violenza perpetrata su un animale da un “maschio” venga considerata parte della violenza normale che caratterizza il processo di crescita da bambino a uomo.

La concezione culturale dominante ritiene i maschi predisposti ad essere più violenti delle femmine, e quest'ultime ad essere compassionevoli e dedite alla cura di chi è in difficoltà.

Nei risultati emersi dai dati di questo studio da me condotto possiamo ipotizzare con certezza una sottostima palese del fenomeno a causa della forma dello strumento che inibisce le risposte sincere condizionando il rispondente a dire ciò che ritiene socialmente desiderabile e non ciò che in realtà fa, pensa o dice.

Lo studio condotto ha portato ad un risultato parziale e poco rappresentativo ma estremamente indicativo per la relazione che svela. Infatti con il doppio delle frequenze rispetto alle femmine, i maschi si dimostrano meno sensibili verso le sofferenze ingiustificate inflitte dagli esseri umani sugli animali. Oltre a questo è emersa una interessante relazione tra l'immagine socialmente condivisa di femminile e di maschile, e l'interiorizzazione di una regola non scritta ma funzionante e diffusa dei limiti di espressione di una sensibilità nei confronti dell'animale a seconda dell'appartenenza di genere.

Questa spaccatura culturale giustifica molti degli atti antisociali che i bambini maschi possono compiere nel corso della crescita. Sembrerebbe quasi che ci sia una credenza inconscia secondo la quale non possono crescere “maschi veri” senza che facciano esperienza della violenza compiuta in prima persona. Come se imparare a staccare la capacità di provare emozioni per commettere un atto di violenza possa essere una garanzia di forza e prestantza.

Il concetto di cerchio della violenza ci fa capire come ogni atto di violenza debba essere preso in seria considerazione a prescindere dalla vittima (Myers 2007).

Da queste riflessioni e dalla letteratura studiata ho iniziato a inquadrare il problema legato al mito della virilità violenta, alla socializzazione dell'identità maschile come identità forte, dura e priva di emozioni. In questa prospettiva emerge con chiarezza come possa risultare prosociale la diffusione di un nuovo modello di mascolinità non legata alla violenza ma alla protezione del più debole, alla cura dell'altro. In prospettiva più generale è emerso come l'impianto educativo della Humane Education (Weil 2003, 2004, 2009) che negli Stati Uniti è nato proprio come una sorta di risposta ai dati emersi in questo ambito di ricerca scientifica, sia una risorsa di elevata importanza e ampie promesse per l'educazione delle nuove generazioni ad uno stile di vita prosociale al di là delle differenze di specie, razza e sesso.

Dobbiamo smontare il modello culturale secondo il quale un bambino non può soffrire per un animale mentre una bambina lo può fare, secondo il quale provare il desiderio di occuparsi di chi è in difficoltà sia prerogativa femminile tanto da de-virilizzare il maschio che vi si dedichi, potrebbe stimolare una modificazione dell'immaginario maschile e femminile su questi ruoli e dare vita ad un nuovo modo di socializzazione del genere maschile, un nuovo uomo, l'uomo buono o come Zimbardo (2008) accenna dare il via alla diffusione della “banalità dell'eroismo” come modello socialmente atteso, desiderabile e io aggiungerei virile nella migliore concezione del termine (forte, protettivo e difensivo).

### **Prospettive future**

Migliorare lo strumento di raccolta dati e definire un campione rappresentativo della popolazione nazionale includendo

Nord, Centro, Sud e Isole.

Confrontare i dati italiani con uno studio transnazionale in modo da verificare l'ipotesi di una influenza legata allo stereotipo di genere caratteristico di una cultura ancora rurale e limitatamente aperta al nuovo, quale il nostro paese è tuttora.

Nel prossimo anno abbiamo pianificato di sviscerare la letteratura scientifica studiata e raccolta, migliorare lo strumento di raccolta dati metodologicamente e infine somministrarlo per poterne analizzare i dati raccolti e confermare o meno l'ipotesi.

Nel caso l'ipotesi venisse confermata si pensa di pianificare un intervento educativo al quale sto già lavorando,.

## Abstract

Symbolic approach to education in ethics reinforces our needs for sense, imagination, feeling, spontaneity, language, intuition, and judgments. Symbolic reality expresses the core of humanity by means of the embodiment of *infinitum in finite*. Symbols are zipped files and our goal is to acquire the right program to unzip them properly. Hermeneutic articulation of symbols in Art, suggested by Gadamer, Cassirer and Ricoeur, were the basis of our research. Symbolic approach promotes a sensitive differentiation between Good and Bad, leads to the development of moral sensitiveness, self-identification and integrity/

## Introduction

Globalization and multiculturalism call for the communication. The basis of communication is sympathy, or at least empathy. But in building of a knowledge-based society we orient to leap forward cognitive capacities. The intellectual development is of an utmost importance, so feelings' development is mostly left behind. Existing contradiction between social demands and educational offers can only be solved by means of symbolical approach to the education. Revealing of a symbolic reality pegs at the development of students' sensitiveness, self-identification and integrity, which is very important for Education in Ethics, because main ethical notion and terms are the expression of senses: sense of tolerance, righteousness, love etc.

We've elaborated the study course to develop students' moral feelings by hermeneutic articulation of symbols in Art. This course helps students 1) to address pre-understanding and forestructures; 2) by asking own questions and answering on Other's questions to check and evaluate interpretation; 3) by entering into hermeneutic circle reflect own pre-understanding and forestructures.

## 1.Looking for the Human identity

In contemporary multicultural world the one of the main problem is the problem of self-identity. Sliding images of mass-media, strange understanding and explanations by different cultures make hard for students to acknowledge his/her attachment to one culture or another which was common sense for traditional societies. The contemporary era of mobility is a constantly evolving process since people's values and the availability of resources are constantly changing. As the technologies of human interchange advance, we become increasingly engaged in a world with others – “a socially saturated world” (Gergen, 1991). As a result, exterior plurality of meanings intermixes with interior plurality. The postmodern fragmentation of the world correlates with “multiple identity”. The decentering of the subject alternates with the movement towards the narration of the flow of consciousness. It interlaces with the deconstruction of the self (Derrida), the disappearance of the author (Foucault), and the individual as a terminal in a network of circulating images (Baudrillard). The implication of decentering of the self that has been proclaimed by psychoanalysts and philosopher for at least one hundred years concerns the problems of personal identity.

For example, Lacan and Arend share a conviction that the decentering of the self seeks a concept of identity that avoids two possible but equally unacceptable perspectives: a biological or developmental account that ignores the hermeneutical dimension of identity on the one hand, and on the other, a “phenomenological” account of the Husserlian or Sartrean variety that elevates to a foundational status of freedom and autonomy of intentional subject. In particular, both Lacan's concept of a subject of the

E-mail address: ekaterina.dvoretckaya@iporao.ru

unconsciousness that emerges through “the discourse of the other”, and Arend’s concept of the “disclosure of the agent in speech and action” theorize the inherent variability and incalculability of identities formed through concrete discursive interaction.

Nowadays it is difficult to identify him/herself not only by means of “Blood brother”, but also by the self-denotation to a reference group. But on the other hand, it is very important to acknowledge him/herself as a human being. So the understanding of what does it mean to be a human becomes the most significant for everybody. The grasp of this meaning is possible by familiarizing with classical exemplars of human culture. We could recognize it by the ever-increasing interest and quantity of people going to museums, theaters and philharmonics. Not only Hermitage and Mariinsky theater’s statistics witness it, but also Louvre’s and Metropolitan Museum’s as well.

The underground of this traction to the Art we could find in Lacan’s theory. In his famous “Mirror Stages” Lacan proved that slink (or aborted) human child learns how to control his/her body, hands and legs and how to possess wholeness by looking on his/her parents and other adults, copying their acts. In an analogical sense, we assume that understanding of what does it mean to be a human could be grasped by examples classicized in Art. It could be Fine Art images, literature as well as theatrical images. The best or classical embodiment of humanity in Art’s images gives us ideal embodiment of infinite in finite. Statement of this is possible in symbols. Symbols are zipped files and our goal is to acquire the right program to unzip them properly. Hermeneutic articulation of symbols in Art, suggested by Gadamer, Cassirer and Ricoeur were the basis of our research.

Aesthetic experience as an endless infusion of humanity advances diacritical values that tend to open oneself to the world in other ways. All art is symbolic. Symbolic approach to education in Ethics reinforces our needs for sense, imagination, feeling, spontaneity, language, intuition, and judgments. Externalizing and expressing awareness and values as an integral part of what makes us human leads to increasing a moral sensitiveness. “Art makes visible the cognitive life of the senses, and the imagination” (Abbs, 2003). The visibility of the senses with emotional and strong-willed concentration is represented by symbols. But we should unarchive archived files of symbolic reality in our unconsciousness by hermeneutic approach.

Ricoeur’s hermeneutics as “the art of deciphering indirect meaning” originates and culminates in the thesis that human existence is itself a mode of interpretation. Ricoeur’s hermeneutic arc summarizes the major movements that comprise the act of interpretation: an initial act of understanding, the moment of explanation, and the moment of appropriation. It is the hermeneutic arc that prevents an appropriation from becoming a subjective interpretation. The hermeneutic gesture of genuine openness can play a vital role in promoting the culture of friendship in a globalized and yet profoundly divided and critically differentiated human society. In the spirit of the recognition of the outsider, of the singularly irreplaceable other, hermeneutics can effectively advocate for conflicting interpretations, which do not need to lead to conflicts but rather to responsible action of the capable human beings (l’homme capable) being in-between, that is of that space and time where human desire “takes hold”.

## **2.Paradigm Shift in Education**

The search for new approaches in Education is dictated by modern changes in thinking paradigm and in education itself. Today’s students belong to the “Shift generation” and personify the change of the paradigm of thought themselves. We convince that main features of the paradigm shift reflect contradiction between rationality and visuality. We can’t appeal to rationality, logicity, memory, which were the main characteristics of the knowledge-based paradigm of Education. Shift generation appeals to visualization, associative and allegoric thinking. It helps them to match unmatchable, and not only logically deduce one thing from another. The knowledge-based paradigm of Education is being replaced with communicative paradigm. Social challenges urge forward students not only obtain some knowledge, but to learn how to work in a team, to have their communicative abilities developed. Development of communicative abilities is necessary to survive in indefinite state, which is common for our fast-changing world. For that, it is necessary to be able to develop the ability to grasp the wholeness of the Other and to interpret it. Our study course aims exactly at the development of these abilities.

The ethical education of a new generation should respond to the challenges of the collapse of rationality, to the challenges of a deconstructed and decentralized subject in a fragmentary contemporary world, and to the plurality of Goods. Challenges and calls for elaborating new contents and methods of Education in Ethics make root of the young generation which is called a Shift generation. Allegorical thinking is more character for them than rational, critical reflection. Regular shift from one point to another is a core of contemporary students’ world view and demands interactive ways of teaching and hermeneutic approach to understanding of contents. Symbolic approach to Education in Ethics was elaborated on the basis and with accordance of Paradigm shift. Its distinguishing features reside in

Universalism vs. Pluralism;

Rational vs. Visual;

Analogical thinking vs. Allegorical thinking;

Reflection vs. Hermeneutical articulation.

New content of ethical education is better to look at symbolic reality because the “symbol invites us to think, calls for an interpretation, precisely because it says more than it says and because it never ceases to speak to us” (Ricoeur, 2005).

Gallagher (1992) notes that hermeneutics has not been widely discussed or adopted in the field of education. We agree

that a hermeneutic approach (a) seeks understanding rather than explanation; (b) acknowledges the situated location of interpretation; (c) recognizes the role of language and historicity in interpretation; (d) views inquiry as conversation; and (e) is comfortable with ambiguity. According to Gadamer an understanding is reached within a fusion of horizons. For Gadamer (1996) "Part of real understanding is that we regain the concepts of a historical past in such a way that they also include our own comprehension of them" (Gadamer, 1996)

### 3.The hidden power of the symbolic reality

Symbolic reality is fused into what Geertz calls the "really real," which is created by "...the imbuing of a certain complex of symbols—of the metaphysics they formulate and the style of life which they recommend—with a persuasive authority which, from an analytic point of view is the essence of religious perspective"(Geertz, 1973). These symbol systems make the ethos intellectually reasonable by being shown for representing a way of life adapted to the worldview, and to make the worldview emotionally convincing by being presented as an image well-suited to accommodate such a way of life. Such value of symbolic reality is very important for multicultural education. George F. McLean underlines that "we create and live in terms of symbols that are more inclusive than concepts and more physical than ideas, yet more exalted than sensation" (McLean, 2005). Symbols are the intermediary between the world internal and the world external, between inner and external reality of human being as a person. As Florensky wrote, symbols are the organs of our contact with reality. Symbols are openings that have pierced through in our subjectivity. Symbol is an integral and indivisible quality and the person can bear within him/herself this quality. Symbol is a trace of sacred being in ordinary life. As Umberto Eco mentioned in "Symbol", "Any symbol is an enigma". Florensky defined a symbol as

"Being, when it's more than itself, – this is the basic definition of a symbol. The symbol is something that reveals, through itself, that which is not itself, that which is more than itself, – and yet something that essentially announces itself through this symbol. Let's unfold this formal definition: a symbol is that essence which fuses or mingles its energy with the energy of a more valuable essence. The symbol thereby carries within itself this more valuable essence (translated by Penny Burt), (Florensky, 1990).

This more valuable essence which symbols introduce involves externalizing and expressing one's awareness and values as an integral part of what makes us human. So the intimate contact with symbolic reality promotes the integrity (wholeness) of a person because the only integrated person could act morally.

Moral act bases not only on reason, but also on feeling. In this case it's necessary to teach ethics by interconnection of Good and Beauty. It will lead to development and maturity of feelings. The cultural sphere of representing sensations and feelings is Art. Sensations and feelings as concrete acts of human being are archived in Symbols. Art symbols help us to unzip zip files of symbolic reality in our unconsciousness.

According to Jung, unconsciousness influences all our experiences and behaviors, most especially the emotional ones, but we only know about it indirectly, by looking at those influences. Jung suggested that we possess collective unconsciousness. It is the reservoir of our experiences as a species, a kind of knowledge we are all born with. Contents of the collective unconscious are called archetypes. Jung also called them dominants, imagos, mythological or primordial images, and a few other names, but archetypes seem to have won out over these. An archetype is an unlearned tendency to experience things in a certain way. It acts as an "organizing principle" on the things we see or do. Umberto Eco describes Jung's collective unconsciousness as symbolic reality:

"The contents of the collective unconsciousness are the archetypes, archaic types, universal images, representations collectives: lunar, solar, vegetal, meteorological representation, more comprehensible in myths, more evident in dreams and visions. Jung is explicit in saying that these symbols are neither mere signs (he uses the Greek technical word *semeia*) nor allegories. They are genuine symbols precisely because they are ambiguous, full of half-glimpsed meanings and in the last resorts inexhaustible. They are paradoxical because they are contradictory... If the archetypes are indescribable and infinitely interpretable, their experience cannot be but amorphous, undetermined, and unarticulated. Symbols are empty and full of meaning at the same time." (Eco, 1996).

Symbols are able to reproduce plurality through singularity. From the one side, symbols create differentiation of the world of actions and form cognitive space of the world. Cognitive space correlates with the space of actions. Rich cognitive space is full of differentiation and symbols. Plurality of symbols as a designation of the differentiated actions set richness and variety of processes and activities in the world and universe. The appeal to symbolic reality allows us to overcome personal boundaries. In Bakhtin's words, person as "organic unity" is capable of "transcending itself that is, exceeding its own boundaries" (Bakhtin, 1986). A "transcending of self" is the activity of "creation". This personal activity translates belief into reality. And this closely resembles what we have called "the sacrifice of self".

The process of ethical behavior one can see as a creating act on the lower planes models and schemes, and on the higher planes these are symbols. Symbols contain convoluted time of the concrete activity. Symbols are powerful because of potentiality of certain activity. Human activity is impossible without emotions and feelings. In accordance with this symbols fill

with the potentiality of activity expressed in emotional, strong-willed concentration. The goal of this expression is not the energies themselves – physical, occult, etc. – as registered from the outside, but rather the meaning which they introduce into the world. By these means the identification is attained, so as the self-sufficiency of the activity which necessary for the identification of the given detached process. This process could help a student to identify her/himself and to obtain integrity through a moral act.

Follow Florenski, we can suppose that eluding of symbols based on the difference between openness and safeness. It is very important, because this is a tact or a tune. Tact of “basing” and of “based” keeps this distinction in harmony. Essence and existence are intact. Here we can distinguish the inner Logos that is dividing the totality of existence from the revealed Logos. This process preforms all the hues and directions of spiritual movements which might arise, and each appearance of the spirit, the newest, most unexpected, and the most uniquely-individual. One can touch a single representation that has passed and interrelate with another representation, which is coming and which is kindred to the first in the unity of symbolical content. Symbolism allows people to communicate beyond the limits of language.

We constructed a new study course to develop a basis for doing ethics in a diverse cultural context. This course emanates out of interpretive phenomenology. This is interactive course because of common experiences that belong together and co-occur and provide a new language for students and teachers. Symbolic reality discovers for us the rear opportunity to articulate the basic concepts of ethics such as Good and Evil. Hermeneutic articulation of symbols in Art builds up students’ ability to form fine differentiation between good and evil. Visual sensation is best suitable for it. According to Aristotle, auditory sensations are memory condition, but visual sensations are giving most differences.

#### **4.Hermeneutic articulation of Moral symbols in Art**

Symbolic approach to Education in Ethics is based on phenomenological hermeneutic analysis about the symbolic interaction of artworks and an aesthetic and values philosophy toward a holistic approach to curriculum development. The purpose of this study is to conduct a deep interpretation of Symbols in Art for making universal inferences about aesthetic and values education and symbolic interaction in teaching multiculturalism. This study course presents a method for teaching sensitivity and ethics to students as citizens in the diverse global society. This phenomenological hermeneutic study includes not only interpretation of Symbols in Art but also a representation of a method of reasoning process that is both aesthetic and ethical.

Effective moral reasoning is not an exclusively cognitive matter, and depends crucially upon the proper development of affective capacities and sensibilities. This is equivalent to Aristotle who insisted that moral engagement with others is not primarily a matter of treating the Others equally in accordance with some impartial rule, but of developing sensitive appreciation of their circumstances and such appreciation involves the cultivation of appropriately ordered feeling. Aristotle who better shows us what this really requires in terms of the development of capacities to feel what the Others feel. Still, the key point of present concern is that Aristotelian moral virtue seems implicated in the cultivation of something like aesthetic sensibilities—specifically attachments to something beyond ourselves—as well as capacities for evaluative reason and judgment. Such cultivation appears to point towards the sort of change in ourselves.

The deep interconnection between Aesthetics and Ethics was ordained by Kant in his famous § 59 of *The Critique of Judgment*. In *Of Beauty as the symbol of Morality* Kant argues that a true ideal of the beauty of the human forms in the “expression of the moral.” “if we combine that with the later doctrine of aesthetic ideas and of beauty as the symbol of morality, then we can see that the doctrine of the ideal of beauty also prepares a place for the essence of art.” (Kant, 1952). If we understand a work of art as the consummation of the symbolic representation of life expression of aesthetic and moral sensations archived within Symbols in Art we could conclude follow Kant that “The beautiful is the symbol of the morally good” and the transition from sensory attractiveness to habitual moral interest could happened “without too violent a leap.” (Kant, 1952). Symbolic approach to Education in Ethics is elaborated to teach values and ethics for students from different ethnic nationalities and groups and to accustom students to live together in the global community.

Gadamer’s hermeneutics offers a flexibility that can help students to develop by artworks’ interpretation and analysis a guide to transform contemporary education. Hermeneutic articulation of Symbols in Art focuses on developing of students’ abilities to become more aware of and refine their prejudices, experience pulled up short moments, and be more open to a dialogue between one’s own understandings and those of others, it would better prepare them for negotiating the diverse realities in their future communities. Gadamer’s hermeneutics can enhance our openness toward Others and can lead students to get beyond the defensive stance they are exhibiting. According to Gadamer, we “remain open to the meaning of the other person or text.” It could help students “overcome” their prejudices. Hermeneutic circle entails a dialogue between parts and whole. This unique peculiarity of Gadamer’s hermeneutics allows reaching integrity of a multiple identity person while practicing dialogical interconnection between parts and whole trough hermeneutic articulation of symbols in an artwork.

Art is especially well suited to provide this kind of knowledge by acquaintance precisely because it so effective at arousing the emotional responses characteristic of an ethical perspective. Emotionally laden acquaintance with symbols in Art is central to core concern for symbolic approach to education. The aesthetic relevance of imaginative and affective engagement

with artworks determines the first question of hermeneutic analysis of an artwork: What do you feel?

The articulation of the feeling or sensation allows students to grasp the inherent meaning of the artwork. Students are able to answer for the question and articulate what act or a state of a soul (for example, in still life) is described in this artwork. Usually, it is a moral act or a moral sensation, or a state of a soul. Artworks possess aesthetical meritorious in so far as it possess an aesthetically relevant ethical merit. Its representing includes indicating what is represented. And we can say, as with Hegel, that this is the "appearing" of the idea. It appears, meaningfully and visibly. Hence what is symbolized is undoubtedly in need of representation.

Students not only judge from their point of view, but they should discover the position of the author. They should get her/his message. Their prejudice is based on sensitive differentiation between good and bad. Practical reiteration in a recognition of this differentiation leads to development of the moral sensitivity. To verify own prejudice students ought to answer the question: By using which symbols the artist is explaining his/her position? The answer on this question requires careful consideration of symbols and its interconnection in the artwork. We discover through a work of art to what extent we know and recognize something outside and inside of us. Students are taught to avoid partiality and aspire to fullness and completeness in pictures' hermeneutic interpretation. An individual limitation of understanding from a point of a view what is close to one's own sphere of ideas in the interpreting of a main idea and its valuation is not enough. The variations possible in hermeneutic analysis are not free and arbitrary. In fact they are all subject to the supreme criterion of "right" representation.

Gadamer underlines that Greek understanding of this process truly represents an aesthetical comprehension. "Theoria is a true participation, not something active but something passive (pathos), namely being totally involved in and carried away by what one sees." (Gadamer, 2004).

The distance is necessary for scrutinizing the picture. It makes possible a genuine and comprehensive participation in what is presented before us. We recognize ourselves in this presentation. According to Gadamer, it is possible, because "a spectator's ecstatic self-forgetfulness corresponds to his continuity with himself." (Gadamer, 2004). Precisely that in which one loses oneself as a spectator demands that one grasp the continuity of meaning. As an artwork is nevertheless self-identical in every moment so also "a spectator stands is both one of self-forgetfulness and of mediation with himself. What rends him from himself at the same time gives him back the whole of his being." (Gadamer, 2004).

Hence, symbolic approach to Education in Ethics promotes a sensitive differentiation between Good and Bad by students; the development of their moral sensitiveness, the self-identification and integrity. Only after answering to some questions the justified prejudice becomes productive. Usually we select some 10 min small artworks to be discussed during the lesson. Students divide into small groups for asking questions (usually 3) about the meaning and answering to question of another group. Gadamer considered the use of questions as a key to enabling a valid interpretation. According to him the understanding is not possible without the activity of questioning. Gadamer popularized questions as a means to open possibilities and to keep them open. The aim of such research using phenomenology is to construct an animating, evocative description (text) of human actions, behaviours, intentions, and experiences as we meet them in the usual life world. This productivity of knowing is based on an aesthetical involvement in scrutinizing the artwork.

For example, students are asked for hermeneutic analysis of Rembrandt's Prodigal Son. The feelings could be a compassion or suffering. This picture is devoted to articulation of Charity (Forgiveness). Rembrandt shows us the ambiguity of Charity. Charity is blind. It demonstrates by father's blindness. Charity does not depend on redemption. We cannot see the face of Prodigal Son. But we could see that charity is not absolutely good. The second main figure is the figure of oldest son. We can see the perplexity on his face. He could say as in Bible:

"Behold, these many years I have served you, and I never disobeyed a commandment of yours, but you never gave me a goat that I might celebrate with my friends. But when this, your son, came, who has devoured your living with prostitutes; you killed the fattened calf for him". (Luke 15:29-30, World English Bible)

We can see his hands clenched which symbolize tension, withholding and suppression. Hands folded symbolize contemplation, passivity and contentment. Hands are very important in this picture. The hand has long been thought as a conduit of power – transforming unseen energy into the world of form. The thrilled and delicate hands of father convince us that charity is good. Rembrandt chose red color of the father's cloak and the cloak of oldest son because red color symbolizes love and blood. The naked feet represent naked soul which is ready for a transformation. The feet symbolize and represent the soul, as it serves to support the entire body and keep it upright.

Education in Ethics through Symbols in Art is a new design of ethics education content. The improving of ethical education is possible on the basis of the understanding and practical application of moral experiences through co-existing involvement in the symbolic reality on the verbal or figurative level. This course allows students to recognize the influence of unconscious on attitudes, actions, and speech. "As our response to the good is made only in concrete circumstances, our cultural tradition and our ethics as a philosophic science must be neither purely philosophical knowledge nor a simple historical accounting from the past, but we must enable our cultural tradition via our moral consciousness to help in concrete circumstances" (McLean, 2003).

The most fruitful results of ethical education appear in the understanding of the essence of ethics and in the formation of an "open moral consciousness" which is going beyond the moral standards of the existing community. As Wittgenstein mentioned, ethics is the anticipation of the universal and we should open new ethical horizons. These new ethical horizons could be open on

behalf of future communities with sensitive and moral responsibility for future events in multicultural and ethnical diverse societies. The ethical person focuses on the future in an anticipation of the Good. It provides him/her an opportunity for self-determination and self-orientation with saving precise inter-subjective meaning. Such an ethical orientation of students contributes to the preservation of society by setting the orientation of the society to the right direction (the focus on the implementation of the Good).

Moral Symbols in Art could be an eligible study course for future politics, teachers, doctors, etc. to develop their moral sensitiveness for correct ethical-making decisions.

## Conclusion

The hermeneutic circle and dialogue of questioning and answering were two key strategies drawn from the hermeneutic literature that were incorporated in this research. Hermeneutic phenomenology and the interpretive narration to the description of symbols in Art find the genuine objective nature of the things. Hermeneutic phenomenology is focused on subjective experience of individuals and groups. Moreover the epistemology applied in this research is interpretive constructivism and draws from hermeneutics. In addition, within the interpretivist epistemology, a hermeneutic approach was considered the most appropriate choice for this research supporting as it does the construction of understanding from the analysis and interpretation. The moral foundations could be understood from the individual words and their combinations. Moreover, the full comprehension of the details presupposes the understanding of the whole.

So, it is suggested that nomothetic explanation (a generalized understanding of a given case) will coincide with idiographic explanation (a "full", detailed, in-depth understanding of a case).

## Abstract

This research has a purpose to 1) analyze the composition of the System of Virtual Team in Cloud Computing to Enhance Teamwork Skills of Undergraduate Students and 2) to assess the suitability of the composition of the System of Virtual Team in Cloud Computing to Enhance Teamwork Skills of Undergraduate Students. The research methodology is divided into 2 phases as follows: the analysis of the composition of the System of Virtual Team in Cloud Computing to Enhance Teamwork Skills of Undergraduate Students and the assessment of the suitability of the composition of the System of Virtual Team in Cloud Computing to Enhance Teamwork Skills of Undergraduate Students. The sample group in this study consisted of five experts using purposive sampling. Data were analyzed by arithmetic mean and standard deviation. The research findings were as follows: The composition of the System of Virtual Team in Cloud Computing to Enhance Teamwork Skills of Undergraduate Students consists of the 3 groups of service providing as follows: 1) The cooperation service consists of the following modules- Discussion Boards Module, Work Planning Module, Work Tracking Module, 2) The communication service consists of the following modules- Instant Messaging Module, Voice and Video Chat Module, 3) The information service consists of the following modules- File Sharing Module, Electronic Document Module. The assessment of the suitability of composition The System of Virtual Team in Cloud Computing to Enhance Teamwork Skills of Undergraduate Students through the experts result in that the level of the suitability is at high level.

## 1.Introduction

According to Thailand's Higher Education Development Plan No. 11 (B.E 2555-2559) (Office of the Higher Education Commission, 2012) stated that the university needs to create graduates who have the skills to work and adapt to life in the midst of difference in ethnic, religious and culture and language effectively work with others and potential was recognized at an international level. Teamwork is considered a form of education that encourages learners to work skills can collaborate with others happily with efficiently performance.

The team is a group of individuals who work together to coordinate roles and responsibilities towards the same goal of completion. Teamwork requires interaction between the communication, coordination, helping each other to achieve performance (Sumet, 2007), which consisting of five steps (Nattaphan, 2003) : 1) Problem Awareness- a step that team members must be aware of the problem and determine to jointly solve problems And exchange ideas to improve the team, 2) Data Gathering and Analysis- team members will jointly establish guidelines for collecting and analyzing data in order to get the facts to be analyzed and processed to determine the choice, to solve problems and selection practices, 3) Action Planning- team members brainstorm with the data derived from the regression analysis to determine the purpose of the solution and plan a concrete, 4) Action Implementation- team members work together to implement a plan to comply with the concrete to take care of the implementation plan proceeded smoothly to its desired goal, 5) Evaluation of Results- team members together monitor, evaluate and propose solutions or development operations to achieve the skills needed to work as a team in 7 skills (Bellinghamschools, 2014) as follows: 1) Listening- to listen to the ideas of each other, support each other's comments, 2) Questioning- to set up a question within the team, to conduct an interaction of discussion, 3) Persuading- to convince or persuade for exchanging of ideas and review, 4) Respecting- with respect the opinions of others, the encouragement to support the ideas and efforts of others, 5) Helping- to assist each other, 6) Sharing- to share the ideas and reported their findings, 7) Participating- to be a part in the work of the team.

The University graduates need to be prepared to work in globally distributed organizations which will involve teaching that is to make learners to work effectively together to solve problems with teamwork. Therefore, students must be able to work with individuals who are in distant places which there may be interactions face-to-face interaction or perhaps none at all (Last, 2014). A current teaching shows that instructors are taught through a group working to develop the skills of work as a tea to escalate the

students' potential. However, teamwork solely is not enough to spend time inside the classroom or during students' free-time. In order to reduce restrictions on time and place where the students will work together as a team, Information and communication technologies have a role to work as a team using the principle of Virtual Teams.

Virtual Teams is a new approach that is different from the teamwork of traditional management and organizer that will be able to work together regardless the different locations and organizations by using technology to facilitate communication and collaboration, rather than confrontation or traveling (Duarte, D. & Snyder, 2001; Gatlin-Watts, et. al, 2007). Virtual Teams will become an increasingly important and growing gradually (Olariu & Aldea, 2014), Virtual Team consisting of two people or more to work together interactively interact to achieve a common goal while at least one member of the team is working in different locations, organizations or time. A communication and coordination are mostly electronic communication such as email, fax, phone, video conferencing, etc. (Hertel, Geister & Konradt, 2005), which suggests that virtual teams can reduce restrictions on team work, as mentioned above. Since work with virtual teams more effective and responsive to use, leading cloud computing then is being used.

Cloud Computing is a form of computer processing with the ability to adjust the size and flexibility. A service using internet technologies applications available everywhere to facilitate the needs of the user for sharing resources through network, server storage units, and various applications (Gartner, 2014; Mell & Grance, 2011). The available of cloud types is various, depending on the needs of users that will use any type from four types (Ames, 2012) as follows: 1) Public Cloud- to serve the public by the service provider owns the infrastructure to serve the user. Services will benefit from the cost savings on infrastructure and expenses incurred by the idea to use, 2) Private Cloud Infrastructure- which is defined specific to agencies they serve to make owned enterprise applications and to reduce concern about data security and control, 3) Community Cloud - a service that is shared in many organizations with a purpose of management and security of all participating organizations that is will take part in the management service 4) Hybrid Cloud computing- a combination of two or more cloud together which can take advantage of each provider type increase the flexibility of processing model for processing cloud is divided into three types (Huth & Cebula, 2011) : 1) Software as a Service: SaaS- will provide that user will be able to access the resources and applications without having to install software on a user's machine. This makes it easy to have software similar on all devices with users, 2) Platform as a Service: PaaS- will provide a higher level of SaaS services by the service providers. to allow the user to access the service elements to software development is performed through Internet, 3) Infrastructure as a Service: IaaS- to provide services related to the infrastructure of computing and storage resources, such as hardware, software, users need to process cloud will work with virtual machines whereas users is no longer need investment in computers capable of levels that require a lot of investment and efficiency in the use of information technology equipment. With virtualization technologies applied in cloud computing, it is enable service providers to share the use of technological devices through a server. Various storage devices to have higher utilization rates. The user will be flexible in the use of information technology equipment (Srisomruk, 2010), from the foregoing, cloud computing has the right features to use in the virtual team,

According to the reason mentioned above, the researchers are interested in the analyzing of the compositions of the System of Virtual Team in Cloud Computing to Enhance Teamwork Skills of Undergraduate Students

## **2.Objectives of the study**

2.1 To analyze the composition of System of Virtual Team in Cloud Computing to Enhance Teamwork Skills of Undergraduate Students.

2.2 To assess the suitability of the compositions of System of Virtual Team in Cloud Computing to Enhance Teamwork Skills of Undergraduate Students.

## **3.Scope of the study**

### **3.1. Population and Sampling Group**

- Population of study is experts in the field of virtual team, instructional design and information technology
- The sample groups are five experts in the field of virtual team, instructional design and information technology by purposive sampling.

### **3.2 Research Variables**

- Independent variable is Systems of Virtual Team in Cloud Computing to Enhance Teamwork Skills of Undergraduate Students.
- Dependent variable is the compositions' suitability of Systems of Virtual Team in Cloud Computing to Enhance Teamwork Skills of Undergraduate Students

#### 4. Methodology

The research was divided into 2 phases as follows.

*Phase 1) Analysis of The Systems of Virtual Team in Cloud Computing to Enhance Teamwork Skills of Undergraduate Students performing the following steps.*

1. Study, analyze and synthesis of documentation and related research to set up a framework of composition analysis.
2. Analyze the component of the system of education and research documents.
3. A presentation of the system components from the analysis and improvement advisors to consider the suggestion.

*Phase 2) The assessing the compositions' suitability of The Systems of Virtual Team in Cloud Computing to Enhance Teamwork Skills of Undergraduate Students with the following steps:*

1. Create a tool for assessing the suitability of the system components.
2. Present elements of the system was analyzed to 5 experts to determine and evaluate the suitability.
3. Improve the system components according to the experts' suggestion.
4. Present an analyzed compositions of the system in a format of conventional illustration essay.
5. Analyze the result of composition of the system's suitability by an average point ( $\bar{x}$ ) and standard deviation (SD), which is a criterion to determine the weight of evaluation is a 5 level (Likert Scale).

#### 5. Result

*5.1. A composition of the System of Virtual Team in Cloud Computing to Enhance Teamwork Skills of Undergraduate Students.*

According to the analysis, the System of Virtual Team in Cloud Computing to Enhance Teamwork Skills of Undergraduate Students will work under the form of Cloud Computing services in the form of Software as a Service in a way of Private Cloud that is consisted of following:

1. Collaboration Services: a system shall be provided in collaboration of team members is comprised of three modules.
  - 1.1 Discussion Board Module; A module that is to provide a forum to exchange ideas, information of team members.
  - 1.2 Work Planning Module; A module that is available in the work of the team, including planning, scheduling calendar works, assigned duties and responsible tasks.
  - 1.3 Work Tracking Module; A service module that is to track the performance of the team that planned and assigned work in them.
2. Communication Services: a system of communication and interaction of the team members is composed of two modules as follows:
  - 2.1 Instant Messaging Module- Module that is available in instant message conversations between team members.
  - 2.2 Voice and Video Chat Module- Module is available in the conversations between team members with sound and video.
3. Information Services: a system that shall be provided in the use and exchange of information between team members is composed of two modules.
  - 3.1 File Sharing Module- A module that is available in the data files shared between the team members.
  - 3.2 Electronic Document Module- A module that is available in electronic document management for the transmission between team members in which the elements of the diagram in Fig. 1.

Fig. 1. The elements of a System of Virtual Team in Cloud Computing.

Modules derived from the analysis is applied to the process of using teamwork through the 5 steps as follows:

Phase 1 (Problem Awareness- the module to be used as follows: Discussion Board Module, Instant Messaging Module and Voice and Video Chat Module.

Phase 2 (Data Gathering and Analysis- the module to be used as follows: File Sharing Module, Electronic Document Module, Discussion Board Module, Instant Messaging Module and Voice and Video Chat Module.

Phase 3 (Action Planning- the module to be used as follows: Work Planning Module, Discussion Board Module, Instant Messaging Module and Voice and Video Chat Module.

Phase 4 (Action Implementation- the module to be used are as follows: Work Tracking Module, File Sharing Module, Electronic Document Module, Discussion Board Module, Instant Messaging Module and Voice and Video Chat Module.

Phase 5 (Evaluation of Results-the modules to be used are as follows: Discussion Board Module, Instant Messaging Module and Voice and Video Chat Module.

## 5.2. The result of the assessment of the composition of the System of Virtual Team in Cloud Computing to Enhance Teamwork Skills of Undergraduate Students.

The assessment is done by introducing the analyzed composition of the system to be assessed in term of the suitability to the 5 experts focusing on the principles and concepts of System. The modules derived from system analysis consequently to be used in the process of teamwork. Skills to work as a team when the systems are used .and the possibility of applying the system in real situation. The results are shown in Table 1-4.

Table 1. The assessment of system's principle, concept and objective.

Evaluation Lists	$\bar{x}$	S.D.	Level of suitability
1. System's principle and concept	4.20	0.45	High
2. System's objective	4.40	0.89	High
Summary	4.30	0.67	High

From Table 1, the assessment principles and concepts of the system from the experts is at high level ( $\bar{x}=4.30$ , S.D. = 0.67).

Table 2. Analyzed module assessment.

Evaluation Lists	$\bar{x}$	S.D.	Level of suitability
1. Collaboration Services	4.87	0.18	Highest
1.1 Discussion Board Module	4.60	0.55	Highest
1.2 Work Planning Module	5.00	0.00	Highest
1.3 Work Tracking Module	5.00	0.00	Highest
2. Communication Services	4.60	0.50	Highest
2.1 Instant Messaging Module	4.80	0.45	Highest
2.2 Voice and Video Chat Module	4.40	0.55	High
3. Information Services	4.80	0.45	Highest
3.1 File Sharing Module	4.80	0.45	Highest
3.2 Electronic Document Module	4.80	0.45	Highest
Summary	4.76	0.38	Highest

From Table 2, the assessment principles and concepts of the system from the experts is at highest level ( $\bar{x}=4.76$ , S.D. = 0.38).

Table 3. The analysis module to evaluate the process of teamwork.

Evaluation Lists	$\bar{x}$	S.D.	Level of suitability
1. Problem Awareness	4.80	0.45	Highest
2. Data Gathering and Analysis	4.60	0.55	Highest
3. Action Planning	4.80	0.45	Highest
4. Action Implementation	4.80	0.45	Highest
5. Evaluation of Results	4.60	0.55	Highest
Summary	4.72	0.49	Highest

From Table 3, the assessment of teamwork process of the system from the experts is at highest level ( $\bar{x}$ = 4.72, S.D. = 0.49).

Table 4. The assessment of teamwork skills, and the possibility of applying in real situation.

Evaluation Lists	$\bar{x}$	S.D.	Level of suitability
1. Teamwork skills that will occur when the systems are used	4.14	0.91	High
1.1 Listening	4.20	1.30	High
1.2 Questioning	4.20	0.45	High
1.3 Persuading	3.60	1.52	High
1.4 Respecting	3.80	0.45	High
1.5 Helping	4.20	0.84	Highest
1.6 Sharing	4.60	0.89	High
1.7 Participating	4.40	0.89	High
2. the possibility of applying in real situation	4.40	0.89	High
Summary	4.27	0.90	High

From Table 4, The assessment teamwork skills and the possibility of applying in real situation from the experts is at high level ( $\bar{x}$ = 4.27, S.D. = 0.90).

## 6. Discussion of results

The composition of the System of Virtual Team in Cloud Computing to Enhance Teamwork Skills of Undergraduate Students derived from the analysis of 3 groups of service providing can be described as follows: 1) The cooperation service consists of the following modules-Discussion Boards Module, Work Planning Module, Work Tracking Module, 2) The communication service consists of the following modules-Instant Messaging Module, Voice and Video Chat Module, 3) The information service consists of the following modules-File Sharing Module, Electronic Document Module. The assessment of the suitability of composition The System of Virtual Team in Cloud Computing to Enhance Teamwork Skills of Undergraduate Students through the experts result in that the level of the suitability is at high level. The assessment result of the suitability of the composition of the System of Virtual Team in Cloud Computing to Enhance Teamwork Skills of Undergraduate Students from 5 experts reveals that the suitability average level is at high level ( $\bar{x}$ = 4.49, S.D. = 0.60). This shown that the composition of the system derived from the analysis can be improved as the System of Virtual Team in Cloud Computing to Enhance Teamwork Skills of Undergraduate Students for a real usage.

## 7. Suggestions

The institution to apply elements of the System of Virtual Team in Cloud Computing to Enhance Teamwork Skills of Undergraduate Students to develop a system should prepare the following terms

- Computer equipment; the institution must have a server computer for the system to provide its services to users of such systems and is available at all times.
- Networking; the institution must have internal network and high-speed Internet connection to support services such system from within and outside the school all the time.
- Personnel; the institution must have the personnel administrator with a better understanding about the functioning of the system.

## 8.Further Research

To apply the components of the System of Virtual Team in Cloud Computing to develop into a system and to study the effect of using the System of Virtual Team in Cloud Computing to Enhance Teamwork Skills of Undergraduate Students.

## ŞİİRSEL DİLİN MANTIK ÖĞRETİMİNDE KULLANIMI

Hülya Altunya

Düşüncenin ölçülü/vezinli ve ahenkli/kafiyeli bir tarzda sergilendiği şiirsel dil, her çağın ve her medeniyetin insanının kendisine yakın bulduğu edebi bir üslup olarak hep varolagelmıştır. Açıkçası her dönemin kendine özgü bir atmosferi ve bu atmosferden doğan şiirsel bir dili bulunmaktadır. Bu durumun bariz örneği Antik Yunan’da, tiyatroda, trajedide, dramda, komedide ve diğer sanat türlerinde şiirsel dile başvurulmasıdır. Özellikle Antik Yunan toplumunda tanrılarla ilgili tarihsel bilgileri hikaye eden mitler, şiirin diliyle sözlü olarak yaşatılmaya çalışılmıştır. Ancak daha sonraki medeniyetlerin, sanatın çeşitli dallarının yanı sıra tıpta, felsefede, mantıkta, destanlarda, lügatta, mesnevide bu nazım dilini eğitim-öğretimin aracı haline getirdikleri bilinmektedir. Şiirsel dilin pek çok alanda kullanılmasının nedeni; insan tabiatıyla uyumlu olduğunun düşünülmesi kadar, düşüncelerin ifade edilmesi ve bilginin nesilden nesile aktarılmasında pedagojik bir araç olarak iş gördüğünün anlaşılması olabilir. İnsanlığın tarihsel deneyiminden biliyoruz ki, ninnilerden başlayarak bir çok alanda, nazım formu insan zihnine estetik bir haz vermekte ve metnin muhafazasını kolaylaştırmaktadır.

Şiirsel dilin kullanıldığı ilimlerden biri olarak mantığın kolayca öğrenilmesine ve öğrencinin konuları rahatlıkla ezberleyerek o ilme nüfuz edebilmesine imkan sağlamak amacıyla bu dille eserler telif edilmiştir. İslam ilim geleneğinde Aristoteles’in (ö. M.Ö.322) mantığa dair eserlerinin Arapçaya çevrilip bu konuyla ilgili metinler telif edilmeye başlandıktan sonra şiirsel dille de mantık kitapları yazılmıştır. Erken dönemlerden itibaren mantık ilminin öğretiminde şiirsel dilin tercih edilmesinin mantığa olan ilgiyi artırdığı söylenebilir. Ne var ki modern dönemlerle birlikte bilme ve anlama teorilerinin değişmesiyle, ilimlerin öğretiminde şiirsel dilin kullanımından vazgeçilmiştir. İşte bu tebliğde mantık ilminde şiirsel dilin geçmişte çok yaygın olarak kullanılmasına rağmen bugün terk edilmiş olmasının olumlu ve olumsuz yanları belirlenmeye çalışılacaktır. Acaba öğrencinin mantık ilminin esaslarını şiirsel dil vasıtasıyla kolayca ezberleyerek hafızada depolaması ve bu şekliyle kullanıma hazır bulundurması öğrenmeye nasıl bir katkı sağlamaktadır? Yoksa öğrencinin konuları anlaması ve ihtiyaç olduğu anda analitik bir zihinle o bilgileri açıklamaya çalışması mı öğrenmede daha iyi bir metottur? Yahut ezberde bulunan şiirsel metnin, gerektiği durumlarda analitik düşünme biçimiyle bilgiye dönüştürülmesi mümkün müdür? Bu araştırmada mantık ilminde geçmişte kullanılan şiirsel metin dilinin günümüz için uygun olup olmadığı incelenecektir.

Antik dönemlerde tanrıların öykülerinin, kahramanlık ya da aşk destanlarının anlatımında kullanılan şiirsel dil, bilgi birikimlerinin birer bilime dönüşmesi ve her bilimin esaslarını anlatan yazılı eserlerin oluşmasıyla birlikte temel kitapların hafızada kalıcı olması için yeniden itibarlı bir edebi üslup haline gelmiştir. Özellikle İslam düşünce tarihinde mantık, dil ve din ilimlerinden tıbbı kadar pek çok bilim dalında manzum eserlerin yazılmasını, geçmişteki bu sözlü geleneğin bilimin hizmetine sunulması olarak anlamlandırmak mümkündür. Sözelimi Osmanlı medrese eğitiminde gerek dini gerekse de dini olmayan ilimlerde şiirsel dilin temel eğitimde vazgeçilemeyen bir üslup olduğunu söyleyebiliriz. İnsan zihninin büyük ölçüde, çocukluk döneminde şekillendiği hatırlanacak olursa, bu dönemde yapılan eğitim/öğretimde, nazım formunun kullanılarak bilgilerin ezberletilmesi, dil estetiği, daha kalıcı öğrenme ve dilin doğru kullanımı için zihinsel formasyon kazandırmaktadır. Dolayısıyla şiirsel dil, hem dilin hem de düşüncenin disiplinize edilerek geliştirilmesi bakımından iş gördüğü için mantık ilminde temel eğitimin vazgeçilmez bir üslubu olmuştur.

İslam Mantık tarihinde ilk defa iki manzum mantık risalesi yazan İbn Sina (ö. 1037)'nin aynı zamanda tıpla ilgili de üç manzum eseri bulunmaktadır.\*\*\*\*\* İbn Sina *el-Urcuze fi'l-Mantık* adını verdiği manzumesinde risalenin yazılış amacını şöyle ifade etmektedir:

“Hafızada kalıcı olması için mantık (ilmin)ı şiir kalıbına (nazma's-şiir) koymamı (istedi)/Özellikle yanımda bir kardeşim var ki; göçüp giden baba(mın) vasiyetidir./Onunla ilgili görevlerini yerine getirmemi ve yolların doğrusunu ona göstermemi vasiyet etti/Ya Ali! Bunu ezberinde tut (ic'alhu-zahara'l-kalb), ta ki akletme çağına gelinceye kadar./Aklının yettiği ölçüde onu düşünürsen bir çok hayırlara ehil olursun/Ancak o çok hayır hikmettir ve bütün nimetlerin en üstünüdür.”\*\*\*\*\*

İbn Sina hem mantığın hafızada devamlı surette bulunmasını sağlamak hem de bu ilmin kalıcılığını arzulayan arkadaşının isteğini yerine getirmek için risalesini yazmıştır. Burada amaç, mantığı şiirleştirmek değil, mantığa dair bilginin aktarılmasının aracı olarak nazım formuna başvurmadır. Mantıksal bilginin kodlandığı hafıza (bellek), deneyim ve bilgileri zihinde saklama ve anımsama yetisi/melekesi olarak öğrenmenin, düşünmenin ve akıl yürütmenin, anımsamanın üzerine oturduğu şeydir. Anımsama, anıyı belleğe çağırma işlemi olduğuna göre o olmaksızın bahsedilen fonksiyonların gerçekleşmesi imkansızdır.

Mantık kitaplarından nazma çekilen bir başkası ise Esirüddin el-Ebheri (ö. 1265)'nin İşagoci'sidir. 16. yüzyılda yaşayan Ahdari (ö. 1575/1576) İşagoci'yi *Süllemü'l-*

\*\*\*\*\* İbn Sina'nın tıpla ilgili manzum eserleri şunlardır: *Manzûme (fi't-Tıbb) veya Elfiyye, Tedbirü's-Sıhha fi Fusulî'l-Erbâa, el-Kanun fi't-Tıbb*'in özeti *Urcûze*. İbrahim Özkılıç, “İbn Sînâ'nın “el-Urcûze fi'l-Mantık” Risalesi (Sunum ve Metin), M.Ü. İlahiyat Fakültesi Dergisi, 32 (2007/1), (127-156), 128.

\*\*\*\*\* İbrahim Özkılıç, “İbn Sînâ ve el-Urcûze fi'l-Mantık, Basılmamış Yüksek Lisans Tezi, İstanbul, 1998, Marmara Üniversitesi Sosyal Bilimler Enstitüsü, 25.

gösterme imkanını verebilmektedir. Bu yüzden şiirsel dil özellikle Osmanlı medrese eğitiminde yaygın olarak kullanılmaktaydı.

Bu durumda şiirin diliyle canlı tutularak toplumun hafızasında yer etmesi sağlanan duyguların ifade edildiği kahramanlık yahut aşk öykülerinden başlamak üzere, eğitim/öğretime kadar pek çok alanda başvurulmuş şiirsel dilin modern dönemlerde neden terkedildiğini sorabiliriz. Bu soruya verilen en basit cevap; kitap basımının artması ve bilgisayar teknolojilerinin gelişmesiyle ders kitaplarının hafızada korunması probleminin çözüldüğünün düşünülmesidir. Zira Homeros'un anlattığı mitler artık hafızada değil, kitaplarda muhafaza edilmektedir. Özellikle matbaa ve elektronik kütüphaneler çıktıktan sonra hafızada kitapların saklanması tümüyle terkedildi. Şu halde hafızanın yerini kolay ulaşılan kitapların alması, metnin ezberde tutulması ihtiyacını ortadan kaldırdığını söyleyebiliriz. Böylece modern dünyada, bilişim teknolojileri; teknolojinin hakimiyeti altına alıcı, ve alanını genişletici tavrı dolayısıyla kendini hafızanın yerine ikame etmektedir. Modern dünyada, hafıza hakkında tahfif edici bir değer alanı oluşturulmuştur. Günümüzde, hafızaya ve ezbere karşı olan bu tahfif edici tutum, geçmişe dair negatif bakış ve modern teknolojinin kendine alan açma çabalarının sonucu olmalıdır.

Burada şiirsel dilin terkedilmesiyle ilgili olarak öne sürülebilecek bir başka neden ise şudur: Eğitim/öğretimde ezberlemenin terkedilerek yerine analitik düşünme, anlama ve yorumlama gibi anlama tekniklerinin ikame edilerek bunlara rağbet edilmesi şiirsel dille yazılmış metinlerden uzaklaştırmıştır. Ezberlenen metnin hafızada bulunmasını bilme olarak kabul etmeyen son dönem iddiaların haklı olup olmadığını sorabiliriz. Daha açık bir ifadeyle şiirsel dille ezberlenen mantık metninin, sadece bilginin ezberlenmesi anlamına gelip gelmediği araştırılmaktadır. Yani “mantık metninin ezberlenmesi” denilirken, dilin ya da cümlelerin ezberlenmesi mi yoksa bunlarla birlikte bilginin ezberlenmesi mi kastedilmektedir? “Mantık metninin ezberlenmesi” ifadesi; dilin hafızasının ezberlenmesi, dilde ortaya çıkan hafızanın ezberlenmesi, bilginin depolanması ve depolanan bilginin hafızadan alınması gibi anlamlara gelebilir. Bu meseleyle ilgili olarak iki noktaya dikkat çekilebilir: İlki; insanın belli bir dili ezberlemesi, ikincisi ise dilin tarih içerisinde üretilmiş bilgileri kendisinde tutarak bugüne kadar getirdiği yani bir tür “gelenek” denilen şeyin ezberlenmesidir. Bu açıdan bakıldığında cümlelerin ezberlenmesinin ya da mantığın ezbere dayanmasının amacı, dilin kendi içinde barındırdığı toplumsal ve tarihsel hafızanın açığa çıkarılmasıdır, bilginin direkt kalıp olarak formel açıdan ezberlenmesi değildir. Örneğin mantıksal önermelerle ilgili bilgiyi 4 yaşındaki çocuk da, 25 yaşındaki genç de ezberleyebilir. Ama ilki, dilin hafızasına vakıf olamayacağı, dilin kendi içinde ne tür tarihsel hafızayı ya da bilgiyi barındırdığını bilemeyeceği için, sadece cümleyi papağan gibi tekrarlamaktadır. İkincisi ise dilin hafızasına vakıf olarak mantıksal bilgiye sahip olmaktadır. Buna göre denilebilir ki ezber konusunda en büyük sorun; dilin kendi iç hafızasına vakıf olabilmek yani “anlama” denilen olaydır.

Elbette ki mantığın öğretiminde bir takım şekilsel unsurların bilinmesi gerekmektedir. Sözelimi önermenin dört formu bilgi olarak öğrencinin hafızasında bulunmalıdır. Bu bilgilerin bilinmesi, hafızada bir şeyin yer tutması anlamında önemlidir. Ama asıl önemli olan burada mantığın ne tür bir tarihsel hafızayı barındırdığıdır. Öğrenciye verilmesi gereken şey; mantıksal önermelerin kendi içerisinde bizzat tarihsel birikimi nasıl taşıyageldiği ve bunun nasıl açığa çıkartıldığıdır. Bu anlamda mesele basitçe bir ezber konusu olarak anlaşılmaya izin vermemektedir. Burada daha çok öğrencinin kavramları, kelimeleri, önermeleri anlarken ön plana çıkarılmış, diğerlerini baskılamış veya baskın gelmiş bir takım boyutları ya da anlamları kavraması söz konusu edilmektedir. Zira dilin hafızası çok boyutludur yani dildeki kelimeler kendi içerisinde birkaç tane ya da onlarca anlamı barındırabilir, diğer kelimelerle işbirliği içerisinde olduğunda ise çok daha fazla anlam çıkmaktadır. Şimdi bu açıdan bakıldığında ezberlemeyle anlama arasında önemli bir fark belirginleşmektedir. Ezber daima bir önermenin bir birim olarak bütüncül bir yapı ve bir blok halinde kavranmasını zorunlu kılmaktadır.

Şiirsel üslupla mantık kitabının yazılmasının öğrenmeyle ve anlamayla olan ilgisini burada tekrar sorgulamalıyız. Şiirde, üslubun kolaylaştırılması, kısaltılması yani cümlelerin mümkün olduğu kadar kısaltılması ve nispeten daha estetik denilebilecek bir cümle yapısına sahip olunması nedeniyle ister istemez estetiğin gücünün o ezberleme noktasındaki rolünü ve katkısını gündeme getirmektedir. Ama böylesi bir noktada anlamayla ilgili husus ortaya çıkacaktır ki, şiir, bir cümlelerin daha estetik bütüncül yapıya dönüşmesine yol açabilir. Yani şiirde, daha bütünlüklü, kolay kavranabilir, hatırlanabilir bir yapının var olması ezberi kolaylaştırabilir. İşte tam da bu nedenle anlamın ortaya çıkması anında, şiirsel dil, diğer taraftan da daha güçleştirici bir rol oynayabilir. Bunun sebebi; öncelikle estetik yapının bilincin doğrudan ilgi konusu haline gelmesidir. Zihnin, mantıksal önermelerde ortaya çıkan tarihsel birikimin ve varlıkla ilişkimizin kavranmasından ziyade, bir sanat eserine doğrudan odaklanmakta söz konusu olduğu üzere, şiirsel ifadenin doğrudan estetik boyutunu esas almasıdır; yani bizi muhtevaya ve bu yolla dış dünyaya yönlendirmekte zorlanmasıdır. Mesela şiirlerin en büyük özelliği bizleri sırf kendisine yönlendirmesidir. Dış dünyadaki gerçek varlıklarla bağımızı bir yönüyle askıya almasıdır. Bu bağlamda bakıldığında mantık eserlerinin şiirsel tarzda yazılması bir taraftan hafızanın güçlenmesine, hafıza içerisinde kelimelerin daha fazla sayıda yer tutmasına yol açabilir, diğer taraftan ise şiirsel dil bizi kendisine (estetik boyuta) yönelteceği için metnin anlamından uzaklaşmaya neden olabilir.

Sonuç olarak denilebilir ki, İslam mantık tarihinde İbn Sina ile başlayan Ahdari ile devam eden ve Osmanlı medrese eğitiminde önemli sayılabilecek oranda tercih edilen şiirsel dille eğitimin öncelikle bu tür metinlerin kendi dönemlerindeki kıymeti ve o toplum açısından önemi bakımından değerlendirilmesi gerekir. Döneminin kültürel dili içerisinde bir takım şiirlerin ezberlenmesi ve bir takım kelimelerin oradan öğretilmesi eğitim/öğretimde olumlu sonuçlar vermiş olabilir. Ancak geçmişte oldukça faydalı sonuçlar veren bu yöntemin günümüz için tekrar denenmesini önermeden önce bugünün hafızasının hareket noktası olarak alınması gerektiğinin farkındayız. Günümüzün hafızasına bakılacak olursa, sinema,

roman, belgesel gibi çeşitli metin tarzlarıyla karşılaşmaktadır. Ayrıca hafıza ve ezber kavramlarının neye tekabül ettiği sorusuna cevap olarak geçmişteki karşılıklarının alınamayacağı açıktır. Çocukların ve gençlerin hafızasında, resimsel bilgiler, medyanın bilgileri vb. yer etmektedir. Aslında mantık eğitiminde hafızanın gerekliliğinden bahsedildiğinde, bu hafızanın bugün ne anlama tekabül ettiği oldukça önemli bir sorundur. Geçmişteki hafıza ile bugünün hafızasının aynı kabul edilmesi, “şiiirsel dilin” olduğu gibi devam ettirilebileceği anlamına gelmez. Osmanlı medrese eğitiminde başvuru olan “şiiirsel dil” yani bir blok halinde cümlelerin ezberlenmesi, estetik bir tat katarak cümle içerisine bilincin, bu anlamda cümleye kolay yönelebilmesi ve hatırlamayı kolaylaştırması önemli olabilir. Bu, döneminin kültürel hafızasına çok uygun bir teşebbüstür. Ancak günümüzde mantık eğitimi denildiğinde, hafızanın, kültürel belleğin ne tür bir rol oynadığını tam olarak tespit edebilmeliyiz. Hafızanın ne tür şeyleri öne çıkartırken ne tür şeyleri de arka plana attığını açıklayabilmeliyiz. Bunun tahlili yapılmaksızın, mantık eğitiminin doğrudan salt geçmişin hafızasıyla anakronistik tarzda yani sanki zaman farkı yokmuş gibi yapılması, şiiirsel tarzda mantık eserlerinin yazılması ve ezberletilmesi olumlu sonuçlar veremeyebilir. Dolayısıyla öncelikle kültürel hafızanın analiziyle günümüze döndürülmesi gerekmektedir. Şiiirin ve musikinin önemli olduğu toplumlarda mantığın şiiirle anlatılması anlamlıdır. Kısacası şiiirin o toplumun hafızasının şekillenmesinde oynadığı rol, mantığın da oradan gündeme gelmesine yol açabilir. Fakat yine de mantık ilmine dair konuların belli düzeyde hafızada tutulması gerektiği de reddedilemez bir gerçektir.

# Tablet as a new interactive tool for education paleography

## Abstract

This article is focused on the possibilities and usability of mobile devices for the study of paleography, the auxiliary science of history. The main aim of the text is to introduce new advanced way of practising ancient inscriptions and modes of writing with the help of tablet mobile device. The use of this new media is changing the face of education and is creating new opportunities for improving the quality of education and learning. This article tries to uncover students' new approaches to modern, innovative and interactive learning of old handwritings using various mobile applications. The authors of this article want to outline new ways of reading and writing old inscriptions.

**Keywords:** paleography, education, tablet, mobile devices, mobile applications, learning, old handwritings

## 1. Introduction

The use of new media is a key milestone in enhancing digital literacy in education. New media brings advanced information and communication technologies (ICT) with opportunities to improve the quality of teaching and learning through interactive devices, applications and the Internet. The importance of new media and its applications in education have recently gained attention of many education institutions and reported in the EU's Digital Agenda EU 2020 strategy (Martín, G. A., 2011) also. The sustainable growth of ICT literacy through EU funding in the Czech Republic enables government to initiate a project through Ministry of Education, Youth and Sport in Czech Republic, called "Výzva51" with the funding of 600 million CZK to upgrade ICT-based education, especially modern mobile devices such as Tablet.

In this article the possibilities and the use of mobile devices such as a tablet in the study of paleography are explored. The text aims to explore possibilities offered by tablets for practical exercises in old handwritings and to improve teaching paleography with the help of interactive new media. The article aims to show how students can use the modern, innovative and interactive teaching methods for historical writing using mobile applications. The authors also want to outline new ways to learn these old handwritings skills of reading and writing. Mobile devices (smartphone, tablet) around the world use different teaching applications and have become potentially very important form of education.

## 2. Technologic base for interactive education of paleography

This initiative is supported by the fact that 7.7 % of youths (approximately 51,000 youths) between 16 years to 24 years in Czech Republic (CZSO, 2014) use mobile Internet through tablet (5.0 % of them use tablet regularly). Due to this reason, mobile devices such as tablet possess the potential to significantly influence teaching and learning. Recently a new mobile device called convertible notebook (or ultrabook) have become popular, which is a more advance device having classical notebook features. It can be used in different ways ad per the need i.e. with tipping, rotating, detachable or plug-in display as a tablet with touch screen input. Students can therefore use a single device that can function both as a tablet and a notebook. A significant increase in the popularity of tablets is evident from the evolution of the market of tablets sold in recent years as shown in the figure below (Fig. 1).

Worldwide shipments of tablets from 2010 to 2017 (in million units)

Fig. 1. (Forecast for global shipments of tablets from 2010 to 2017. Source: Dodd, N. et al., 2013).

### 2.1. Multipurpose mobile device with touch screen user interface

The touch screen is used as a user interface for most of the mobile devices (smartphone, tablet, notebook). Even the notebooks which use keyboards as input devices traditionally are getting equipped with touchpads (Display Search, 2013) and 10% of notebooks sold in 2013 were equipped with touch screen (over four years, but it is estimated that touch screen interfaces will dominate). On the other hand, tablets are already equipped with touch screen. The vast majority of smartphones and the overall sales of devices with touch screen interface over the next three years will get doubled (Yi D., 2014). The above statistics clearly show that the touch screen is a promising way to control portable computers, which will become very easily affordable to general population due to higher expansion and lower prices. Another advantage is that these devices will replace positioning device such as a mouse or a touchpad in near future. The other advantage is an intuitive gestures recognition which simply expresses the intended requirement.

For teaching paleography using touch screen to draw fonts of old inscriptions figures can be controlled in a more accurate manner using a pen tool (so-called stylus) provided with the tablets as a touch screen pointer. The price of the stylus is approximately 3 Euros (in the case of resistive and capacitive), in the case of very high precision of fine-tipped capacitive stylus is approximately 20 EUR (which is more suitable for teaching paleography by replacing classical pen or pencil). There exists special digitized stylus, which actively communicates with the screen via an extra layer of technology usually via Bluetooth. Because of this, tablet can recognize line thickness or line intensity according to sensitivity of hand pressure to touch screen with the stylus. Except classical styluses (available through companies like Adonit, Wacom, Dagi, etc.) designed for drawing pattern like classical pen, there exist special category styluses designed for drawing pattern like paintbrush (available through Nomad Brush company) which could simulate real drawing old handwritings with different line width of end points of fonts.

Touch screens obviously use two different technologies:

- Resistive – touch screen control by fingers or any stylus can be realized. Stylus is a simple pen-shaped instrument used as a pointing device. Surface of touch screens is made of flexible membrane, which carry signals over the electrically conductive layers to process when user touch the screen.
- Capacitive – display covered by electrically conductive layer, works on basic principal of human body conductivity. When screen is touched by a finger, electrical circuit associated with it gets closed and on the basis of it device determines the position of the finger. This type of display is currently being used in mobile devices. The disadvantage of these type of touch screens is the need to control it by electrically conductive object. Any stylus designed for the resistive touch screens cannot be used for the capacitive touch screens. A special capacitive stylus is designed to fulfil requirement of various application for this kind of displays.

### 2.2. Mobile native applications for education of paleography

A mobile application is software designed for mobile operating systems (i.e. Android or Windows-Phone/RT) available on mobile devices such as a tablet or smartphone. The mobile applications provide advanced functionality specifically high rate of mobility and ease of use i.e. operated by the user via touch screen. Mobile applications exist in two different forms – first one limits users to use it on certain operating systems only (so-called native applications) and second one on the contrary, allows users the freedom to use applications on any operating system (so-called multi-platform applications). Since there are only a few applications for the education of paleography and are available only for the most popular operating systems – Android (46.9 % worldwide penetration on all mobile devices among population in May 2014) and iOS (32.4 % penetration) (Statcounter, 2014) only exhibiting a very big disadvantage. These mobile applications are unavailable for all users having mobile devices with different operating systems (Windows Phone: 1.9 %, Symbian: 2.4 %, BlackBerry: 1.6 %, etc.). It should be noted that among the tablets alone three dominant mobile operating systems are expected to occupy a significant market share by 2017 – Android

(58.5 %), iOS (30.6 %) and Windows (10.2 %) (Jones, 2013). Review of actual available applications for education of paleography is described in section 3.1.

### 2.2.1. Multiplatform solution of education

The solution to the problem of very fragmented supply for different platforms (Android, iOS, Windows etc.) of paleography applications is to develop a multi-platform application. Typical examples are web applications supported on all modern mobile devices, so that users of minority operating systems have the ability to fully use mobile applications just like everyone else. However most of the web applications do not execute without a mobile Internet connection and web technologies HTML version 5. This must also be supported by the web browser. The unavailability of newest versions of the softwares and plugins can cause problem to the technologies/libraries required by the touch screen drivers are available through the newer versions of browsers only (Canuse, 2014).

The problem of insufficient platform independent and therefore widely available applications for education of paleography, especially to learn old inscriptions motivated authors to develop a multiplatform application in HTML version 5 on new mobile devices such as tablets. Its detailed description is provided in section 3.2.

## 3. Education and understanding paleography

Learning of reading and writing begin in childhood using various methods. Children learn to recognize letters which then can read and write. (Mikulenková; Malý, 2004). Writing and reading is an important part of teaching. It is not restricted only to remember letters and numbers but also to understand how to recreate them. This whole process develops intellect and ideas in children. Reading old historical inscriptions is a similar process. Although we get to learn this script in university, we have similar problems in reading this text as compared to the problems, students of first class encounter while getting trained to learn a contemporary script. Students must completely ignore current font shapes and relearn similar or completely different forms of historical inscriptions. A script, that we use for general communication, is called Latin. Its development took place in several millennia. The evolution of font shapes depends on many factors such materials and instruments which were used for writing, and high demands of fast writing (Uncial, National hands, Gothic minuscule, Humanistic scripts. etc.) (Hlaváček, I., Kašpar, J. & Nový, R. 1994). Therefore, it is imperative to relearn the alphabets of these scripts and of course practicing font shapes.

Palaeography introduces students with old inscriptions or handwritings. The practice of deciphering, reading and the cultural context of writing is included in the discipline. A paleographer must have the ability to recognize numerous styles of handwriting prevalent in different ages and places, because there are many scripts with enormous variation. Scribes often used many abbreviations, which palaeographer must know how to interpret them. Knowledge of individual letter-forms, ligatures, punctuation, and abbreviations enables the palaeographer to read and understand the text (Encyclopædia Britannica, 2014).

### 3.1. Interactive reading-book and mobile applications for paleography

Nowadays, multimedia tools are involved in the teaching of paleography and auxiliary historical disciplines. Especially, the Internet offers many archived materials, practical exercises and various interactive paleographic reference books (Interaktivní paleografická čítanka, 2014; Projekt OPPA, 2014). Websites (Medieval writing, 2014; The National Archives, 2014 & Harvard University, 2014) encourage public to participate in the paleography study and exhibit that the reading old manuscripts can be fun. In many archived materials paleographers may obtain information about alphabets and different transcription rules and specimen letter forms. Another transcript should be formulated to understand the old manuscript fully.

Users may acquire knowledge and then verify it by attempting to solve specific examples and tests. Unlike traditional books, the advantage of the websites is to add manuscripts and across all improved.

A great potential also offer mobile applications that are focused on education. The potential of mobile applications in the education is considerable and the future promise big boom. Already, most students have own smartphone and tablet. It is a reason, why research institutes issue with them. University of Leeds developed a mobile applications aimed at mediaval handwriting and english renaissance handwriting (University of Leeds, 2014). The aim of the applications are to provide practice in the transription of wide range of medieval and renaissance hands. These applications made for Android operating system (and now for iOS too) and offer medieval manuscripts, where every word can be zoomed in. Applications contain the introduction to manuscripts, transcription rules, specimen letter forms, attempt transcription and full transcript. These beneficial applications, however, allude to the fact that do not work on other platform – tablet with Windows operating system and that for users of this platform becomes unusable. For iOS operating system created University of Exeter mobile application called Exeter Manuscripts Project, which explores medieval manuscripts and culture. *The project aims to create an iPad app to introduce young people to the amazing world of medieval manuscripts. Through the app users will go on a journey into the past to discover the history of the places the manuscripts come from and the people and communities that made and owned these incredible and beautiful objects* (University of Exeter, 2014).

Many mobile applications available through App Store (iOS), Google Play (Android), Windows Store deal with teaching of

alphabet writing for kids and teaching or practicing calligraphy or Arabic script. Paleography in this regard, however, still lags, except for a few of the applications as many developers do not deal with this field.

### 3.2. Tablet as a new interactive tool for education paleography

The authors therefore wish to contribute to the development of paleography and to motivate students by using web application developed for all mobile device with touch screen (smartphone, tablet, convertible notebook, notebook with a touch screen). This application called PaleoGraphTouch (Paleographtouch, 2014) is available for all operating systems and mobile devices and is based on HTML version 5 supported by all operating systems. HTML pages can work with or without connecting to the Internet and work as online/offline mobile applications. This application also differs from other application in a way which allows students to learn writing (especially the alphabet) and getting visual training as well. Imitating font shapes and tracing by stylus on the tablet reminds pen (brush, pencil) helps and facilitates students to acquire a basic ability to understand the historical text. It reminds Strobel's method, which is about writing by using a dry pen on printed artwork or writing by using an ink pen on a draft written by pencil. (Penc, 1968). Students, by tracing shapes, do not create anything new but it is sufficient for the training of historical writing. In this web application, users may choose from a variety of application writing mode - pencil, pen or brush and may choose a line thickness. An important part of the application is also adjusting the transparentness (from the visible to invisible), so the users can adjust it according to their own needs.

Once students create their own study pattern (saved in JPEG file format), this application allows to show this manuscript or to choose from a predefined old handwritings patterns that have a transcript so that students can see distinguish each letter or word separately. The application also offers a feature to store layer with the written text into a graphic file (in JPEG format widely supported). This file can be accessed by any graphical browser or editor and allows to continue work with the generated text. This application obviously can not replace teaching with expert guidance and interpretation, but offers teachers a more interactive tools in learning palaeography and the auxiliary science of history.

## 4. Conclusion

The main aim of the text is to introduce novel ways of practising ancient handwritings and modes of writing with the help of tablet mobile device. The use of this new media is changing the face of education and is creating new opportunities for improving the quality of education and learning. The article tries to uncover the students' new approaches to modern, innovative and interactive learning of old handwriting scripts by solving examples using applications on mobile devices. The authors of this article created a novel web application, which helps students to understand historical handwritings in a better way and makes history learning easier.

# Taxonomy of the cognitive domain:

## An example of architectural education program

Süheyla Birlik

Karabük University, Faculty of Safranbolu Fethi Toker Fine Arts and Design, Department of Architecture, Karabük 78050, Turkey

---

### Abstract

Cognitive domain includes the behaviors regarding mental skills. These behaviors are at the level of knowledge, comprehension, application, analysis, synthesis and evaluation according to American education psychologist Benjamin Samuel Bloom et al.

Architectural education aims to acquire a profession within the efforts of designing and building along with creative solutions by harmonizing the requirements with technical opportunities. It is built on the architectural project studies and contains theoretical and practical courses.

In this paper; elective course named as 'New Buildings in Historical Environments-Studio' included in the educational program of Department of Architecture of Karabük University will be analyzed according to Bloom Taxonomy.

▪ *Keywords:* cognitive domain-Bloom Taxonomy, architectural education program, new buildings in historical environments

---

### 1.Cognitive Domain-Bloom Taxonomy

The behaviors in cognitive domain are the mental skills acquired with the knowledge at the end of education.

These behaviors were classified in 6 levels as to require a different thinking type for each and to be prerequisites for each other from simple to complex, from concrete to abstract as

- knowledge
- comprehension
- application
- analysis
- synthesis
- evaluation
- by Benjamin Samuel Bloom et al. in 1956 (Bloom, Engelhart, Furst, Hill, & Krathwohl, 1956).

*knowledge*

At this step; it is expected to recognize or remember the information the way it is. It is not expected to contribute or to

---

· Corresponding author. Tel.: +90-554-638-1761; fax: +90-370-712-8706.  
e-mail address: suheylabirlik@karabuk.edu.tr

use the information. Therefore, behaviors at knowledge level derive from memorization.

- knowledge of specifics
  - terminology
  - memorize, identify, name, define
  - specific facts
  - know, recall, select, label, locate, state
- knowledge of ways and means of dealing with specifics
  - conventions
  - point out
  - trends and sequences
  - list, sequence
  - classifications and categories
  - classify, group
  - criteria
  - set the framework of
  - methodology
  - recite
- knowledge of the universals and abstractions in a field
- principles and generalizations
  - generalize
- theories and structures
  - tell, attribute

#### *comprehension*

At this step; it is expected to understand the information, to express in different words without losing its content and to re-organize the information.

- translation
  - translate, distinguish, comprehend, express, paraphrase, give examples, explain, illustrate, rewrite, extend, summarize, transform, visualize, diagrammatize, match
- interpretation
  - determine, interrelate, interpret, explain the meaning, restate, infer
- extrapolation
  - guess, arrive at a decision, adapt, fill the gap

#### *application*

At this step; it is expected to use the information in explaining or reaching solutions the new situations.

- choose, transfer, guide, use, sketch, experiment, survey, calculate, solve, operationalise, activate, dramatize, show, paint, draw, model, configure, build, apply, present

#### *analysis*

At this step; it is expected to subdivide the information by using various criteria, to determine the relations (one or multiple ways) between the segments and to set forth the principles of gathering the segments. Therefore, behaviors at analysis level are related to both content and style; it requires in-depth thinking.

- analysis of elements
  - collect data, differentiate, parse, subdivide, prioritize
- analysis of relationships
  - associate, outline, analyze
- analysis of organizational principles
  - set out principles, map out, disintegrate, qualify, attribute

#### *synthesis*

At this step; it is expected to create a new and original product to serve a certain aim and to reflect the creativity. Therefore, selected information should be gathered together in a meaningful manner.

- production of a unique communication
  - compile, discover, design, plan, originate, compose, produce, construct, reveal, exhibit
- production of a plan, or proposed set of operations
  - offer an alternative, make a plan, organize, formulate, tabulate
- derivation of a set of abstract relations
  - combine, restructure, synthesize, hypothesize, develop a system

#### *evaluation*

· At this step; it is expected to compare the quantitative and qualitative properties of the information and to take the measure of their accuracy and benefits.

- judgments in terms of internal evidence
  - appraise, overview, control, compare, consider, find mistake, confirm, support
- judgments in terms of external criteria
  - examine thoroughly, decide, judge, critique, give points, admire, defend, recommend, predict, talk over

## 2. Architectural Education Program

Architecture is a multi-directional discipline based on designing and producing spatial inputs.

Compulsory and elective courses on;

- architecture and design culture
- construction technology and management
- tectonics -historical development and effects on design-
- architectural heritage and conservation

are included in 4-year architectural education program in Turkey; the program also includes construction site and office internship studies.

#### *program learning outcomes (uluslararasi.karabuk.edu.tr, 2014)*

- be able to express intellectual thoughts verbally and in written
- to have information about environment, art, history of architecture, be able to follow the current developments
- be able to use different tools in the concrete expressions of the abstract thoughts
- to protect historical environments and be able to apply the architectural restoration techniques
- be able to show the physical environment control data in their works
- be able to create original designs taking advantage of traditional and new concepts in relation to architecture
- be able to transfer to their designs the information acquired from single structure scale to urban environment
- be able to reflect innovations in the field of construction technology and material on their designs
- be able to think critically about the design, be able to produce alternatives for changing conditions
- to have a grasp of scientific research process, to report and be able to present in required places the information and findings obtained
- be able to make disciplinary and interdisciplinary studies on a specific subject
- to have social sensibility and occupational ethics

## 3. New Buildings in Historical Environments

MIM448 New Buildings in Historical Environments-Studio is carried out as one of the elective courses of the eighth semester at the Department of Architecture of the Faculty of Safranbolu Fethi Toker Fine Arts and Design in the Karabük University (Table 1).

· Table 1. MIM448 New Buildings in Historical Environments-Studio

· <b>objective</b>	· to introduce the design approaches in historical environments, to discuss the topic on the examples
· <b>content</b>	· explanation of the historical environment concept, introduction of the design approaches to be applied on the infill buildings in historical environments together with their examples, examination and assessment of the topic on a featured environment
· <b>weekly schedule</b>	· concept of historical environment · reasons for conservation of historical environments · the factors that cause deterioration of historical environments · the stages to be applied in conservation-improvement aimed urban renewal works · the design approaches in historical environments

  - design: field rehabilitation-redevelopment
  - design: field rehabilitation-redevelopment
  - design: field rehabilitation-redevelopment
  - subjective evaluation
  - presentation
  - final exam
- 

Matching with Bloom Taxonomy of the evaluation system (2013-2014 academic year) of the course is as follows:

*mid-term exam*

- Write to which countries the following historical cores belong. (**knowledge**)

Kairouan

Sana'a

Bukhara

Bern

Carcassonne

Český Krumlov

Dubrovnik

Florence

Heidelberg

Matera

Mostar

Salzburg

San Gimignano

Toledo

Valletta

- Write the reasons for conservation of historical environments itemized. (**knowledge**)
- Depending on the abovementioned articles, write the reasons for conservation of the following examples. (**comprehension**)

Koza Han

Pyramids of Giza

Venice

Taos Pueblo

- ----- means absoletion of the structures against the law. (**knowledge**)
- Under the influence of which facts were the following settlement examples remained and changed? (**comprehension**)

Pompei

Warsaw

Galata

- Specify the stages to be applied in conservation-improvement aimed urban renewal works. **(knowledge)**
- Write the design approaches to be applied on the infill buildings in historical environments itemized. **(knowledge)**
- Depending on the abovementioned articles, write the design approaches of the following examples. **(comprehension)**

30 St Mary Exe

Inn and Spa at Loretto

Peri Tower Hotel

Richmond İstanbul Hotel

Hilton Budapest Hotel

Clapham Manor Primary School

#### *term paper*

- Settlement-shape analysis and facade surveys of Safranbolu Hacılarobası Village **(application)**

#### *final exam*

- Explain the effects of copying the history properties 'imitation approach' on designer and texture. **(comprehension)**
- Explain the effects of reflecting the own era properties 'opposite approach' on designer and texture. **(comprehension)**
- Tell the architectural properties of the village in which you have carried out identification-documentation studies. **(analysis)**
- Develop/suggest a model for conservation-improvement aimed rural renewal work for this village. **(synthesis)**
- Support the design approach you will prefer in the model to be suggested. **(evaluation)**
- Discuss the contributions of your renewal study to the village and city life. **(evaluation)**

## 4. Conclusion

According to Bloom Taxonomy... a student completing successfully the course of New Buildings in Historical Environments-Studio;

- defines the historical environment,
- know-can give examples the reasons for conservation of historical environments,
- classifies the factors that cause deterioration of historical environments-can illustrate,
- sequences the stages to be applied in conservation-improvement aimed urban renewal works,
- explains the design approaches in historical environments giving examples-interprets,
- gains sensitivity to the environment,
- can analyze the historical environments,
- can develop conservation models for the historical environments,
- can design new buildings in historical environments,
- can evaluate the admiration preferences of the designs,
- can make evaluation on the historical environments and their conservation.

As a result, each education program aims to gain cognitive domain behaviors. However, it shouldn't be expected to find solutions for the educational problems only with the taxonomy.

## Abstract

Creative trends in the formation of professional and pedagogical culture of the teacher, including the creation, development and use of pedagogical innovations are means of updating educational policy with regard to the training of highly qualified personnel. Therefore the development of pedagogical creativity is an important condition for successful education. Pedagogical creativity directly affects the development of the student. Furthermore, professional motivation is an important factor for the competitiveness of the institution. Higher vocational training is a fundamental component of an integrated system of continued professional education in today's highly competitive job market. The process of developing professional motivation in modern conditions is not possible without the use of pedagogical creativity.

## Introduction

Creative trends in the formation of professional and pedagogical culture of the teacher suggest his or her inclusion in the activities of creation, development and use of pedagogical innovations in the practice of training and education and the creation of a specific innovative environment. The need for innovation-oriented pedagogical activity of the teacher in modern conditions of development of culture and education is caused by social and economic changes, emergence of new types of educational institutions, including non-governmental, which not only creates competition among universities, but also among teachers, increasing humanization of higher education, continuous changes in the volume and composition of academic disciplines, entry of new professions and specializations that require updating of organizational forms, learning technologies, changes in the relationship of teachers towards development and application of creativity in teaching.

Creative trends in the formation of professional and pedagogical culture of the teacher, including the creation, development and use of pedagogical innovations are means for updating educational policy in the sphere of training a highly qualified personnel. The development of pedagogical creativity is therefore an important area for creating conditions for a successful educational work.

According to the leading educational concept<sup>§§§§§§§§§§</sup>, creativity affects the formation of intellectually and morally complete person, allows a person to understand his or her personality and talent and use it for the benefit of the people.

Various sciences, including philosophy, psychology and pedagogy, have been engaged in the study of the essence of creativity, conditions for its development and other aspects. Plato, for example, refers to the creativity of all things man-made: "Anything that causes a transition from nothingness into being is creativity."<sup>\*\*\*\*\*</sup>

If in ancient philosophy and pedagogy creativity is understood as discovering the new with novelty present in all human creations, then "novelty" in the interpretation of Kant is something rare and impressive. "The novelty is a source of and a means for revitalizing attention. All creativity becomes subjective and universally transforms itself into a particular ability of the person."<sup>††††††††††</sup>

Spinoza connects creativity directly to human activity and is convinced that this is an essential characteristic of 'being'.<sup>††††††††††</sup>

The problem. Nowadays the problem of creativity has become so topical that many scientists believe it to be a "problem of the century", while its solution lies in a number of areas, including the education, i.e. in the modern school. In this situation the personality of the teacher comes to the fore - the leading professional characteristic of this personality is the ability to be creative. That very pedagogical creativity of the teacher is capable of solving the problem of functioning of any educational institution, to ensure society's need for highly qualified professionals capable of effectively solving variable tasks, and to unconventionally respond to changes in the modern technological society.<sup>§§§§§§§§§§</sup>

Scientific studies of creativity have many aspects: activity - creating something qualitatively new, distinctive, original and socially and historically unique; and procedure - such as personality development, and self-actualization through the process of creating material and spiritual values (V. Tsapok).<sup>\*\*\*\*\*</sup>

British researchers S. Das, Y. Dewhurst, D. Gray look at creativity on two levels: the first level is inherent in human thinking and human practice, and the second is related to inventions, scientific work, etc...<sup>††††††††††</sup>

According to Vygotsky creativity is human activity, aimed at coming up with something new; these are the things of the external world, or of the inferences and feelings, inherent to the human being.<sup>††††††††††</sup>

creativity is the most important criterion for quality personality formation of modern man, primarily in the social need to work creatively

on an innovative component in accordance with the following criteria (Skibickij, Tolstovskij):

- which allows to determine the level of novelty (absolute, locally absolute and relatively absolute);
- which contributes to high results at a lower cost of physical, mental effort and time invested;
- which means efficiency, which mean specific positive results in the work of a teacher;
- which means a creative use of experience in the learning process.

Psy.D. Rita Bebre argues that creativity consists of three aspects: as an individual attribute, as a process and as a product. As an individual attribute creativity is characterized by originality, innovativeness, non-conformity, courage, etc. As a process it is characterized by creative intuition, imagination, divergent thinking, inspiration, mental plasticity, and conscious and unconscious activity. As a creative product in different areas (art, science, technology, etc.) it is characterized by innovation and benefit to the society.

Teacher is working on an innovative component in accordance with the following criteria (Skibickij, Tolstova, Shefel, 2008):

- innovation, which allows to determine the level of novelty (absolute, locally absolute and relatively subjective level of innovation);
- optimality, which contributes to high results at a lower cost of physical, mental effort and time invested;
- effectiveness and efficiency, which mean specific positive results in the work of a teacher;
- the possibility of a creative use of experience in the learning process.

\*\*\*\*\* Kichuk N. От творчества учителя к творчеству ученика. - Измаил, 2002. - 96 с.

Analysis of research results shows that on the average 44.27% of first-year students have a broad interest towards specialising in a certain field, yet this interest is not connected to the practical activity. Moreover, the highest percentage by this indicator was recorded in the course "Business Administration" (47.5%). We explain this by the fact that most of the students enrolled in this particular programme are high-school graduates, who wish to establish their own businesses. Contrary to that we have found a drop in professional interest among fourth year students: from 40.27% in the first year to 8.6% in the final year. Such results are likely related to first-year students' idealistic ideas about the profession contrasted by the fourth-year students' realistic attitude towards entrepreneurship, together with risks and necessity for self-financing your enterprise. Such results naturally request a more stimulative approach towards learning through the use of pedagogical creativity.

ISMTA (%)									
№	INDICATORS	Study programs, courses							
		Business Administration		Tourism Business		Manager Information systems		Average value	
		I	IV	I	IV	I	IV	I	IV
<b>Appendix A. Professional orientation</b>									
1.	Attitudes towards specialisation	47,5	9,4	43,2	9,8	42,15	11,4	44,27	10,20

§§§§§§§§§§§§§§§§§§§§ Gale, K. (2001) Teacher education within post-compulsory education and training: A call for a creative approach,  
in: Craft, A., Jeffrey, B. and Liebling, M. (eds.) Creativity in education pp. 103-115 (London, Continuum)

2.	Interest in other areas	13,2	24,2	14,6	21,09	14,9	20,1	14,25	21,8
3.	The interest in entrepreneurial activity	20,1	26,8	17,1	22,9	16,42	26,32	17,87	25,34
4.	Lack of sustained interest	13,1	35,1	15,3	32,8	17,68	36,8	15,36	34,9
5.	The degree of awareness of the future profession	25,1	76,2	27,3	73,9	27,1	77,3	26,5	75,8

In order to raise the level of creativity and competencies it is necessary not only to increase the amount of obtained information and the quantity of forms and methods of work, but also to establish environment, which is going to systematically incite self-analysis and self-development of the students.

For instance only 17.87% on average of first-year students and 25.34% of fourth-year students have an interest in working in the sphere of entrepreneurship, hospitality / tourism and information systems. 14.23% (1<sup>st</sup> year) and 21.8% (4<sup>th</sup> year) expressed interest in other industries and sectors, while 15.36% of the first-year students and 34.9% of future graduates (seniors) show a lack of interest in any profession. Level of awareness about the future profession in the first year reaches 26.5% and 75.8% in the final year. Such data confirm a real necessity for developing lecturer's engagement. Indeed, the highest creative activity and intensive expert and professional interest are found among students in the field of active independent research, which is enabled by the corresponding teaching methods of the lecturer.

Research problem focuses on finding the way for overcoming contradictions between emerging societal demand for creatively active pedagogues and the teaching stereotypes at institutions of higher education.

Substantive and constructive changes that occur in the education system, particularly in secondary schools as its basic cell, necessitate preparation of a new generation of teachers who can perform professional activities on democratic and humanistic principles, implement educational policy as a priority function of the state, and instil in the younger generation a certain readiness for life and work in a modern society.

Analysis of the philosophical and psycho-pedagogical literature allows us to suggest the following approach to the definition of a creative personality. Creative personality is a creative person (a person that has internal prerequisites for creative activity), which has due to the influence of external factors acquired additional motives necessary to actualize human creativity and personality structures and abilities the enable the research of creative results in one or several types of creative activity.

Thus, if the teacher aims at developing the potential creative possibilities of the student, he or she must master the forms, methods and means of teaching activities that ensure the development of creative personality traits, as well as those additional motives, personal qualities and abilities that contribute to a successful creative activity. To do this, the teacher himself (herself) must possess creativity, because as good brings good, creativity develops through creativity.

## Summary

Creative trends in the formation of professional and pedagogical culture of the teacher, including the creation, development and use of pedagogical innovations are means of updating educational policy with regard to the training of highly qualified personnel. Therefore the development of pedagogical creativity is an important condition for successful education. Pedagogical creativity directly affects the development of the student. Furthermore, professional motivation is an important factor for the competitiveness of the institution. Higher vocational training is a fundamental component of an integrated system of continued professional education in today's highly competitive job market. The process of developing professional motivation in modern conditions is not possible without the use of pedagogical creativity.

Satisfaction with learning leads students to concentrate more on their studies, while at the same time increasing social activity which also improves motivation. In the context of underdeveloped student abilities, creative teaching can achieve great success improving student's performance in an education system which formerly did not apply this approach. Therefore, the development of students using pedagogical creativity is one of the priorities of higher education.

Thus, if the teacher aims to develop the potential for creative possibilities of learning, he/she must master the forms, methods and means of teaching activities that ensure the development of creative personality traits, as well as those additional motives, personal qualities and abilities that contribute to a successful creative process.

The research challenge is to find the way for overcoming contradictions between emerging societal demand for creatively active pedagogues and the teaching stereotypes at institutions of higher education.

---

## Abstract

Thai government implemented a technology policy entitled "One Tablet Per Child" (OTPC) aimed at preparing Thai students to become a competitive world citizen. To accelerate teacher competencies, CIAR (Classroom Innovative Action Research) coaching process was developed to reach the optimum goal of teachers' competencies and students' learning outcomes including; (1) Teachers' profile assessment (2) Academic integrity (3) Classroom technological challenge (4) Peer coaching (5) Reflection and (6) Publishing. Mix method research design was applied throughout the study, detailed the cumulative findings of teachers' profiles and competencies as well as students' learning outcomes. The findings of this study ensure the CIAR coaching process to be an effective nation wide teacher professional development program.

---

## Introduction

In 2012, Thai government implemented a technology policy entitled "One Tablet Per Child" (OTPC), aimed at preparing 21<sup>st</sup> century skills for Thai students to be competitive world citizens, including learners' competencies in four areas known as 4C: critical thinking & problem solving, creativity & innovation, communication, and collaboration, as well as digital literacy and life skills (Kay, K. & Greenhill, 2011; Ministry of Education, 2012). According to this policy, more than 500 thousands of the first grade students were offered personal tablet devices at no cost and to use as a learning tool in their daily classroom activities. In the later year of 2013, Thai government launched a pilot project of Tablet for 7<sup>th</sup> grade students in five schools, no matter the result of the first year tablet policy reported to be a negative result to the first grade students (Satit, 2012). Targeted at students' competencies, several efforts in uplifting teachers' knowledge and skill were focused on integrating tablet technology into a classroom to reach optimal goal of students learning outcomes. In order to accelerate teacher competencies development, this research was purposed to design a teacher training process that could succeed four teachers' competencies areas of (1) self-development by mean of academic information updating; (2) students' learning management skills; (3) classroom management; and (4) analytical and research ability. In parallel with teachers' competencies, students learning outcomes in terms of learning achievement and students' competencies in critical, creative, collaboration and communication competencies (4C) were assumed to successfully achieve through CIAR coaching process. The process derived from a concept of Classroom Action Research (CAR) that serves as a powerful method for teachers to discover what work best in their classroom. In addition to the CAR, Design-based research (DBR), which is one type of research methodology that commonly used by researchers in the learning sciences, was applied to be a process work for teachers to follow an iterative cycle of a classroom technology integration of analysis, design, implementation, and redesign (Lofthouse, R. Leat, D., and Towler, C., 2012; Williamson, R., 2012; Wang and Hannafin, 2005).

## 2. Objectives of the study

2.1 To develop a "Classroom Innovative Action Research (CIAR) coaching model" that enhancing Thai teachers competencies, and

2.2 To examine the effects of CIAR process on teachers' competencies and students learning outcomes.

### 3. Target population and sampling procedures

Expert group was selected from Thai Instructional Technologists by a purposive sampling technique. The samplings were selected from Instructional Technologists who had research and publications in Tablet technology and had more than ten years of teacher training programs. Considering a list of Thai Instructional Technologist from Audio-Visual and Educational Technology Association members, researcher found 23 qualified Instructional Technologists and 13 members agreed to participate in the research.

Three sampling groups were selected from the target population accordingly:

3.1 Ten Teachers from two schools, which were chosen from five schools in a tablet project of the Year 2013, and were selected with a voluntary sampling technique.

3.2 Hundred and thirty- three students at the secondary level of teachers sampling group were selected with voluntary sampling technique.

3.3 Hundred and thirty- three parents were from students sampling group.

### 4. Scope of the study

This study is a Research and Development, applied a mix method approach, and was designed into 2 folds:

*4.1 The first phase* In the first phase of the study, a qualitative procedure was applied in developing a coaching process of CIAR. The procedure is explained into 3 steps consequently:

4.1.1 An analytical document review using a table in a matrix format to compare and contrast DBR, CAR, and a participation development process for a CIAR coaching process. Using the CIAR coaching process, the coaching modules were developed, including set of activities plans, instructional media, coaching manual, and teacher competency assessment tool.

4.1.2 Later, a set of questionnaire based upon the result of the analytical review of CIAR coaching process and together with CIAR coaching modules were proposed to an expert sampling group, using a focus group technique.

4.1.3 Content analysis by two experts in Educational Researchers was in this stage of data interpretation to verify the coaching process. Then, a proposed coaching process was completely developed at this stage.

*4.2 The second phrases.* The second phrase contains 3 mains procedures accordingly;

4.2.1 The designed coaching modules based on "CIAR coaching process" were implemented to two schools from five pilot schools of Tablet Technology project of the Year 2013, within a school semester time frame.

4.2.2 A qualitative procedure was applied to study the before and after result of teachers' competencies as well as students' learning outcomes. Along with this procedure, qualitative method of data collecting of classroom observation and teachers' reflection were collected to explain the atmosphere of teachers and classroom during their classroom research.

4.2.3 Finally, based on the result, the CIAR coaching process was modified by researchers and verified by 3 experts and policy makers to be six stages of the CIAR coaching process.

### 5. Instrument and measurement

This research study applied a mix method of qualitative and quantitative was applied using a measurement test, questionnaire, and a list of observation guidelines accordingly:

*5.1 Teachers' competencies assessment*

An instrument for assessing teacher competencies was modified from national teacher competency standard measurement, covered four areas of teachers competencies using a Likert scale, and validated by IOC (Item- Objective Congruence) from three Educational measurement experts. Instrument was administered to supervisor to assess performance of their subordinate teachers before and after participating the CIAR process.

*5.2 Students' competencies assessment*

An instrument for students' competencies assessment was a standard measurement developed by Thailand Basic Education, assessed by a classroom teacher and one Instructional Technologist.

*5.3 Students' learning outcomes assessment*

Five instruments of students learning outcome were developed by classroom teachers, and later assessed by classroom teacher and one Instructional Technologist.

*5.4 Questionnaire for students 'self report*

A questionnaire was developed and administered to gather students' opinions and self report of their behaviors change after the usage of Tablet toward their learning outcomes and competencies.

#### *5.5 Questionnaire for parents*

A questionnaire for parents was also developed to gather opinions and cross-check of the students self report of their behaviors in using of Tablet technology.

#### *5.6 Guidelines for classroom observation*

A set of guideline for classroom observation for researchers was to analyze the learning environment in three classrooms throughout the school semester.

### **6. Results**

The results were presented into two parts: (1) CIAR coaching process (2) teachers' competencies and students' competencies and learning outcomes.

#### *6.1 CIAR coaching process: Descriptions of the CIAR coaching process*

A CIAR coaching process was developed and meant to be a tool for an in-service coaching on technology integration. The CIAR consists of 6 stages of coaching 1) Teachers profile assessment 2) Academic integrity 3) Classroom technological challenge 4) Peer coaching 5) Reflection 6) Publishing.

6.1.1 Teachers profile assessment: gap analysis is a comparison of actual performance with potential performance by four assessment activities:

6.1.1.1 lesson plans analysis,

6.1.1.2 classroom observations,

6.1.1.3 teachers' gap interview: after gathering evidence and creating a complete picture of practice, teachers were interviewed for some specific questions, and

6.1.1.4 peer/supervisor survey: anonymity breeds honesty; survey teachers, staff, administrators, and especially students.

6.1.2 Academic integrity: academic integrity is a knowledge and value that is set to be a fundamental success of technology integration, adherence to moral and ethical principles by activities accordingly:

6.1.2.1 accessing teachers' opinions,

6.1.2.2 ethical use of information and Creative Common (CC) licensing,

6.1.2.3 case study and discussion, and

6.1.2.4 a proposed community digital ethical guideline.

6.1.3 Classroom Technology challenge: four modes of coaching were provided:

Entry levels of comfortable basic technological skills: get to know each other at the entry level and overview best practices and lesson learned of technology intervention and pedagogical approaches,

Analysis of practical problem: pre-coaching teachers' sessions on tablet technology, teaching best practices, and explore and analyze of current learning problems,

Development of solutions: hypothesize some alternate choices of solutions: peer, one-on-one peer coaching, and individual case consultation with expert in Research & Educational Technology to analyze an existing learning problem using collaborative discussion technique to elaborate the use of cognitive and collaborative technological tools for a learning intervention integrated to classroom, and

Sharing: teaching and evaluating solution: Small group sharing and pair up teachers on lesson plan and technology integration; this session is to establish a peer assisting.

6.1.4 Coaching: teachers implemented their lesson plan with a technological support and a coaching on students' learning assessment, to help teachers in data collecting in the classroom.

6.1.5 Reflection: Teachers reflected from the data interpretation from classroom, and brings up a new solution to improve classroom with technology.

6.1.6 Publishing: Result of the classroom researches were published for lesson learned and for teachers' profile.

#### *6.2 Teachers' competencies and students' competencies and learning outcomes.*

##### *6.2.1 Teachers' competencies*

Teachers' competencies assessed by supervisors. The result showed that teachers had a higher score of competencies than the beginning of the mobile usage in the areas of self-development through academic information updating, students' learning management skills, classroom management; however no significant improvement in the area of analyze and research skills.

Table 1. Instructional types/learning activities, Common Characteristics of technology

## 6.2.2 Students' learning outcomes, competencies, and self-report on behaviors in tablet usage.

### 6.2.2.1 Students' learning outcomes

Students' learning outcomes were examined in 5 levels: below 9 very low; 10-14 low, 15-19 average, 20-24 high, and 25-30 very high. Students' learning outcomes were assessed in three areas; content learning achievement, creativity, and presentation. Content achievement item was in high level in all subjects (23.33, 23.33, 23.33, 21.36, 22.25), and higher than items of creativity and presentation.

Table 3. Student's Learning Outcome

Learning Outcome	Thai		History		Math		English		Science	
Items of assessment	Mean	SD	Mean	SD	Mean	SD	Mean	SD	Mean	SD
Content achievement	23.33	0.00	23.33	0.00	23.33	0.00	21.36	0.99	22.25	1.45
Creativity	19.70	1.77	18.51	1.64	20.69	1.83	19.99	1.11	12.04	0.71
Presentation	17.31	1.46	n/a	n/a	20.94	1.38	11.54	1.10	11.72	0.84

(Below 9 very low; 10-14 low, 15-19 average, 20-24 high, and 25-30 very high).

#### 6.2.2.2 Student's Competencies

Student's competencies were examined based on their communication, critical thinking, problem solving, life skills, and technology skills found to be in a low level (Table 4).

Table 4. Student's Competency

Areas of assessment	N	Mean	SD
Communication& collaboration	133	1.89	.74
Critical Thinking	133	2.00	.81
Problem Solving	133	1.82	.72

#### 6.2.2.3 Self-report on behaviours in tablet usage

Pearson correlation coefficient was computed to assess the relationship among the critical thinking, collaboration, creative thinking, ethics and Entertainment variables (Table 5). There was a strong positive correlation between critical thinking and creative thinking ( $r = .598$ ,  $n = 131$ ,  $p = .000$ ) and collaboration ( $r = .426$ ,  $n = 132$ ,  $p = .000$ ). There was a negative correlation between ethic and the other variables including critical thinking ( $r = -.385$ ,  $n = 131$ ,  $p = .000$ ), collaboration ( $r = -.200$ ,  $n = 132$ ,  $p = .022$ ), creative thinking ( $r = -.210$ ,  $n = 130$ ,  $p = .016$ ), and entertain ( $r = -.220$ ,  $n = 132$ ,  $p = .011$ ).

Table 5. Pearson Correlation of critical thinking, collaboration, creative thinking, ethics and Entertainment variables

		Critical	Collaboration	Creative	Ethic	Entertain
Critical	Pearson Correlation	1	.426(**)	.598(**)	-.385(**)	.289(**)
	Sig. (2-tailed)		.000	.000	.000	.001
Collaboration	Pearson Correlation	.426(**)	1	.405(**)	-.200(*)	.257(**)
	Sig. (2-tailed)	.000		.000	.022	.003
Creative	Pearson Correlation	.598(**)	.405(**)	1	-.210(*)	.299(**)

	<b>Sig. (2-tailed)</b>	.001	.003	.001	.011

\*\*, Correlation is significant at the 0.01 level (2-tailed).

\*, Correlation is significant at the 0.05 level (2-tailed).

#### 6.2.2.4 Parents opinions on students' learning outcome

Table 6. Parents opinions on students' learning outcome

<b>Opinions</b>	<b>N</b>	<b>Mean</b>	<b>SD</b>
Critical thinking	133	5.56	1.16
Creativity	133	4.93	1.42
The alienation from society	133	4.90	1.25
Aggressive behavior	133	4.16	1.25

## 7. Discussions and Recommendations

A professional development process for teaching with tablet technology through a CIAR coaching process mainly empowered teachers to master their technology classroom integration through a recursive classroom action research. When teachers were at a comfortable level of teaching by technology, they designed their instructional methods to be students' oriented.

However, the ethics variable was noticeable to be a negative correlation with other variables. Some opinions of teachers agreed and praised choices of information usage by students who could cleverly manipulate the information available on the Internet. Teachers perceived that ethics of technology usage should be an individual right and responsibility. Teachers could monitor only during students are in schools. It could be said that there was an emerging need of literate ethical issue throughout student's learning process, and teacher professional development as well. Therefore, increasing an awareness of the ethical and academic integrity was proposed to be one of the CIAR coaching processes.

Interestingly, the CIAR coaching process is evidentially proved a significant improvement of teachers competencies in three areas but not analytical and research skill at the first round of classroom action research, and that found in the low and average level of students' learning outcomes and competencies, especially negative correlation of students' ethics to other cognitive aspects. It is noticeable that teachers overloaded with regular teaching works and projects at school demanded by district and national projects could lessen teachers dedicated time to the nature of recursive CAR, which was found at the stage of publishing. Findings from published research report, teachers should be able to define a new conceptual intervention and implementing test the validity of their intervention in order to generate new framework that become more iterative process. Failed to do so, the success of CIAR could be limited.

Executives and supervisors in schools were suggested to consider emphasizing classroom improvement by using a previous learning result to re-design an effective classroom teaching, which could be a method to ensure quality of teaching with technology in a Basic Education program.

# Teacher opinions about the conceptual challenges experienced in teaching physics curriculum topics

Işıl Aykutlu<sup>a</sup>, Sevim Bezen<sup>a</sup>, Celal Bayrak<sup>a</sup>

<sup>a</sup> Hacettepe University, SSSM Education Department, Physics Education, 06800 Beytepe, Ankara, Turkey

## Abstract

This study aimed to determine the teacher opinions about the conceptual challenges experienced in teaching the topics of the physics curriculum. Qualitative research methods were used in the study, which was conducted with 38 physics teachers teaching at 28 different Anatolian High Schools in Ankara during 2012 – 2013 spring and 2013 – 2014 fall semesters. The semi-structured teacher interview form developed by the researchers was used as the data collection tool. The form consisted of seven open-ended questions. The data obtained during the interviews were analyzed through the descriptive statistic method. As a result, teachers mentioned that students had difficulties in the conceptual understanding of motion, torque and simple harmonic motion in the “Force and Motion” unit, the particle nature of light and the wave nature of particles in the “Modern Physics” unit as well as variable current, capacitors, coils, transformers and electronic circuit elements in the “Electricity and Electronic” unit. It was concluded that the challenges that were experienced in general stemmed from various factors such as students’ lack of knowledge in terms of concepts, existence of misconceptions, difficulties in comprehending abstract concepts, deficiencies in mathematical operations and insufficiency of time allocated to the course leading to incomplete teaching tasks.

## 1. Introduction

Physics is the field of science that is encountered at various locations in the universe as well as being related to the events that we use and observe in the universe and enabling individuals to find solutions for daily life events or analyze them from various perspectives. Since physics has such an essential role in the universe, the importance of physics courses, which are taught and applied effectively at schools, has increased significantly (Aycan, Aycan, Genç, & Özkaya, 2000). Physics education enables students to attain the required skills for scientific thinking, producing knowledge, keeping track of developing technological changes, understanding and interpreting the events occurring in the nature (Arslan & Eraslan, 2003). Students attend physics classes under the impression of their previous knowledge, attitudes, beliefs and values. This leads them to have opinions and prejudices that involve incomplete or scientifically inaccurate thoughts. These false or incomplete assumptions may continue in students throughout their educational lives. On the other hand, students may also generate scientifically inaccurate opinions within the teaching process. These factors make conceptual learning and teaching of physics even more challenging (Jonassen, 1994; Treagust, Duit, & Fraser, 1996). Studies on physics education have shown that such reasons as low level of interest and motivation about physics classes, inability to attribute meanings to abstract concepts, misuse or inaccurate usage of concepts related to scientific thoughts and beliefs, false usage of concepts related to the models and theories as well as the previous thoughts and beliefs are the main reasons that make concepts difficult to learn (Hoffmann, 1990; Duit, 1992; Sencar & Eryılmaz, 2002; Eryılmaz & Tatlı, 2000). Within this scope, this research has been designed to study the factors that hinder learning of concepts included in the physics curriculum.

Education system has an essential role in effective physics teaching. Today, various countries have implemented changes and innovations in their education systems to increase the level of development (Ünal, Coştu, & Karataş, 2004). One of these changes is the revision, modification or organization of the curriculum (Ayas, Çepni, & Akdeniz, 1993). Since 2004, there have been attempts to revise, modify or organize the curriculum in Turkey based on the constructivist learning theory (Göçen & Kabaran, 2013). The curricula aim to ensure that students attain knowledge and skills that address the aims of the education program in an organized way (Varış, 1996). The aim of the physics curriculum, which has been revised in Turkey recently, is to improve scientific literacy in students as well as increasing the level of their interest in physics, motivating students towards inquiry, using scientific knowledge and methods to explain an event and creating awareness about the nature of science (Ministry of National Education [MONE], 2013). In the light of this aim, secondary school physics curriculum was developed in 2007 when the high school education period was extended to four years and implemented gradually starting from the 2008 – 2009 academic year. Later on the curriculum was updated in 2011. The Physics Curriculum (PC), which was developed in 2007 and updated in 2011,

E-mail address: aykutlu@hacettepe.edu.tr

was implemented to Grades 9, 10, 11 and 12 in two hours per week as a main course. However, for students that choose Physics as an elective course in Grades 10, 11 and 12, the allocation of hours per week is 3 for students whose Grade 10, 4 for Grade 11 and 3 for Grade 12. The number of attainments changes for students who choose Physics as an elective course and for those who do not. The topics and concepts/terms that are included in the curriculum for both options mentioned before are displayed in Table 1 and Table 1.1.

			<u>UNIT 7: REALM OF PHYSICS</u>
			<i>Concepts/terms:</i> Hypothesis, law, theory

In 2013, Physics curriculum was revised and decided to be implemented gradually starting from Grade 9 in the 2013-2014 academic year. The New Physics Curriculum (NPC), which was decided to be implemented gradually starting from the 2013-2014 academic year, was planned to be taught to Grades 9 and 10 two hours per week and the 4 hours per week was decided to be allocated for Grades 11 and 12 (Table 2, Table 2.1). One of the major differences between the PC and NPC is that the PC is based on the spiral structure; however the NPC is not (MONE, 2007).

<u>5. UNIT: HEAT AND TEMPERATURE</u>		<i>Concepts/terms:</i> Special relativity, Blackbody radiation, Photoelectric effect, Compton effect, De Broglie hypothesis
<i>Concepts/Terms:</i> Heat, temperature, internal energy, specific heat, heat capacity, change of state, thermal stability, energy transmission speed, expansion		<u>6. UNIT: APPLICATIONS OF MODERN PHYSICS IN PHYSICS</u>
		<i>Concepts/Terms:</i> Semiconductor, solar cell, LED's, diodes, transistors, superconductors, Nano-materials, x-ray, laser, stimulation, stimulated emission

Teachers, who are the inseparable elements of education as the implementers of the curriculum, are one of the most important factors ensuring qualified teaching and training of individuals who would contribute and guide the society (Karakuyu, 2008). With respect to the opportunities they are provided, teachers aim to ensure that students attain the targeted attainments in line with the aims of the curriculum (Budak, 1997). The education programs, which have been designed in this perspective, have become the major resources for the teachers as important actors of teaching (Yiğit, 2013). The problems or deficiencies of a program may be identified during its implementation; therefore, the opinions, criticism, recommendations and suggestions of teachers should be taken into account within the process (Sadi & Yıldız, 2012). Additionally, it has been reported that teachers, being in verbal or nonverbal communication with the students throughout the learning process, have an essential role qualified to make judgments about learning and learning process through observing and understanding the thoughts and emotions of students within the classroom (Şişman, 2000). In the light of all these reasons, it is believed this study on the teacher opinions about the conceptual challenges experienced regarding the topics of the physics curriculum, which was developed in 2007, revised in 2007 and 2011, would contribute to the literature due to the lack of sufficient research on the new physics curriculum in particular.

## 2. Method

This study, where the teacher opinions were taken about the conceptual challenges experienced in teaching the topics in the physics curriculum, the qualitative research methods were used.

### 2.1. Sampling

This study was participated by 38 physics teachers teaching Grades 9, 10, 11 and 12 at 28 Anatolian High Schools in Ankara during the 2012 – 2013 spring and 2013 – 2014 fall semesters. There were teachers among the participants that taught more than one grade level. For each grade level, 20 teachers were asked for their opinions. The participants were determined according to the criterion sampling method, which is one of the purposive sampling methods. Criterion sampling methods was preferred due to the fact that the study required the opinions of individuals that have certain levels of knowledge and experience in a subject area (Ersoy, 2013). Within this scope, teachers were expected to express their opinions about the classes they were teaching during the course of the study.

### 2.2. Data collection tools

In order to be used as the data collection tool, a semi-structured teacher interview form with seven open-ended questions was developed by the researchers. The questions were created upon the analysis on the PC and NPC. During the development of the interview form, three physics education experts were asked for their opinions and the questions were formulated accordingly. Before the interview form was finalized, a pilot study was conducted with four physics teachers and the questions in the form were revised in such a way to address the research problem. As a result of these evaluations, the final version of the interview form, which would reveal the conceptual challenges experienced in teaching the topics in physics curriculum.

### 2.3. Application of data collection tools

The semi-structured interviews with physics teachers were made in the environments appropriate to the teachers. Each interview lasted about 25 – 30 minutes. The interviews were audio recorded and transcribed in the electronic environment for further analysis. Each opinion expressed by the teachers for the questions were recorded in separate files in the electronic environment.

### 2.4. Analysis of data

For the analysis of the data obtained as a result of the semi-structured interviews, descriptive statistic method was used. It has been reported that in semi-structured interviews, the categories should not be determined before the data are obtained (Yin, 1984). As Yin suggested (1984), categories were created based on the similarities or oppositions of the responses given to the questions by the physics teachers. At the initial stage of the data analysis, the files that the data were saved in were reviewed and categories were determined to fit for each response. Next, the categorized data were classified within themselves. And at the final stage, the findings of the study were obtained upon categorization of the data that were found to be similar after classification. Furthermore, the responses provided by the physics teachers for the questions were cited in order to support the findings of the study.

## 3. Findings

The findings obtained at the end of the analysis indicated that there were topics, in which the students experienced conceptual challenges at each grade level and that these challenges stemmed from the lack of conceptual knowledge, existence of misconceptions, difficulty that students had in understanding abstract concepts, lack of mathematical operational skills and insufficiency of the time allocated to the course. With respect to the NPC teachers were observed to mention that the content of the curriculum was more simplified than the previous one, there were less restrictions imposed on teachers for teaching the curriculum content, the program was not in conformity with the university placement test and the existing textbooks did not comply with the curriculum. Similarly, it was found that teachers expected potential conceptual challenges due to the factors such as the sequence of the topics presented and the insufficiency of the time allocated to the course hours. The seven questions that the physics teachers were expected to answer with the aim of determining the conceptual challenges experienced in teaching physics curriculum topics are presented hereby below along with the findings obtained as a result of the analysis.

*“Among the topics of the physics curriculum, what are the most challenging topics for students in terms of conceptual learning?”* was the first question asked to the physics teachers. The findings obtained from the semi-structured interviews made with participating teachers indicated that motion as a part of the “Force and Motion” unit in Grade 9, current, voltage and electrical power in electrical circuits at the “Electricity” unit in Grade 10, torque an the “Modern Physics” unit in Grade 11 as well as the simple harmonic motion in the “Force and Motion” unit and variable current, capacitors, coils, transformers and electronic circuit elements at the “Electricity and Electronic” unit in Grade 12 were most challenging topics and concepts for students in terms of conceptual learning (see Table 3).

During the semi-structured interviews, teachers expressed the reasons for the conceptual learning challenges that the students experienced using the following statements (T: Teacher; #: Number of teacher):

**T5:** “Students lack the sufficient knowledge about derivatives and integral in mathematics; therefore, they cannot comprehend the formula or do the operations. The problems occurring due to the lack of knowledge in mathematical operations are generally experienced in the ‘Force and Motion’ unit.”

**T23:** “RLC circuits and transformers at the ‘Electricity and Electronics’ Unit and the simple harmonic motion at the ‘Force and Motion’ in Grade 12 do not comply with the content of the university placement test. The first phase of the university placement test that is administered in March does not contain relevant questions; however the topics are presented in the fall semester according to the curriculum. Students, who focus on the university placement test do not study the topics of Grade 12 that are not in the scope of the university placement test and therefore they have difficulties in learning these topics.”

**T30:** “‘Waves’ unit is quite comprehensive and challenging; however, it is taught in Grade 12 and due to the stress experienced by students with respect to the upcoming university placement test, students have difficulties in attributing meanings to the topic”.

**T31:** “Students have difficulty in understanding topics that contain abstract concepts such as the ‘Modern Physics’ unit.”

According to the semi-structured interviews made with the teachers, the lack of students’ ability to do the mathematical operations, intensity of the abstract topics and the noncompliance with the university placement test content were the main reasons for the conceptual challenges that students experienced.

Table 3. The most challenging units and topics for students to learn

UNITS	SUBJECTS	GRADE 9	GRADE 10	GRADE 11	GRADE 12
		Number of Teachers (%)	Number of Teachers (%)	Number of Teachers (%)	Number of Teachers (%)
Force and Motion					
	Motion	10 (50%)	6 (30%)	-	-

	Structure of Nucleus, Radioactivity	-	-	-	6 (30%)
Electricity and Electronic					
	Variable Current, Capacitors, Bobbins, Transformers and Elements of Electronic Circuit	-	-	-	9 (45%)

“According to you, why do students experience conceptual challenges in learning topics generally?” was the second question that was asked to the participating teachers. Teachers reported that the major reasons were the realization of mechanical learning without attributing meanings to the topic, lack of ability to do the mathematical operations, insufficient amount of hours allocated to teaching, existence of incomplete knowledge and misconceptions from past learning experiences, low level of student motivation and the development of negative attitudes towards physics due to the anxiety stemming from the upcoming university placement test, particularly observed in Grade 12 students (Table 4).

Table 4. The reasons for the conceptual challenges experienced in learning

	GRADE 9 Number of Teachers (%)	GRADE 10 Number of Teachers (%)	GRADE 11 Number of Teachers (%)	GRADE 12 Number of Teachers (%)
Insufficient allocation of hours	15 (75%)	14 (70%)	15 (75%)	-
Lack of the ability to do mathematical operations	15 (75%)	8 (40%)	12 (60%)	8 (40%)
Realization of mechanical learning without attributing meanings to the topic	10 (50%)	11 (55%)	-	7 (35%)
Existence of incomplete knowledge and misconceptions from past learning experiences	8 (40%)	8 (40%)	1 (5%)	5 (25%)
Development of negative attitudes towards physics due to the anxiety stemming from the upcoming university placement test	11 (55%)	6 (30%)	9 (45%)	10 (50%)
Failure in provision of level-appropriate teaching for students	8 (40%)	5 (25%)	3(15%)	-
Inclusion of rather extensive knowledge in the curriculum	5(25%)	4 (20%)	9 (45%)	-
Teachers' lack of field knowledge	4 (20%)	3(15%)	3 (15%)	-
Failure to ensure student motivation	2 (10%)	1(5%)	14 (70%)	3 (15%)
Inclusion of abstract concepts in the topics	-	12 (60%)	5 (25%)	-
Lack of experimental applications within the topics	-	-	4 (20%)	-
Anxiety due to the upcoming university placement test	-	-	8 (40%)	18 (90%)

Table 4 shows that the major problem in Grades 9, 10 and 11 is found to be the insufficient time allocated to the teaching of the topics, which further leads to a quick pace of learning activities and hinders the performing of practical applications. Findings obtained from teachers interviews did not contain a reference by Grade 12 students to the problem of insufficient time allocated to the teaching (Table 4). This may be a result of the failure to execute level-appropriate teaching according to such statements of teachers as “Students have become distant to school. They do not want to come to school. When students are in Grade 12, they focus on the private supplementary courses and the university placement test. Even though students attend school, the lessons are quite unproductive or they practice test questions to prepare for the university placement test within the scope of its content.”

The third question that was asked to the physics teachers was “*What are the teaching methods, techniques and strategies you use in teaching the topics that are challenging to learn conceptually for students?*”. Teachers mentioned that they preferred to use the instruction method, question and answer technique and problem solving method in teaching of the said topics (Table 5).

Table 5. Teaching methods, techniques and strategies used in teaching topics that are challenging to learn conceptually

	GRADE 9 Number of Teachers (%)	GRADE 10 Number of Teachers (%)	GRADE 11 Number of Teachers (%)	GRADE 12 Number of Teachers (%)
Instruction method	20 (%100)	15 (%75)	20 (%100)	15 (%75)
Question and answer technique	9 (%45)	5 (%25)	1 (%55)	6 (%30)
Demonstration and Practice Method	7 (%35)	4 (%20)	6 (%30)	5(%25)
Demonstration Technique	6(%30)	4 (%20)	6 (%30)	6 (%30)
Problem Solving	7 (%35)	8 (%40)	11(%55)	11(%55)

Technique				
Individual Studying Technique	8 (%40)	5 (%25)	7 (%35)	-
Discussion Technique	5 (%25)	8 (%40)	-	3 (%15)
Analogy Technique	4 (%20)	3(%15)	6 (%30)	-

Interviews with the teachers revealed that the methods, techniques and strategies they used in teaching conceptually challenging topics were not any different from those they used in their usual teaching. The supporting opinions expressed by the teachers were as follows: (R: Researcher; T: Teacher; #: Number of Teacher):

**R:** What are the teaching methods, techniques and strategies you use in teaching conceptually challenging topics?

**T2:** I usually prefer the instruction method. I sometimes make use of the question and answer technique and problem solving method.

**A:** Why do you prefer to use these methods, techniques and strategies?

**T2:** Because; I believe that I am able to provide students with more effective learning by using these methods, techniques and strategies, which I am used to implement for many years,

**R:** So, what are the teaching methods, techniques and strategies you use in general in teaching other than the teaching of the conceptually challenging topics?

**T2:** I use the same methods, techniques and in teaching of other topics.

**R:** Why is there no difference between the methods, techniques and strategies you use in teaching all topics?

**T2:** I have time limits with respect to the teaching of the topics and I don't have much time for activities that require alternative methods, techniques and strategies.

**R:** According to you, do alternative methods, techniques and strategies have to be used in teaching of the conceptually challenging topics?

**T2:** Of course, that would ensure that students learn more meaningfully. However, in order us to use alternative methods, techniques and strategies, we should have more hours allocated to teaching.

According to the interviews made, teachers believe that in order to use appropriate methods, techniques and strategies, the number of hours allocated to classes has to be increased.

"Considering the conceptual challenges, do you believe that you are able to address all the attainments indicated in the curriculum?" was the fourth question that was asked to the participating physics teachers. All teachers teaching Grades 9 and 11, 18 (90%) of the teachers teaching Grade 10 and 17 (85%) of the teachers teaching Grade 12 mentioned that they were not able to address all the attainments indicated in the curriculum due to the comprehensiveness of the topics and the insufficient allocation of time. Only, 2 (10%) of the teachers teaching Grade 10 and three (15%) of the teachers teaching grade 12 mentioned that they were able to address all the attainments indicated in the curriculum. One of the teachers, who mentioned that s/he was able to address all the attainments indicated in the curriculum, expressed this as follows:

**R:** Considering the conceptual challenges, do you believe that you are able to address all the attainments indicated in the curriculum?

**T15:** Yes, I am.

**R:** What do you think about the sufficiency of the time allocated to teaching the topics of the curriculum?

**T15:** The allocation of hours is not sufficient, topics are quite comprehensive; however, I teach very fast in order to address all the attainments indicated in the curriculum on time.

**R:** Does that have a negative effect on the students?

**T15:** Yes, it does. Students have difficulty in attributing meanings to the concepts when I teach fast.

It was determined that the teachers, who were able to address all the attainments in the curriculum, taught very fast. However, as mentioned before, a fast teaching pace is believed to cause students to experience conceptual challenges in learning the topics.

"Are the topics that are conceptually challenging to learn related to the other disciplines? Please explain." was the fifth question that was asked to the physics teachers who participated in the study. Teachers mentioned that the topics that were challenging to learn in terms of concepts were related to mathematics, geometry and chemistry. Teachers reported that students' learning in mathematics, geometry and chemistry affected their performance in physics (Table 6).

Table 6. The relationship of the topics that are conceptually challenging to learn with other disciplines

	GRADE 9	GRADE 10	GRADE 11	GRADE 12
	Number of Teachers (%)	Number of Teachers (%)	Number of Teachers (%)	Number of Teachers (%)
Chemistry	8 (40%)	10 (50%)	10 (50%)	18 (90%)
Mathematics	14 (70%)	15 (75%)	14 (70%)	17 (85%)
Geometry	14 (70%)	15 (75%)	12 (60%)	16 (80%)

Opinions of teachers supporting the existence of a relationship between the topics that were conceptually challenging to learn and the other disciplines were as follows:

**T9:** “Many topics such as radioactivity and nuclear structure coincide with the subjects of chemistry. We can treat these topics in a more comprehensible way with these students who learned and understood them in chemistry.”

**T18:** “That the students are successful in mathematics and geometry positively affects the physics. The students can learn easily through the formulas and derivations.”

According to the opinions of the teachers, learning in chemistry, mathematics and geometry were effective in learning of physics meaningfully. As some topics of chemistry were related to the Grade 12 physics topics, it was identified that the teachers experienced less conceptual challenges than the other topics while teaching the relevant ones.

“What do you do to teach the topics that are challenging to learn conceptually?” was the sixth question that was asked to the participating physics teachers. It was found that the participating teachers preferred to exchange opinions with their colleagues and lecturers in the universities as well as benefiting from the international resources, and they believed that these choices had positive influences on teaching challenging topics. Another result of the research was that the teachers did not prefer to participate in in-service training activities (Table 7).

Table 7. The activities made by the teachers for teaching the topics that were challenging to learn conceptually

	GRADE 9	GRADE 10	GRADE 11	GRADE 12
	Number of Teachers (%)	Number of Teachers (%)	Number of Teachers (%)	Number of Teachers (%)
Exchange opinions with colleagues	20 (%100)	20 (%100)	20 (%100)	16 (%80)
Exchange opinions with the lecturers in the universities	4 (%20)	5 (%25)	2 (%10)	6 (%30)
Benefit from international resources	-	2 (%10)	1 (%5)	5 (%25)
Benefit from their own experiences	1 (%5)	-	-	1 (%5)

“While teaching the topics in physics curriculum that will be gradually applied as of 2013-2014 school year, what elements may cause the students to have conceptual challenges while learning?” was the last question that was asked to the participating physics teachers. Teachers first explained their opinions about the New Physics Curriculum. A total of 30(79%) teachers thought that the new curriculum was better than the previous one while 31 (82%) teachers thought that it did not impose restrictions on teachers in teaching the topics in the curriculum and 35(92%) teachers believed that it did not comply with university placement test. Among the participants, 25(66%) teachers found the textbooks incoherent with the new curriculum and 34(89%) teachers thought conceptual challenges would reoccur in the new curriculum due to the ranking of the topics and insufficiency of the periods. Fifteen (75%) of the teachers who taught Grade 9 physics curriculum stated that Grade 9 New Physics Curriculum differentiated from Physics Curriculum in the second semester; however, while the ranking of the topics was better in the New Physics Curriculum (see Table 1, Table 1.1), the allocation of periods was insufficient and the titles in new textbook provided better motivation for the students. Five teachers (25%) mentioned that they appreciated the Physics Curriculum much more (See Table 2, Table 2.1). It was identified that 18 teachers teaching Grade 10 thought that was inappropriate to place the optics topic at the end of the semester, as it was a quite significant and comprehensive topic. Two teachers (10%) were found to believe that they would have troubles while teaching the topics, as they would have to step out of their routines due to the requirement of the New Physics Curriculum on not to introduce any numerical expressions. Besides, all the teachers of Grade 10 told that the periods allocated to teaching were insufficient and should be increased. In addition, all physics teachers of Grade 11 reported that a basic topic such as vectors which was placed in Grade 11 physics curriculum should have been taught at the beginning of Grade 9, it was not appropriate and it would be too late to teach it in Grade 11, and that this situation would cause some troubles as the students needed the knowledge of vectors while learning the topics listed prior to vectors. Among the participants, 19 teachers (95%) who taught Grade 12 stated that the topics were too intense considering the fact that the lessons were inefficient as students focused on the university placement test, they pushed the school in the background and focused on the preparatory courses due to their exam anxiety, or they stepped out of the curriculum and solved questions for university placement test. Teachers mentioned that the number of topics in the Grade 12 curriculum should be reduced. It was identified that they thought

“Applications of Modern Physics in Technology” topic could be taught at the university level and it would be more appropriate not to apply a heavy curriculum to the high school students. One (5%) of the teachers told that he appreciated the Grade 12 curriculum as it was more comprehensive.

#### 4. Conclusion and discussion

In the light of the data obtained in this study, which intended to identify the opinions of the physics teachers about the conceptual challenges experienced in teaching the topics of the physics curriculum; it has been identified that the students had difficulties in understanding concepts in motion, torque, simple harmonic motion topics in “Force and Motion”; in granularity of the light, wave feature of particles in “Modern Physics” unit; in alternate current, capacitors, bobbins, transformers and the elements of electric circuits in “Electric and Electronic” unit at most, and these challenges generally resulted from the insufficiency of the periods, the deficiencies of the students in numerical expressions and the fact that they learned mechanically without understanding the topic. According to the opinions of teachers, the curriculum has certain problems that stemmed from the ranking of the topics in New Physics Curriculum, the insufficiency of the periods, and these problems resulted in various conceptual challenges for students.

Referring to the opinions of participating physics teachers, it has been determined that the students have difficulties in understanding motion in “Force and Motion” unit in Grade 9, current in electric circuits, tension and electrical power in “Electric” unit and particularly in specific relativity in “Modern Physics” unit in Grade 10. It has also been determined that students found torque in “Force and Motion” unit challenging in Grade 11 as well as the granularity of the light and wave feature of particles in “Modern Physics” unit. In Grade 12, simple harmonic motion in “Force and Motion” unit, along with the alternate current, capacitors, bobbins, transformers and the elements of electronic circuits in “Electric and Electronic” unit were challenging for the students to learn. The reasons why students had difficulties in learning the topics in physics curriculum were identified as follows: mechanical learning without understanding the topic, the deficiencies of the students in numerical expressions, the insufficiency of the periods allocated, the knowledge deficiencies and misconceptions of the past learning experiences, lack of motivation, inappropriate level of teaching for the students, inclusion of abstract concepts in the “Modern Physics” unit (Wosilait, Heron, Schaffer, & McDermott, 1999), deficiencies of teachers in the field of expertise, the intention of teachers to give more information than required in the curriculum, the inability to perform experiments in teaching of the topics, and the negative attitudes of students towards physics due to the anxiety of the university placement test, particularly experienced in Grade. Previous studies have shown that misconceptions occurred when the students studying for the university placement test were not able to learn the topics thoroughly, the topics were explained superficially and fast due to the insufficiency of the periods, the students were incompetent at numerical expressions due to their prejudices about mathematics and these deficiencies affected the teaching of physics (Çınar & Teyfur, 2006; Yaygın & Dindar, 2007; Karakuyu, 2008; Tüysüz & Aydın, 2009; Kutluca & Aydın, 2010). It has been identified that the reason why all the acquisitions in the curriculum could not be addressed was the intensity of the topics and the insufficiency of the periods according to the opinions of most teachers. The study by Göçen and Kabaran (2013) is also supportive of the findings of this research. They have stated that in cases where the periods cannot be increased, decreasing the number of the acquisitions in the curriculum can reduce the load of each lesson, and they think the teacher can teach and observe the students more easily in a longer period. In the light of these studies, it is believed that decreasing the number of the acquisitions or increasing the length of the periods could be implemented to overcome the insufficiency of the period, which is a frequent problem.

It has been found that the physics teachers used instruction method, inquiry method, modeling method, demonstrating method, problem solving method, individual studying method, discussing method and analogy method while teaching the topics that were challenging to learn conceptually. In the research, it was found that the usual methods, techniques and strategies of the teachers were not different from the methods, techniques and strategies that they used while teaching challenging topics (Karakuyu, 2008; Kapucu, 2010). It is believed that instead of using the same method, technique and strategies while teaching the topics that are challenging to learn conceptually, teachers should benefit from different methods, techniques and strategies, which are open to changing and development and as well as being appropriate for the level of the students, ensuring the achievement of curriculum goals, embodying the topic and addressing more than one sense organs in accordance with the topic.

Teachers are determined to think the topics that are challenging to learn conceptually are related with mathematics, geometry and chemistry. Besides, it has been emphasized that some topics of chemistry are related with especially topics of Grade 12. The relationship between these three disciplines and physics is that according to teachers, the students who have no deficiencies in math, chemistry and geometry or have learned these lessons meaningfully have less conceptual difficulties in the topics that are related with these three lessons compared to other topics. When physics and chemistry curriculum are analyzed, it is seen that some topics of chemistry are related to radioactivity and nuclear structure in “Modern Physics” unit in Grade 12 physics curriculum at most. There are some teachers who think that this relationship has some positive effects. In addition, considering

the high number of acquisitions in physics curriculum and inadequate periods, and the suggestion of Özdemir et al. (2011) to reduce the number of the topics in physics curriculum, it is would be appropriate to revise the topics that are common in physics and chemistry and design the curriculum in such way that these topics will not be repeated.

In-service training activities contribute to the continuity of the education of teachers and continuous updating of teachers' knowledge (Kanlı, 2001). It has been identified in this research that the teachers prefer to exchange opinions about the topics that are challenging to learn conceptually with their colleagues and the lecturers in the universities, and benefit from the international resources and their own experiences; however, they do not prefer to participate in in-service training activities as they do not mention anything about benefitting from these activities. The reasons why they do not prefer to benefit from these in-service training activities may be that they think these activities are not effective in developing their professional knowledge and skills as Kanlı (2011) has stated in his research. These training activities are believed to be more preferable if they are reorganized in such way to improve teachers' professional knowledge and skills, alternative solutions are found for the passive listener role of the teachers, teachers are encouraged to participate in these activities and the activities are performed by the experts.

Among the principles agreed upon without grounding on only one model, approach or method in New Physics Curriculum, it has been adopted that the students learn by interpreting the new knowledge using their previous knowledge (MONE, 2013). But after the interviews with teachers in this research, it has been found that there were certain problems resulting from the ranking of the topics in the New Physics Curriculum. In accordance with the result, it can be said that the absence of the relationship between the rankings of the topics in the curriculum does not coincide with the adopted principle and this problem may complicate the conceptual learning. Other conclusions of this study are as follows: the ranking of the topics in Grade 9 physics curriculum and the change of titles in the textbook have a positive influence on the students (see Table 1); the place of optics topic that is the last topic in Grade 10 physics curriculum should be changed as it is an important and comprehensive topic; vectors as a basic topic of Grade 11 physics curriculum should be among the first topics of Grade 9; the intensity of the topics should be reduced as the requirements of Grade 12 curriculum cannot be met due to the fact that the students focus on the university placement test and push the school in the background and attend preparatory courses. In addition to these results, it has been identified that it would be more appropriate to teach the "Application of Modern Physics in Technology" at the university level instead of Grade 12. Other opinions of the teachers teaching Grades 9, 10, 11 and 12 about New Physics Curriculum are as follows: it does not impose any restrictions on the teachers about teaching the topics of the curriculum contrary to the previous one; the content of the curriculum is more simple; the number of teaching hours allocated is insufficient and should be increased; the textbooks are not coherent with the new curriculum, and the curriculum is not coherent with the university placement test. In order to eliminate this problem, either the university placement test should be modified to comply with this curriculum, or a curriculum that is more compliant with the university placement test should be developed (Kutluca & Aydın, 2010; Nartgün et al., 2011). In the research conducted by Yiğit (2013), it was stated that teachers did not want to adhere to a theory directly within the teaching-learning approach in the New Physics Curriculum. Due to the independence emerging from the fact that teachers can teach without adhering to a theory directly within the teaching-learning process, it is believed that there will be differences in the ways teachers teach, which would lead to conceptual challenges and negative influences for teachers.

## Abstract

The submitted contribution focuses on the question of ICT competences as a necessary part of technical education teacher's professional qualities. The aim of this contribution is to outline the area of ICT competences and their importance for the work of a teacher in the so called information society. Through a survey we then present partial results of the research realized within writing of the dissertation theses named Teacher's Competences for Evaluation and the Use of Web Pages in Teaching.

## Introduction

The strength and power of technology is a typical feature of this era. Technology and information technology are an integral part of everyday lives of adults and children as a component of material culture influencing the whole development of science, art or sport. Technical education is specific mainly by its relationship between social and natural phenomena, when it uses natural laws to satisfy social needs. This caused that a contemporary person is existentially dependent on technology. The basic philosophy of technical education assumes that technology is one of the critical factors of current and future being. The progress and necessity of implementation of information technologies into education is reflected mainly on education content. Technical education attempts at systematic development of pupil's knowledge and skills, but above all, his positive attitudes to technology and its use, so that it positively influences the quality of life in contemporary culture. A teacher, who is the crucial factor in influencing the level of pupils' education, has here doubtless importance. His professional and personal qualities are therefore the object of attention of many researchers in the field of pedagogical reality.

## Undergraduate Preparation of Technical Education Teachers at Palacký University in Olomouc

Undergraduate preparation of future technical education and information technology teachers is realized through the study program Specialization in Pedagogy in bachelor and master study programs, which are guaranteed by the Department of Technical Education and Information Technology. In bachelor study programs there are Fundamentals of Engineering Sciences and Information Technologies for Education and Information Technology Focused on Education. Students can then continue in master program Teacher Training in Technical Education and Information Technology for Secondary Schools and Second Stage of Elementary Schools.

Characteristic features of technically focused disciplines is the endeavor to create optimal assumptions for mastering the set of competences essential for graduate's employment in information-technical society. The program Information Training Focused on Education includes, apart from disciplines of information and mathematical nature, also fundamentals of electrical engineering and electronics so that the graduate is fully able not only to know but also mediate all necessary terminology of information activities, knowledge of software structure, programming, information technologies functions, knowledge of operating systems as well as technical knowledge.

Bachelor and master graduates should possess general knowledge and master basic skills and processes in their fields. They should also be ready to apply scientific and technical findings and creative skills in a creative way and by methods emphasizing active approach. They should stimulate the development of desirable ties and attitudes to techno sphere, technology and the use of technology and information technologies. The graduate is then employed especially in the field of education, according to the needs of institutions providing lower or higher secondary education (ISCED 2, ISCED 3, elementary schools, special schools, technical lyceums, secondary vocational schools and practical schools).

## ICT Competences of Technical Education Teachers

The work with modern ICT requires, given its scale and varied character, analytical, critical and creative thinking (Uhlířová 2004, p. 206). Attention is directed mainly at the use of ICT. The time when it seemed that everyone will have to learn to program is long forgotten. The current situation requires „use and get“, „use and move further“ approaches. Information literacy is therefore more „user-based“ and more open to other areas of activities. Out of this reason there are new, higher demands placed on teachers regarding efficiency.

ICT integration into education depends on complex teacher's readiness. In connection with this, there arise many questions, e.g. how will teachers use ICT, how will they be able to make the best of them, how they will implement them into education process, which ways of learning will they stimulate at pupils, how will they develop the components of pupil's personality etc.

The document „Škola pro 21. století“ (2009, p. 7) states long-term key priorities of the use of ICT in education and sets two conditions essential for reaching the aims of innovation process in education. One of them is modification of teaching practices and teacher's role. The teacher has to go through phases, from which, as we judge, teacher's competences with direct link to the use of ICT have to develop and become more precise. The phases of this process can be summarized as follows:

1. **Necessity** – this is mainly accepting the necessity to know ICT, which are generally possible to be used in education and teacher's profession.
2. **Mastery** – the choice of more effective strategies, better teaching models and freedom from ICT specialists enabled by increasing technical knowledge
3. **Empathy** – the move of attention towards pupils, technology is not the aim but the means, the range of usable technologies is broadening.
4. **Innovation** – the achievement of functional creativity, own adjustment of education aims, plans and practices.

The area of teacher's ICT competences is elaborated in outlined links. The competences are first understood as a set of yet unlabeled structures, thanks to which the teacher effectively uses modern ICT, aiming to reach better education results and simplification of his own work.

Teacher's ICT competences are dealt with on two levels; first explicitly defined or implicitly incorporated (resp. deducible) parts of teacher's professional competences classification (in the Czech Republic e.g. J. Vašutová or V. Švec). V. Rambousek (2007, p. 53) labels them as the necessary part of teacher's ICT competences for incorporating ICT into education, and on the level of field expertise, also for the realization of modern information education. Teacher's ICT competences therefore represent a whole, built from technological and functional point of view on information literacy, and including components, identified by different authors. We will introduce some definitions which enable us also more schematic comparison of their development in time. E.g. M. Černochová (2003, p. 16) defines components of teacher's competences as follows:

- professional skills and discipline knowledge,
- pedagogic and manager skills and teaching knowledge necessary for ICT supported education,
- teacher's information and communication technological skills necessary for ICT application in education,
- language competences – knowledge of a foreign language, especially English,
- social communicative competences.

The above list contains items known from the systems of teacher's professional competences but entails also some specific ones. These are mainly the language competences, the binding of which is distinctively reflected in the frame of English language usage in ICT generally. Another important part are social communicative competences, under which it is crucial to understand the set of teacher's skills and abilities to motivate and activate a pupil while using ICT in education.

It is challenging to compare it with the model of DfEE study, which identifies three areas of teacher's ICT competences (taken and adapted from Uhlířová 2004, p. 207):

1. **Curricular area**, including:
  - Orientation in specific teaching ICT means and teaching environments, ability of their critical evaluation.
  - Knowledge of various utilization of ICT within and outside education.
  - Qualified choice and use of ICT products regarding fulfillment of education aims.
2. **Methodological area**, including:
  - Choice of stimulation and pupil's leadership methods.
  - Choice of method of work in case of pupils with specific needs.

---

\*\*\*\*\* These are mainly initiating changes leading to optimizing the use of technical means in teaching process.

3. **Organizational area**, including:

- Adaptation on the use of different organizational forms of education.
- Creating and use of education proposals supported by accessible ICT means.
- Organization of such forms of work, which stimulate mutual cooperation among pupils and the need to develop their existing knowledge.

Individual areas outline the connection of teacher's preparation for tuition and its realization supported by ICT, with the main goal of enhancing the efficiency of education. This targeting interconnects ICT competences with teacher's professional competences and enables to view different links of pedagogy and ICT expressed in teacher's competences.

A broader connection of teacher's ICT competences with the areas of professional competences and own personality is included in the innovative model used by the Chilean Ministry of Education. The document *Competencias y Estándares TIC para la Profesión Docente* (2011), which aims at setting the basic frame of teacher's ICT competences, is based on five areas describing the relationship of a teacher to ICT (in their specification we mention the parts significant for this study):

1. **Ethical, social and legal area** – primarily focused on teacher's abilities to use ICT as a means of social inclusion together with new forms of socialization.
2. **Pedagogical area** – teacher's abilities to add value to teaching, incorporates ICT to enhance teaching efficiency.
3. **Professional area** – firstly entails self-development and secondly teacher's abilities to mediate more recent and effective perspective in ICT to the pupils and students.
4. **Organizational area** – uses ICT to improve curriculum's organization, school-pupil and school-family relationships.

This model reflects broader links and the trend of ICT in today's society. It spreads onto aspects of pupil's and teacher's personalities' development in environment which moves more and more towards social contacts and communication realized via ICT. In the mentioned areas there are reflected pedagogical requirements to increase efficiency of education as well as cross-curricular requirements focused on every person's ability to become a full member of society, able to adjust to continuous changes.

In the current conception we understand teacher's ICT competences as a part of his professional competences, which is not strictly limited (i.e. including e.g. only technical knowledge and skills connected with the use of ICT in teaching), but linked and consequent with other areas of teacher's professional competences. The nature of teacher's ICT competences lies in the connection of ICT with teacher's educational activity, from this reason we perceive them as superior to teacher's competences for evaluation and use of web pages for teaching.

We present the following set relationship:

Teacher's competences for evaluation and use of web pages for teaching.	€	Teacher's ICT competences
---	---	---------------------------

The research dealing with ICT competences of teachers at the second stage of elementary schools was realized within the writing of the dissertation thesis. We built on Schulman's theory (Janík 2005, p. 40) of pedagogical knowledge:

- **Knowledge of the content of teaching** – including not only the facts and terminology of given field, but also teacher's ability to understand the cause of the formation of the content, judging which topics are essential and which are less important (Janík 2005, p.40).
- **Didactic knowledge of content** – expressing the connection of teacher's didactic and content knowledge. Under these we understand knowledge of presentation and approach to different forms of subject matter and knowledge associated with the specifics of teaching different contents.

Knowledge of the content of teaching as well as didactic knowledge of content are in J. Vašutová's (2004) model a part of current teacher's competences. It can be assumed that it is not necessary to analyze these areas more deeply within the discussed competences and focus only on technological knowledge. However, according to modern pedagogical theories, developed abroad as well as here, technological knowledge cannot be understood separately, but always in interaction with the content of teaching and didactic aspects of their utilization. It follows from the work of professors of Michigan State University P. Mishra and M. J. Koehler (2006) that it is the separation of technological knowledge from the content and didactics which results in inefficient use of technologies, often only as a compulsory supplement in teaching or diversification which is only short term and without the desired effect.

### Using Web Pages in Teaching

In introducing ICT into education processes was and is seen a risk of little explored and in many respects unclear activity (Průcha 2006, p. 310). Nevertheless it is practically unthinkable to imagine current school without broader use of ICT within or

outside teaching. The centre of content of web pages use falls in the interaction teacher – subject matter – pupil to the area marked by the dash lined ellipse, see Fig. 1. It means that the features of web pages through which the education process is influenced and education aims are being met.

Fig. 1. Identification of Web Pages Features in Teaching

Many pedagogues dealt with the question of ICT in education, or the position of specific technologies in teaching. It is well known that this area is so progressive and fast developing that it can never be considered complete and closed in particular time. The authors therefore attempt at the greatest universality, abstraction and separation from specific technological solutions. We are interested above all in the role of the Internet in education and also the use of web pages regarding anticipations which they could fulfill thanks to their features.

The World Wide Web service or WWW (simply also Web) belongs among three most widely used Internet services. From the original environment for sharing and viewing text documents it became the centre of enormous amount of hypertext and hypermedial objects and a synonym for easy, fast and cheap information sharing. The current strategy (version) of the service WWW labeled as Web 3.0 is, unlike in the past, more focused on users interaction, sharing own information and most recently use of mobile technologies.

The didactic functions of web pages or the way of their use in teaching need to be connected with the meeting of pedagogical constructivism principles. We see the educational potential of web pages in the support of reflecting the requirements of constructing of knowledge, discovering information and their wider context, support of active learning and different forms of cooperation. Next, it is necessary to take into account the complementary principles of connectivism such as interconnection of information resources, widening and sharing of current knowledge database and the possibility to learn and communicate in creative environment.

## Survey Methodology

Q-methodology was used to ascertain the views of respondents on the use of web pages in teaching. Questioned teachers from the field of technical and information education expressed their opinion on individual components of competences on the basis of the question:

How important are the claims, stated on individual cards, for teacher's competences for evaluation and the use of web pages in teaching? The respondents then compared individual claims and allocated them degrees of importance from the most important to the least important. Individual claims (Q-types) were prepared based on the content of dimensions of teacher's web pages competences. The formulation of Q-types was approached with the aim to make them as close to respondents' language as possible, link them semantically and simplify them.

Q-types were semantically classified into four working areas. This intention lied in the need of wholeness, better transparency and possibility of level comparison of Q-types within the dimension of respective competence, from which the Q-types were derived. Characteristics of individual Q-types working areas:

1. **Knowledge area** (dimension) – focused on the content of professional knowledge,
2. **Social area** (dimension) – focused on the social area,
3. **Personality area** (dimension) – focused on teacher's personality, his teaching and flexibility,
4. **Methodical area** (dimension) – focused on professional knowledge application.

## Analysis and Interpretation of Partial Results in Relation to Teacher's Competences Characteristics

In the initial phase of the final analysis of results in relation to specified competences of a teacher for web pages we divided the Q-types into charts according to individual areas and ranked them according to the order of average score and standard deviation. Graph 1 depicts the total average Q-type evaluation within the areas of individual dimensions.

Graph. 1. Average Dimensions, in Formulated

Score of Areas of Which Q-types Were

Average score as a whole is balanced, was certain emphasis on Q-methodical application of knowledge). From characteristics of competences there

of individual areas fundamentally nevertheless, there dominance in types in the area of dimension (i.e. professional the evaluation and individual can be formed an

overall picture about the significance of these competences and about the layout of dimensions in the context of evaluation and the use of web pages in teaching. It is evident that considering the structure of a competence in the conception including personality and social aspects fulfils the set purpose, i.e. to capture the characteristics of a competence in terms of behavior, cognition and experiencing (Duismann 2005, p. 66). Mastering the professional knowledge within knowledge dimension and its application represented by methodical dimension are always adequately interacting with personality and social dimensions, which provide the competence with wholeness and interconnection with the structure of teacher's personality.

## Conclusions

The conclusions that we reached underline the current constructivist orientation of education on pupil, his personality and needs. In the personality dimension defined competences there prevails the emphasis on teacher's ability to perceive the pupil as a partner, mediate him free and creative environment with the help of web pages – be always creative and inventive in this respect; be able to learn from pupils in this area since their experience often anticipates teacher's experience. Teacher's ability of reflection and self-reflection of own education appeared to be essential. From the point of view of the social dimension the emphasis is put on the ability to communicate and cooperate with pupils, to reflect their corresponding interests and needs, the ability to adjust one's own personal style to changes. Similarly e.g. in (Wiegerová 2012, p. 49). Teacher has to use web pages as an organic part of education, incorporate them into pedagogical situations to avoid interrupting the content of education itself.

The competences focused on evaluation and use of web pages for the development of pupils' independence and creativity proved to be of key importance in the whole system of defined competences, which proves the flexibility and variability of web as an environment, which, if used efficiently, enables participation in pupils' personality development and contribution to the quality and innovation of education. As it was assumed, the competences focused on technological aspects proved to be less significant. They are, however, in their conception not dissociated from pedagogical orientation of the whole system, still their characteristics reflects the current trend of departure from the need of technological knowledge and skills to greater orientation on broadening and innovation of didactic and pedagogical areas of teacher's professional competences.

# Teachers' organizational citizenship behaviors and organizational identification in public and private preschools

Kamile Demir<sup>\*</sup>

*Department of Primary Education, Mehmet Akif Ersoy University, Burdur, 15030, Turkey\**

---

## Abstract

The purpose of the present study was to compare organizational identification and organizational citizenship behaviors of public and private preschool teachers. Participants included 159 teachers from diverse school backgrounds with a wide range of teaching experience. The data of the research were collected with Organizational Citizenship Behavior and Organizational Identification Scales. Differences in organizational citizenship behaviors and organizational identification between public and private school teachers were tested using Multivariate Analysis of Variance. The results of the study indicated that there was a statistically significant difference in teachers' organizational citizenship behaviors and organizational identification based on their job status.

## Introduction

Organizational citizenship behaviors and organizational identification influence the social and psychological environment of schools, since these involve perceptions of oneness with the school and teachers' extra role behaviors toward school. These teachers help students with class materials, acquire expertise in new areas that contribute to their work, prepare special assignments for higher or lower level students, volunteer for school committees, help absent colleagues by assigning learning tasks to their classes, and work collaboratively with others (Bogler & Somech, 2004; Mael & Ashforth, 1992). Organization Citizenship Behavior is defined by Organ (1988, 4) as "individual behavior that is discretionary, not directly or explicitly recognized by the formal reward system, and that in the aggregate promotes the effective functioning of the organization" This definition stresses three main features of organizational citizenship behavior. First, the behavior must be voluntary; that is, neither role-prescribed nor part of the formal duties. Second, the behavior benefits the organization from the organizational perspective. The important point here is that organizational citizenship behaviors do not simply occur haphazardly within an organization, but are behaviors directed towards, or seen as, benefiting the organization. Third, organizational citizenship behavior has a multidimensional nature (Bogler & Somech, 2004; Somech & Ron, 2007; Belogolovskya & Somech, 2010; Podsakoff, Podsakoff, MacKenzie, & Maynes., 2014).

Several researchers have postulated that organizational citizenship behavior is likely to result in higher levels of organizational performance and task effectiveness. According to Podsakoff, MacKenzie, Paine, and Bachrach. (2000), organizational citizenship behavior provides a means of managing the interdependencies among members of a work unit, which increases the collective outcomes achieved; reduces the need for an organization to devote scarce resources to simple maintenance functions, which frees up resources for productivity; and improves the ability of others to perform their jobs by freeing up time for more efficient planning, scheduling, problem solving, and so on. Oplatka (2009) also stated that activities such as volunteering, persisting, helping, following rules and endorsing organizational objectives are conceived of as increasing employers' productivity and contribution to organizational success.

Podsakoff et al. (2000) reviewed organizational citizenship behavior studies, and identified over 30 different forms of organizational citizenship behavior. After comparing those, they proposed seven common dimensions of organizational citizenship behavior: helping behavior, sportsmanship, organizational loyalty, organizational compliance, individual initiative, civic virtue and, self-development.

As Somech and Ron (2007) pointed out that determining the reasons why individuals engage in organizational citizenship behaviors has attracted a substantial amount of research attention. Attempts to understand the correlates and causes of organizational citizenship behavior frequently focus on individual characteristics. However, recently scholars have argued that these behaviors might be further understood by an investigation of how they are embedded in different contexts, such as job status.

Compared with organizational citizenship behaviors, organizational identification has received little attention as a unique research topic until recently. Researchers in organizational behavior, social psychology, and communication re-discovered organizational identification as a unique construct in the late 1980s (Riketta, 2005). To date, the concept of organizational identification has played a significant role in organizational research during the past 20 years. There is a large and growing body of literature focusing on this construct (Johnson, Johnson & Heimberg, 1999). Organizational identification is defined by Mael and Ashforth (1992) as a perceived oneness with an organization and the experience of the organization's successes and failures as one's own. Dutton and Dukerich (1991) is defined organizational identification as shared beliefs and attitudes among employees on the central, enduring, and distinct characteristics of the organization, which is one of the most crucial factors holding employees together and committed to the organization.

One of the key theoretical bases for understanding organizational identification is social identity theory that people use groups as sources of information about themselves and individuals may use their status or social standing in their organizations to enhance their self-worth (Cheung & Law, 2008). Organization identification is a specific kind of social identification which serves the individual's needs for belonging, safety, or self-enhancement (Pratt, 1998; Kane, Magnusen, & Perrewe, 2012). Thus, an individual who identifies more strongly with an organization will have more of his or her needs satisfied and will therefore express a greater level of job satisfaction (van Dick et al., 2006). Following this, as stated by Dutton, Dukerich, and Harquail (1994), the more individuals identify with their organization, the more they think and act from the organization's perspective and the more effort they expend on behalf of the organization.

Organizational identification has emerged as a predictor of various individual and organizational level outcomes (Rousseau, 1998), such as organizational citizenship behaviors. Organizations with high levels of employee identification, therefore, can be expected to benefit from a more cohesive work atmosphere and greater levels of cooperation, altruism, participation and exertion of effort on behalf of the organization, including greater levels of citizenship behavior (Ashforth & Mael, 1989; Cheung & Law, 2008; Gonzalez & Chakraborty, 2012). Many studies demonstrated organizational identification is positively related to organizational citizenship behavior. Bergami and Bagozzi (2000) and Dukerich, Golden, B.R., and Shortell (2002) found that organizational identification has a significant positive impact on organizational citizenship behavior. Meta-analysis from Riketta (2005) also indicated a positive correlation between organizational identification and extra-role behavior. Members who have a high level of organizational identification will think and act from the angle of group norms and values, even if the work contract or control mechanism does not require explicitly, they have fused the group norms and values with their self-concept.

Although the study of citizenship behaviors has increased remarkably in the past few years, little work has focused on the relationship with organizational identification. Also, studies that compare organizational citizenship behaviors and organizational identification levels for teachers employed on public schools with private school teachers are few in number. In Turkey, preschool education is offered in both public schools and private schools. While the job status of teachers working in state schools is permanent, the job status of teachers in private schools is contracted. Honingh and Oort (2009) have stated organizational behavior of employees in public sector and private sector organizations differs. Hence, teachers' organizational citizenship behaviors and identification with their schools also may differ according to job status. Therefore, the purpose of the present study was to compare organizational identification and organizational citizenship behaviors of state and private preschool teachers.

## **Method**

### *Participants*

Participants included 159 preschool teachers from diverse school backgrounds with a wide range of teaching experience. Data for this study were collected via a survey of preschool teachers, who participated in a professional development seminar. The teachers who participated in the survey from two different school-types (public school,  $n=75$ , and private school,  $n=84$ ). On average, their teaching experience was 6.7 years (standard deviation [SD] 6.24, median 5, range 1–40).

### *Measurement*

The data of the research were collected with Organizational Citizenship Behavior Scale (DiPaola, Tarter, & Hoy, 2005) and Organizational Identification Scale (Mael & Ashforth, 1992): The Organizational Citizenship Behavior Scale is a 12-item Likert-type scale that measures the degree to which the teaching faculty of a school engages in organizational citizenship behavior; the higher the score, the greater the extent of organizational citizenship of the school. Two negatively worded items were reverse coded. Each item was answered by using a 1–5 rating scale numbered from 1 (Strongly agree) to 5 (Strongly disagree). Example of items is: 'Teachers volunteer to support extra-curricular activities' (DiPaola, Tarter, & Hoy, 2005). The scale was adapted to Turkish by Tasdan and Yilmaz (2008). Total variance explained by the Turkish version of scale 46.39%. The internal reliability of the scale (Cronbach's alpha) was 0.85. In the present study, Cronbach's alpha inter reliability coefficient of the scale was 0.90.

The strength of organizational identification was measured with a six-item Likert-type scale developed by Mael and Ashforth (1992), adapting it for the school context. The scale was adapted to Turkish by Tak and Aydemir (2004). Example of items is: 'This school's successes are my successes'. Each item was answered by using a 1–5 rating scale numbered from 1 (Strongly agree), through 3 (Neither agree nor disagree), to 5 (Strongly disagree). Total scores could range from 6 to 30 with higher scores

indicating stronger organizational identity ( $\alpha=.85$ ). Factor loadings of the items in the scale are larger than 0.63, and the total variance explained by the scale is 56%. In the present study, Cronbach's alpha reliability coefficient of the scale was 0.83.

## Result

Pearson correlation coefficient was used to examine the relationship between teachers' organizational citizenship behaviors (OCB) and organizational identification (OI). This analysis was found to be statistically significant,  $r_{(159)}=0.52$ ,  $p < 0.01$ , indicating a moderate positive relationship between organizational citizenship behaviors ( $M=45.08$ ) and organizational identification ( $M=23.91$ ).

Differences between public and private school teachers in organizational citizenship behaviors and organizational identification were tested using Multivariate Analysis of Variance. The Box's Test of Equality of Covariance Matrices checked the assumption of homogeneity of covariance across the groups using  $p < 0.001$  as a criterion. It was observed that Box's  $M$  (5.958;  $p=0.12$ ) was not significant. As indicating that there are no significant differences between the covariance matrices. Therefore, the assumption is not violated and Wilk's Lambda is an appropriate test to use. The Levene's Test of Equality of Error Variances was not significant for both dependent variables (OCBs,  $p=0.52$ ; OI,  $p=0.97$ ), which means the variances of each variable are equal across the groups.

Table 1. Descriptive statistics

	Job Status	N	Mean	Std. Deviation
OCBs	Public	75	43.32	7.13
	Private	84	46.67	8.12
	Total	159	45.08	7.82
OI	Public	75	22.91	4.80
	Private	84	24.80	4.99
	Total	159	23.91	4.98

Table 1 provides descriptive statistics of study variables for each group taken separately. According to the results the organizational citizenship behaviors levels of private school teachers ( $M=46.67$ ) were higher than public school teachers ( $M=43.32$ ), while organizational identification level of private school teachers ( $M=24.80$ ) were higher than public school teachers ( $M=22.91$ ).

Table 2. Results of one-way multivariate analysis of variance (MANOVA)

Source	Dependent Variable	Sum of Squares	df	Mean Square	F	Sig.	Partial Eta Squared
Corrected Model	OCB	443.781 <sup>a</sup>	1	443.781	7.546	.007	.046
	OI	141.679 <sup>b</sup>	1	141.679	5.878	.016	.036
Intercept	OCB	320848.309	1	320848.309	5455.784	.000	.972
	OI	90169.201	1	90169.201	3741.257	.000	.960
Job Status	OCB	443.781	1	443.781	7.546	.007	.046
	OI	141.679	1	141.679	5.878	.016	.036
Error	OCB	9232.987	157	58.809			
	OI	3783.906	157	24.101			
Total	OCB	332913.000	159				
	OI	94791.000	159				
Corrected Total	OCB	9676.767	158				
	OI	3925.585	158				

a. R Squared = .046 (Adjusted R Squared = .040)

b. R Squared = .036 (Adjusted R Squared = .030)

As shown table 2, there was a statistically significant difference in a linear combination of organizational citizenship behaviors and organizational identification based on a teachers' job status ( $F_{(2, 156)} = 4.194$ ,  $p < 0.05$ ; Wilk's  $\Lambda = 0.949$ , partial  $\eta^2 = 0.05$ ). Teachers' job status has a statistically significant effect on both organizational citizenship behaviors ( $F_{(1, 157)} = 7.546$ ;  $p < 0.01$ ; partial  $\eta^2 = 0.46$ ) and organizational identification ( $F_{(1, 157)} = 5.878$ ;  $p < 0.05$ ; partial  $\eta^2 = 0.36$ ). The findings of this research clearly revealed that there was a statistically significant difference in teachers' organizational citizenship behaviors and organizational identification based on job status.

## Conclusion

The purpose of the present study was to compare organizational identification and organizational citizenship behaviors of state and private preschool teachers. Differences between public and private school teachers in organizational citizenship behaviors and organizational identification were tested using Multivariate Analysis of Variance. The study findings show that teachers' organizational citizenship behaviors had a moderate positive relationship to organizational identification. This is consistent with previous studies. For instance, according to Riketta (2005), the motivation for organizational citizenship behaviors may stem from internalization of organizational norms and emotional attachment to the organization. These two variables, however, are at the core of most definitions and measures of OI. Bergami and Bagozzi (2000) and Dukerich et al. (2002) also found that organizational identification has a significant positive relationship to organizational citizenship behavior.

The results of the study also indicated that there was a statistically significant difference in teachers' organizational citizenship behaviors and organizational identification based on job status. Teachers' job status has a statistically significant effect on both organizational citizenship behaviors and organizational identification. Honingh and Oort (2009) have stated organizational behavior of employees in public sector and private sector organizations differs. For instance because of difference in monitoring and evaluation of performance, the visibility of individual efforts in private schools is higher than public schools. This may make public school teachers less inclined to expend extra-role effort because they feel that their individual contributions cannot be identified. Organizational citizenship behaviors are based on the principle of reciprocity or social exchange (Kamdar, McAllister, & Turban, 2006; Wat & Shaffer, 2005). Social exchange theory is a model of human behavior; employees' desires to maximize rewards and minimize losses support the interactions between them and the organization or its representatives (Wat & Shaffer, 2005). Generally, high quality social exchange relationships are likely to motivate employees to engage in behaviors that have favorable consequences for the organization (Rhoades, Eisenberger, & Armeli, 2001; Sluss, Klimchak, & Holmes, 2008). On the other hand, private schools are generally considered more prestigious in Turkey. According to Dutton et al. (1994), members may feel proud to belong to an organization that is believed to have socially valued characteristics. They stated that individuals identify with an organization partly to enhance their self-esteem: the more prestigious one perceives one's organization to be, the greater the potential boost to self-esteem through identification. The private schools operate in a highly competitive sector. Mael and Ashforth (1992) asserted that perceived competition is antecedent of identification with organization. They noted that during competition, group boundaries are drawn more sharply, values and norms are underscored, and increase school spirit.

Organizational citizenship behaviors levels of private school teachers were found higher than public school teachers in this study. Similarly, the strength of organizational identification of private school teachers also was higher than public school teachers. The findings of this study also show that the o were higher, while, Goulet and Frank (2002) compared employees in public, non-profit and for-profit organizations, and found that private sector employees were the most identified with their organizations. Similarly, Honingh and Oort (2009) found that teachers in privately funded schools in the vocational sector identified with their schools more than their colleagues working in publicly funded schools. Feather and Rauter (2004) also found that organizational citizenship behavior was higher in private schools in comparison to that of the public schools. Thus, these findings of the study confirm results obtained in prior studies.

# Teachers personality of various approbation orientation

Katarína Cabanová

Comenius University in Bratislava, Faculty of education, Department of psychology and patopsychology, Račianska 59, Bratislava 81334, Slovak republic

---

## Abstract

In the current school teacher takes a key role in the education of students. There are high demands required of the teachers personality, which could be characterized as professional, educational, psychological and practical competence. Paper offers detailed view at the teacher's personality, namely, the research focuses on a different profile of teachers of nature and of social focus. We administered Cattell 16PF questionnaire to 50 respondents (25 social sciences teachers and 25 teachers of mathematics, physics and informatics). We focused on global factors, extroversion, anxiety, rigidity, independence and self-control. The greatest differences were found in the dimension of extroversion - introversion.

## 1. Introduction

Teacher's personality is of interest to both psychologists and educators, because the teacher is the second important factor in raising children immediately after parents and children spend with teacher's fairly large part of the day. Kariková (2001) says that the teacher is not only an important model for the identification of students, but also intermediary of information and knowledge, it is the person who teaches children to learn and leads them to be interested in acquiring this knowledge. This brief characteristic implies that the teaching profession requires from its proprietor competence in education and educational areas. Therefore, according to Kariková (2001) teacher should have adequate theoretical and practical knowledge of several areas:

1. expert knowledge of the subjects they teach,
2. expert knowledge of the developmental characteristics of students,
3. knowledge regarding the organization of the lesson
4. knowledge of didactics
5. adequately developed language and speech skills,
6. knowledge of evaluation.

Zelina (1990) states that the teacher's personality can be structured into three main areas:

1. area of knowledge, skills, cognitive amenities teacher; his intellectual capacity, intelligence;
2. non-cognitive area, beyond intellectual, which some authors call affective area of teacher's personality (R. de Charms 1976 in Zelina, 1990). This area includes the emotional equipment of the teacher, his work motivation, activity, socialization, communication skills and abilities, his values and ethical relationships and his creativity;
3. area of teachers' work conditions - their optimization with respect to the objectives of education and training, as well as the self-development of teacher's personality.

High requirements are being put on teacher's personality. On the one hand he has to be professional, expert, scientist and on the other hand an artist, an actor who can mediate his knowledge to the audience, it means his pupils. According to Kariková (2001) when talking about the teacher's personality, we should not forget that above all it should be a man personally mature and mentally healthy. And this condition is associated with multiple requirements:

1. Adequate assessment of reality. Fairness and objectivity in resolving conflicts, to be able to react properly to the arisen situation, problems and assessment of pupils.
2. Efforts to self-knowledge. Self-awareness and self-reflection increases the level of teaching.
3. The ability to control your actions. Emotional stability is very important for teachers and helps smooth and satisfactory course teaching.
4. Creativity and initiative. Creative and active teachers pay more individualized attention to students.
5. Ability to create a positive emotional bonds. As reported by Goleman (1997), successful workers in professions targeting people should have emotional intelligence, that manifests itself in knowledge and managing their own

E-mail address: cabanova@fedu.uniba.sk

emotions, in sensibility to the emotions of others and in the ability to motivate yourself.

6. The moral demands on the teacher's personality. As important traits for a teacher, for example Štefanovič (1991) finds in particular rectitude, honesty, sincerity, credibility, consistency, fairness. Justice as personality characteristics was also presented in the first place in the survey, which concerned the destination profile of the "ideal teacher" for the first grade of primary school. 68 teachers identified this as the most important characteristic (Kariková, 1999). Requirements for character and morality of the teacher are important because the first grade teacher at primary school in particular is the first and leading example for the children with which they meet outside the family (Kariková, 1999).
7. Load resistance. C. Henning and G. Keller, authors of the publication Antistress program for teachers (Kariková, 1999), note that the teaching profession belongs to the groups most at risk in terms of the stress occurrence. States of exhaustion and nervousness among teachers were the subject of medical research at the beginning of the 20th century. Ch. Kyriacou (1999, in Višňovský, Kačáni, 2001) uses directly the term teacher stress, which is defined as, „situations in which teachers feel angry, depressed, disappointed, when they feel anxious or tense due to some facts related to their educational activity ". Fontana (1997) notes that stress is caused for teachers in many different, often mutually contradictory claims from pupils, colleagues, parents, directors.
8. Sense of humor and optimism. As stated by Fontana (1997), sense of humor is given by students in a list of properties of "a good teacher" in the second place, just after the justice. Therefore he almost invites teachers to be entertaining in the classroom. Teachers should have the characteristics such as optimism and sense of humor. It is not only related to the positive atmosphere that such an approach will create in class, but also to their resistance to stress, to creativity and empathy (Kariková, 2001).
9. Ability for the optimal communication. Under this requirement we imagine all the components of communication, it is an important aspect of the relationship of the teacher and the pupil.

There are several typologies of teachers. Doring's typology, Luke teachers typology, Vorwickel's teachers typology. Caselmann's teachers typology, Pavlovian teachers typology. Each of these typologies distinguishes between different types of teachers. Typology importance lies in that it allows us to know a particular teacher's personality sooner and better.

Like any personality formation, the formation of the teacher's personality depends in the first place on the talents, the assumptions for the teaching profession, the motivation to engage in the occupation. These capabilities, assumptions can be summarized under the common concept - teaching talent. More specifically, the following characteristics are love of children, interested in working in youth organizations already in high school, the inclination to teach, impart the knowledge and others. Later, the teacher's personality is formed during theoretical and practical training for practicing teacher's profession. During learning, the teacher prepares on the one hand at a technical level, i.e. to the subject he is going to teach and on the other hand, at education level, which includes knowledge of pedagogy, didactics, education, school organization, psychology. The objective of this training is best to prepare future teacher and his profession and act as a factor in school education process.

Based on various studies there have been confirmed some generalizations about teachers, outlined in their publication Research in classes (1989, in Kariková, 1999) LW Anderson and R Burns:

1. There is no universal definition of good or effective teacher. The main argument for this thesis is the fact that the scope of the teacher's professional activities is so large and diverse that no teacher can meet this range evenly.
2. Teachers are very different in many personal and professional characteristics, only some of which have a direct impact on the effectiveness of teaching. That argument is based on research findings that teachers differ in their attitudes, interests, motivations, value preferences and the like, which do not correlate significantly with the learning results of students.
3. Characteristics of teachers don't have a direct impact on school grades. As the key term in this thesis is considered "direct impact". That argument does not claim that personality characteristics don't affect pupil's school grades at all, but notes that this influence is indirect rather than mediated.
4. Teachers develop in a way that progresses through several fairly well predictable and qualitatively distinct stages, i.e. from the beginner status to the expert status.

The aim of our research is to determine whether there is the difference between personality of the humanitarian subjects teachers, and the personality of the teacher of mathematics, physics and informatics, and therefore we can talk about some personal differences with the respect to approbation at all.

For our research we set the following assumptions:

1. We assume that the teachers of humanitarian subjects will be more extrovert as the teachers of Mathematics, Physics and Computer science. On the contrary, they will be rather introverted.
2. We assume that humanitarian teachers will be more tense, alert and reactive in the dimension of anxiety than the teachers of Mathematics, Physics and Computer science. On the contrary, they will be more relaxed, confident, trusting.
3. We assume that the teachers of humanitarian subjects will be more socially bold, opened to changes, independent in the dimension of autonomy than the teachers of Mathematics, Physics and Computer science. On the contrary, they will be more adaptable.
4. We assume that the teachers of humanities subjects are more likely to be not self-possessed, matching the rules, dreamy in the dimension of self-control than the teachers of Mathematics, Physics and Computer science, they in turn will be more principled, realistic, perfectionists, serious.

## 2. Research methods and research sample

We used the 16PF Questionnaire - Fifth Edition by authors Raymond B. Cattell, Karen S. A. Cattell, Heather EF Cattell (update: M. Jurčová) issued by Psychodiagnostika a.s. Bratislava in 1997, the original edition of 1994. Although 16PF fifth edition is updated and revised, it continues measuring the same 16 primary personality factor scales that Cattell identified 45 years ago. 16PF fifth edition contains 185 entries, constituting 16 primary personality factor scales (Warmth A, Thinking B, Emotional stability C, Dominance E, Liveliness F, Consistency G, Social boldness H, Sensitivity I, Vigilance L, Reverie M, Containment N, Jittery O, Openness to changes Q1, Self-reliance Q2, Perfectionism Q3, Tension Q4) and 5 global factor scales (Extroversion EX, Anxiety, Stiffness TM, Independence IN, Self-control SC).

The total number of collected questionnaires is 50. The number of respondents in these files are listed in the following table 1.:

Table 1 Numbers of respondents.			
Approbation orientation	N	Gender	N
Teachers of Mathematics, Physics and Computer science	25	Man	17
		Women	8
Teachers of humanitarian subjects	25	Men	5
		Women	20

## 3. Result 16PF- Fifth Edition

**Ho (statistic hypotheses):** between the studied performance of humanitarian subjects teachers and teachers of mathematics, physics and informatics is a consensus (no statistically significant difference).

We focused on the results of global factors, the factor **extroversion, anxiety, stiffness, independence** and **self-control**. For the global factor extroversion \* we made one more calculation on the basis of the primary factors **Warmth (A +), Liveliness (F +), Social boldness (H +), Openness to change (Q1 +)**, which statistically significantly correlated with extroversion (see Appendix), as in the global factor extroversion there were the most obvious differences, but not statistically significant.

Values are classified on the basis of achieved weighted scores into the groups „a”, „b”, „c” a „d”.

The classification to groups based on the results is shown in tables 2,3,4, 5, 6, 7,8.

- a) a = introvert (WS 1, 2, 3)
- b) b = rather introvert (WS 4, 5)
- c) c = rather extrovert (WS 6, 7)
- d) d = extrovert (WS 8, 9, 10)

Table 2 Extroversion results structure.				
Extroversion	a	b	c	d
Maths/ Physics	2	9	10	4
Humanitarian	0	5	11	9

- a = low anxiety (WS 1,2,3)
- b = rather low anxiety (WS 4,5)
- c = rather high anxiety (WS 6,7)
- d = high anxiety (WS 8,9,10)

Table 3 Anxiety results structure.				
Anxiety	a	b	c	d
Maths/ Physics	1	11	9	4
Humanitarian	1	8	11	5

- a = open-minded, open (WS 1,2,3)
- b = rather open-minded, open (WS 4, 5)
- c = rather stubborn, resolute (WS 6,7)
- d = stubborn resolute (WS 8, 9, 10)

Table 4 Stiffness results structure.

Stiffness	a	b	c	d
Maths/ Physics	5	10	5	5

a = adaptable (WS 1, 2, 3)

b = rather adaptable (WS 4,5)

c = rather independent, stubborn (WS 6,7)

d = independent, stubborn (WS 8, 9, 10)

Table 5 Independence results structure.

Independence	a	b	c	d
Maths/ Physics	2	9	12	2
Humanitarian	0	8	13	4

a = not self-possessed (WS 1, 2, 3)

b = rather not self-possessed (WS 4, 5)

c = rather self-possessed (WS 6, 7)

d = self-possessed (WS 8, 9, 10)

Table 6 Self-control results structure.

Self- control	a	b	c	d
Maths/ Physics	4	11	9	1
Humanitarian	2	18	4	1

a = introvert (WS 1, 2, 3)

b = rather introvert (WS 4, 5)

c = rather extrovert (WS 6, 7)

d = extrovert (WS 8, 9, 10)

Table 7 Extroversion\* results structure.

Extroversion*	a	b	c	d
Maths/ Physics	16	31	37	16
Humanitarian	4	29	42	25

For optimal result, for "extroversion" and "independence" we combined the column "a" and "b" into one in the calculation, as Pearson test of good consent can distort the outcome of the data O.

Table 8 Result of the global scale PF16 - Fifth Edition.

Variable	Chi- square statistics	Chi- critical	df	alfa	Hypotheses
Extroversion	4,221	5,991	2	0,05	Ho accepted
Anxiety	0,785	7,815	3	0,05	Ho accepted
Stiffness	4,551	7,815	3	0,05	Ho accepted
Independence	1,180	5,991	2	0,05	Ho accepted
Self- control	4,279	7,815	3	0,05	Ho accepted
Extroversion*	9,559	7,815	3	0,05	Ho not accepted

In assumption No.1, we came to rather large differences, which were not statistically confirmed. We tried to verify this assumption on the basis of correlated primary factors Warmth (A +), Liveliness (F +), Social boldness (H +), Openness to change (Q1 +). In this case, the differences were confirmed statistically significantly. In the group of teachers of humanitarian subjects there was significantly lower number of introverts (also rather introverts) than in the group of teachers of mathematics, physics and computer science, there was a higher number of introverts (rather introverts).

#### 4. Conclusion

Humanitarian subjects teachers have more representatives who tend to focus on people, seek relationships with others. They have a greater orientation towards people, they initiate and maintain social contact. Teachers of Mathematics, Physics and Informatics have more representatives, who tend to spend more time with them than with others, they are hesitant to express their views and needs. This is also coming from what was already said, the very nature of naturalists, whose exploration and scientific approach to life has attracted more introverted personality and humanity-oriented approach to life attracts extrovert personality.

## Abstract

In Secondary Schools, Mathematics Applications course started to be taught at 5th and 6th grades in 2013-2014 academic year electively. The aim of this study is to analyze the curriculum of Mathematics Applications class in accordance with teachers' viewpoints. In this research, interviewing technique of qualitative research methods is used. A semi-constructed interview form was prepared by the researchers. Interview form was finalized in accordance with expert views. In the research, with purposeful sampling method, interviews were conducted with 20 teachers who work at secondary schools in Pendik, Istanbul. Data collected in the interviews were analyzed via descriptive analysis method. Results achieved in the research: 1- The teachers were not adequately informed about the program, they reached the information about the curriculum on Internet sites. 2- The strength of the program was that it enabled more practice for students; whereas the shortcoming was that there were uncertainties in the implementation of the program. 3- Objectives aimed at the program were not clear and understandable, activities were not appropriate for students, and lack of examination in the evaluation decreased the level of students' motivation towards the class. 4- That there was no course book and no teacher guide book was a big problem. 5- That there were high course dropout levels because grades did not have any place on term papers and the activities were not appropriate for the students' level.

## 1.Introduction

Mathematics is one of the leading courses at which students who study at primary and secondary school are unsuccessful (Tıraş, 1999). The reasons why students are not successful at this course are associated with the facts that no relationship can be built between mathematics and everyday life, the contents are not related to one another, and the subjects are comprised of disciplines, theories, equations and formulas. In this context, Mathematics is seen as irritating and a class which should be learned by memorizing (Baki, 2006). Today, Subjective information which people acquire via transfer based on their own experiences rather than objective and fixed information come into prominence (Çetin, 2004). The information taught in Mathematics class needs to be comprehended, constructed and put into practice by students so that it can be beneficial. For instance, learning proportion subject does not contribute to the student's everyday life; because people are not asked anything about proportion except for examinations. Apart from that, while planning any day, a person can encounter with such a situation as "last time I spent 7 hours to paint the 85 m<sup>2</sup> wall. Today, I need to paint 700 m<sup>2</sup> walls. How much time does it take?" (Altun, 1998). When it is taken into consideration that Mathematics has an important place in solving problems we encounter in our lives, (Baykul, 1998) Mathematics activities associated with daily life are of great importance.

Quests for benefitting from Mathematics in daily life have started and attention has been directed to mathematics subjects and teaching period. Increasing efficiency in teaching Mathematics, time spared to teaching Mathematics and how the subjects thought to be hard to learn by some people are taught are discussion issues (Altun, 2002). In order to effectiveness in teaching Mathematics, certain points should be reflected to the activities carried out in the classroom. Since what should be put into the center is not scientific information, but students who attend the process through activities actively (Duru&Korkmaz, 2010). Doyle (1988) thinks that students should be provided with taking responsibilities and duties in the activities carried out so as to have them take part in the class actively (Özmantar, Bozkurt, Demir, Bingölbalı&Açıl, 2010).

The aim of Mathematical Applications classes which started to be taught in secondary schools in 2013-2014 school year is; "have them love Mathematics and have a positive attitude towards Mathematics while improving mathematical information and skills by giving opportunities to make mathematical applications appropriate for their level" (MEB, 2013: 1). The way how to teach a lesson is determined in accordance with this aim. Problems which need to be chosen should be associated with daily life and should enable practical applications. They should also be meaningful for students at the same time. Students should

produce solutions to the determined problems by making group work, groups should present solution suggestions to the class and via discussion method, the most appropriate solution technique should be chosen all together. Teacher should be a listener and a leader after explaining the problem (MEB, 2013).

Mathematics is one of the courses which implementation takes a great place in daily life, too. Moreover, Mathematics also increases students' thinking and questioning ability. For this reason, teaching mathematics at school and mathematics activities should be given great importance. Since activities support an easy learning of Mathematics and create a positive attitude towards Mathematics. Students who like activities develop a positive attitude towards Mathematics, too. For this reason, conducting researches about the effectiveness of the classes with Mathematics activities and discussing how those classes can be rendered more effectively are important. The aim of the present study is to analyze the curriculum of Mathematics Applications in accordance with teachers' viewpoints.

## 2. Method

### 2.1. Participants

In this research, interviewing technique of qualitative research methods is used. A semi-constructed interview form was prepared by the researchers. Interview form was finalized in accordance with expert views. In the interview form, there are five open-ended questions. The teachers were asked questions as to whether informing about Mathematics Applications class curriculum was made or not, how they reached the information about the program, good and bad sides of the program, acquisitions aimed at the implementation of the program, activities and evaluation dimensions, course books and course materials, the problems encountered in the implementation of the program and their own suggestions for solving the problems. In the research, via purposeful sampling method, 20 teachers who work at secondary schools in Pendik, Istanbul were reached. 12% of teachers who comprise of working group are female. 8% of them are male. The age average of teachers is 25.7 and the seniority average is 3.4. Interviews made with the teachers were recorded by taking permission from them. The audio records were transcribed later. The data gathered was analyzed with the method of descriptive analysis. Descriptive analysis; is comprised of four stages; creating a framework for descriptive analysis, processing the data in the thematic framework, identification of findings and interpreting them (Yıldırım & Şimşek, 2008: 224). For the analysis of the data, a thematic framework was identified by the researchers. Within this scope, the data were firstly coded by each researcher. And then, by comparing the data raked together, common codes were made in common themes with common viewpoints. The teachers who were interviewed are shown in G1, G2, G3 ... shape.

### 3. Findings

The teachers' viewpoints about Mathematics Applications curriculum are shown as tables in the following. When examined the teachers' situation of being informed about the curriculum, all of the 20 teachers interviewed expressed that they were not informed about the curriculum. The studies conducted by the teachers to get informed about the curriculum are presented in Table 1.

Table 1. Teachers' viewpoints about their situation of being informed about the curriculum

Theme (Categories)	Codes	n	%
Studies for getting informed	Getting informed from Internet sites (forums, social networks) (G1, G4, G5, G6, G7, G8, G11, G12, G13, G15, G16, G19, G20)	13	65
	Getting informed by communicating with group teacher and teacher friends (G3, G4, G6, G8, G9, G15, G17, G18)	8	40
	Examining the curriculum, yearly lesson plan (G2, G9, G16)	3	15
	Examining the workbook (G1, G2, G9, G10, G14, G15)	6	30

As Table 1 shows that, 65% of the teachers got information from forums and social networks. Other viewpoints are getting informed from group teachers and communicating with other teacher in %40 percentage, getting informed about the curriculum in %30 percentage, examining the curriculum and yearly lesson plan in %15 percentage. The quotations from the teachers' viewpoints are presented below.

"No informing about the curriculum was made. I tried to reach the information about the curriculum on the Internet sites such as "Eğitimhane". I tried to identify my own curriculum by communicating with our teachers who taught Mathematics at the past. (G4)

"No informing was made. I also reached my own information from the Internet. " (G13)

"Informing was not made. I got informed when I examined the curriculum. In fact, I think there is no certainty. I do not think all schools evaluate them in the same way." (G14)

"No informing was made. After approximately 2 months, a workbook was sent by MEB. I taught my lessons in the light of this workbook. (G18)

"Actually there could have been better information. The process went on with my exertion. Since I thought the lesson and applied the activities according to the plan that I found in the internet. I think I could have been informed much more." (G16)

The teachers' opinions about the superior and limited properties of the program are presented in table 2.

Table 2. The Teachers' ideas about the superior and limited properties of the program

Theme/Category	Codes	n	%
Superior Properties	It provides applying group work (G1, G2, G7, G9)	3	15
	It gives chance to solve much more problems (G2, G3, G11, G16, G15)	5	25
	It provides brain storming (G7)	1	5
	It provides solving intelligence problems (G8)	1	5
	It provides playing math games (G15)	1	5
	It makes the students to link the math with the real world (G17, G18)	2	10
Limited Properties	There are some unclear points while applying the program (G3, G4, G18, G19, G5, G20)	6	30
	Lack of equipment makes it harder to apply (G4, G17)	2	10
	It provides less mathematical addition (G12, G13)	2	10

Table 2 shows that teachers think the program provides 25% more problem solving. Other opinions about the opportunities of the program are as follows: it provides 15% group work, 10% linking with the real world, 5% brain storming, solving intelligence problems, playing mathematical games and it increases students' mathematical thinking. The teachers' opinions about the limited properties of the program are 30% unclear parts while applying the program, 10% lack of equipment and it provides less mathematical improvement. The quotations given by teachers are presented below.

"I applied the activities which are included in the book for a week. I solved the mathematic problems and made the students solve them in another week. I sometimes copied the activities in the book and divided them into groups. When they had difficulties I gave them some clues. It is beneficial for them. It is good that there is a program which provides this kind of applying." (G2)

"I think it is beneficial when it is applied according to the aim. But there is not enough electronic equipment. There are some unclear parts about the plan, so some difficulties of making the students interested in mathematical world occur." (G4)

"We are negotiating the problems. We are brain storming. We are trying to create new solutions. It is different that we have group working. It is a good program for students." (G18)

"Although there are some problems because of the unclear sides of the program it is of course beneficial. I think making the students face with the real world problems improve them." (G18)

The opinions of the teachers about acquisitions, activity and evaluation aspects are presented in Table 3.

Table 3. The opinions of the teachers about acquisitions, efficiency and evaluation aspects

Themes (Categories)	Codes/Teachers		n	%			n	%
	Positive				Negative			
Acquisition					Not appropriate for students level (G8, G14)		2	10
	Appropriate for students level (G1, G3, G9, G16)		4	20	It is hard to distinguish the acquisitions between 5th and 6th grade (G4, G10, G11)		3	15
	Clear, understandable (G2, G5, G9, G16, G17)		5	25	Acquisitions are not related to Mathematics (G7, G15, G19)		3	15
					Are not understandable (G11, G20)		2	10
					Not in sufficient number of (G1, G8, G9, G15, G19)		5	25
Activity	Appropriate for students level (G3, G13, G16, G17)		4	20	Not appropriate for students level (G1, G4, G5, G6, G7, G13, G18, G20)		8	40
					No material (G3, G10)		2	10
	Interesting (G12, G14)		2	10	5 <sup>th</sup> and 6 <sup>th</sup> classes are processing together. That causes differences in level (G2, G16)		2	10
					Without Examination, course is not acknowledged (G5, G11, G18)		3	15
Evaluation	Absence of Examination removes the pressure (G3, G4)		2	10	Absence of Examination causes decreasing motivation (G1, G2, G3, G6, G8, G9)		6	30
	Using assessment methods without examination does not create problems. (G7, G15, G16, G17)		4	20	Absence of Examination causes absenteeism (G1, G2, G12, G13, G14)		5	25

As seen in Table 3 teachers' views regarding to acquisitions, efficiency and evaluation aspects are divided into "positive" and "negative" themes. The view of teachers according to acquisitions is the item "clear and understandable" and is represented with 25%. A different view is that acquisitions are gained through "appropriate for student's level" and is represented with the rate of 20%. Teachers' negative views through acquisitions are most valued with 15% and are the items "it is hard to distinguish the

acquisitions into 5th and 6th grade” and “acquisitions are not related to Mathematics”. Again different negative views rated with 10% are “not appropriate for student’s level” and “are not understandable”. Negative views towards activities are mostly ranked by 40% with the element “not appropriate for student’s level”. Different views show the result of 20% that activities are “not in sufficient number”, and 10% that “No material” is available and “5th and 6th classes are processing together. That causes differences in level”. Teachers’ positive view towards the evaluation is mostly rated with 20% to the item “Using assessment methods without examination does not create problems”. A different view is that “absence of Examination removes the pressure” and is rated with 10%. Teachers’ negative opinion towards evaluation is highly valued with 30% by the item “absence of Examination causes decreasing motivation”. Different views are valued with 25% by the item “absence of Examination causes absenteeism” and 15% with the item “without Examination, course is not acknowledged”. The quotations given by teachers are presented in the previous part below.

“It is possible to increase the amount of activities. In my opinion, in books there should be activities for each level. Teachers’ should have the opportunity to make the activity according to the level of the class. That will help to overcome problems related to compliance with class level.” (G1)

“It affects in a negative way that the evaluation is done by examination. Some of the student’s interest decrease to almost zero. There are problems caused by absenteeism because we do not have regular attendance.” (G2)

“In my opinion, the acquisitions are not appropriate for 5th grade students. For instance, ratio and proportion is taught in 6th grade, but there are two ratio and proportion gaining activities prepared.” (G18)

“I think a few of the activities do not fit to 5th grade students. It is possible that there are activities which are not taught yet. As a matter of fact, it would be beneficial to prepare the Textbooks with diligence in later years.” And in my opinion the 5th and 6th grade students should not work together.” (G16)

“Some of the activities are not appropriate for classroom. The use of computers and excel program would be beneficial. We have not that in our school. For that reason, the application would not succeed.” (G11)

Teachers’ views towards textbooks and course materials which change during the program are represented in table 4.

Table 4. Teachers’ views towards textbooks and course materials which change during the program

Themes (Categories)	Codes	n	%
Strong Sides	Books are not exiting and boring (G1)	1	5
	Activities are related to the real world (G1)	1	5
Weak Sides	Activities are not appropriate to the level (G2, G16)	2	10
	There is no content in the activity book (G3, G7)	2	10
	No guidebook (G3, G4, G15, G8)	4	20
	Activity book does not fit to the level (G5, G6)	2	10
	Distribution in activity book are disproportionate (G9, G19)	2	10
	There should not only activities in the textbook (G10)	1	5
	No textbook (G11, G12, G13, G14, G15)	5	25
	Span of activity is to long (G17)	1	5

In the 4th table there are opinions of the teachers regarding to textbooks and course materials which change during the program are shown in two themes; “strong sides” and weak sides”. Teachers’ views about the strong sides are ranked with 5% that “books are not exiting and boring” and “activities are related to the real world”. The weak sides according to the teachers’ view are mostly valued with 25% to the item “no textbook”. The other views are ranked with 20% that there is “no guidebook”, 10% is the score for the items “activities are not appropriate to the level”, “there is no content in the activity book”, “activity book does not fit to the level” and “distribution in activity book are disproportionate”. Eventually, the items “there should not only activities in the textbook” and “span of activity is to long” are valued with 5%. The quotations given by teachers take place below.

“I think, the preparation of the textbook are well arranged. The activities are related to the daily life and it is easy to motivate students because they are exciting.” (G1)

“In general, I do not like the textbook. Because the activities for 5th grade class are created without taking into consideration that they are not taught yet.” (G2)

“We have no textbook, only a book with activities which is on the net.” (G14)

“Some of the activities take 4 hours. In my opinion, the time factor should be considered carefully in the construction phase.” (G17)

The thoughts of the teachers about the difficulties they encounter in applying the program and the ideas for solutions are given in table 5.

Table 5. The opinions of the teachers about the problems they encounter in applying the program and the suggestions for solutions.

Theme(Categories)	Codes	n	%
Problems	Late check in of the course grades to school report causes absence (G1, G12, G13, G14, G17)	5	25
	No check in of the course grades to the school report reduces attention (G1, G8, G9, G18)	4	20

Solution Suggestions	Course not arranged for the level of students (G1)		
	The level of activities is not convenient for the students (G2, G6, G7, G16, G18)	5	25
	It is hard to understand the activities. (G5)	1	5
	There are uncertainties in the program (G4, G11, G20)	3	15
	It is overshadowed by the mandatory Mathematics (G3)	1	5
	Due to the crowded class size, it is not efficient (G15)	1	5
	There is difficulty in finding material and copying (G10, G11)	2	10
	Activities are not interesting (G6)	1	5
	Allocated time for the activities is not enough (G13, G14)	2	10
	Distribution of the activities to the subjects is not right (G19)	1	5
	Due to the differences between the level of students classroom management is difficult (G6)	1	5
	Students do not have awareness of the course (G14)	1	5
	Course should effect the school report (G1, G6, G8, G9, G12)	5	25
	Students should be grouped according to class level (G1, G16, G18)	3	15
	Level of activities should be scrutinized (G2, G7, G16)	3	15
	Activities should be diversified (G11, G14, G17, G19, G20)	5	25
	Elective course should be included in mandatory mathematics (G3)	1	5
	There should be a guidebook for the teachers and teachers should take in-service training (G4, G16, G20)	3	15
	Physical conditions of the schools should be regarded (G5)	1	5
	There should be teachers who have expertise on the activities (G5)	1	5
	Materials should be improved (G10, G17)	2	10
	Activities should be correlated with the subjects of mandatory Mathematics (G6, G7)	2	10
	Elective courses should be abolished (G12, G13)		
	Books sent to schools should be in different levels (G13, G14, G20)	2	10
	Problem solving should be concentrated on (G15)		
		3	15
		1	5

In the 5th table opinions of the teachers are indicated in two themes; problems and solution suggestions. In the opinions of the teachers about the application of the program, “late check in of the course grades to school report causes absence” and “the level of activities is not convenient for the students” are the highest rated problems with 25% ratios. Other opinions are, respectively; “no check in of the course grades to the school report reduces attention” with 20%, “uncertainties in the program “ with 15%, “difficulty in finding material and copying” and “allocated time for the activities is not enough” with 10%, hardship in understanding the activities, being overshadowed by the mandatory Mathematics, crowded classroom size, no striking activities, distribution of the activities to the subjects, classroom management and awareness of course with 5% ratios. Teachers’ solutions for problems that there faced with is scored with the rate of 25% by the item “the level of activities is not convenient for the students” and “Activities should be diversified”. Different suggestion are in sequence, with 15% the item “there should be a guidebook for the teachers and teachers should take in-service training”, “students should be grouped according to class level” and “level of activities should be scrutinized”. The items “materials should be improved”, “elective courses should be abolished” and “activities should be correlated with the subjects of mandatory Mathematics” are valued with 10% and with rate of 5% the items “elective course should be included in mandatory mathematics”, “physical conditions of the schools should be regarded” and “problem solving should be concentrated on” are ranked with rate of 5%. The quotations given by teachers take place in the previous part below

“It would make sense, if the number of the weekly mathematics lessons in the curriculum were taken into compulsory lessons and also the content of the activities. At least, students would gain the logic that the application is given in mathematics lesson, not under a different lesson. Also that they are equal (some of them choose, some not) and in a regular schedule.” (G3)

“One of the biggest problems is the low interests; because the course is elective. Students attend the course for marks, not for learning. Students with this mentality do not care about the lesson.” (G8)

“I would change some of the main lines, which are; the teachers’ who give lessons should attend an in-service training course. Because the background knowledge is weak. Guide books should be sent to the schools. I would separate 5th and 6th grade. After that, I would adjust the conformity of the activities with the level of proficiency.” (G16)

“It is possible to distribute the themes according to activity issues.” (G19)

“The classes are crowded so the activities are not much valuable. For that reason I limit the activities” (G15).

#### 4. Discussion

The results which are obtained in the research about selective application of mathematics curriculum and the views of the teachers could be summarized as following: 1- The teachers were not informed about the program, they reached the information about the curriculum on Internet sites mostly. 2- The good side of the program is that it enabled the solution of more questions; whereas the bad side of it is that there are uncertainties in the implementation of the program. 3- Acquisitions aimed at the program are not clear and understandable, activities are not appropriate for students, that the examination does not exist in the evaluation decreases the level of students’ motivation towards the class. 4- That there is no course book and no teacher guide book is a big shortcoming. The activities in the workbook are not appropriate for the students’ level. 5- That there are absences because grades do not have any place on term papers and the activities are not appropriate for the students’ level and these are

the leading problems experienced. That grade affects term papers and that activities should be varied are these are the leading suggestions for solutions of the problems.

According to the results of the research, it is easy to say that there are uncertainties in the procedure of selective mathematics application, particularly in the process of supplying the program application. This situation leads to dissimilarities in practice. The reasons of these differences are defective information about methods in acquisition, activities and evaluation classes and the missing guidebooks which are not sent. The Investigations of Bozkurt (2012) related to mathematical activities in primary and secondary class shows the necessity to inform teachers about the concept of mathematical activities, otherwise the expected outcome cannot be seen. In order to overcome this obstacle, it is essential to create an environment in which the teacher is able to grasp the importance of the activities, also the opportunity to improve the effectiveness of their professional development to create such activities.

Another result obtained in the study is the negative effect caused by not distributing the textbooks which affect teachers as well as students. Students, who are unable to catch the importance of this course and incompetent to create the sufficient awareness, do not continue the class. This leads to absenteeism. Schools with economic problems have not the chance to print out the copy of the activity book from the Internet. As a result, the activities are limited for the teachers who are able to write it on the whiteboard. Moreover, teachers lecture the compulsory mathematics course with editing covered topics so far, solving logic and intelligence questions and sometimes playing mathematic games.

Işık (2008) mentioned the importance of teachers' decision in terms of choosing the textbooks which should be taken into consideration, when the textbooks will be deploy to the schools. Because these factors influence primary second stage mathematics teacher in usage of course book, the frequency and level of the course book. An investigation occurs in order to determine expectation of the course book and it is appropriate that the ministry delivers the course books for free, whereas the negative effect is that the books are changing every year. As consequence teachers' are unable to become familiar with it, so that they cannot use it in full extent.

The predicted aims for acquisitions are clear and understandable; on the other hand, it is obtained that the activities are inappropriate for the level of students. Demirtaş, Arslan, Eskicumalı ve Kargı (2014) found that elective curriculum related to applications of mathematics teachers stated that gains are definite and precise. Karakuş and Yeşilpınar (2013) investigated the process of assessment and teachers' procedure of application and evaluation according to activities which are applied in elementary sixth grade mathematics level class. For this reason, the obstacles are structure content, level and physical features caused by students and educational settings.

There are no written examinations in the elective course. Besides, the notes are not represented in school report. As a consequence according to the study, a lack in students' motivation or problems in attendance of the course occurs. There should be alternative assessment methods to avoid such situations. This could be only achieved with in-service training. To illustrate the necessity of in-service training of alternative assessment methods, Arıbaş and Göktaş (2004) found out that the secondary mathematics class teachers' have not enough background knowledge about the need of alternative in-service training. Furthermore, a study of Baki and Girgin, (2004) related to individual development file whether monitoring and evaluation of students' performance is an effective technique shows that increasing importance of introducing teachers' in the field of pre and in-service training in order to use it as a tool of assessment and a technique for students' individual development.

According to the current research, to represent the course grade in the report, some essential steps should be taken. First of all, enough information about the program must be implied. Measures should to be taken to avoid uncertainties during the application. The activities which are in the program should be revised and adjust to students level and the material and sources related to the course should be sent by the involved department.

## Abstract

This study tries to analyze the problem of the communication phenomenon in the university environment. The university education as a priority area of the social life, contributes to the formation of human resources, so the communication between the teacher and the student is very important for the student's professional evolution. For this reason the teachers have to understand the students, to guide them and value their potential. The communication in the education area is very complex, there for we consider that the students should be frequently involved in intercommunication activities so they will be more self-confident and they will improve their communication skills.

## 1. Introduction

In present, all life areas, including the educational activity, are based on communication, so there is a complicated mutual relationship between communication and education. In the didactic communication, the teacher and the students are continuously interacting, changing information in order to achieve the objectives established during the teaching – learning – evaluation process.

The communication from the university environment has the following characteristics:

- Is always realized between two persons: teacher – student, student – teacher or student - student
- The message is always logically structured by the teacher in order to achieve the established objectives
- By actively involving the students it has a teaching, learning and developing effect
- The communication process involves the following types: verbal and non-verbal communication.

For an efficient communication process the teacher has to be a good manager in order to take the best decisions, to plan, to organize, to control, to evaluate and not last to motivate the students using verbal appreciations and nonverbal reactions to encourage positive behavior.

In all pedagogical and psychological studies it is mentioned that communication has past, present and mainly future.

Landshere quoted by Silvas A. analyzes the verbal interactions between teacher and student discovering nine functions which cover the most important teaching events:

- Organization function – refers to the participation and organization of students and pupils
- Assessment function – involves information, solving methods and suggests answers
- Development function – stimulates and structures the students' thinking
- Personalization function – interprets a personal situation
- Positive feedback function – specific and stereotype approval respecting the students' answer
- Negative feedback function – stereotype, ironic and accusing disapproval
- Materialization function – a figurative presentation material using audiovisual technics
- Positive emotionality function – recognition, encouragement, compensation of the students' activity by using nice words
- Negative emotionality function – criticizes, threatens, accuses, etc.

In the education, the transmitter is the teacher, the receiver is the student and between them there is an information transfer where barriers can occur and alter the desired messages.

These barriers are caused by:

- Lack of trust
- Negative behavior
- Wrong perception
- Different cultures

## 2. Material and method

In this study we used as research method the survey, applied on a sample of 120 students from the Banat's University of Agricultural Sciences and Veterinary Medicine from Timisoara, aged between 18 and 30 years. During the research we respected the following steps:

- We established the structure of the sample
- We distributed the survey
- We collected the answers
- We analyzed the answers

## 3. Results and discussions

The teachers are real managers with an important role in transmitting the information necessary to achieve the objectives, coordinate the intermediary communication sources and make act in such a way that the important communication reach in time the students.

For an efficient communication in the University it is very important to choose a way to transmit the information as fast and correct as possible.

In table 1 we presented the most important communication channels used by the teachers and the students from Banat's University of Agricultural Sciences and Veterinary Medicine from Timisoara.

Table 1. Communication channels used in the university

Communication channels	Advantages	Disadvantages
Face to face meeting	Offers the possibility to check the understanding of the message and of the answer.	Takes more time (time consuming)
Electronic means (e-mail, fax)	The message is transmitted fast and the receiver can reply fast	There is a risk of personal information leak
Telephone	The information is transmitted immediately	No visual contact.
Planned meetings (meeting between two persons or of a group of teachers and students)	The information is transmitted, the decisions are taken and the objectives are achieved.	Time consuming and the persons from the meeting can deviate the discussions to other subjects and the objectives are not achieved

Question: What does the term communication mean for you?

For this question the participants had the possibility to choose one of the following variants:

- To speak correctly, fluently;
- To transmit information, decision, ideas;
- To be heard, understood and to establish a relationship.

In table 2 we can notice that the participants understand differently the communication: 31% chose "to speak fluently", 49% "transmit information, decisions and ideas" and 20% consider that communication means to be heard and understood.

Analyzing the answers we can conclude that the students consider that through communication we transmit ideas, decisions and information they need in order to succeed.

Table 2. Communication perception

The term "to communicate"	Value	Percentage (%)
To speak correctly, fluently	37	31
To transmit information, decision, ideas	59	49

To be heard, understood and to establish a relationship	24	20
<b>TOTAL</b>	<b>120</b>	<b>100 %</b>

Question: Do you think that a person's nature influences the communication?

In table 3 we can notice that 73% of the participants answered yes, a person's nature influences the communication, and 27% answered that a person's nature does not influence the communication.

Table 3. Analysis according to human nature

The importance of human nature in communication	Value	Percentage (%)
Yes	87	73
No	33	27
<b>TOTAL</b>	<b>120</b>	<b>100 %</b>

Analyzing the answers we noticed that the students consider that the intonation is very important in communicating information, and if the teachers have a choleric nature manifested by irritability and screaming, creates a dissatisfaction feeling among the students which can lead to failure in achieving the objectives and to an unfavorable work environment.

Question: Do you think that a good communication increases the self-confidence?

76% of the participants answered that yes, a good communication with the teacher increases their self-confidence, 5% answered that they don't know and 19% consider that communication does not make them more self-confident.

Table 4. Communication efficiency

Efficient communication	Value	Percentage (%)
Yes	91	76
No	23	19
Don't know	6	5
<b>TOTAL</b>	<b>120</b>	<b>100 %</b>

Question: Do you consider that your teachers have highly developed communication skills?

Table 5. Communication skills

Communication skills	Value	Percentage (%)
Large extent	72	60
Small extent	48	40
<b>TOTAL</b>	<b>120</b>	<b>100 %</b>

In table 5 we notice that 60% of the students consider that their teachers have developed communication skills, fact that determines them to go to courses with pleasure, to listen and understand the teacher, but 40% consider that they need to develop the communication skills because it is not enough to have the information but they also have to transmit it and explain it.

#### 4. Conclusions

Whatsoever the communication means are, the teachers should be aware that they have to control not only the students' success but also their human evolution and this can be realized only through a real and efficient communication.

The main communication channels used by the teachers from Banat's University of Agricultural Sciences and Veterinary Medicine from Timisoara are: face to face meeting, e-mail, fax, telephone and meeting with the students.

Analyzing the answers we can conclude that the students consider that through communication we transmit ideas, decisions and information they need in order to succeed.

The participants that the intonation is very important when transmitting the information, there for we consider that the teachers with a choleric nature should control themselves and understand that this aspect creates an unfavorable working climate and the student – teacher relationship is damaged.

We recommend to create a pleasant, trustful, respectful education environment leading to the development of healthy,

receptive and communicative personalities.

40% consider that they need to develop the communication skills because it is not enough to have the information but they also have to transmit it and explain it.

<sup>a,b,c,d</sup> Sakarya University Faculty of Education, Sakarya, Turkey

## Abstract

The aim of the present study was to determine mathematics teachers' opinions about the renewed fifth grade mathematics curriculum and to investigate the new mathematics curriculum and the former one comparatively. In the current study, two qualitative research methods namely, document review and semi- structured interview methods were used. With document review, the similarities and differences between the renewed fifth grade mathematics program and the former one were discussed by comparing the two curriculums. The related documents were derived from mathematics curriculum that was published in Turkish Education Board official website. With semi structured interview form, teachers' opinions about the new curriculum was determined. In the present study, in which the purposeful sampling was used, 18 mathematics teachers were interviewed that worked at schools depending on the Ministry of Education in Sakarya province Ferizli district. The obtained data was analyzed via descriptive statistics. According to findings, the new mathematics curriculum and the former one were similar in general, and teachers had both positive and negative opinions about the new curriculum.

## 1. Introduction

In the 21st Century, the knowledge has changed rapidly and in the globalizing world, it has increased in value. As it always has been in every area, in education area the change necessity shows up. Nowadays, with the extensiveness of the application fields, the mathematics has become indispensable for all scientific fields. The mathematics education given in school life, forms a significant part of the teaching that individual takes for his/her life (Baki, 2006). Mathematics was accepted as a universal language that builds on symbols and figures. Mathematics includes processing data, producing information, making prediction, and solving problem by using this universal language (Ministry of Education, 2005.) According to Askar (1986) learning mathematics is highly important for the individual who can improve higher order thinking skills as communicating, thinking creatively and independently in daily life. Altun (2003) indicated that, mathematics teaching was important in terms of improving students' intellectual and creative thinking competencies. According to Olkun and Toluk (2003), nowadays, the effective education that is appropriate to the structure of mathematics can be actualized with associative learning, which is explained as the knowledge of concepts and operations and the relationship between them and which also ease remembering and using the information. As Baykul stated that (2003), the important part of the student problems related to learning the mathematics is derived from mathematics teaching methods. In our country, reforms have been made for more effective mathematics teaching. The new primary and secondary school mathematics curriculums that were in the direction of program development efforts in education system, and which were tested with a pilot study in 2004, were put into practice in 2005-2006 years by the Ministry of Education. The method, applied before 2005, was in accordance with the traditional teaching methods, while after 2005, it was arranged in accordance with contemporary methods. In the 2006 program, the principle of "Every child can learn the mathematics" used as base. Within the scope of the curriculum aims, raising individuals that can use the mathematics, solve problems, share their solutions and thoughts, work in groups, feel confident in mathematics, and develop positive attitudes towards mathematics is essential (Ministry of Education, 2005). The 2013 mathematics curriculum had the same aims with 2006 mathematics curriculum. Furthermore, 2013 program included extra skills like students' appraisal of the mathematics, being enjoyed while dealing with the mathematics, considering the mathematics as useful, using the mathematics in daily life, and communicating with mathematic knowledge in addition to features that should be brought to students (Ministry of Education, 2013). In the renewed mathematics curriculum, the content was simplified, and accordingly, the necessary features in terms of more effective and fruitful mathematics teaching were determined. The aim of the present study was to investigate the renewed fifth grade mathematics curriculum and the former one comparatively and to determine teachers' opinions about the renewed fifth grade mathematics curriculum.

## 2. Method

The current study was divided into two stages. In the first stage, the renewed fifth grade mathematics curriculum and the former one were compared. The new curriculum was stated as “2013 program”, and the former one was stated as “2006 program”. The similarities and differences between the two programs were discussed. In the first stage, the document review method that is one of the qualitative research methods was used. The related documents were derived from mathematics curriculum that was published in Turkish Education Board official website. In the second stage, teachers’ opinions about the renewed fifth grade mathematics curriculum (2013 program) were determined. In this stage, interview method that is one of the qualitative research methods was used. With semi structured interview form, teachers’ opinions were determined. In the present study, in which the purposeful sampling was used, 18 mathematics teachers were interviewed that worked at schools depending on the Ministry of Education in Sakarya province Ferizli district. In the semi structured interview form teachers’ opinions about the followings were included: getting informed about the new curriculum, the foreseen gains of the program, the content, activities, evaluation methods, problems in the application process of the curriculum and teachers’ solutions offers for these problems. The obtained data was analyzed via descriptive statistics and findings were presented as tables.

### 3. Findings

The fifth grade mathematics curriculum that was applied in 2005-2006 academic year and that of 2013 program were investigated comparatively in terms of the following criteria: the vision of the program, the aim of the curriculum, its approach, explanations towards applying the curriculum (teacher- student role, course book, workbook, teacher guidebook; learning areas, and skills), mathematics learning and teaching, assessment and evaluation, number of gains, and course hours.

#### 3.1. The vision of the Program

In 2006 program, under the title of the vision of the program, the vision was explained while in 2013 program, there was no such a title. The vision of 2006 program based on the principle that “Every child can learn the mathematics.” On the other hand, in 2013 program, the vision of the curriculum was described in the direction of general purposes. In the curriculum, students’ appraisal of the mathematics and improving problem solving abilities were emphasized. In addition, preparing learning environments that provide students with considering the mathematics as “perceivable, useful, worth the effort” was emphasized.

#### 3.2. The Aim of the Program

The aims of the 2006 program were to improve students’ individual skills and abilities such as independent thinking, making their own decision, and self-regulation. The 2013 program included similar aims and the aim of the program was described as “bringing students in knowledge, skills, and attitudes that are specific to the mathematics and students can need those things in their lives and further education steps”. The aim of the program was presented in 15 items in 2006 program, whereas it was stated in 10 items in 2013 program.

#### 3.3. The Approach of the Program

Both the 2006 program and the 2013 program adopted the conceptual approach. The conceptual approach requires spending more time to form a conceptual basis of mathematical knowledge, thereby forming an association between conceptual and operational knowledge and skills is necessary. 2006 program aimed to make students form mathematical meanings based on their concrete experiences and feelings. On the contrary, 2013 program aimed to encourage students to be fast in their mathematical operations and to communicate with mathematical knowledge. Besides, it put emphasis on improving students’ problem solving skills.

**Teacher- Student Role:** Both of the curriculums used similar expressions while mention to roles of teachers and students. In 2006 program, student is active while teacher is the guide. On the contrary, in 2013 program, the active role of the student was expressed as active participant whereas the guidance role of the teacher was expressed as planning well structures activities and actualizing activity applications in the classroom.

**Learning Areas:** Both in the 2006 and 2013 programs, there were 5 learning areas. Differently, in 2006 program the learning area of “Numbers” was changed as “Numbers and Operations” in 2013 program. Moreover, in 2006 program, “Geometry” and “Measurement” learning areas were approached separately while in 2013 program they were mentioned under the title of “Geometry and Measurement”. Finally, in 2006 program, there was a learning area called as “Probability and Statistics”, while in 2013 program, there were learning areas as “Probability” and “Data Processing”.

**Skills:** In 2006 program, skills were divided into two categories as “Skills Specific to Common Field” and “Mathematical Skills”. Skills that are specific to the common field covered effective, correct, and fluent Turkish performance, critical thinking, creative thinking, communication, problem solving, research, making decision, using information technologies, and entrepreneurship. On the other hand, the mathematical skills included problem solving, communication, association, and reasoning. In 2013 program, skills were collected under the same title as “basic skills that the program gains”. These skills

included problem solving, mathematical process skills (communication, reasoning, and association), affective, and psychomotor skills, and information and communication technologies. In both programs, mathematical skills were similar. Differently, in 2013 program, affective and psychomotor skills took part in the curriculum.

Course book, Workbook, Teacher Guidebook: In 2006 program, information related to the course book, workbook, and teacher guidebook took part in the curriculum whereas in 2013 program there was no such information. In the application of 2006 program, students and teachers provided with books. However, in the application of 2013 program, students and teachers provided only with the course book, and the workbook and teacher guidebook was not provided.

### 3.4. Learning- Teaching Approach

The learning and teaching approaches were indicated in similar expressions in both programs. Students' active participation to learning process should be provided. Learning environment based on problem solving should be benefited. Students should be assisted in terms of forming meanings from their concrete experiences and abstracting. Individual differences should be considered. Learning based on cooperation should be emphasized. Information and communication technologies should be used effectively. Differently, in 2006 program, associating the gains with intermediate disciplines were given importance while in 2013 program, this issue was not mentioned.

### 3.5. Explanations Related to the Application of the Curriculum

In both programs the explanations related to the application of the curriculum were stated as items in detail. Differently, in 2013 curriculum, suggestions related to preparing individualized education programs for students who needed special education took place.

#### Assessment and Evaluation Methods

In both programs, as an assessment and evaluation concept, progress evaluation was given particular importance. Students' evaluation of themselves and their friends were emphasized. Using the necessity of various assessment and evaluation methods was stated. In addition to student evaluation, both the evaluation of the curriculum and teacher's self-evaluation were emphasized. Differently, in 2006 program, all alternative assessment and evaluation methods were introduced and explained in detail. On the other hand, in 2013 program, there was no explanation related to methods.

#### The Number of Gains and the Course Hours

In 2006 program, the number of gains was 94 and the course hours were 144 hours in total. On the contrary, in 2013 program, the number of gains was 57, and the course hours were 180 hours in total. When considering the number of gains and the course hours of the two curriculums, it can be said that 2013 program was simplified. In 2013 program, the weekly course hours of the mathematics of the fifth grade was increased to 5 hours in a week. Thus, the allocated time for the gains was more than that of 2006 program.

Teachers' opinions about the renewed fifth grade mathematics curriculum were represented as tables below. Teachers' opinions about getting informed about the curriculum were presented in Table 1.

Table 1. Teachers' opinions about getting informed about the curriculum

Themes/ Categories	Codes	N	%
Getting informed	There was no informing. (T1,T2,T3,T4,T5,T6,T7,T8,T9, T10,T11,T12,T13,T14,T15,T16,T17,T18)	18	100
Getting information methods	I got information on the internet.(T2, T4, T5, T6, T7, T8, T9, T10, T11, T12, T14, T15, T17, T18)	14	77,7
	I got information from the course book. (T1, T13, T16)	3	16,6
	I got information about the curriculum by attending the classes. (T3)	1	5,5
	Source books. (T4, T7)	2	11,1
	I got information by discussing with other group teachers. (T5, T9)	2	11,1

As seen in Table 1, all of the teachers indicated that they got no informing. Moreover, 77,7% of the teachers got information about the curriculum from the internet, 16,6% of them got information from the course book, 11,1% of them got from source books, and by discussing with group teachers, and 5,5% of them got information by attending the classes. Direct quotations from teachers' opinions were as follows:

"There was no informing. I reached information from the course book." (T1)

"... We reached information about the curriculum on the internet and by discussing with other mathematics group teachers." (T5)

"...We leagued together with group teachers and we exchanged opinions. There was no informing. We reached necessary information from the internet." (T9)

Teachers' opinions about the elements of the curriculum like the gains, the content, activities, and evaluation methods were presented in Table 2.

Table 2. Teachers' opinions about the elements of the curriculum

Themes (Categories)	Codes					
	Positive	n	%	Negative	n	%
The gains	They are appropriate to student level (T1, T3, T4, T6, T12, T15, T17)	7	38.8	They are not accessible (T5, T7, T11, T13, T14)	5	27.7
	They are clear and explicit (T1, T2, T3, T5, T6, T8, T9, T10, T15, T6, T18)	11	61.1	Time of the gains is insufficient (T4, T7)	2	11.1
The content	It is compatible with the gains (T3, T4, T5, T6, T7, T10, T11, T12, T14, T16, T17, T18)	12	66.6	It is not sufficient (T1, T5, T6, T8, T9, T14, T17, T18)	8	44.4
	Topics are concrete (T5, T15)	2	11.1	It is not appropriate for student level (T11, T13)	2	11.1
				It is not compatible with the immediate environment (T4)	1	5.5
Activities	They are compatible with the gains and the content (T1, T3, T4, T5, T6, T17, T18)	7	38.8	They are not enough (T2, T11, T14, T15)	4	22.2
	They are appropriate for student level (T8, T10, T12, T13)	4	22.2	They are not applicable in the classroom (T5, T7, T9, T11, T14)	5	27.7
				Time is not enough (T12, T13, T17)	3	16.6
Evaluation methods	They are compatible with the student level (T2, T5)	2	11.1	Insufficient (T9, T11, T12, T13, T15, T16, T17, T18)	8	44.4
	They are applicable in the classroom (T3, T6, T14)	3	16.6			

As Table 2 shows that the elements of the curriculum was categorized into four groups as “the gains”, “the content”, “activities” and “the evaluation methods” and teachers’ opinions about them were coded as either positive or negative. Teachers’ positive opinions about the gains were mostly related to clarity and explicitness with 61.1%. Other positive opinion was related to their appropriateness to student level with 38.8%. Teachers’ negative opinions about the gains were mostly related to inaccessibility with 27.7%. Other negative opinion was related to insufficient time with 11.1%. Teachers’ positive opinions about the content were mostly related to its appropriateness with the gains with 66.6%. Other positive opinion was related to concrete topics with 11.1%. Teachers’ negative opinions about the content were mostly related to its insufficiency with 44.4%. Other negative opinions were related respectively to its inappropriateness to student level with 11.1%, and its inappropriateness to the immediate environment with 5.5%. Teachers’ positive opinions about the activities were mostly related to its compatibleness with the gains and the content with 38.8%. Other positive opinion was related to its appropriateness to student level with 22.2%. Teachers’ negative opinions about the activities were mostly related to inapplicability of them in the classroom with 27.7%. Other negative opinions were related respectively to its insufficiency with 22.2%, and insufficient time with 16.6%. Finally, teachers’ positive opinions about the evaluation methods were mostly related to their applicability in the classroom with 16.6%. Other positive opinion was related to their appropriateness to student level with 11.1%. Teachers’ negative opinions about the evaluation methods were mostly related to their insufficiency with 44.4%. Direct quotations from teachers’ opinions were as follows:

“It is a program that students can understand. The gains are clear and explicit. Moreover, the gains were prepared in a level that student can reach. The activities mentioned in the curriculum are compatible with the gains and the content.” (T1)

“In my opinion, some gains are not in a level that students can be brought, even the gains exceed the level of some students. I think the content is compatible with the gains. However, the activities are not applicable in the classrooms because of the high class size.” (T7)

“Most of the contents and gains are not compatible with the student level. They should be prepared by considering students’ intellectual development. The time is not enough to apply the activities. In my opinion, the evaluation methods are insufficient.” (T13)

Teachers’ opinions about the problems they confronted in the application process of the curriculum and their solution offers were presented in Table 3.

As seen in Table 3, teachers confronted with some problems in the application process of the curriculum. 26.3% of the teachers thought that students’ readiness level is not enough for the fifth grade mathematics subjects, and the evaluation methods were insufficient. 22.2% of them stated that there was an imbalance between the content and the course duration, and there was no workbook and teacher guidebook. 11.1% of them indicated that they experienced problems while applying the curriculum related to be not informed about the curriculum. Teachers offered some solutions to solve these problems. 38.8% of them stated that the content should be more interesting for the students. 33.3% of them thought that the evaluation methods should be increased. 26.3% of them indicated that schools should be provided with necessary source books (workbook, teacher guidebook), and materials. 22.2% of them pointed out that the allocated time for the subjects should be arranged in a more planned way. 11.1% of them asserted that interactive CDs related to subjects should be prepared. Direct quotations from teachers’ opinions were as follows:

“There were problems because we got no information related to the fifth grade mathematics curriculum before, and students’ readiness level was not enough. Students were used to a single teacher so that they were confused for a long time. Students associate the Mathematics with some words such as complicated, difficult, operation etc. This is because of the facts that the curriculum does not attract students’ attention. While preparing the content, alternative sources that can attract students’ attention and help teachers should be provided or should take part in course books.”(T4)

“I had problems while applying the curriculum because we cannot exceed students’ habits from the primary school. I would include more evaluation methods because they are insufficient. The content should be more interesting.” (T1)

“As for me students should have workbook. This was not published in this year so that students cannot do enough practice. I should increase some revisions that enable students to use their intellectual capacity instead of memorizing, and reveal creative ideas. In other words, I would make it more interesting for the students.” (T5)

#### 4. Discussion

The findings the present study that compared the renewed fifth grade mathematics curriculum and the former one, can be summarized as follows:

1. The vision of the curriculum was every child can learn the mathematics in 2006, whereas in 2013 it was the mathematics is valuable. 2. In terms of the aims of the curriculum, in 2006, the curriculum put emphasis on individuals’ independent thinking, making their own decision, and self- regulation, while in 2013 program, bringing individuals in knowledge, skills, and attitudes specific to the mathematics for the future was emphasized. 3. In terms of the approach of the curriculum both programs adopted the conceptual approach. 4. In the sense of Teacher- student roles, the 2006 the curriculum asserted that the student was active and the teacher is the guide whereas the 2013 program stated that student was the active participant and the teacher was someone who was responsible from applying the activities. 5. With regards to learning areas, both programs collected the learning areas under five titles. 6. In terms of skills, in 2006 program the skills specific to the common field and to mathematics skills were handled separately. On the contrary, in 2013 program, it was mentioned as basic skills that should be gained in mathematics. Furthermore, in 2013 program affective and psychomotor skills were defined. 7. In the sense of source books, in 2006 there were course book that was compatible with the curriculum, student workbook, and teacher guidebook. On the other hand, in 2013 program, there was only a course book. There was no student workbook and teacher guidebook. 8. In both curriculums, the suggestions in terms of applying the curriculum were similar. Differently, in 2013 curriculum, suggestions related to preparing individualized education programs for students who needed special education took place. 9. With regards to assessment and evaluation, in 2006 program, there were explanations about alternative evaluation methods, whereas in 2013 program, there was no such information. 10. In terms of gain numbers and course duration, in 2013 program, the number of gains was decreased and the course duration was increased as compared to 2006 program.

In general, the 2006 and 2013 programs are similar to each other. In 2013 program, there was no appropriate student workbook and teacher guidebook, and there was no information related to evaluation methods in the curriculum, and these were shortcomings of the curriculum. According to researches, it was found that teachers had problems in terms of assessment and evaluation in the application process of the curriculum because the curriculums did not mention enough explanations and examples in terms of applying the evaluation methods. Although student-centered assessment and evaluation was suggested in the curriculum for this reason, teachers evaluate students with traditional methods due to lack of information (Bal, 2009; Güneş & Baki, 2011; Budak & Okur, 2012). In the new curriculum, decreasing the number of gains and increasing the course hours are thought to be superior things about the program. The researches about the former curriculum show that teachers had problems in the application process of the curriculum mostly because the course hours were not enough for bringing students in foreseen gains of the curriculum (Güneş & Baki, 2011; Üzel & Şimşeker, 2012; Budak & Okur, 2012; Anılan & Sarier, 2008; Keleş, Haser & Koç, 2012). It can be stated that with decreasing the number of gains and increasing the course hours in the new curriculum, this problem can be overcome.

In the present study, findings derived from teachers’ opinions about the renewed fifth grade mathematics curriculum can be summarized as follows:

1. Teachers got no information about the curriculum. Teachers reached information about the curriculum mostly from the internet. 2. The positive features of the foreseen gains of the curriculum were they are clear and explicit while the negative features were they are not accessible. The positive thing about the content was its appropriateness to gains, whereas the negative thing was the content is not sufficient. The superior characteristics of the activities were they are in line with the gains and the content, while the shortcoming about them was they are not applicable in the classroom. The positive feature of the evaluation methods was they can be applied in the classroom whereas the negative feature of them was they are insufficient. 3. The most important problem that teachers confronted in the application was students’ readiness level was not sufficient, and the evaluation methods were insufficient. The most suggested solution was the content should be more interesting for students. In the current study, it was found that teachers got no information about the new curriculum, and they reach necessary information on the internet. It is thought that in order to apply the new curriculum as proposed in the classes, it is important to give information to teachers about the curriculum. Teachers had troubles in the application because they did not have enough information about the curriculum. This is in line with the literature that, according to findings, teachers experienced problems in the application because the new curriculum was not introduced to them adequately (Duru & Korkmaz, 2010; Güneş & Baki, 2011; Demirtaş, Arslan, Eskicumalı & Civan, 2014). Similarly, as Halat (2007) stated that class masters cannot apply the curriculum exactly in

mathematic course because they had no informative seminars about the curriculum. Besides, Keleş, Haser and Koç (2012) indicated that mathematic teachers needed effective in service training so as to apply the curriculum as proposed. In the present study, it was found that teachers considered the gains as clear and explicit but not reachable. This is compatible with the previous researches that the positive things were the gains are clear, explicit, and understandable (Bal & Dinç-Artut, 2013; Budak & Okur, 2012), while the negative things were they are not compatible with student level (Güneş & Baki, 2011) so that they are not reachable for students. In terms of the content and activities, the findings of the current study show that teachers considered the content as compatible with the gains but as insufficient. Similarly, they thought that the activities are in line with the gains and the content but they are not applicable in the classroom. Budak and Okur (2012) indicated that for teachers' opinions, the content's being compatible with the gains and the activities' being compatible with the gains were found at good levels while the content's being enough for actualizing the gains and the activities' being applicable were found as moderate level. Bal and Dinç-Artut (2013) found that the content was superficial and insufficient, and activities were not applied completely. In the present study, with regards to the evaluation methods, it was found that for teachers methods were applicable in the classroom but they were still insufficient. Budak and Okur (2012) stated that teachers thought assessment and evaluation activities were applicable in moderate level and enough. Besides, Aksu (2008) pointed out that the evaluation activities were not sufficient. In the current study, it was found that teachers had problems because the students' readiness level was not enough, and the evaluation methods were insufficient so that as a solution offer they suggested that the content should be arranged in a way that it should be more interesting for student. Previous researches showed that the program's being incompatible with the student level, students' being not ready for the new curriculum, and not accommodate to it, the readiness level of students' being not enough, and students' being uninterested to the curriculum were considered as problems (Güneş & Baki, 2011; Keleş, Haser & Koç, 2012). Moreover, as Bal and Dinç-Artut (2013) stated that the subjects were not interesting for students. In addition to this, according to Aksu (2008), the content was not applicable. Thus, it is thought that it is important to prepare the content as compatible with students' readiness and learning levels, and arrange it in a way that it is interesting and attractive especially for applying the curriculum effectively.

All in all, the followings can be suggested according the findings of the present study: teachers and students should be provided with the sourcebooks that are appropriate to the curriculum, the evaluation methods should be explained in more detail in the curriculum, besides, a separate brochure related to the assessment and evaluation methods should be prepared, related persons should be informed about the new curriculum before the application process, and the gains, the content, activities, and evaluation methods of the new curriculum should be revised in a way that they are compatible with students' readiness and interest levels

## Abstract

Here, we report the first survey of teachers' ideas about the brain in East China (N=238), aimed at identifying the prevalence of “neuromyths” thought to detract from effective classroom practice. Analysis identified many neuromyths popular in Europe (e.g. value in teaching to learning styles, left-brained or right-brained learners and in using only 10% of the brain). However, some important differences with the European data also emerged (e.g. greater belief in the importance of attention and avoiding emotional disruption of thought). An inverse relationship between favouring genetic influence and a belief in a biological limit to student achievement was also observed.

## 1. Introduction

A global field of enterprise is developing around attempts to bridge the gap between education and neuroscience. Formal organised initiatives to build bridges between neuroscience and education are so recent that their many progenitors are still settling on a name for this enterprise, with “Brain, Mind and Education”, “Neuroeducation” and “Educational Neuroscience” all currently contending. Efforts in the last decade have included a supranational project on “Learning Sciences and Brain Research” by the Organization for Economic Cooperation and Development (OECD)’s Centre for Educational Research and Innovation (CERI) from 1999 to 2006, and the formation of the International Mind, Brain and Education Society in the US which launched its journal “Mind, Brain and Education” in 2007. A second journal “Trends in neuroscience and education” was launched last year. Research centres combining neuroscience and education are springing up around the world, often associated with popular postgraduate courses. East China Normal University (Shanghai) has now opened its centre in Educational

Neuroscience and this year, supported by the OECD and UNESCO, the School of Education Science at East China University hosted the International Convention on Science of Learning. Here, global and local experts in education mingled with neuroscientists to discuss news forward in developing a new scientific basis for educational practice. Given the current Western interest in the high-performance (PISA) of schools in cities such as Shanghai, such initiatives in the East may have global political significance.

However, as the dialogue increases between neuroscience and education, there is a growing concern about the prevalence of neuromyths in many schools. In 2002, OECD defined “neuromyth” as “a misconception generated by a misunderstanding, a misreading, or a misquoting of facts scientifically established” (OECD, 2002). These myths are related to the practices of teachers and are often promoted by brain-based programmes and books marketed to teachers that are intended to inform their teaching strategies. There is good reason, therefore, to consider these misunderstandings contribute to poor practice in the classroom.

Studies have found high levels of neuromyths amongst teachers in the UK, Netherlands, Portugal, Brazil, China and Turkey. Beyond the impact of commercial brain-based programmes in promoting myths, it seems likely that cultural contexts will influence the types of myth that become prevalent in a particular country. Neuromyths may provide the opportunity for our biases to distort scientific fact and create misunderstandings about the brain that become popular. However, given that different cultural forces and biases exist amongst the peoples of different nations, it cannot be assumed that the prevalence of all neuromyths will be the same across international boundaries. For example, only half of the UK population report any affiliation with any religion (Park, Clery, Curtice, Philips, & Utting, 2012) and here, only 15% of trainee teachers believed that the mind results from the spirit, or the soul, acting on the brain (Howard-Jones et al., 2009). The people of Greece, however, have notably high religious involvement. High levels of religiosity characterize a large proportion of the Greek people (Hirschon, 2009) and the majority of this population are Christian Orthodox. Here, 72% agreed with the statement that “The mind is the result of the action of the spirit, or of the soul, on the brain”.

Here, we report the first survey of neuromyths amongst teachers in China, using a questionnaire used to assess levels of misunderstandings about the brain in Europe.

## 2. Method

### 2.1. Participants

Participants were 238 primary, secondary and high school teachers recruited in Shanghai, Shandong, Jiangsu and Zhejiang provinces.

### 2.2. Procedure

The translation and suitability of the survey was first validated through preliminary interviews and piloting with teachers not included in the final survey sample. The research was presented as a study of how teachers think about the brain and its influence on learning.

### 2.3. Instruments

Participants were asked to complete a survey used in a previous study of UK trainee teachers (Howard-Jones et al., 2009). This consisted of 40 assertions (15 correct and 16 incorrect factual assertions, and 9 open to subjective opinion) to which participants were asked to respond agree, don't know or disagree and is provided in Appendix 1. Of these 40 assertions in our survey, 38 statements were originally created by combining assertions used in a study of public neuroscience literacy (Herculano-Houzel, 2002) with ideas that have arisen in interviews with educators (see Howard-Jones et al., 2009 for further details concerning the underlying rationale for including these statements). The survey included the two additional statements of subjective opinion ("There is a biological limit to what some individuals can achieve in their education", "There is no biological limit to what any individual can achieve in their education") that Howard-Jones et al. (2009) used in a follow-up survey to explore ideas around genetic determination. Related to this issue, respondents were asked what percentage of educational outcome they attributed to a student's genes, their educational environment and their home environment. Participants also provided background information for the purpose of characterizing the sample (type of school, years of experience, gender, age, etc.) and whether they were familiar with a range of brain-based programmes common in the US and Europe (Brain Gym, Multiple Intelligences, Learning Styles). 15 of these participants were then randomly selected for in-depth interview in which they explained their responses.

## 3. Results

The summary of responses of our sample of teachers to our 9 statements of subjective opinion is shown in Table 1. Summaries of responses to assertions related to general knowledge and educational issues regarding the brain are shown in Tables 2 and 3.

Table 1. Beliefs of our sample of teachers in East China regarding 9 statements that might be regarded as open to subjective opinion, including the mind-brain relationship, the impact of developmental difference on moral responsibility and belief in a biological limit to achievement.

	Response as percentage % of sample		
	Agree	Don't know	Disagree
The mind is the result of the action of the spirit, or of the soul, on the brain	85	11	4
State of mind is a reflection of the brain state in a given moment	82	14	4
If there are ways to study brain activity, the mind can be studied through them	60	31	9
The mind is a product of the working of the brain	88	9	3
Without a brain, consciousness is not possible	75	11	14
Intuition is a "special sense" that can't be explained by brain	71	15	14

Individuals are not responsible for behavior associated with a developmental difference in brain function	24	20	57
There is a biological limit to what some individuals can achieve in their education	61	29	10
There is no biological limit to what any individual can achieve in their education	27	25	48

Table 2. Responses of our sample of teachers in East China to general assertions regarding the brain (C = correct statement, I = incorrect statement). It should be noted that some scientific evidence supporting one statement (marked C\*) has recently been found, raising questions about the correctness, or otherwise, of this statement.

	Response as percentage % of sample		
	Agree	Don't know	Disagree
Brain activity depends entirely on the external environment: with no senses stimulated, we don't see, hear or feel anything (I)	34	8	57
Emotional brain processes interrupt those brain processes involved with reasoning (I)	93	4	3
Cognitive abilities are inherited and cannot be modified by the environment or by life experience (I)	8	4	88
Learning is not due to the addition of new cells to the brain (C*)	53	36	12
One's environment can influence hormone production and, in turn, personality (C)	88	12	0
We use our brains 24 hours a day (C)	57	16	27
To learn how to do something, it is necessary to pay attention to it (C).	89	3	8
Learning occurs through modification of the brain's neural connections(C)	68	29	3
Performance in activities such as playing the piano improves as a function of hours spent practicing (C)	37	7	56
It is with the brain, and not the heart, that we experience happiness, anger, and fear (C)	65	11	25
Hormones influence the body's internal state, and not their personality (I)	36	27	37
Memory is stored in the brain much like as in a computer. That is, each memory goes into a tiny piece of the brain (I)	78	16	5
We mostly only use 10% of our brain (I)	59	36	5
Memory is stored in networks of cells distributed throughout the brain (C)	53	31	16
Keeping a phone number in memory until dialing, recalling recent events & distant experiences, all use the same memory system (I)	24	44	32
When we sleep, the brain shuts down (I)	8	9	82

Table 3. Responses of our sample of teachers in East China to assertions regarding the brain that are related to educational practice (C = correct statement, I = incorrect statement).

	Response as percentage % of sample		
	Agree	Don't Know	Disagree
Children are less attentive after sugary drinks and snacks (I)	62	29	10
Omega 3 supplements do not enhance the mental capacity of children in the general population (C)	44	42	14
Extended rehearsal of some mental processes can change the shape and structure of some parts of the brain (C)	66	26	8
Environments that are rich in stimulus improve the brains of preschool children (I)	89	6	5
Individuals learn better when they receive information in their preferred learning style (e.g. visual, auditory, kinaesthetic) (I)	97	3	1
Short bouts of co-ordination exercises can improve integration of left and right hemispheric brain function (I)	84	13	3
Regular drinking of caffeinated soft drinks reduces alertness (C)	52	37	11
Differences in hemispheric dominance (left brain, right brain) can help explain individual differences amongst learners (I)	71	23	7
Learning problems associated with developmental differences in brain function cannot be remediated by education (I)	50	19	31
There are no critical periods in childhood after which you can't learn some things, just sensitive periods when it's easier (C)	80	7	14
Vigorous exercise can improve mental function (C)	40	15	46
Individual learners show preferences for the mode in which they receive information (e.g. visual, auditory, kinaesthetic) (C)	93	6	1
Drinking less than 6-8 glasses of water a day can cause the brain to shrink (I)	5	30	65
Exercises that rehearse co-ordination of motor-perception skills can improve literacy skills(I)	79	18	3
Production of new connections in the brain can continue into old age (C)	44	40	16

The mean percentage of educational outcome that participants attributed to genetics, home environment and school environment were 28 (SD= 16), 36 (SD=14) and 35 (SD=15) respectively. The mean percentage of educational outcome attributed to genetics that participants who agreed (N=140) and disagreed (N=23) with the statement “There is a biological limit to what some individuals can achieve in their education” was 29% (SD 16%) and 22% (SD 12%) respectively. An independent samples one-tailed t-test revealed this difference to be significant ( $t(161)=1.84$ ,  $p=0.033$ ). The mean percentage of educational outcome attributed to genetics that participants who agreed (N=62) and disagreed (N=110) with the statement “There is no biological limit to what any individual can achieve in their education” was 23% (SD 11%) and 30% (SD 16%) respectively. An independent samples one-tailed t-test revealed this difference to be significant ( $t(169)=3.01$ ,  $p=0.001$ ). The percentage of teachers who were familiar with Brain Gym, Multiple Intelligences, Learning Styles were 6%, 61%, and 53% respectively.

#### 4. Discussion

The research revealed that teachers in East China held many neuromyths and misconceptions about the brain that have been recorded elsewhere in Europe. These include almost three-quarters (71%) of teachers (compared with 91% and 86% in UK and Netherlands, Dekker et al. (2012)) believing that differences in hemispheric dominance (left brain, right brain) can help explain individual differences amongst learners, and the great majority (97%) believing in the effectiveness of teaching to learning styles (compared with 93% and 96% in UK and Netherlands respectively).

However, there were also appeared to be some differences between responses of teachers in our sample and those collated in previous studies elsewhere. For example, fewer teachers (only 40%) in East China appeared enthusiastic about the potential for vigorous exercise to improve mental function, compared with 65% teachers in Greece, 63% of UK trainee teachers. However, this result may need to be treated with caution. Through our interviews with teachers, it became apparent that vigorous exercise was being interpreted as meaning a highly repetitive task rather than aerobic physical activity. This points to difficulties we encountered in translating the language and concepts used in our survey which designed for Western teachers. This process of translation creates many opportunities for both linguistic and cultural misunderstandings. Indeed, a high number of teachers in East China were enthusiastic about co-ordination exercises improving integration of left and right hemispheric brain function (84%), and about exercises aimed at motor-perception skills improving literacy (79%). These figures, respectively, are similar to and sometimes higher than those from surveys in European countries. They can be compared, respectively, with 88% and 78% for UK teachers and 82%, 63% for teachers in the Netherlands (Dekker et al. 2012), or 65%, 35% for trainee UK teachers and 56%, 72% for teachers in Greece (Deligiannidi and Howard-Jones, 2014). Popularity in these other countries has been attributed to programmes such as Brain Gym, but in our sample of teachers in East China, only 6% were familiar with this programme. Some insights into the popularity of physical exercise arose from the interviews, in which 6 teachers offered rationales to justify their enthusiasm for it. Two teachers explained in terms of oxygen provision to the brain, two teachers in terms of improved attentional abilities, and another recounted his observations that coordination skills in sport (e.g. basketball) appeared associated with literacy skills. Another teacher referred to her own tendency to walk around when learning a foreign language, and also to the film *Akeelah and the Bee* in which Akeelah remembers her spellings better while skipping with a rope. It may be that programmes such as Brain Gym exploit a popular association between exercise and learning that already exists in many cultures.

Compared with UK trainee teachers, teachers in East China appear more enthusiastic about attention (89% believe “To learn how to do something, it is necessary to pay attention to it” compared with 43% in the UK) and less enthusiastic about emotion in reasoning (93% believe “Emotional brain processes interrupt those brain processes involved with reasoning” compared with 69% in the UK). These may reflect genuine cultural differences. For example, while the Western media is fascinated with the idea of multitasking, there is an old Chinese saying that “a man cannot spin and weave at the same time”. In terms of attitudes to emotion, European American individuals have been shown to value high-arousal positive affect (e.g., excitement) more than do Hong Kong Chinese, while Hong-Kong Chinese value low-arousal positive affect (e.g., calm) more than do European American individuals (Tsai et al., 2006). The American philosopher Ralph Waldo Emerson (1841/2000, p262) believed that “Nothing great was ever achieved without enthusiasm,” while the Chinese philosopher Lao-tzu (6th century; as cited in Cleary 1989, p2) believed “If people can be clear and calm, heaven and earth will come to them.”

The fact that 50% of our sample of teachers from East China agreed that “Learning problems associated with developmental differences in brain function cannot be remediated by education” can be interpreted in a number of ways. It appears considerably higher than the 9% of UK trainee teachers (Howard-Jones, et al., 2009), or 16% of UK teachers and 19% of Dutch teachers in the Dekker et al. (2012) study. This may reflect differences in how the phrase “Learning problems” is interpreted compared with participants in these other studies. That is, it may communicate more problematic disorders (e.g. amentia) than those it may associate itself with amongst European teachers (e.g. dyslexia). Alternatively, it may suggest teachers in East China consider the brain is less plastic than those in Europe. In either respect, further research on this topic may be illuminating and helpful in understanding different cultural attitudes towards the brain and learning disorders.

We also believe the somewhat contrary results we derived for opinions with regard to the mind-brain relationship also point towards the need for further research. Our current results suggest 85% of Chinese teachers believe “The mind is the result of the action of the spirit, or of the soul, on the brain” but at the same time 88% believe “The mind is a product of the working of the brain”. However, in Chinese, this first statement used words without religious association for spirit, or soul. This resulted in there being little potential conflict between these statements. Further research is planned that is intended to disentangle beliefs of teachers more carefully regarding the mind-brain relationship.

Our finding that there was a relationship between belief in genetic influence and a diminished sense of student’s potential (or a biological limit to their achievement) emphasises the potential importance of teachers gaining a better understanding of neurodevelopment and genetics. There is increasing scientific and media interest in the role of genetics in education, but if these messages are misinterpreted then our results suggest this will influence the attitudes of teachers in the classroom.

## 5. Conclusions and recommendations

In summary, since many of the myths and ideas we report here are directly related to practice, we conclude that the knowledge and practice of teachers in East China would benefit from more accurate knowledge of the brain, as might be received from teacher training and in-service professional development. This may be an important first step for future efforts in China to enrich education with insights from neuroscience. Comparison of our results with international data sets suggests cultural factors influence teachers' understanding of the brain, and better understanding of these factors would be a valuable target area for future research.

**The complete set of statements used in the questionnaire. Participants were asked to indicate their agreement with these statements as agree, don't know or disagree.**

The mind is the result of the action of the spirit, or of the soul, on the brain  
"State of mind" is a reflection of the brain state in a given moment  
If there are ways to study brain activity, the mind can be studied through them  
The mind is a product of the working of the brain  
Without a brain, consciousness is not possible  
Intuition is a "special sense" that cannot be explained by the brain  
Individuals are not responsible for behavior associated with a developmental difference in brain function  
There is a biological limit to what some individuals can achieve in their education  
There is no biological limit to what any individual can achieve in their education  
One's environment can influence hormone production and, in turn, personality (C)  
We use our brains 24 hours a day (C)  
To learn how to do something, it is necessary to pay attention to it (C).  
Learning occurs through modification of the brain's neural connections(C)  
Performance in activities such as playing the piano improves as a function of hours spent practicing (C)  
It is with the brain, and not the heart, that we experience happiness, anger, and fear (C)  
Hormones influence the body's internal state, and not their personality (I)  
Memory is stored in the brain much like as in a computer. That is, each memory goes into a tiny piece of the brain (I)  
Memory is stored in networks of cells distributed throughout the brain (C)  
Keeping a phone number in memory until dialing, recalling recent events & distant experiences, all use the same memory system (I)  
When we sleep, the brain shuts down (I)  
Learning is not due to the addition of new cells to the brain (C\*)  
Brain activity depends entirely on the external environment: with no senses stimulated, we don't see, hear or feel anything (I)  
Emotional brain processes interrupt those brain processes involved with reasoning (I)  
Cognitive abilities are inherited and cannot be modified by the environment or by life experience (I)  
We mostly only use 10% of our brains (I)  
Children are less attentive after sugary drinks and snacks (I)  
Omega 3 supplements do not enhance children's mental capacity in the general population (C)  
Environments that are rich in stimulus improve the brains of preschool children (I)

# Teachers' views related to the effectiveness of in-service training programs in primary schools

Aysun Kurt Katman<sup>a</sup>, Ömer F. Tutkun<sup>b</sup>;

<sup>a</sup>Teacher, Ministry of Education, Turkey

<sup>b</sup>Sakarya University Faculty of Education, Sakarya, Turkey

## Abstract

The purpose of this study is to determine primary school teachers' views related to the effect of in-service training programs on teaching-learning process. The research study group consists of 120 primary school teachers working in the formal primary schools. "The Determination of Teachers' Views related to the Effect of In-Service Training Programs on Teaching-Learning Process Survey" was used as the data collection tool in the study. The research results are as follows: The majority of the participants argue that in-service training supports the development of the education system; that in-service training programs have a purpose; that in-service training increases teachers' professional knowledge and skills. On the other hand, only half of the participants argue that in-service training meets teachers' educational needs.

## 1. Introduction

Recent developments in science and technology necessitate to learn new knowledge and technologies in each profession and to educate employees on these issues. In this regard, today's organizations seek for some competencies in their employees such as having multi-faceted skills, understanding complex intra and extra-organizational relationships and adapting to effective teamwork. From now on, human resource management has taken the place of the concept of personnel management in organizational structure. Therefore, requirements for staffs undergo some changes. In order to adapt to this new understanding and applications, it is necessary that education system must be established in an open structured frame which is open to developments and adapt other things to itself rapidly (Çiftçi, 2008; Doğan, 2009).

In this context (Uçar&İpek, 2006; Çiftçi, 2008), within the scope of "lifelong learning" getting increasingly common and important, it is clear that teachers' professional and personal development also should be developed, that their efficiency should be increased and that in-service training activities for preparation for senior positions should be provided. Because the quality of school depends on the quality of educational services presents by teachers. For this reason (Taymaz, 1981; Tutkun, 1991), it is necessary that both teachers should be trained well before pre-service training and that they should improve themselves continuously during the service. In this context (Özyürek, 1981; Tutkun, 1991), it can be said that training of a teacher who performs his/her profession does not come to an end only with starting to work. Continuing education is a must for a member of a profession in order to fulfill service required by job effectively, not to remain behind professional development and to keep himself/herself updated. This process is referred to as in-service training.

On the other hand, major changes and increases have occurred in the knowledge, attitudes and skills which an individual should have in this new era 21st century (Tutkun, 2010; Tutkun&Aksoyalp, 2010; Tutkun&Aksoyalp, 2012). It is no longer sufficient that these information is brought to individuals during only formal education process. Due to lack of knowledge and skills and changes in information acquired during the education of individuals who begin their professional career passing through different educational levels, acquiring knowledge, skills and techniques relates to their profession, producing solutions to professional problems, adapting their institutions and thus being successful are dependent on continuous training throughout their professional lives.

The history of understanding and practice of in-service training dates back to the Egyptians. Egyptians trained the captives brought from other countries for work. This training was made directly on-the-work. There were "Summer School" and "Harvest Holiday Camps" for teacher in England and Wales Coast before the 1840s. Aiming compliance training in staff training, on-the-job training, task-based training, teaching the crafts requiring dexterity, apprenticeship training has come forward in the 20th century. Some courses opened for teachers and imams teaching in some teacher training schools and Ottoman primary schools in the 1890s can be accepted as the first in-service training activities for teachers in Turkey. In-service training unit in the

organizational structure of Turkish Ministry of Education was established in 1960. Starting centrally initially, in-service education activities was conducted as "On-the-Job Training Seminars for Teachers", which were held in teacher training schools and higher education institutions training teachers, in the form of evening courses and summer courses later on. Before this date, the in-service training activities were planned and conducted at the local level. Since 1982, these types of in-service activities has been conducted by "In-service Training Department" (Pehlivan, 1997; Özyürek, 1981; Milli Eğitim Bakanlığı, 2014).

Teaching profession is a field of occupation which has social-cultural, economic, scientific and technological dimensions concerning with education sector, which is based on specialist knowledge and skills in the field, which requires academic study and professional training in the professional status (Basic Law of National Education, 1973; Aydın, 2006). In this context, teaching profession as an occupation requires some qualification. Nowadays on which education has gained so much importance, both public and private sectors have to give a systematic training to their staffs in order to provide quality products or services toward their purposes. The way to achieve this is "in-service training". In-service training (Taymaz, 1981; Aytaç, 2000, Günbayı&Taşdöğen, 2012) is the training provided to the staff who is assigned for a fee or works in the workplaces belonging to legal and natural persons, without any sector distinction, for the purpose of both increasing efficiency of the share of labor factor for the goods or services produced, and providing people to gain or enrich necessary knowledge, attitudes and skills. The main purpose of in-service training is to inform teachers and administrators on changing and evolving training understanding and bring them necessary knowledge, skills and behaviors in order to be efficient and effective in this process.

Providing expected benefits from in-service training depends on that the whole processes planned should be tackled in a systematic approach and be consistent, logical, simple and applicable. Planning of in-service training allows usage of all sources in the most appropriate and efficient manner system development and ensuring effective coordination among other elements. In-service training activities for teachers in Turkey are conducted in cooperation and contribution with Ministry of National Education, Higher Education Council, Universities, Turkey Middle East Public Administration (TODAIE), other public-private institutions/ organizations, nongovernmental organizations and cultural centers of other countries (Ministry of Education, 2012; Erdogan, 2010; Ministry of Education, 1995).

The fundamental element of being a developed country is to train qualified people. Education system training these types of people and teacher the most important element of the system has to adapt to changes occurring in each area and renew themselves constantly. The quality of a school depends on the quality of the training teachers offer. It is possible to make this realize for teachers on the condition that they should be both trained well pre-service and improve themselves constantly during the profession. It is contemplated that the results of this study will contribute to designing qualified in-service training programs planned according to scientific criteria and to implementation processes. In this context, the purpose of this study is to determine teachers' opinions related to the effectiveness of in-service training programs in primary schools.

## 2. Method

### 2.1. Methods

In this study, general descriptive survey research method was used. Descriptive models are a research approach aiming to describe a situation occurred past or now in its existing shape (Karasar, 2003, 77).

### 2.2. Study group

The study group consists of 120 teachers determined by random sampling method from the classroom teachers working at the primary schools in the province of Çayirova in Kocaeli.

Table 1. Participants' gender, age, graduation level, seniority, education state based for the appointment of the teaching profession and number of participation in in-service training

		f	%	Total (f)
Gender	F	87	72,5	120
	M	33	27,5	
	20-30	42	35,0	
Age groups	30-40	56	46,7	120
	40-45	13	10,8	
	45-50	3	2,5	
	50+	6	5,0	
Graduation level	Associate degree	5	4,2	120
	Undergraduate degree	107	89,2	
	Master degree	5	4,2	
	Other	3	2,5	
Seniority	0-5	22	18,3	120
	6-10	53	44,2	
	11-15	25	20,8	
	16+	20	16,7	
Education state based for the appointment of the teaching profession	Institute of Education	7	5,8	120
	Faculty of Education	104	86,7	
	Other	9	7,5	

87 (%72,5) of the participants are female and 33 (%27,5) of them are male. There are 42 people (%35,0) in 20-30, 56 people (%46,7) in 30-40 age group, 13 people (%10,8) in 40-45 age group, 3 people (%2,5) 45-50 age group, 6 people (%5,0) in 50 and older age group. 5 (%4,2) of the participants have associate degree, 107 (%89,2) of them have undergraduate degree, 5 (%4,2) of them have master degree and 3 (%2,5) of them selected other graduation level. 22 (%18,3) of the participants have 0-5 years seniority, 53 (%44,2) of them have 6-10 years seniority, 25 (%20,8) of them have 11-15 years seniority, 20 (%16,7) of them 16 and older years seniority. 7 (%5,8) of them graduated from an institution of education and 104 (%86,7) of them from a faculty education while 9 (%7,5) of them selected other graduation state.

## 2.3 Data Collection

“Survey for Determining Teachers’ Opinions related to Effects of In-Service Programs on Teaching-Learning Processes in Primary Schools” developed by Doğan (2009) was used for data collection instrument in the study. First part of the survey having two parts contains personal information. There are 30 items aiming to describe the effects of in-service programs on teaching-learning processes in the second part. The survey is rated in Likert-typed with the options of “strongly agree, agree, undecided, disagree, strongly disagree.

## 3. Findings

### 3.1. Primary School Teachers’ Opinions related to the Effectiveness of In-Service Training Program

Table 2. The Distribution of Teachers’ Views related to the Effectiveness of In-Service Training Programs in Primary Schools

Teachers’ Opinions related to In-Service Training Programs		Strongly Disagree		Disagree		Undecided		Agree		Strongly Agree	
		f	%	f	%	f	%	f	%	f	%
1	In-service training increases teachers’ professional knowledge and skills.	13	10,8	16	13,3	12	10,0	58	48,3	21	17,5
2	In-service training increases effectiveness and efficiency in the education system.	7	5,8	15	12,5	27	22,5	60	50,0	11	9,2
3	In-service training provides unity and solidarity among teachers.	6	5,0	20	16,7	16	13,3	61	50,8	17	14,2
4	In-service training provides morale and motivation among teacher.	5	4,2	18	15,0	22	18,3	65	54,2	10	8,3
5	In-service training changes existing negative behaviors.	3	2,5	24	20,0	32	26,7	53	44,2	8	6,7
6	In-service training completes the shortcomings of pre-service training in terms of professional competence.	5	4,2	20	16,7	25	20,8	58	48,3	12	10,0
7	In-service training brings the teachers who just begin to work as a teacher in the education field the knowledge, skills and behaviors which teaching profession requires.	2	1,7	19	15,8	21	17,5	67	55,8	11	9,2
8	In-service training supports the development of education system.	2	1,7	14	11,7	18	15,0	77	64,2	9	7,5
9	In-service training ensures teachers’ compliance to the organization.	2	1,7	21	17,5	25	20,8	64	53,3	8	6,7
10	In-service training prepares teachers prepares teachers for an upper task.	6	5,0	27	22,5	32	26,7	49	40,8	6	5,0
11	In-service training meets teachers’ training needs.	4	3,3	38	31,7	33	27,5	34	28,3	11	9,2
12	In-service training increases the quality of teaching.	2	1,7	25	20,8	21	17,5	65	54,2	7	5,8
13	In-service training gives the opportunity to capitalize for the acquaintances and to take vacation in resorts.	20	6,7	48	40,0	23	19,2	24	20,0	5	4,2

14	In-service training means showing off and giving the impression about doing something to upper levels.	15	12,5	48	40,0	23	19,2	29	24,2	5	4,2
15	In-service training is to burden chores on teachers.	10	8,3	52	43,3	34	28,3	19	15,8	5	4,2

Table 2. Cont.

Teachers' Opinions related to In-Service Training Programs		Strongly Disagree		Disagree		Undecided		Agree		Strongly Agree	
		f	%	f	%	f		f	%	f	%
16	In-service training does not have any aim.	14	11,7	70	58,3	16	13,3	15	12,2	5	4,2
17	In-service training provides beginning teachers to adapt to the profession.	3	2,5	13	10,8	17	14,2	75	62,5	12	10,0
18	In-service training prepares teachers for an upper task.	4	3,3	31	25,8	29	24,2	48	40,0	8	6,7
19	In-service training teaches teachers new developments in science and technology.	4	3,3	25	20,8	23	19,2	59	4,2	9	7,5
20	In-service training brushes up past information of teachers.	5	4,2	14	11,7	20	16,7	48	56,7	13	10,8
21	In-service training contributes to teacher-student interaction.	5	4,2	17	14,2	24	20,0	65	54,2	8	6,7
22	In-service training makes more efficient teachers and teaching.	4	3,3	13	10,8	28	23,3	65	54,2	10	8,3
23	In-service training provides teachers to increase information about accurate communication with students.	3	2,5	21	17,5	14	11,7	73	60,8	9	7,5
24	In-service training increases teachers' information on classroom management.	3	2,5	20	16,7	21	17,5	64	53,3	12	10,0
25	In-service training provides teachers informed on the subjects about conflict management.	3	2,5	25	20,8	22	18,3	62	51,7	8	6,7
26	In-service training give information about the importance of teacher and parent communication.	5	4,2	30	25,0	25	20,8	54	45,0	6	5,0
27	In-service training gives information to teachers about adapting to change.	4	3,3	9	7,5	25	20,8	75	62,5	7	5,8
28	In-service training increases teachers' competences in using IT.	5	4,2	23	19,2	22	18,3	61	50,8	9	7,5
29	In-service training encourages teachers to develop themselves.	3	2,5	17	14,2	17	14,2	75	62,5	8	6,7
30	In-service training provides to learn personal rights of teachers.	7	5,8	25	20,8	23	19,2	57	47,5	8	6,7

#### 4. Conclusion Discussion and Suggestions

The participants, in general, believe that in-service training programs are effective. The majority of the participants argue “that in-service training supports the development of the education system, that in-service training programs have a purpose, in-service training increases teachers' professional knowledge and skills, that in-service training practices are effective for providing beginning teachers to adapt to their profession, and that in-service training encourages teachers to develop themselves”. On the other hand, half of the teachers argue that “in-service training meets the training needs of teachers, gives information about the importance of teacher parent communication, and prepares teachers for an upper task”.

The expressions which the teachers reported at the highest level for presenting their opinion related to the effect of in-service training programs on teaching-learning process are respectively as follows:

1- “In-service training provides beginning teachers to adapt to the profession.” It is stated for this item that %10,0 of the teachers are strongly agree, %62,5 of them are agree, %14,2 of them are undecided, %10,8 of them are disagree and %2,5 of them are strongly disagree.

2- “In-service training supports the development of education system.” It is stated for this item that %7,5 of the teachers are strongly agree, %64,2 of them are agree, %15,0 of them are undecided, %14 of them are disagree and %1,7 of them are strongly disagree.

3- “In-service training encourages teachers to improve themselves.” It is stated for this item that %6,7 of the teachers are strongly agree, %62,5 of them are agree, %14,2 of them are undecided, %14,2 of them are disagree and %2,5 of them are strongly disagree.

4- “In-service training programs do not have any purpose.” It is stated for this item that %4,2 of the teachers are strongly agree, %12,2 of them are agree, %13,3 of them are undecided, %58,3 of them are disagree and %11,7 of them are strongly disagree.

5- “In-service training means showing off and giving the impression about doing something to upper levels.” It is stated for this item that %4,2 of the teachers are strongly agree, %24,2 of them are agree, %19,2 of them are undecided, %40,0 of them are disagree and %12,5 of them are strongly disagree.

6- “In-service training gives the opportunity to capitalize for the acquaintances and to take vacation in resorts.” It is stated for this item that %4,2 of the teachers are strongly agree, %20,0 of them are agree, %19,2 of them are undecided, %40,0 of them are disagree and %6,7 of them are strongly disagree.

7- “In-service training meets the training needs of teachers.” It is stated for this item that %9,2 of the teachers are strongly agree, %28,3 of them are agree, %27,5 of them are undecided, %31,7 of them are disagree and %3,3 of them are strongly disagree.

8- “In-service training gives information about the importance of teacher-parent communication.” It is stated for this item that %5,0 of the teachers are strongly agree, %45,0 of them are agree, %20,08 of them are undecided, %25,0 of them are disagree and %4,2 of them are strongly disagree.

The research findings of Dogan (2009) support these results. In the study, the teachers gave the highest score to “In-service training increases teachers' professional knowledge and skills” item while they gave the lowest score to “In-service training programs do not have any purpose”. These results are also consistent with the research results of Demirtaş (2008), Uçar&İpek (2006), Aytaç (2000). In these studies, the majority of the teachers stated that in-service programs are useful but there are some deficiencies in the programs.

In accordance with the results of this study, it can be suggested that:

- 1- In-service training activities should be planned by identifying teachers' training needs, desires and expectations.
- 2- In-service training practices should be carried out by qualified experts and academicians.
- 3- Teachers should be believed the professional and individual benefits of in-service training.
- 4- Some researches discussing teachers' expectations from in-service trainings and their results should be done.

# Teaching “principles of Atatürk and history of revolution” class at the universities

Şefika ÖZMEN

Selcuk University Ilgın Vocational School, Konya, 42600, Turkey

---

## Abstract

History is a discipline, which enables to make healthy predictions related to the future and to produce correct policies within the process of the time, by means of questioning the past. Every society examines the facts and events within its own knowledge, skills, conditions, and capabilities as well as tries to give direction to the future by taking lesson from all those experiences. From this point of view, ‘History of Revolution’ class is far from being just a static history class confining itself to narration of the past. At the same time, it is a dynamic, sociality-increasing culture class, lighting the things that happened in near history by evaluating them within the known special conditions of the country and thus showing how to use that knowledge for correct decision-making process for the future. Hence, this study deals with teaching ‘Principles of Atatürk and History of Revolution’ class at the universities with an effort to find answers to the questions of ‘when this class was started to be thought at the universities?’ and ‘what kind of a progress did it show within the time?’ Firstly, the reasons for the emergence of such a class and the opinions related to the History of Revolution at one-party period was explained and then the studies regarding the formation of History of Revolution programs within the periphery of Turkish-Islamic synthesis were presented, by using descriptive scanning method.

## 1. Emergence of ‘The Principles of Atatürk and History of Revolution’ Classes

History rooted from VHR in Hebrew, means ‘to narrate, to transfer, and to tell’. In Western languages it means a discipline ‘historia’ that describes true life past and is based on true life past. In addition to its lexical meaning, many descriptions have been attributed to history. In two of these descriptions, history has found meaning. The first one describes history as a science which is based on human and social events and the second one describes history as a science based on past. No matter how it is described, the mission of the history as a science is to research past and also transfer this to the people of today and future. At this point a question is asked “What does teaching and learning history do?”. Learning history helps analyse the past of societies and therefore let people direct and organize their lives based on this experience and by taking lessons. Moreover, it directs nations to live according to their national values and to remain standing in a healthy way. At this point teaching history becomes an important issue (Göç, 2007). In nation states, one of the most appealing ways to procure national culture and national identity has been education of history included in national education. Education of history has been reclaimed as a tool to nationalise history and a political legal source. The reason for history to be used in such practical aims is that it is one of the best ways of nurture and one of the richest treasures to create national conscience. Such duty which is attributed to history to create national identity and conscience has also shaped the education of history. Research of history has an important role in developing cultural policies and societies (Köken, 2004:188).

As the Ottoman Government submitted the appalling conditions of Armistice of Montrose signed on the 30th of October, 1918, at the end of World War I, they could not stop the country from being occupied. In this setting, Mustafa Kemal, who came to Anatolia as an official inspector, started Turkish War of Independence. The main aim of this movement is to found an independent Turkish State that is appropriate for European model over the ruins of Ottoman Empire which demolished at the end of World War I. (Sarıay, 2004: 55). Turkish public struggled to survive in this independence war. After this war was won, foundations of the new Turkish State were laid, with the developing political events Turkish State got through a period of time when reforms took place. It was thought to be important for Turkish public to know this process and understand it (Göç, 2007:10).

After the declaration of Republic, Atatürk rapidly started reforms. As he was bringing these reforms into life, he applied his ideas about history into the process. Studies about history started at early years of Republic, accelerated at the end of 1920s. Atatürk used the history as a moral support to improve the state and modernise it and he acknowledged history as the most reliable tool for Turkish public to gain individuality (Öztaş, 2009:94).

In 1925 Ankara Courthouse Law School was opened to raise people that would pursue reforms. The philosophy of Turkish Revolution was given as a class in the name of "History of Revolution" by Mahmut Esat for the first time in this school. In this respect, lecturers of this school conducted conferences every month which were open to public and including debates. On the other hand, with the decision of council of ministers on the 13th of January 1926, Turkish Revolution history classes took place among the other classes of Faculty of Literature which were accepted by the 6th clause of Ottoman University regulations (Erdaş, 2006:11).

It is observed that the emergence of History of Revolution classes is related to three reasons. First, History of Revolution emerged as a part of science of History since the early years of republic. Second, History of Revolution emerged as a part of citizenship education. Each new regime regulates educational programmes according to their ideals to raise people which adopt its ideals. In Turkey, raising citizens who adopted the ideals of this new regime and making use of history and social disciplines were highly important for the continuity of the regime. The third reason of education of History of Revolution was to form a comparative history of revolution (Kaya, 2008:6).

Turkish Republic has inherited the modernism reservoir and philosophy of Turkism from Ottoman and revised it as 'Westernization despite the West' and accepted it as the starting point of reforms. Although the influence of this philosophy can be observed in political, social and economic reforms, particularly, the foundation of Turkish History Investigation Committee (Turkish Historical Society) which is one of the cultural reforms should be analysed in this context (Şimşek, 2007:12).

IV Congress of Turkish Hearts which gathered on the 23rd of April 1930, took the first steps of founding Turkish Historical Society. In this congress, "Turkish History Committee" which is a part of Turkish Hearts was established in order to investigate Turkish history and civilization. The first meeting of this committee was conducted on the 4th of June 1930 under the presidency of M. Tefik Bıyıkhoğlu. After this date, the committee had eight meetings until the 29th of March 1931 and also Atatürk attended these meetings. Turkish History Committee wrote 605-page "Guidelines of Turkish History" in 1931. Atatürk started history studies to properly define Turkish history and to reveal groundless allegations about Turkish history. After 1930, history studies started to become institutionalised, and first "Turkish History Committee" (1930), then "Turkish History Investigation Committee" (1931) were established. With the help of Turkish History Investigation Committee "Turkish History Thesis" was put forward and it aimed to indoctrinate national consciousness. In order to teach history, "Guidelines of Turkish History" was published (Öztaş, 2007:97-104).

The most determiner effect of Turkish revolution over the literature of Turkish history was the First Turkish History Congress which took place between the 2nd and 11th of July 1932 in Ankara Community Centre and the Turkish History Thesis which was accepted at the end of this congress.

This congress was conducted by official attempt of Ministry of Education and initiative of Mustafa Kemal. The congress started with the speech of Mahmut Bozkurt, Minister of Education in that period, and continued sessions of four main topics and witnessed intense debates. The history thesis which was accepted in the congress had these following aims: 1. Legitimizing the existence of Turkish Republic in Anatolia, 2. Emphasising secularism and in order to keep the new national identity away from religion, researching Pre Islamic Turkish history (Middle Asia), 3. In order to have equal relations with other contemporary and independent nations in the world, defending cultural expansion thesis based on Middle Asia, which would bring Turkish people among those who created the civilization of today's world (Yetim&Erşan, 2008:727).

In 1932 Reşit Galip offered to teach history of Revolution in universities in the honour of 10th Anniversary of the Turkish Republic. This offer took place two years later. The fact that Ottoman University at that time was not coherent with the new regime completely played an important role in such an offer. Therefore, the youth of the university established an Institution of Revolution depending on history department of the new universities and this institution had the aim of engaging in ideals of the republic, adopting the understanding and philosophy of revolution. According to Reşit Galip the first qualification of new universities was their nationalism and reformism. These new universities would treat the ideology of Turkish Revolution. Turkish Revolution Institution which was established for this aim, would investigate the reasons of Turkish revolution in the fields of law, politics, legalisation, society and economics; core elements and principles of Turkish Revolution; future of Turkey in every aspect. Four staff was allocated for the lecturers that would teach the class. The first one was allocated to Yusuf Hikmet Bayur and his assistant Ass. Prof. Enver Ziya Karal to teach political history of Turkish revolution. The second one was allocated to Mahmut Esat Bozkurt and his assistant Ass. Prof. Yavuz Abadan to compare Turkish Revolution with other reforms in the world and to present its judicial aspect. The third one was allocated to Yusuf Kemal Tengirşenk and his assistant Ass. Prof. Ömer Lütfü Barkan to economically analyse reforms. The last one was allocated to Recep Peker and his assistant Ass. Prof. Hıfzı Veldet Velidedeoğlu to evaluate the political life in Turkey in comparison with political parties and political systems in the world (Göç, 2007:13).

The lectures were decided to be given for three months, four times a week and in the afternoon. Senior students of the university and senior students of War Academy, Engineering, Economy and Trading schools took these courses. The classes were compulsory and the students were responsible for "Atatürk's Speech" and "History IV" along with other courses in the exams. As today, foreign students were expected to be successful in courses given by the institution in order to graduate. The aim of this approach is to inform young people who were resigned to pursue Republic about how the secular order which is lead by science was gained and could be maintained ( Erdaş, 2006:14) .

On the other hand, on the 9th of March 1934, a Revolution Chair was established in Ankara Law School. Students from Faculty of Law, High School were enrolled to this course and also audience out of the school were invited and the classes were lectured by lecturers assigned in Istanbul Revolution Institution. Education in this school started through a conference by Prime Minister İsmet İnönü on the 20th of March. İnönü stated that the meaning of the revolution should not only be analysed in political fields but also in social and moral fields. He added that it was the duty of the chair of Revolution history to do so. With the establishment of Revolution Institution and Revolution Chair the first serious researches including Republic period started. In order to define the roots of Turkish revolution Bayur wrote books including the period from 1876 to the end of World War I. These books were: History of Turkish Revolution (1940-1967), External Politics of New Turkish Republic (1935), Atatürk's Life and Masterpiece. These books were the main pieces that aimed to adopt principles of revolution (Erdaş, 2006:15).

From 1934-35 educational year to 1942, Recep Peker, who was teaching History of Revolution in Istanbul University and Ankara Law Faculty, had these topics in his first four classes respectively: The Meaning of Revolution, Revolution of Independence, Reactions of Class Revolution (Çapa 2002:44).

With the 4240 Law dated 15th of April 1942, Ankara University "Institution of History of Turkish Revolution" which was assigned to give classes on "History of Revolution" prepared a curriculum for "History of Turkish Revolution Class". In this class broad evaluations and comparisons were made about the revolutions in world and their places in a conference. Later, this method changed and the emphasis was given on the specificity. This mentioned curriculum consisted of an introduction and four chapters:

Introduction

The Aim of History of Turkish Revolution

- A View on the Collapse Era of Ottoman Empire

Chapter One

- The State of Ottoman Empire at the End of World War I

Chapter Two

- The Period From the Beginning of National Independence to the Establishment of Turkish Grand National Assembly

Chapter Three

- The Period From the Establishment of Turkish Grand National Assembly to the Declaration of Republic

Chapter Four

- Evolvment of Turkish Revolution, Republic Period (Aksoy, 2006:66).

## **2. Teaching History Of Revolution In The Period Of Multi-Party System**

The history policies applied in the period of İnönü, particularly between 1940 and 1946, were discussed by public opinion after 1946 and in this context the historiography and history curriculum of İnönü period were questioned. After 1948, not only one part of the Turkish history but whole of it was analysed. In 1946, transition to multi-party system and democratization made out alternative views of history against humanism centred history policies. Nationalism and Turkish History Thesis which were accepted in the period of İnönü were left and instead antique Greek and Latin (Humanist) culture were accepted. The main goal to develop the country was westernization. To achieve this "Main principles of Western civilizations and Greek and Latin cultures should be known and understood." In the history research in the first years of republic, studies to find out history and culture of Aegean and Anatolia played an important role among Turkish highbrows to have "Humanist" tendencies (Güler, 2013:3).

Views of the single partied Government on History and History of Revolution continued until 1950. When Democrat Party got in charge, western history started to take more place in programmes in order to be more close to western countries. Moreover, as the multi-partied life began, both History programmes and History of Revolution Programmes were shaped in the frame of Turk-Islam synthesis. In addition, as the countries started annihilated their enmity after World War II, studies started to annihilate concepts of enmity in History programmes and books. In the frame of the studies carried by UNESCO, terms and concepts about enmity were removed from history books. On the other hand, words and sentences that humiliated other nations were also removed from the History of Revolution. In 1960s and 1970s, History of Revolution programmes that were included in the curriculum of history continued to shape according to existing political ideas. This period is the one when cultural pluralism was constituted and was based on secular state understanding. The fact that this period was called pluralist proved that the programme was under the influence of politics. Moreover, some of the topics of history were removed from the programme and they were treated as reading passages in the programme. According to 4240 numbered programme published in 1942, the course called "History of Revolution and the Regime of Turkish Republic" changes into "Atatürk's Principles and the History of Revolution" by the law 2547 published on the 6th of November 1981. This new class which was perceived as teaching history of revolution and considered to be separate from History programme since 1930s, officially separated from the discipline of History in 1981. The new programme was in practice in 1982. Also in 1982, Kemalism concept was added at the end of the name of the lesson and the name was changed into Republic of Turkey History of Revolution and Kemalism. After the intervention the programme was constituted by taking the societies Islamic structure and national values around Atatürk's Principles (Kaya, 2008:7).

With the acceptance of Higher education Law no 2547 and according to the constitution, Principles of Atatürk and History of Revolution course was added to the curriculum of all universities beginning from the first class and it was started to be taught

more systematically compared with the past(Yılmaz, 2004:9). In the beginning of 1998-1999 Educational year, in accordance with University senates' law no. 2547, article 5, sub clause "ı" and Board of Higher Education Executive Council decisive dated 19.8.1991 and numbered 91.30.920, History of Revolution classes should be minimum 60 hours for at least 2 semesters(Aksoy, 2006:67).

### 3. Conclusion

In the early years of Turkish Republic, Atatürk and his friends were aware of the fact that education is very important. Among the reforms, special emphasis was given to teaching of history. It is a fact that each state should tell the basic idea to its citizens in order to protect its existence. When we consider the importance of history education in terms of forming the national personality of young generations, it is natural that history education is to be carried out in accordance with the national perspective. For this reason, students had studied national history from primary school to university and they have still been studying. The course of History of the Revolution emerged as a part of history of science and it has been taught since 1932. A Revolution Institute was established depending on the universities' history branch. At this institute, it was decided that students had to attend courses during three months. In the following years, Revolution Chair was opened in Ankara School of Law and therefore, serious researches had started to be done including the republican regime. While the name of the course was History of the Revolution in 1942, it became Principles of Atatürk and History of Revolution. The course was designed again with the decision of the executive committee of Board of Higher Education dated 19.08.1991 and it was decided to be taught at least two semesters.

## Abstract

Art is a language which tries to convey abstract information. The main element of art is the uniqueness of the transmitted message. A Masterpiece is the correct execution of a unique and unrepeatable creative idea. Thus, creativity is the main object of artistic labor, but it goes beyond the objectives of academic education. Artistic creativity is halfway between memory and imagination, how these two elements plays in art creation is the subject of this work.

---

## 1. Art and Creativity

Art is the most complex of human languages; its complexity is not limited to the left hemisphere of the brain. This language means to relate concepts that are apparently disjointed, extract their meanings, assign them emotions and express them synthetically. The message transmitted is extremely complex, generally in the field of sensations and emotions. It has been said a lot that the creative process in the artistic field as a god's inspiration, state of grace or totally unconscious self-absorbed state (Zweig, 2010); but rarely this process relates to the living experiences and the transformation from memory into imagination. This work intends to fill that void.

## 2. The Study of Memory

Philosophically, the study of memory is still dominated by Greek metaphors. Phenomenology of memory stems from the metaphor of the wax block. This metaphor is the basis the icon theory. For Socrates experiences are printed in the human soul as a stamp leaves its imprint on the warm wax. The metaphor of the imprint, however refers to a foreign cause that pushes the object to make their mark. This foreign cause, or movement, in turn implies an internal split of the mental image or a double intentionality.

Then Socrates proposes to imagine the soul as a book. On whose pages, memory, as a scribe who thinks over the sensations, writes truths or lies of a soul that determine the true or falsity of the opinion or speech. Moreover, after this writing a painter sketches on the soul the images corresponding to the things made or intended. These texts and images contrast with the external traces left by past events, which are physical and objective documents of history.

Plato's metaphor of the portrait highlights the problem of the fidelity of the memory. Consider the existence of a printing means to distinguish between the mold that was printed and the imprinted mark. The comparison among them solves the problem of the faithful as opposed to imitation. That is, faithful memory against fantasy.

The idea of the imprint leads directly to the concept of memory trace. Paul Ricœur (2000) distinguishes three types of memory traces: the physical trace, the psychic and the cortical. The physical trace is the external evidence of the passage of time, i.e. the physical document. The psychic trace on the other hand, is the sensation obtained by the experience with thoughts and opinions. Finally, the cortical trace refers to neuronal storage experiences, generally consider as unknown field. These three types of traces make up a triangle that points to the fact that generated the imprint.

However, trace and memory are distinct. Memory, as Aristotle says, belongs to the past, while the trace is what remains to the present by the action of the past. The confusion between trace and memory is the basis of the complex relationship and difference between memory and imagination.

---

<sup>\*</sup> Corresponding author.  
E-mail address: leus@unam.mx

Now, the psychic trace is the cause identified as a present image and feel that we call memory. This memory that Aristotle named “*mnesis*” is perceived as a condition and is ontologically different from the active pursuit or “*anamnesis*” that we identify as a remembrance. The “*mnesis*” is the simple evocation, singular recall; while the *anamnesis* is the effort of remembrance. This intellectual effort involves the schematic interpretation of juxtaposed images where each constitutes a point of remembrance, from which the route on the return to the original trace is profiled.

### 3.The Memory Social Network

Internally, the cortical trace can be identified as a set of neurons and the relations created between them. A system consisting of a set and a relationship defined between the elements of the set are mathematically defined as a network. Clearly, the cerebral cortex has the structure of a network. Moreover, this network is strongly related that contains a huge number of connections. This property gives not only stability but also makes it capable of accepting contradictions.

Mathematically this network implies the properties of a social network (Newman, Barabási, & Watts, 2006). The most direct example of a social network is Internet. Internet as a social network continuously flows information. The flow in a social network continuously alters its structure, adding or strengthening connections. The neural network is continuously traveled by an electrochemical flow. The electrical impulses which flow into the neural network are the psychic trace. Thus, the psychic trace flowing in the brain are thoughts that run through the concepts generated by the experiences. Thus, events or human experiences are stored within this structure as a bounded subset of the neural network remembered by electrical stimulation.

In this order of ideas, related experiences share among them part of their neuronal structure. The storage of new experiences is done relating the information already contained in the network and expanding its structure. In such a way that contact with new experiences change previously stored information and determines to some extent the perception and the same storage.

As mentioned above, the electrical impulses flow continuously in the neural network by changing its structure, i.e. they add relationships or reinforce connections. New relations caused by the continuous flow, which do not have their origin in experiences are pure imagination. One of the functions of the prefrontal region of the cerebral cortex is to control the separation between the experiences and imagination. In other words the psychic trace is the origin of imagination and memory modification. It is here where creative ideas are conceived.

Art is however part of the tangible physical world. The physical expression of ideas is what is philosophically called exegesis and inevitably requires some interpretation. (Ricoeur, 2003) The physical expression of ideas thus defined a hermeneutic problem. Fortunately, and it is not a coincidence, arts education generally focuses precisely in the practice of the correct physical expression i.e. in exegesis. Similarly to what happens in the cerebral cortex, the transformation of the external physical world through the human driving force using the technical elements developed by artistic discipline, leads to the material creation of art. In this external process we can again distinguish the psychic trace generated by the electrochemical impulses that produce the motor functions of the body acting on the physical trace which is the outside world.

### 4.Conclusions

The artistic creation involves the realization of two disjoint processes: the generation of a message to convey and the execution of the work of art. Obviously the transformative element is the psychic trace that we can identify with the intent; but it requires enough information stored in the cerebral cortex to generate creative ideas. This information can only be stored through life experiences or transmitted through human interaction.

Finally, humans are constantly swimming in a sea of data from where senses select information relevant for its own proposes (Meadows, 2001) i.e. the complexity of cortical trace depends on the amount of information that the senses collect from the outside world.

On the other hand, each artistic discipline uses a specific vehicle to communicate feelings and emotions. Thus, art education focuses on teaching the technique necessary for the use of these vehicles. This is what is known as Academy. The proper execution of the work of art is the usual issue of the Art Academy. Then, artistic creation is only possible if there are sufficient psychic elements to be carried out. This includes enough technical practice within some of the artistic disciplines to faithfully express creative ideas.

# Teaching health information science for health care instructors

Pasquale Fiore\*

*Camosun College, Victoria, BC, Canada  
University of Victoria, Victoria, BC, Canada*

---

## Abstract

Health Information science is part of health care. Today the use of technology by health care students is relevant in all parts of their communication. How can we better prepare students wanting to work in health care to face these various technology challenges in health? How can we bring health care students to be competent, ready and comfortable enough to face the health care technology challenges in their specific field?

## Introduction

Bringing content from Health Information Science (HIS) that will provide students with tangible activities is important for future health care professionals and their instructors. Concern has been raised by many educator colleagues about the unsatisfactory, poorly structured emails that students send. This brought me to explore the question: “what are the communication issues that exist in a virtual environment?” Many believe that *students are computer savvy* but these instructors are not satisfied with the performance of these computer savvy students in something as simple as an email. One student stated: “how can you expect students to compose a professional email when we were never taught how to do this?” This was the beginning of my journey to find a solution to this issue. I was thinking: what kind of learning activities would students and instructors would find essential to work through and embed in their practice. Four main activities were developed and suggested to be offered in a third year nursing course. This paper discusses the development of these four activities, how these activities were evaluated by the students, the results and what outcomes were identified for future research. In the latest edition of the activity handbook a link was made between the specific learning activities and the new *Nursing Informatics Entry-To-Practice Competencies for Registered Nurses* developed by the Canadian Association of Schools of Nursing (CASN).

### 1. Objectives

When consulting the document *Competencies in the Context of the Entry-level Registered Nurse Practice in British Columbia* (College of Registered Nurses of British Columbia ((CRNBC)) it is noticed that: “Entry level registered nurses understand the significance of nursing informatics and other information communication technologies. They use existing health and nursing information system to manage nursing and health care data.” These statements guided my selection of activities to be practical for the future health care professional working in the field. Researching the literature, I had the opportunity to read this interesting report: *Educating Tomorrow's Nurses – Where's Nursing Informatics?* This document complimented very well the Doctoral research from Mrs. Sylvie Jetté. Two specific recommendations triggered me to develop four specific activities.

point 2 : *Cibler les ressources internes suivantes dans la formation des infirmières et infirmiers :*

- *La recherche sur les banques de données scientifiques électroniques;*
- *L'évaluation des sites internet en sante;*
- *La sécurité des données électroniques en lien avec les droits des patients*

This second recommendation provided me the energy to share the HIS handbook activity with my coworkers at Camosun College.

In the meantime, the National Expert Commission launch: *A nursing call to action* (Canadian Nurses Association, Vancouver, 2012). This document linked directly the application of the HIS handbook activities, calling educators to focus on: “working collaboratively to reach consensus on the scientific knowledge, education, competencies and skill sets demanded of effective 21<sup>st</sup> century registered nurses”. At the same time CASN launched their competencies and I had developed the activity that was linking all of this. I was invited to implement these activities at the University of Victoria, School of Nursing. The handbook activity was developed with the main goal to provide activities that can help and enhance discussion between the health care instructor and the student. These self-directed activities can be completed prior to come to class and then it provides a great resource foundation for future assignments.

## **2. Health Information Sciences activities**

The four health information sciences activities are:

- confidentiality & access with technology,
- social media,
- email/text communication and
- evaluation of health care web sites.

The first activity provides an opportunity to gain an understanding of how health care students are keeping in mind the ethical considerations when they access, view and interact with data through technology. The second activity focus on social media and how future health care professional can interact, enhance their practice by still keeping their boundaries with a respectful professional behavior. The email/text communication activity provides the student with a greater understanding of the rules, the etiquette and the core elements included in writing a professional email or a text message. The evaluation of health care web sites is the last activity in the HIS handbook. The future health care professional will acquire the skills on how to determine the validity of a health care web site with feeling more confident about searching the credibility, authority and reliability of the information consulted on health care web sites from the World Wide Web.

## **3. Evaluation**

The first year that these activities were implemented, students and nursing instructors provided very positive feedback - through spontaneous oral feedback or the receipt of emails. After reviewing the feedback ideas and suggestions were then included in the activities for the next time the class was offered. The activities were then included as part of a mini 2% assignments activity due in class. The last day of the semester marks were provided to the students and anonymous feedback was sought through a free clicker application (Socrative). Thirty four students out of 40 participated in the survey. Students were asked to compose their own unique identification an answering the following questions to the corresponding Likert scale (Strongly agree, Agree, Undecided, Disagree & Strongly disagree). The last two questions (Q5 & Q6) where open-ended questions for students to answer.

Q.1: Learning how to write a professional email or text communication was a valuable activity for my future RN practice?

Q.2: Learning how to evaluate a health care web site was a valuable activity for my future RN practice?

Q.3: Learning how you can use various social media to enhance your practice and reach more clients was a valuable activity for my future RN practice?

Q.4: Learning the differences between confidentiality, privacy and security was a valuable activity for my future RN practice?

Q.5: Do you have any suggestions that can enhance these 4 main activities?

Q.6: What other topics would you like to see in the next edition of this handbook?

## **4. Results**

Fig. 1 - Evaluation of the four main activities & satisfaction rate of students question 1 to 4.

Question	Strongly agree	%	Agree	%	Undecided	%	Disagree	%	Strongly disagree	%
1	13	38%	18	53%	2	6%	1	3%	0	0%
2	18	53%	13	38%	3	9%	0	0%	0	0%
3	4	12%	22	65%	6	18%	2	5%	0	0%
4	9	26%	18	53%	6	18%	1	3%	0	0%

Fig. 2- Student's suggestions to enhance these four main topics from the HIS handbook activity.

N	Answers :
14	No, None, N/A, the activities were just fine, can't think of anything in particular.
3	Well structured, well lay' d out
3	Make the assignment worth more
5	The assignments were good and relevant to nursing, well done gives me a great resource. The activities were short, simple, and applicable to practice...Without needing to be changed or modified. No suggestions
2	Confidentiality issue should be more expanded to community settings
2	Discussion with the group or group work
3	Discussing them in class a bit. More clarification on Moodle.

Fig.3 – Other topics that students would like to learn in a future HIS handbook.

N	Answers:
26	No, None, not sure,
8	Making/creating professional social media page, paperless hospital, nursing application and resume, using Facebook and Instagram professionally, more practice with professional communication in the work place, how to be professional for a presentation. Teaching regimes to patient, advocacy, policy making in epidemiology.

## 5. Discussions

The analysis of the data collected from questions 1 to 4 in this survey provides information on the various HIS learning activities student's satisfaction rate. The evaluation of a health care web site is the most popular activity with a *strongly agree* satisfaction rate of 53 %. The following activity "how to use various social media" received an *agree* satisfaction rate of 65 %. The two other learning activities received the same *agree* satisfaction rate of 53%.

When compiling the results for question 5 it motivated me to readjust the syllabus for subsequent years' course. The value of the mini activities was increased, at the beginning of the semester students received a written guideline with an explanation for each learning activity, one week before the activity was due activity was validated with students and further clarification was offered. One area identified for future development was a more specific activity on confidentiality when caring for people in community and public health without neglecting the link between the community and the acute care settings.

The last question in the survey provided precious data on what were the topics students would like to learn more about. When reading the data it is fascinating to corroborate information that was recommended by the Doctoral study of Mrs. Sylvie Jetté and this survey. Students identified that they would like to learn more about how to develop a professional presentation with interactive tools and how to understand how to use social media better.

## 6. Conclusion

This project began in the summer of 2012 and since then the embedding of these learning activities into the clinical practice of students and faculty is visible. After consulting with peers (at local, provincial and national levels) and receiving encouragement from students and other UVIC nurse educators, I decided to seek the possibility of having this handbook published on a nursing resource web site. On April 15<sup>th</sup> 2014, I received an email confirmation that NurseONE. from the Canadian Nurses Association has decided to post this content on their new public resources tab. I am looking in the near future to develop a second handbook with four other topics that can be inspiring for the health care community when interacting with health information sciences technology.

## Acknowledgements

In the summer of 2012, Mr. Robert Fraser commissioner from *A nursing call to action* posted this document on his web site (<http://robertfraser.ca>) for the nursing community to share. I was flattered and honored of his acknowledgment, Thank you! I would like to thank the UVIC students and instructors for their supportive feedback. A special thank you to Dr. Lenora Marcellus. Thank you to the kind and wise words of Heather McCue & Jenna Grant nursing students for their specific feedback, I truly appreciate it. Since the last edition this handbook has been translated into French and adapted to the Quebec context by Mrs. Sylvie Jetté under the name: “Enseigner les sciences de l’information dans les soins de santé, manuel de l’enseignant” and presented to RN’s in Quebec on June 11<sup>th</sup> 2013. I was honored of this special request for permission to translate my handbook in another language and be part of the review team, Merci beaucoup Sylvie! The French edition was lately reviewed in 2014 and now available under the name: “*Enseigner les sciences de l’information dans les soins de santé*”. The latest English edition was part of the reviewing process in 2014 and is now available under the name: “*Teaching Health Information Science in Health Care*”. Thank you to my life coach Mrs. Wilma Van Wiltenburg for your work with me. I would like to say a special thanks to the PD funding committee at Camosun College for allowing me to present my SD 2012 project at the *2014 International Conference on New Horizons in Education*, Paris, France

# Teaching in megastore

Michela Mazzucchelli

Department of Architectural Sciences, Polytechnic School, University of Genoa, Stradone Sant'Agostino 37, Genoa 16123, Italy

---

## Abstract

The study investigates the role of drawing teaching of *Master of Science in Product Design and Boat* conducted at the Polytechnic School of the University of Genoa.

In particular, it aims to illustrate the training of the *Laboratory of Design* and sketch for the first year of studies and experiments that for some years has seen the University to collaborate with IKEA multinational company that provides the students their own exhibition spaces and their products to be the subject of study and drawing representation. The teaching of freehand drawing aims to develop the student's understanding of how to represent an object means to know, exploring the dimensional, qualitative, material and chromatic character.

## The Drawing Lab

The training that is offered by the courses to obtain a degree in Product and Nautical Design at the Polytechnic School at the University of Genoa has, as its objective, the training of “project technicians” able to operate with competence in all the execution phases of projects for industrial artifacts.

Upon completion of the course, degree-holders shall, in particular, be in possession of knowledge of a scientific, technologic, and humanistic nature, which is able to back up the diverse project specializations in the various course paths that have been taken. These can be related to “the design of the product”, the “design of its communication/advertising”, and “nautical design”. In particular, as seen in the “Qualifying Training Objectives of

the L-4 Industrial Design Class” it becomes evident how, for the students acquiring this degree – in a transverse manner to the training course path taken – *it is essential to have acquired the ability to visualize the project's idea in the diverse phases of the process: from the research and definition of the problem at the heart of the project, to the processing of the concept, all the way to the technical and working drawings used to put it into production. Therefore, the knowledge and the competences related to languages and artistic, visual, and representative culture, which allow for the elaboration of expressive modes and languages that are adequate to transmit the design idea, are of central importance.*

Consistently with the pursuing of these educational objectives, the Drawing Laboratory is a fundamental course to be taken during the first year of studies. It lasts a year and corresponds to 10 University Training Credits (CFU), which can imply 250 hours of individual study and exercises, on the part of the student, aimed at the learning of the program and therefore the passing of the final exam. The study program at the Laboratory is divided up into a series of ex cathedra lessons, which are followed by graphic exercises of an analogous type carried out by each student on an individual basis.

The professors to allow the student to become aware – in a critical sense – of his own studies route, punctually evaluate these targeted exercises, structured to verify the understanding of the notions acquired. The choice of integrally using analog drawing techniques derived from the necessity of having the student understand that drawing is – above all – an essential tool for understanding, which, in order to be adequately used, requires the knowledge of a very precise method. In the first, place the ability to *observe* is required, and therefore the need to train one's eye in the comprehending of the essential characteristics of any object. Next, one must *reason*, and therefore train the mind to attribute such characteristics to known geometric forms, to then understand which and how many are to be the characterizing signs to be used to transfer the thought onto paper.

This latter act must be born from the training of the hand, which must learn to use the instruments and the supports for drawing, thereby producing efficient signs, because one must even “persuade” in order to carry out correct communication. This instrument of understanding therefore sets the basis for all types of idea processes that the student has, because (...) *the first signs the pencil draws on a sheet are the traces of a thought being born, which the drawing transcribes as the first representative tracts of that which will take form in the mind* (Ruffilli, 2010).

The drawing of a reality today, as the first experience to arrive, therefore, at a drawing of one's own project, tomorrow.

### Analog Drawing as an instrument of knowledge

Fig. 2. (a) Verification of the effect of light on volumes in space (b) Synoptic table composed of orthogonal projections and 3D view. Students: (a) (b) Lamberto Anderloni (c) Beatrice Bianchetti.

The first part of the course tackles the teaching of Drawing from a semantic point of view. The drawing is, in fact, a universal language whose lexicon and whose syntax must be mastered by the student himself with the goal of producing an efficient form of communication. Therefore, the teaching path starts with the need of sensitively improving the student's manual skills, in order to give him greater expressive confidence in his own graphics.

His work must become, in fact, an immediate instrument to translate and communicate in an efficient way, his own design thoughts, be they still tied to the investigation of that which exists, be they the source of inspiration for the creations of new concepts.

Therefore, an illustration is given of the tools to be used (pencils, charcoal, pastels, pens, watercolors) and the supports that can be used for drawing and which are the first graphic exercises to be done to learn how to use these tools. A series of exercises is therefore assigned, to be done by free hand, relating to the graphic development of the background, shadowing, and texturing, based on hatching. These exercises allow the student to evaluate his own manual ability in the use of the above-mentioned instruments and to understand which ones, among these, are most harmonious with his way of expression, and which best reflect his own character. Once greater confidence has been acquired in the use of the "tools for design", the lessons then concentrate on the semantics of design, with the illustration of diverse systems of representation and their respective graphic norms, through a series of seminars on projective geometry. Drawing means to carry out, in fact, a double operation of projection and selection, through which it is possible to transfer the image of a tridimensional object onto a two-dimensional plane. The nature of this projection – cylindrical or conic – allows for the obtaining, respectively, of orthogonal projections, axonometric (isometric) projections, and perspective projections. The graphic exercises related to this part of the program are always those of an analog type, and foresee the use of the instruments stated as follows for technical drawings: rulers, set squares and compasses.

The exercises first of all look at the representation of the fundamental elements of drawing (points, lines, and planes), to later address the representation of plane figures and of solids – and compositions of solids – that are lying on the three fundamental

planes (the horizontal, the vertical, and the lateral) which are perpendicular to each other, as well as to the planes that are generically placed in space. These exercises are educational for the elaboration and resolution of the most complex problems, tied to the representation of the intersection of solids variously placed, whose comprehension and capacity for resolution offer the student the method and the capability to handle, in a later moment, the representation of any type of industrial product.

Having acquired the notions related to geometric drawings, it becomes essential to have the student do exercises in the understanding of the forms of the objects that surround him, to be able – in a process of synthesis – to transform any item into a noted form (plane or solid) and thereby make it easily rendered. Several drawing exercises of real items are therefore proposed, in which the requirement is to redraw design objects using freehand drawing. *The procedure for the carrying out of a drawing from a real item, cannot be shown schematically, as often its implementation is tied to the person who is carrying it out. Generally speaking, we can identify three distinct preparatory levels for the execution of a drawing: seeing, comprehending, and synthesizing. Teaching how to see is not easy, because one must remove a series of psychological conditions and above all be in command of the projection process, which allows for the passing, through an operation of projection and sectioning, of space onto a plane ... The mental process of understanding pushes the perception organs into evaluating the relationships between the various parts which make up the object, to identify its structure and its formal qualities. ... In this phase, we also select those elements, which have a strategic value to identify the object that is to be depicted .... The understanding of the hierarchy of values allows for the passing to real drawing, which is always an operation of synthesis, as it in itself is represented only by a part of the elements, which make up the object.* (Docci, 2002).

Freehand drawing helps develop in the student a comprehension that how to represent means to understand an object, exploring its dimensional, qualitative, material, and chromatic character.

The fundamental passages for the creation of a hatched drawing to induce understanding is, therefore, the reading of the proportions, which underlay the forms and the ability to reproduce such forms passing from a tri-dimensional view to its representation in a two-dimensional plane. The choice of the method for representation to be used will privilege, from time to time, the descriptive aspect of the single components of the object (orthogonal projections), the system of the assembly of these (isometric projections), and the realistic perception of the object in space (perspective projections). *In addition to being an indispensable form of communication, the drawing is - in fact - a tool for comprehension and for ideas ... The drawing allows, first of all, for the understanding of the real nature of an object or a manufactured artifact: the object is disassembled, all its components sectioned, analyzed, studied, and therefore fully understood.* (Cecconello, 2009).

Particular attention is given to the elaboration of synoptic tables composed of orthogonal projections and exploded isometrics and/or broken isometrics. The choice of showing on the same sheet a two-dimensional (orthogonal projection) and the three-dimensional view which are not altered neither in the dimensional relationships nor in the degrees of the angles of the objects that are analyzed (isometric projection), allows in fact students to represent and comprehend the spatial combination of the planes of reference (the horizontal, vertical, and lateral planes) and to better handle, in future, the orientation of the UCS (User Coordinate System, the UCS icon visualizes the orientation of the system of coordinates users of tridimensional space), whenever they will use the program for digital design. Greater skills in handling three-dimensional space and the correct layout of the parts that constitute an object are in fact the necessary condition for the handling of any type of idea process. *Let us remember in fact that in philosophical discussions, where the act of representing happens to coincide with that of knowing and of thinking, the representation – in that it is a conscious act – assumes over time different meanings which – simplifying greatly – end up taking us, on the one hand, to an automatic mode of the internalization of objective data and of their reproduction of signs, and on the other, to a process of international character, creative thought-action tending to the externalization of the idea* (Bistagnino, 2010).

## The Drawing of Material and of Color

To acquire expressive and appropriate ability in the field of the representation of objects, it is not possible to do without the study and the understanding of what graphic techniques are the most efficient in the realistic representation of their material and color components: *... to identify and render in the layout those which are, from an optical point of view, the main qualities of a given material, that is the characteristics which make it recognizable at first sight. To this end the element that must be most kept in consideration is the light-material relationship. Before passing to depiction, it is necessary to understand if the material absorbs or reflects light and the type of chiaroscuro produced* (Verucchi, 1987). The natural evolution of the expertise acquired through the drawing of isometrics and perspectives is, in fact, the ability to redirect drawings in which one takes account – not just in intuitive terms but also with the correct geometrical handling of the forms – of the verification of the effect of light on volumes in space. The second part of the course deals, therefore, with the teaching of the theory of shadows: *Geometrical studies, which allow, once the light source has been set, for the construction through a series of geometrical graphic operations of the movement of the shadows themselves and of those created by a determinate object* (Docci, 2002).

Fig. 3.  
The  
advertising:  
(a) the  
original, (b)  
studies (c)  
photo-  
realistic  
render.  
Student:  
Sofia Aquila.

The practical exercises regard the representation in isometrics and perspectives, first of compositions of regular solids, and then of those of objects which are of a more complex design.

The student trains his own graphic ability, not just seeking to resolve real design exercises, but also by copying some drawings of particular interest: the advertising. This exercise requires the student to reproduce a three-dimensional form, which, however, is represented on a two-dimensional surface thanks to the technique of photography. Therefore, the purpose here is to make a drawing that is defined as photo-realistic by using the representational technique of analog drawing. The instruments proposed are therefore mainly felt pen markers, which offer an ample range of colors and allow for a rapid application adding interesting immediate graphic effects. The felt pen markers, with tips of differing thicknesses, allow in addition for an ever more precise definition of the object depicted. This technique offers notable results when used in drawings with mixed techniques as the marker can be easily enriched, in fact, by the use of additional instruments to depict with more contrast – and therefore with greater efficiency – the zones of light, be it diffused or incidental, semi-darkness, shadow sides, or cast shadows.

The following instruments can be used in this sense: colored pencils, white pencil, colored chalks, white chalk, white ink pens, and felt pens of diverse thicknesses. The drawings requested of the students need therefore to be related to all the themes that are contained in the copying exercise of a graphic communication such as an ad, studying separately its components: drawings (forms and colors), words (lettering), and the corresponding graphic signs (Falcidieno, 2006). In particular, concerning lettering, the typical fonts used must be studied geometrically and reproduced. In addition, evaluation must be done of the possibility of synthesizing these letters with a box of equivalent dimensions. Concerning the graphic signs, they must be positioned correctly in the setting of the composition.

Concerning the background, various tests of the final product must be done with differing techniques in order to evaluate which one is most similar to the original. These range from the use of colored paperboard to the use of an airbrush. The study of the object to be depicted requires obviously a greater number of drawings: the form of the object must be correctly reproduced – translating the photographic image into a perspective view, showing the material of which it is made and its chromatic components, in addition to the all the effects of the interaction of the object with light. Extremely interesting are the cases, for example, of glass objects with metallic components, or the reproduction of textiles and leather characterized by a particular weave.

### **The Workshop in the Megastore**

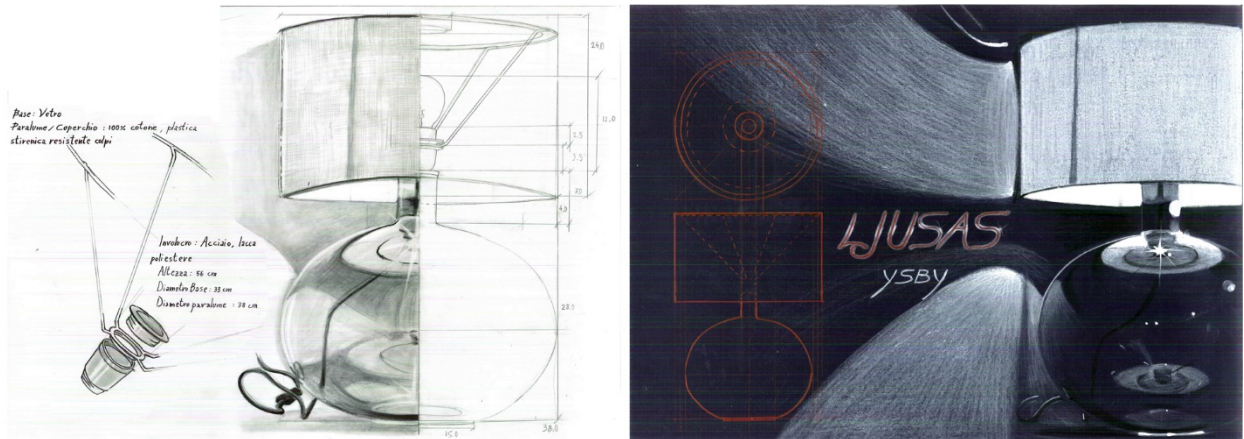

The Drawing Lab also has a final exam, which is the moment to verify the knowledge acquired en route by each student. At the end of the year, therefore, required as a “written exam” is the drawing up of a graphic exercise which contains a sort of synthesis both of what has been transmitted as the study program as of the exercise carried out up till that moment. This drawing exercise is structured as the graphic tale of a design object which is to be communicated, both in a two-dimensional as in a three-dimensional manner, through visual proportions, without the support of setsquares and rulers, but simply by freehand. It is also requested that the perspective depiction be rendered, that is, given the graphic information, which aims to reproduce both the material of which the object in question is composed, as its chromatic components.

Starting from the 2009/2010 academic year, up to this present academic year, and thanks to a Convention Framework that has been stipulated with the Department of Science for Architecture at the University of Genoa, the company called IKEA which has a branch in our city, has placed at the disposal of the Drawing Lab its own exhibition spaces with the purpose of offering the students the possibility to observe, draw, and tell about the objects that it produces. During these five years of work, approximately 800 students have had this experience and, obvious, done an equal amount of drawings.

The final workshop is organized for two days of work, one introductory to the other. On the first day, the students choose a design object of a moderate size to bring to the university hall, and there they make, during a day of study, a drawing of this object, synthesizing on one sheet, which is to be handed in at the end of the day. This is

the preliminary test before they exercise their skills at IKEA. This first exercise allows them to calibrate the time that they have at their disposal in relation to the three drawings required: an orthogonal projection, a freehand rendering on a perspective

depiction, and the reproduction of the lettering of the brand of the company that makes the object that they have chosen. The students have to design the layout of the sheet requested while keeping in mind, in their graphic composition, the general criteria of perception and communication: the existence of an invisible grid of reference and relative alignments, legibility and the evaluation of the different visual weights of each component, and graphic coherence between the drawings proposed. This passage is considered fundamental in the educational program of the lab because ... *the knowledge [of the student] indicates his skills and abilities with respect to the instruments and the contents. These need to serve as the basis of the design of a communication. Such knowledge allows, in fact, for the avoidance of ambiguities, incomprehension, or even errors, because it allows the selecting of the best elements with respect to the final [communicative] end to be reached* (Falcidieno, 2009).

Fig. 4. Workshop at the IKEA: (a) studies; (b) freehand ex-tempore drawing. Student: Giangiacomo Guida.

The corrections and the related notes on this first drawing allow the students to critically evaluate their own work before carrying out the real exercise of the exam, which deals with IKEA products. In preparation for this exam, the students are invited to carry out a site survey at the exhibition space of the company and there they are oriented, in their choice of the object that they will depict, towards interior design accessories of medium size, which are not monolithic, but which can be disassembled, to analyze each single part which makes it up and the consequent assembly system. The key moment at the workshop is the day in which the students are hosted by IKEA and do their written exam by the use of a freehand ex-tempore drawing. The students spread out along IKEA's exhibition route and draw a real object, which is on exhibition, chosen in accordance with their teachers. This type of practical exercise is carried out in a new setting for the student, who is used to drawing in the classroom. A situation of unease is caused by the lack of tables and chairs on which to work, the confusion of the sales environment with its flow of visitors, and the fact that it is impossible to isolate the object that was chosen from its own exhibition context. All the same, and in spite of the problems, the students show (and above all see it themselves) that they have matured during the course of the Lab, acquiring a greater feel for drawing, a greater self-confidence both in the handling of the instruments as in the management of time for the execution of the various depictions along with a new expressive maturity with regards to their own graphics, such that they can overcome these difficulties with new concentration and greater attention.

This is surely a prime result that is very interesting in the course of work studies carried out in the classroom during the months of the Lab. Obviously the most important results are given by the quality of the drawings done during the six hours of work at the workshop and, in particular, the critical ability of the student to choose an object which responds to the requisites requested and the ability to design a layout before starting to draw, and therefore to acquire self-confidence and knowledge with respect to paper space which is at his disposal, and the communicative aspect of the drawing. The graphic maturity acquired in learning the "language" of drawing is therefore verified by the student himself, before even being seen by the professor, for his own ability to methodologically face the problem proposed with the application of the techniques of drawing which are considered to be the most expressive and pertinent to the expression of the material and chromatic characteristics of the object chosen.

This knowledge is the true essence of design: being able to graphically communicate a project in a punctual and efficient way, both with respect to the communication of the existing, as the fruit of an ex novo design. IKEA renews each year with pleasure and enthusiasm this challenge (which is also numerical) of welcoming the students into its own exhibition space, without altering the normal flow of visitors/buyers, and it does this because it has verified the enthusiasm, knowledge and professionalism with which the students face this final test. Moreover, this moment of meeting has generated, in the past and we hope in the future, opportunities for work contacts between the company and the students, offering the most worthy the possibility of an active internship for their professional training.

## Abstract

The demand for experts in the field of information and communication technologies, who in addition to professional knowledge and skills have quality management and economic capabilities, is constantly growing. It is due to the fact that these candidates are not only technically proficient, but are able to respond to the new demand, innovate old markets and gain the interest of customers. The contribution introduced points out the content and methodological aspect for teaching bases of Microeconomics for the students of Informatics. It presents the occurrence of Microeconomic theory in practice and proposal of teaching methods for the practical application of economic knowledge.

## 1.Introduction

The primary objective of universities is the creation of knowledge, as well as their replication, publication and application. The added value of each educational institution in the process of education is determined by not only the number, but mainly the quality of the graduates in the form of their ability to further growth and facilities for practice. The continuous development of information and communication technologies is reflected also in the growth of the number of candidates for study in the fields of Informatics, Computer engineering, and other related information and communication fields. Many young people today, however, come to study with the idea of what they want to be and how much they would like to earn in the future, but without knowledge of what the specific requirements they will be asked for in the future in a given employment or working position. Universities must also adapt the methods and content of teaching to the current requirements of the labour market. Therefore, their primary task is the identification and analysis of the current educational needs, which includes a series of activities, which lead to the definition of the difference between the desired state in the future and the present and the subsequent choice of appropriate educational activities. In doing so, it is necessary to examine not only the needs of a particular company, market, as well as the needs of society and economy as a whole.

The objective of our contribution is, based on the analysis of the current state, to identify the areas of Microeconomics the students of the Department of Informatics can meet with in their future profession and subsequent proposal of teaching methods, how to make this area of Economics the most addressed to them.

## 2.Related work

There are many perspectives and recommendations how to bring economic theory nearer students. The reference literature in this field includes research results f. e. from Gardner, 1991, Walstad & Allgood, 1999, Becker, 1995, Becker & Watts, 1997, Davis& Ereksón, 1998. The results of the experts point out that the students of universities have little economic knowledge, despite the fact that they went through a variety of economic subjects and courses during their study. (Walstad & Allgood, 1999; Gardner, 1991; Allgood, 2001). The cause of the problem, according to experts at the education in the field of Economics, is the reluctance of teachers to apply new and innovative teaching methods. As a result of this approach there may come to failure how to keep the attention of those students who are more technically and philosophically-minded, and decrease in their performance. "Educational activity is successful if it fulfils set learning objectives and expectations of interested subjects" (Rostašová, Čorejová & Chrenková, 2013). Many experts think that the key to understanding economics is first and foremost an understanding of the everyday activities of people.

It is also disputable that, standard outlines of subjects are primarily focused only on teaching economic theory according to the neo-classics and they do not admit teaching about new economic approaches and paradigms, although on the other hand, many agree that the understanding of the main issues of Economics, as they are defined in the neo-classical economics, is essential and necessity for students to their further economic education. Some experts on education in the field of economics emphasize non-

E-mail address: Emese.Tokarcikova@fri.uniza.sk

traditional teaching strategies (Sloman & Mitchell, 2002; Taylor, 2002, Walstad & Saunders, 1998) or even the importance of that outline of the subject contains not only the theoretical foundations but also reflect the recent developments in the economy (Sutcliffe, 2002; Holt & McDaniel, 1998, Williams & Walker, 1993; DeYoung 1993, Volpe, 2002; Buckles, 1998; Noussair & Walker, 1998; Oxoby, 2001). Also, the use of information and communication technologies (ICT) in the process of teaching and learning of Economics is notable and useful (Hobbs & Judge, 1995; Brooksbank et al, 1998; Sosin, 1998; Chalmers & McCausland, 2002; O'Leary & Ramsden, 2002, Elliott, 2003, Frank, 1998). "Effective management of innovation processes (also in field of education ) encourages innovative activities in business and will bring it expected results in the future." (Lendel, & Varmus, 2013).

### 3.Method, data and partial findings

University teaching of Microeconomics can't do without the knowledge of other disciplines, especially Mathematics, as well as without the knowledge of requirements of the practice. When drafting the content of the subject, it is therefore important to know these links and clarify what students of Informatics should know after graduating from this subject. The fundamental questions, which should be clarified include:

- What subjects students have already gone through and what knowledge they have already mastered?
- What economic areas the students of Informatics have the greatest weaknesses?
- What are their strengths and weaknesses?
- What working situation indicates a need for education in Microeconomics?
- What will students know to do better / more efficiently after graduating Microeconomics? (What is to be a value added of subject for IT students?)
- What would happen if they did not have a chance to take Microeconomics?
- How to take interest of students as much as possible? (What educational method to choose in teaching Microeconomics for IT students?)

Since we have been working at the Faculty of Management Science and Informatics for a long time, where we have been providing economic subjects, we have found the answers to these questions using the analysis of the environment in which we operate. Our students of Informatics meet with Microeconomics in the second semester. Students are taking the following compulsory subjects in the first semester:

- Informatics 1 – the objective of the subject is a general introduction to computer programming with an emphasis on object access and algorithmization. Practical application in Java.
- Algebra – focused on basic knowledge of linear algebra on the base of algebraic structures and linear space.
- Mathematics for IT students – the subject is focused on the teaching of Discrete Mathematics.
- The basics of economic theory – students on the subject will obtain the key economic terminology; understand basic relationships, context and principles of the interaction of economic phenomena, processes and subjects in the economic system.
- An introduction to the study - the objective of this subject is to acquaint students with the basic principles of Informatics, legal and ethical aspects of the use of information technologies. Draw attention to the possible risks of abuse on the part of companies and workers and contribute to conscious and sensitive perception and application of the code of ethics in the information and media practice. Teach them how to use PC to search for information on the Internet, make calculations, prepare a document, create and use databases, prepare presentations.

The compulsory subjects are supplemented with optional subjects:

- Practicum of programming, 1, English language 1, German language 1.

We have made an entry testing of knowledge of students from the area of Economics and Mathematics on the subject of Microeconomics in the course of 3 years. The objective of testing was to determine what knowledge they acquired during the previous half-year. Students did not prepare for testing; even teachers did not revise the basic knowledge from the first semester. The correct answers and results from testing were then discussed with the students. A sample of students was made up of an average of 80 students each year (90% men and 10% of women). After comparing the results of the first semester of study, we have identified the following facts from the results of entry testing and subsequent discussions:

- most of the students, despite they passed examination of particular subjects, could not remember the knowledge acquired, build on them, or create connections among them,
- students lacked a deeper understanding of continuous mathematics, i.e. mathematical analysis (e.g. they were able to calculate the derivative of simple linear functions, but did not know what derivative meant and what was its practical application),
- students did not follow the current economic events and used the economic phrase learned, which they knew to identify correctly, but did not realize what is their real use in their future profession,

- despite the amount of teaching material, which is located in the library and on the Internet, students prefer university textbooks of those specific teachers, where they attended the subject.

### 3.1 Characteristics of IT specialist and his roles

IT specialist (computer expert) is a general term for the position where the special information and technological knowledge is used, including the development, deployment, sale and administration of information and communication systems. Many IT specialists find the use in practice as a developer and administrator of a variety of company information systems. Considering this perspective, we have identified the following basic IT roles requiring not only the computer, but also economic knowledge:

- IT business analyst. In this the role, IT specialist of sales connects trade with IT. His basic working activities include:
  - identification, analysis and documentation of requirements of stakeholders at the beginning of IT project,
  - communication with key users and business customers,
  - proposal of architecture, standardization and optimization of software solutions developed,
  - cooperation with the department of development to increase product quality and customer satisfaction of software,
  - analysis and proposal of business effects achieved using ICT,
  - coordination of the deployment and customization of the software, application developed, etc.
  - planning the future development of applications,
  - coordination of the new requirements and the implementation of the requirements for a change.
- IT project manager, provides:
  - formation and coordinating of IT project team,
  - formation of the timetable and budget for IT project,
  - setting priorities in solving and reporting the problems,
  - patch management, optimization of manual operations and proposal of automation,
  - test management,
  - ensuring communication with internal and external partners.
- Sales manager with IT products and services, has the task:
  - search for potential customers and develop the optimal offer on the basis of their requirements,
  - marketing (creation, registration and evaluation of marketing activities), sale and purchase of IT products and services,
  - communication with the media, PR activity, website content management.

The other roles of IT include:

- Information systems developer,
- Information systems and applications manager.

Even though, the basic job description does not require these roles, IT specialist also needs basic economic literacy to improve software quality and customer satisfaction of economic software. In addition, we cannot forget the fact that many of the students of information study intend to start their own business in the future, where it is necessary to understand and be familiar with the economic terminology, relations and context.

## 4. Findings

Human capital is one of a key factor for increasing the productivity of each company. Also “the competence of efficiency utility of knowledge and skills are the basic of the new economy. Firms and society need high competent workers” (Kucharčíková, 2014). At present, graduates of Informatics must demonstrate in the work process, in addition to professional competence, additional knowledge and skills, such as languages, managerial experience, economic literacy, etc. Good knowledge of microeconomic allows them to:

- become a more well-founded manager (or project manager), who can assemble his team, communicate with co-workers, plan the budget of the team, manage and evaluate team members, etc.
- to better understand, e.g. their customers, suppliers or customers, communicate with them more effectively, and where necessary, optimize the selected processes, not only from a technological but also economic point of view. Also to realize that “in time of crisis, the real uncertainty, associated with placement of the product to market are rises” (Kozubíková, 2013).
- 
- in the case of private business, to acquire faster a variety of economic, business and management skills in connection with the setting-up of the company as well as with other activities related to the business (business plan, financial management of the company, making the pricing strategy, accounting, use of marketing tools, managing the logistics processes, etc.). Knowledge of “the relationships between costs, prices, levels of sales and profits are extremely useful for the management”

(Ďurišová, 2011) and other business activities.

- last but not least, regardless of the professional orientation of economic education, to offer useful tools for each individual for decision making and everyday solution of work as well as personal problems.

On the basis of an in-depth analysis of the problems we have come to the conclusion that when teaching Microeconomics for IT students, it is necessary to intervene in the area of:

- **Knowledge**, intellectual skills – explain students basic information using diagrams, algorithms and other educational methods, which are close to them (e.g. understanding of derivatives, bordering quantities).
- **Skills** – strengthen the application of knowledge in the practice (e.g. using concrete examples and demonstration of the existing software applications).
- **Attitudes** – change their opinion, beliefs and thoughts about what will be their future working content, i.e. in addition to the computer knowledge, they will also need economic knowledge. In this respect, we cannot expect an immediate change, but at least we want to start up this change.

On the basis of the above findings, we have decided to identify selected examples from the area of microeconomics and demonstrated them using existing software applications. Students can see concrete assignments and software solutions and better understand that it is not enough to be just a good IT specialist within the meaning of having excellent computer knowledge, but it is necessary to know to sell IT products / services. Since most of IT products / services are demanded for the area of sales, marketing, business processes, banking, public services, it is also necessary for IT specialist to know the "language" of customer. In each of the areas of microeconomic theory, the interconnection of knowledge on their possible future application we recommend the demonstration in the following way:

- **Consumer Preferences and Consumer Choice**

„Continuously increasing competition and technical progress has caused that individual trade businesses begin to direct their efforts towards consumers' wishes and to be aware of their own responsibility for the welfare of society“ (Križanová, Majerová, Klieštík, Majerčák, 2013). Firstly is needed to explain and understand the basic terminology of the consumer theory (indifference analysis, model of rational customer choice, changes and elasticity of the demand and supply curve). Then we can show some sample of software products focused on the detection and evaluation of different:

- individual's preferences depend on different consumption bundles,
- marketing activities (launching and adaptation of product, measurement of the consumer satisfaction),
- business activities (product lifecycle, product sales prognosis, database of clients, interconnection of microeconomic knowledge to CRM systems).

For IT students can be very interesting to see and try some software applications in this field developed for the banks, research agencies and marketing agencies. Students can realise the synergy between their microeconomic knowledge and IT solutions. Students of the study programs of Informatics once will be employed as a project manager or will have your own business, so as a manager “will communicate with potential partners and their employees actively and join them into the cooperation creation” (Vodák, Soviar, Lendel, 2013).

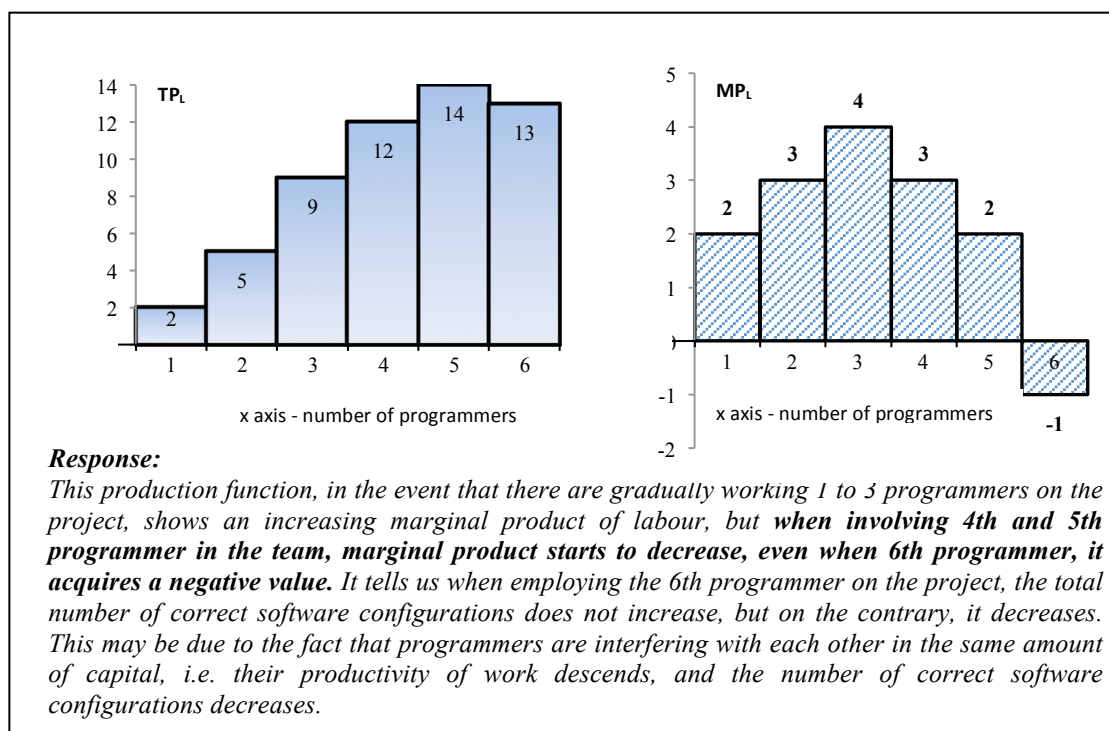

- **The Production Decision**

Existing company information systems and their specific modules enabling to present simply the formation of software products and their improvements will be required from the future IT specialist in practice. Each company information system (CIS) must include monitoring, evaluation, and data connection acquired from the production process on the costs and benefits, the determination of the effective production and maximization of profits, etc. under the terms of CIS, classic microeconomic analyses include the BEA analysis and analysis of "produce or buy". We suggest bolstering teaching of Microeconomics using simple examples that solve "problem" of the area, which IT specialist can meet with in practice, and which is described in the "language" of IT specialists within the assignment. Table no. 1 and Table no. 2 show the concrete sample of such assignment and example of solution.

- Table no.1. Concrete microeconomics assignment and example of solution for IT students

*Example: A computer company performs its activity on the project under permanent capital equipment. When analysing, they found that if it gradually increases the number of programmers on the project from 1 to 6, then the amount of the administrative configuration of the software accepted is hereby changed as follows: 2, 5, 9, 12, 14, 13. Calculate the marginal and average product of labour for this production function. Does this production function have a decreasing marginal product of labour?*

Table no.2. Graphical solution and response of microeconomics assignment

#### Market structures and the state

“In an economy where the offer and the demand meet even more often in the virtual space, it is high time to eliminate the time and space barriers, and to use Internet as a business environment” (Moga, Buhociu, Ionita, Virlanuta, Antohi, Zugravu, 2009). Synergistic with this fact and considering the presentation of the knowledge in these areas of Microeconomics, we suggest inviting experts from different IT companies, who would present what software products and web applications they have developed for:

- international companies managing their business activities in different parts of the world and requiring complex company information systems containing the evaluation of the global and local market position, the creation and evaluation of strategies in oligopolistic industry (on the basis of knowledge of game theory), the creation and evaluation of price discrimination in monopoly industry, etc.
- government and state institutes, which are the sponsor of various governmental and state contracts in all areas of e-Government,
- multinational research and marketing agencies,
- the world agencies and institutions requiring the creation of database of economic data, their processing and evaluation for their activities and decision making. (OECD, Eurostat, ILO, World Bank, etc.)

## 5. Discussion

The effective results of education process depend on the choice of the appropriate educational methods, which represent the path, or way in achieving the educational objectives defined in the teaching process. Biggs (1989, cited in Gibbs, 1992) recommend including four key elements in the teaching to encourage students to adopt a deep approach to their learning:

- Motivating context – increasing the motivation of all available means – positive emotional learning climate. It is like in real business where “creative proactive motivation leads the managers to utilize an individual approach to their employees and use perceptiveness to the needs and expectations of the employees and organisational environment” (Blašková, 2010).
- Active learning in the form of activation teaching methods (heuristic, situation, simulation, staging, didactic games).
- The teaching base a student may apply for a new problem (interconnection of theory and practice – project teaching, autonomous student groups and peer tutoring).
- Discussions (respect of student personality and helping students to develop a well-structured knowledge base).

We can increase the efficiency of results from the introduction of new educational methods using a mix of appropriately complementing methods. These educational methods include:

**Programmed learning** – is an educational method based on management of teaching activities of the students. It is based on the basic formula of S-R (stimulus – response), which takes the form of L-S (learning – strengthening). It uses university available ICT (computers, internet, multimedia). Study material is usually presented as a book or on a computer and processed into the programme according to:

- The principles of small steps – distribution of teaching material for very short follow-up periods, steps (frames), which have three elements: Information, Questions, and Correct solution (key) usually at the end of the text.
- The principle of active response – study material is presented as a question or problematic situation and therefore, it forces student to approach the subject and learning actively.
- The principle of strengthening – student is confronted with the results of his work after each step. In the event that he makes a mistake, he is immediately warned to return to the previous step, analyse the problem again and avoid previous mistakes.
- The principle of own pace – responds the situation, when more skilful students may be detained by weaker students during the educational process, and therefore, there is created space for them to pass using individual pace.

**Educational method of algorithm** – it uses an algorithm involving logical and psychological factors suitable for the use in the educational process. The algorithm is a sequence of finite number of elementary steps toward resolving the given tasks using the apparatus of mathematical logic. This method assumes the correct structural definition of the objectives of teaching and requires a division of the individual creative processes. These processes are appropriately accompanied by specific instructions by the teacher so that they are easily understood by all students. The use of algorithm leads to the solving of the task so that all students perform similar activities and reach the same result. The method of using algorithms rather corresponds with convergent type of tasks, and it is unusable in some cases, since some of the problem tasks require non-algorithmic solution, creativity and alternative approaches. On the other hand, the method of algorithms finds the appropriate application in programme teaching.

**Simulation and game** – are among the activation educational methods. When creating authentic conditions, students are confronted with the real situations of company environment and have the opportunity to practice how to analyse, develop and implement alternatives, formulate own ideas, evaluate the consequences of their decisions without errors when the damage occurred. "In an atmosphere encouraging new initiatives, teams and individuals themselves can compare their current direction and results with the obligations that they have given, regardless of whether they existed in plans or in the form of a continuous dialogue on searching new directions" (Vodák - Kucharčíková, 2011). Playing their roles they may examine the model internal problems, but also problems of interpersonal relations in difficult work situations and obtain socio-economic skills in this context, which are necessary in the development of strategies and subsequent decision making.

**Education using ICT** – “In the time of globalisation, internetisation, social networks, information spreading and new way communication the ability to make something new, creative, efficient and unique is a key factor of success” (Soviar & Vodák, 2009). Thanks to the new technologies, the nature of education and learning is changing. **E-learning** uses modern information and communication technologies as laptops, tablets or smart phones. It is possible to study in online mode by logging in through the web interface or in off-line mode. They include e-learning, using e.g. all-university online system (e.g. Moodle, iTutor, eDoceo, IBM learning), or using domestic but also international web portal of the subject (Coursera, MIT), or using social networks. CBT and WBT represent progressive form of education, which use a combination of traditional educational methods with the use of advanced multimedia technology. „Thanks to new technologies, we have new tools for faster satisfaction of educational needs in spite of our limited cognitive abilities” (Tokarčíková, 2011). Using ICT there is created an interactive educational environment, which provides its users the maximum local, time, personnel and instrumental freedom.

**Blended Learning** is a combination of traditional forms of teaching (face-to-face) and form of online learning (e-learning). Its

effectiveness lies in the fact that students can attend "information" part of the development using the computer, at the time and in an environment they are most comfortable with and they may focus, in particular, on practicing the techniques, acquiring skills and the exchange of experience with consultant and other participants within the traditional learning.

## 6. Conclusion

"The knowledge-oriented world receives more and more attention, which does not limit the development prospects given the immensity of its capabilities." (Litvaj, Poniščiaková, Stančeková, Drbúl, 2013) Economic literacy allows understanding how to effectively manage limited resources and achieve individual, but collective prosperity. It allows understanding it how money has shaped and formed our whole world. A quality university education process aims to master the expertise and enables Informatics graduates easier application in the labour market. Appropriate educational methods and innovation are the key factor in this regard, since it allows students turn information faster on the knowledge in lectures and create a consolidation of theoretical knowledge and practical applications in seminars. Regardless of the professional orientation, economic knowledge and skills are useful in everyday decision making and they help graduates to solve the complex situations occurring either in the workplace, but also in personal life. Since the relationship of students to the subject that are not related to their primary specialization tends to be rather dismissive, the role of the teacher of economic subjects is to choose and apply appropriate educational methods and innovation to bring the students the basic economic connections and their usefulness in practice using more attractive way.

# Teaching migration studies through collaborative learning practices in an intercultural environment.

## The case of the erasmus ip *sono un migrante*

---

### Abstract

Collaborative learning refers to methodologies and environments in which learners engage in a common task where each individual depends on and is accountable to each other. These include both face-to-face conversations, working group and online forums, chat, etc. The aim of this paper is to outline the main features of a project of collaborative learning in an international context: the Erasmus Intensive Programme *Sono un Migrante* to be implemented at the University of Salerno. Funded by the Italian Erasmus LLP Authority, the project involves the participation of students and teachers from 7 different universities of 6 EU countries.

### 1. Introduction

The purpose of this paper is to present the main features of a project still under way at the University of Salerno. The Erasmus Intensive Programme *Sono Un Migrante* was launched in September 2013 and will end in July 2014. It shall involve students and teachers from 7 Universities of 6 EU countries. Tutors and technical staff from our University will also be involved.

In our opinion, the importance of this project lies in its attempt to combine the use of new technologies to promote processes of interaction in the classroom, in order to create a *learning community* that should be able to overcome the language and curricular barriers between the national and institutional contexts of origin. Of course, the project aims to contribute to the social construction of shared knowledge on migrations – what we can call a *civic culture of migration*: with special reference to migrations related to the Mediterranean region –, thus helping participants to develop a broader awareness of the complexity of social processes. It also aims to provide a stronger sense both of European identity and a shared social and educational citizenship.

The article is divided into two sections, each divided into two parts. In the first section we discuss the organizational and technological features of learning processes, with a brief review of the concepts of collaborative learning and collaborative e-learning. In the second one, we refer instead to the purpose and structure of the project.

#### 1.1. Pathways and educational tools to build a learning community

The first step of our journey is to describe the organizational and technological characteristics we focused while developing the *Sono Un Migrante* project. We identified our key references, firstly, in the now extensive and well-established literature on the use of ICT in the educational field and, secondly, in the contribution by Ulf-Daniel Ehlers (2011; 2013) on open and innovative learning resources and practices. Moreover, the wider debate on *collaborative* or *cooperative* learning (Dooly, 2008) was important for the definition of our procedures. We chose *collaborative learning* because, facing the social and political relevance of the migration issue, we felt that students are easily motivated to "take almost full responsibility for working together, building knowledge together, changing and evolving together and of course, improving together" (p. 21). In this section we will refer therefore to the concepts of collaborative learning and collaborative e-learning.

### 1.1.1. On collaborative learning

According to Vygotsky (1978), students can perform at higher intellectual levels in collaborative situations than when working individually. Furthermore, group diversity (within the group, as well as among groups) can contribute positively to the learning process. In this case, students are faced with different interpretations, explanations or answers about what they are studying and this forces them to “re-think” their own viewpoints. The basis of collaborative learning is *constructivism*: knowledge is constructed, and transformed by students. Thus, the learning process must be understood as something a learner does by activating already existent cognitive structures or by constructing new cognitive structures that accommodate new inputs. Learners do not passively receive knowledge from the teacher; teaching becomes a transaction between all the stakeholders in the learning process.

Collaborative Learning (CL) is, therefore, a mode of learning in which students work together in small groups to achieve common goals, trying to help each other in the learning process. The CL is “considered not only a learning theory or a method of teaching, but a theory or a method which helps to identify a set of educational principles that, from a systemic perspective, define how students can learn from each other as they work together in the implementation of task” (Cacciamani, 2008, p. 32).

This method differs, therefore, both from competitive learning and individualistic learning; unlike these, it can be applied to each task, and for each topic of study. It is a mode of learning in a group characterized by a strong positive interdependence among members. In a CL environment, the so-called *social skills* (Gut & Safran, 2002) held by the student become more important because, along with the cognitive and motivational skills, they become the main foundations on which to structure a learning process.

CL is aimed at enabling the students to take almost full responsibility for working together, building knowledge together, changing and evolving together and of course, improving together (Dooley, 2008). Successful collaboration involves, therefore, some agreement on common goals and values: the pooling and spreading of individual skills for the benefit of the group; the autonomy of the learner in choosing who to work with; and flexibility in the organization of groups (Kaye, 1994). This condition is not achieved simply by bringing the students together, or stimulating their cooperation, or asking them to get together in order to produce a final output. Rather, it is the result of the ability to adequately structure the tasks to be assigned to the group, set up the necessary materials for learning and prepare activities in order to educate its members of the social behaviors needed for effective cooperation.

For CL to be effective, there should be both “group goals” and “individual accountability” (Slavin, 1989). This means that the collaborative learning task must ensure that every group member has learnt something. Ideally, a CL task would allow for each member to be responsible for some concept necessary to complete the task. This implies that every group member will learn their assigned concept and will be responsible for explaining/teaching this to other members. Thus, as evidenced by Tessaro (2002), an effective CL practice needs the following basic elements:

- a. *Positive interdependence*. Group members have to rely on each other to achieve the purpose. If someone in the group does not do his/her part, the others suffer the consequences. Students should feel responsible for their own personal learning as well as the learning of other group members;
- b. *Individual responsibility*. All students in a group must be accountable for their part of the work and for what they have learned. Each student should demonstrate personally what he has learned by means of appropriate verifications;
- c. *Face to face interaction*. Although part of the group work may be distributed and carried out individually, it is necessary that the members of the group work interactively, checking the chain of reasoning, the conclusions, the difficulties, and providing a feedback to each other. In this way the teaching staff can receive another advantage: the students peer teaching;
- d. *Appropriate use of collaborative skills*. The students in the group are encouraged and helped to develop confidence in their abilities, such as communication, leadership, the ability to make choices and defend them, conflict management in interpersonal relationships;
- e. *Evaluation of the work*. The members of the group periodically evaluate the effectiveness of their work and the functioning of the group, and identify the changes needed to improve efficiency.

The social benefits of education based on CL have been shown by some studies (Cacciamani, 2008) which show the following advantages:

- *Better student performance*: all students work longer on the task and with better results, improving the intrinsic motivation and developing greater capacity for reasoning and critical thinking;
- *More positive student relationships*: the students become aware of the importance of the contribution of each of them to the common work, and therefore develop mutual respect and team spirit;
- *Improved psychological well-being*: the students develop a greater sense of self-efficacy and self-esteem, coping better with the difficulties and stress.

### 1.2 On collaborative e-learning

Training needs and learning objectives guide the choice of the appropriate technological system for a given context (Arcangeli & Diana, 2009). For example, the presence of a high number of students and objectives aimed at the transfer of well codified

knowledge suggests learning patterns near the base of the pyramid shown in Fig. 1. If, however, the educational goal is the acquisition of problem solving skills, models and technologies that also ensure a good level of interpersonal communication can be useful. Finally, if you want to develop the ability to work in a team and the ability to build new knowledge, sharing their own experience with that of others, the most useful technologies will be those aimed at cooperation (Trentin, 1999).

Fig. 1. Pyramid: approaches in e-learning

Therefore, there are three models of e-learning that can be chosen within integrated training courses (Midoro, 2002; Banzato, 2003). These differ in two fundamental elements, primarily attributable to the mode of learning and the type of system through which the educational process is realized. The choice of one approach over another is actually determined by the organizational, educational, and technological practices of the different contexts in which the training project takes place.

The taxonomy is divided into three basic classes: *self-paced training*; *assisted training*; and *collaborative training* (Fig. 1). Near the base of the pyramid we can find the network applications supporting processes of self-learning; in a central position, instead, there are the applications in which the network supports assisted learning processes; and, finally, near the top we find the network applications that support collaborative learning processes.

At each level there is a different use of the network and internet services. The more we move away from the base of the pyramid and we build an integrated use of the system of interaction (e-mail, forums, newsgroups), the more we move toward models of aided education, in which assistants such as technical assistants, tutors and teaching staff come into play and interact with participants, aiding them in the use of materials. In aided education, access to the materials is still important, but to a lesser extent in relation to the previous level, because here human communication, although mediated by the computer, assists and enhances the learning process, no longer based exclusively on the study of materials. The more you approach the top of the pyramid, the greater, however, the importance of interpersonal interactions, not only with tutors or teachers, but among the learners.

In the upper layers of the pyramid lie, in fact, systems based on CL and learning communities. Here the most important activities are carried out cooperatively by the participants and the technology is designed to encourage collaboration, while allowing services access to materials and communication. The teaching materials collected in the net are the *common catalog* of this community; the latter uses the network as a support to communicate and cooperate (Harasim, 2000; Midoro, 1998).

In this type of networked education there are three fundamental elements: a pool of *materials* (available on the network and / or sent by mail); *ICT* used by the community as a means to communicate, cooperate, access and produce information and knowledge; a *learning community* consisting of several figures with many functions (educators, students, experts and observers).

As for the *materials*, we can distinguish three types: those relating to the *organization* and *carrying out* of the course; those related to *technology*; those relating to the *content*. The first consist of a course guide, setting out the objectives, content, structure, scheduling and materials. It may also be useful the creation of a website where the learner can find a course guide, a description of the community, links to the learning environment, questionnaires for participants, and anything that can offer a vision of the course. The materials relating to technology refer to the CMC (Computer Mediated Conferencing) used (user of the system, guidance on how to download local software from the network, etc.). The last class includes materials that participants use to study individually and conducting group activities suggested by teachers. It is noteworthy that, in these systems, the materials are a “living body” that changes during the course. Participants can add new materials or produce new ones, so that you have a content enrichment by the students at the end of the course.

Turning now to the ICT technologies in online courses, it is widely recognized that they fulfill four main functions: *communication*; *sharing*; *access to information*; *cooperation*. *Communication* within the virtual community is mainly accomplished using a system of CMC. Sometimes, synchronous modes of communication such as chat or audio conferencing can be used in these systems. The information *shared* by the community may be contained in the documents prepared by the teachers, in printed material, videos or even Web sites. In a CMC environment a “library” area is often open, where all the documents used or produced inside the course are deposited. Furthermore, a systematic *access to information* contained in websites is often provided.

Finally, *cooperation* can take place on two levels: within *local* groups or *virtual* groups. Local groups interact on a face-to-face basis. Collaborative activities involve a sharing of tasks and an explicit intention to “add value”, as opposed to a simple

exchange of information or execution of orders. In this case it is important to distinguish and define the various figures involved in the process of collaborative e-learning. The *virtual community* of an online course usually includes: students; tutors; a technical staff; teachers.

Incorporating network-based learning into the process of collaborative learning can be very beneficial in terms of knowledge and experience: students will be working in a group context and this interaction may bring them to re-formulate some of their ideas (Bruner, 1985). In this kind of educational practice, teachers must help their students learn to interact positively with people who are different from themselves and who may not think the same way they do. Through online or classroom collaboration, students may come to see the importance of taking responsibility for their own learning and feel empowered to do so while learning to respect the opinions and work of their online partners. Of course, a feeling of confidence is a very important factor for ensuring that students will be willing to participate and contribute in online interaction. It may be a good idea to make sure that the learners have some prior experience in small online exchanges before “diving into” a full collaborative project.

## 2. The SUM project

Having described the major features of the educational approach, we turn now to the description of (1) the aims our project intends to achieve, and (2) the main phases in which the project takes place and the tools developed to ensure its effectiveness.

### 2.1. Main goals: Or, what the SUM Project intends to be

Our LLP Intensive Program 2013/2014 *Sono Un Migrante* (SUM), approved by the Erasmus LLP Italian Authority, has a duration of one year. Our course will gather 19 teachers with different skills in the area of social sciences, particularly Economics, History, Sociology, Psychology, Gender Studies, Demography, and 47 students from 7 universities (5 of which are in the public sector and 2 are private) of France, Spain, Romania, Greece, Italy and Cyprus. In addition, 7 persons of the technical staff, and 5 tutors selected among the students of the Advanced Degree in Sociology will take part in the course. The crucial phase of the IP will be carried out from July 7th to 19th, 2014, at the Campus of the University of Salerno, as a project leader.

The more direct goal of the project is to improve knowledge on international migration among students, with respect both to its more general features, and to the specific nature of the most recent phase; moreover, our intent is to explore both the quantitative and the qualitative dimensions of this phenomenon. The IP, then, has the goal to overcome the curricular and linguistic differences among learners in order to promote the spreading of a *civic culture of migration*, seen not as a mere repository of information of various kinds, but as a real internalization of critical knowledge.

As stated, we chose a CL technique in order to obtain these results. We felt that, in our case, the use of a collaborative approach in order to produce socially shared knowledge may not be only related to the technological and organizational features that make it suitable to work in a multicultural context (with the use of English as *lingua franca*). The use of this approach seemed particularly appropriate to us, also considering the relevance of migration for European culture and citizenship today.

In their study courses, European students of Economics, History, Social or Political Sciences and Psychology usually approach contemporary migration processes in a partial way, referring to specific aspects or local contexts. On the contrary, we believe that the complexity of contemporary migrations and the problems they pose in European public and scientific debates need a comprehensive approach (Maddaloni, 2012). The geography of contemporary migrations, in fact, has changed both for the articulation and the overlapping of their routes, and the global character they have assumed since the 80s (Castles & Miller, 2009). Countries of long standing emigration, such as Italy, for example, now become at the same time areas of emigration and immigration. Migration in this sense becomes, as Castles and Miller have shown, a true *total social fact*, which redraws the social, political, economic and cultural landscape of the contemporary world. Migration now not only involves those who migrate, but affects the society as a whole: it is the origin of new social and cultural hybridization that is affecting the identity of the Europeans.

We think, therefore, that the multidisciplinary skills of the teaching staff and the teaching approach we have chosen will be particularly useful in order to allow students a broader understanding of this complex phenomenon, by integrating its historical, economic, demographic and social dimensions with those more specifically psychological or related to gender studies. Furthermore, since the development of a responsible attitude towards migration and cultural pluralism in European societies can easily be seen as a very important aspect in a more general process of European identity building, an indirect goal of our project is to contribute to the spread of a deeper awareness about our *being Europeans*.

Another indirect purpose of the IP is “to expand the cultural competence of educators and other professionals who are increasingly called upon to perform in the global, transnational arena” (Aust, Furman, Quesada, 2008, p. 2), thus increasing their ability to develop networks and communities in the educational field and improving the effectiveness of educational policies in the European context. For the participating teachers, many of which already have specific educational experiences related to migration, participation in the project may mark an important milestone. They will have the opportunity to test themselves in an innovative educational experience on the topic, characterized by international and interdisciplinary dialogue, and learning by

doing. So, they will be able to broaden their professional horizons as teachers and improve their educational practices, becoming promoters of social innovation at both national and European levels

## 2.2. Steps and tools

Let us now turn to examining the stages and tools of the learning process we propose to the participant students. Our project is articulated in two steps inspired by the educational practices presented above. The first phase takes place *in a remote mode*, through the platform dedicated to the project implementation (<http://des-k.it/sum>), in order to allow (1) a greater communication in all its phases, (2) an easier sharing and discussion of documents, and (3) smoother and more transparent monitoring. In particular, at this stage teachers collect and select the materials aimed at the realization of the educational intervention. The materials collected for a first approach to migration focus on biographies, non-standard interviews, songs, movie scenes, documentaries and cartoons. Furthermore, we collected and selected a large amount of statistical material, processed in the form of tables, graphs or maps (Fig. 2), which are useful for constructing scenarios of current international migration.

Fig. 2. SUM Project: geo data

Once collected and sorted, educational materials are made partially available to students, in order to encourage a first socialization to the issue, although again individually. *Moving from individual study to collaborative learning*, there are communication tools within the platform such as forums and chat rooms, through which students not only introduce themselves and socialize, but also have the opportunity to revise the materials provided in a collaborative dimension. This phase has the additional function of socializing the participants to the use of ICT for the construction and sharing of knowledge. By way of example, Figure 3 shows the page of the platform dedicated to forums.

Fig. 3. SUM Project: forum

The second step concerns the *work in the classroom*, that will be implemented on a two-week basis (that is, from July 7<sup>th</sup>, to July 19<sup>th</sup>, 2014). The work will be divided into three stages. The first (days 1-3) will be based mainly on statistical material, and allow students to gain a clear picture of the scale of the phenomenon in the Mediterranean area, the multiplicity of migrant subjectivities, and the diversity of their motives and destinations. The second stage (days 4-9) will be based instead on the use of life stories and other non-standardized documents, in order to bring the student to re-live the experience of specific migrants in different stages of the migration process, stimulating an attitude of greater understanding for the difficulties and obstacles inherent in migration projects in the contexts of departure and arrival. The third and final stage (days 10-12) will be dedicated to the creation of a multimedia communication tool that will show the IP results in order to “export” the students’ experience in the different countries of origin.

CL will be especially crucial in this phase of work in the classroom: the student will be at the center of the educational activity and will perform an active role in the process of social construction of knowledge. Since his/her arrival, each student will be placed in a multicultural working group, coordinated by teachers and supported by tutors. Each group will be asked to produce their own perspective on the topics proposed. Therefore, discussion within the group, as well as comparison and sharing between

groups, will be central in this phase of the educational process. In this regard, it should be noted that the adoption of a collaborative approach, as pointed out by several studies (Sharan, 1980; Comoglio & Cardoso, 1996), can reduce those linguistic problems, which are seen as a major obstacle in the development of transnational educational communities (Aust, Furman, Quesada, 2008). Cooperation among students creates an environment with more opportunities for communication and the possibility of more widespread help from their colleagues. This can also be useful in order to overcome the differences between learning styles embedded in the students' national cultures. We believe that, in our case, CL can be an educational strategy that can both respect the personal characteristics related to a particular cultural identity, and promote the integration of students from different cultural groups.

The role of the teacher, as previously described, while not being traditional is nevertheless of great importance. He/she remains, in fact, an essential point of reference in the selection and organization of materials and a valid support and facilitator in the learning process. This explains the ratio of 1 to 3, which marks the teacher/student relationship in this project.

### 3. Concluding remarks

The international research team that has supported this project aims to use the experience gained in the CL to introduce significant changes in their usual educational contexts. The more general purpose of our IP is to develop communities of practice that focus not only on learning, but on the social construction of knowledge useful to the community in the perspective identified by Scardamalia and Bereiter (Bereiter, 2002; Scardamalia, 2002). Following these authors, we intend to push the stakeholders of educational systems to reconceptualize learning activities and to think of European schools and universities as *learning communities* producing valuable, critical knowledge for their students and for the wider societal context.

This is therefore an example of collaborative learning in a sociological discipline in an intercultural context. In our opinion, the project raises issues of great interest for teaching sociology – and, more generally, social sciences – in a time when the need for the internationalization of university activities is becoming widespread, and the quest for a learning society is becoming more urgent (Kuhn, 2007).

## Abstract

Many researchers and teachers agree that the inclusion of Science, Technology, Engineering, and Math in early education provides a strong motivation and a great improvement in learning speed. Most curricula in primary schools include a number of concepts that cover science and math, but less effort is applied in teaching problem solving, computer science, technology and robotics. The use of robotic systems and the introduction of Robotics as a curricula subject can bring the possibility of transmit to children the basics of technology and to give them other kind of human and organizational values. This work present a new program introduced in an Italian primary school thanks to the collaboration with National Instrument and Università Politecnica delle Marche. The subject of Robotics becomes part of the Primary school curricula for all the five years of formation. The program has allowed the teachers training and a complete way through which children have demonstrated great learning abilities, not only in mere technology but also in collaboration and teamwork.

## 1.Introduction

Many researchers have been investigating the use of robots to support education. Studies have shown that robots can help students develop problem-solving abilities and learn computer programming, mathematics, and science. The educational approach based mainly on developing logic and creativity in new generations since the first stage of education is very promising. To these aims, the use of robotic systems is becoming fundamental if applied since the earlier stage of education. In primary schools, robot programming is fun and therefore represent an excellent tool for both introducing to ICT and helping the development of children's logical and linguistic abilities of children. Robotic teaching experiences have been carried out in Italian schools since 2000-2001, when the first project was proposed. It was called "Building a robot" and its description can be found in [Merlo, 2010]. Moreover, learning robots programming also becomes an opportunity for primary school pupils for developing their linguistic and logical skills, always focusing on pedagogical rather than technological issues. This paper presents an innovative program developed in order to teach robotic basics at the primary school as a curricula subject. The same instruments are used as a multidisciplinary validation and motivation for other subjects (Italian, Mathematics, Science, etc...). Education in Italy is compulsory from 6 to 16 years of age and is divided into five stages: kindergarten (scuola dell'infanzia), primary school (scuola primaria), lower secondary school (scuola secondaria di primo grado or scuola media), upper secondary school (scuola secondaria di secondo grado or scuola superiore) and university (università). The Scuola primaria (primary school), also known as "scuola elementare", is commonly preceded by three years of non-compulsory nursery school (or kindergarten, "asilo"). Scuola elementare lasts five years. Until middle school, the educational curriculum is the same for all pupils: although one can attend a private or state-funded school, the studied subjects are the same. The principal subject are Italian, English, Mathematics, Natural Sciences, History, Geography, Social Studies, Physical Education and Visual and Musical arts.

Until 2004, pupils had to pass an exam to access Scuola secondaria di primo grado (Middle school), during which they had to demonstrate their abilities in composing a short Italian essay, passing a Math test and an oral test regarding all the other subjects. The exam has been abolished, only private primary schools legally recognized maintains this kind of test. In order to introduce Robotics as subject during the Primary school five years, a special program has been introduced. The global five-years schedule is divided into two main blocks: during the first two years pupils are introduced to logics and mechanical feel with remotely

---

E-mail address: l.sorbi@univpm.it

controlled independent machine (using Lego WeDo system); in the last three years childrens are asked to design, build and program their own independent robots, using Lego NXT system.

The LEGO Education WeDo is an easy-to-use robotics platform that introduces young students to hands-on learning through LEGO bricks and the easiest form of graphical programming software that National Instruments has to offer. It is a fun and simple way to get younger students exposed to basic engineering concepts at an early age. The use of LEGO Education WeDo provides a hands-on learning experience that actively engages children's creative thinking, teamwork, and problem-solving skills. LEGO Education WeDo is a hands-on platform that primary school students can use to build simple robotics applications driven by a personal computer with a simplified version of LabVIEW. By combining the intuitive and interactive interface of LEGO Education WeDo software with the physical experience of building models out of LEGO bricks, students can bridge the physical and virtual worlds to provide the ultimate hands-on, minds-on learning experience ([LabVIEW Graphical System Design]). The system has being applied in other countries, proposing their use in primary schools and studying the possible benefits for children education. In [Mayerová, 2012], for example, the author analyzes the first-contact situation in which 3rd grade pupils in primary school encounter LEGO WeDo for the first time. In [Romero, 2012], a pilot study of robotics in primary schools is described, together with motivation of choosing The LEGO WeDo for children activities: the low learning curve of the programming language (visual programming rather than code writing), and the educational content provided with it.

Recent years have seen the development of cooperation between National Instruments, Università Politecnica delle Marche and primary schools to improve the use of new technologies since the first grade of the school. One of them is Primary School Istituto Comprensivo Largo Cocconi.

Both the scientific and educational communities recognize the role of ICT company investment in improving science and engineering education, engaging students with technology, and equipping educators with resources to help them teach fundamental engineering concepts in a fun, hands-on way. Specifically, the National Instruments and Lego provide interactive, real world learning experiences; low-cost and free training opportunities; a strong global mentorship program; technology and funding.

Initiatives such as K12Lab.com for primary and secondary school teachers and the NI courseware portal for university professors feature effective content that educators can use directly or adapt to their learning environments [<http://k12lab.com>]. The K12Lab is a website where teachers can browse and share lesson plans, find inspiration from what others are accomplishing with technology, and get tools and support to help their students connect theory to reality faster. K12Lab users gained access and contributed to a growing library of 86 lesson plans for subject areas such as physics, robotics, and computer science.. The Austin Children's Museum (ACM) creates innovative learning experiences for children that equip and inspire them to be the next generation of creative problem solvers. The ACM program, TechReach, provides students from low-income families with opportunities to gain hands-on science, technology, engineering, and math skills. Working with LEGO MINDSTORMS NXT kits, participants learn the basics of designing, building, and programming robots. The TechReach program addresses a three-fold problem for economically disadvantaged children in Austin: shortage of access to technology, the need to build 21st century skills, and the lack of interest and awareness in a science-related future [9, 10]. Another interesting experience could be found in the Lana Stone, a technology instructor, with the Govalle Primary school team participation on the FIRST LEGO League. National Instruments recently chose to partner with "The Boys & Girls Club", a non-profit organization dedicated to enabling all young people to reach their full potential as productive, caring, and responsible citizens. At the clubs, youth are provided a safe place to learn and grow ongoing relationships with caring adult professionals, life-enhancing programs and character development experiences, as well as hope and opportunity. In the project the LEGO Education WeDo has been used. The kids who attended the workshop ranged in age from 6 to 15 years old. It was clear that they had not been exposed to this type of technology before which made the volunteer's experience particularly rewarding. Many of them had interacted with LEGOs but were extremely excited to make a LEGO robot that moved. One child was surprise at a LEGO alligator that bit his finger through the use of a motion sensor is: "It is always motivating to see the eyes of a child light up when they learn something new." It was also rewarding to watch the proud, glowing faces of the parents who were dragged into the computer lab by their kids who wanted to show off the robots that they had built and programmed [austintexas].

Following what already done in the past form a lot of institutions and the experiences in pedagogical, technological and teaching aspects the here presented project arises from the collaboration among three principal groups of researchers from Università Politecnica delle Marche (UNIVPM), of teachers from Istituto Comprensivo Largo Cocconi and the National Instruments Company for the hardware involved in this work.

The paper will presents the different aspects of the project and the preliminary results. The presentation is organized as follows: Section II describes the objectives and the expected results of the project; Section III explains the instruments and times used to realize this project, while Section IV illustrates the preliminary results, and the conclusions and future developments are illustrated in Section V.

## 2.Objective and expected results

The first and main aim of this project concerns the introduction of Robotics at the Primary school as a normal subject in the curricula besides being proposed as a lateral extra curricula activity to be performed out of official school hours. The projects wants the children to increase their capabilities, teaching them to program a machine and to consider robotics as a normal method of work rather than an exceptional way of operating. With robotics, the students can have a different opportunity for developing their logical ability and their creativity, features at the base of reasoning and critical thought. The first experimental work done in the last five years has covered a complete Primary school cycle; it has been performed with the priority of introducing the subject ROBOTICS as a curriculum component, improving the usual Gantt of the regular Ministry plans with a new teaching theme involved in its Didactic years, weekly Programming and the regular learning evaluation methods.

The presented scholastic program has been divided within the five years of Primary school and the new study program for each Class is proposed in the following.

The main objectives of the project are distributed as follows:

### 1. Class I

- Learning the roboethics concepts with the introduction of the Asimov's literature and the three robotics laws;
- Gaining knowledge of the single mechanical elements through simplified programs of ordering and planning: learning the differences among shapes, materials, colors and functionalities of the elements presented on the market;
- Planning a model using LEGO system through a simplified program;
- Understanding the model verification and validation concepts in the work environment.

### 2. Class II-III

- Acquiring the ability to attribute coherent purpose to a constructed robot;
- Introducing to the concept of ROBOT as a machine that must complete a specific task;
- Studying sensors and actuators through the comparison with human apparatuses;
- Introducing the software programming for the LEGO WeDo system.
- Realizing a simple robot able to interact with the environment.

### 3. Class IV-V

- Acquiring the ability of attributing coherent purpose to a complex constructed robot.
- Acquiring the ability of building a robot in accordance with specific and relative complex purposes.
- Planning a robot for a specific scope of research, that is able to live in a defined environment.
- Introducing software for robot analysis.
- Realizing a technical manual for the final operator in order to explain how to design and realize a robot.

During the quinquennial of the educational training the main objectives are accomplished by mean of different activities.

The activities are scheduled in didactic units, different for each school year and class. Each didactic unit consists in specifics aims and skills developed in activities, increasing and pursuing children competences.

The first activity is aimed firstly at involving the children to collect the changes in the surrounding environment about the technologies development. Secondly, the same activity is focused on the relevance of practical activities, to increase curiosity, fantasy, and logic in the children. The evaluation of the accomplished knowledge is be checked asking children to realize a document filled with images about different robot duties and aims useful for human being.

The second activity concerns of the approach to the Robotics laws, in particular guiding them to analyze the necessity of the three laws and their connection to society laws. The purposes are to educate children to social values and to have respect for others; moreover, it becomes important to underline the necessity of establishing rules that save and increase the well-being of all people. Another aim is to learn technological progress as a positive aspect in life, and to increase collaboration with other subjects giving own contribution to the group. Practically, teachers help children to learn and to apply the three robotics laws working with pictures.

The third activity is aimed at planning and building a robot made of structured and not structured materials, using WeDo for the first two years, NXT for the third and the fourth classes and custom hardware with COTS and LabVIEW for the last year). The objective is to increase logic in the activity of materials discrimination and classification, coherently increase creativity in order to handle different materials, and try to make objects with the use of acquired skills. The children are asked to pass two final tests. The first, where the children have to correctly classify different robot pieces and a second where the children

have to put in order the different parts to make a robot. Other evaluation activities are carried out in groups; each group have to assemble pieces and to build a robot.

The fourth activity concerns the training on how to program with visual development tools (mainly the WeDo and the NXT with an introduction to LabVIEW). The final aim is to give some basics about programming, using a visual framework, which is, therefore, quite simple and intuitive; at the same time, they start discovering the new functionalities made available by a computer. They learn how programming a robot and its specific functions that change according to the abilities the robot itself has to show. Then it is important to stimulate children to think about personalizing the robot program. The skills developed with this work are the comprehension and the execution of deliveries and instructions for understanding and communicating own experiences in clear way, being able to use computer and graphic programs and lastly to attribute purpose to an object. This work is aimed at understanding the single blocks during the elaboration of the program realized. The teacher supports the children when they have difficulties during the software production, or they can be tutored by classmates.

The fifth activity aims at building and programming a robot, according to specific aims: examination of the robot skills, classification of building pieces, robot software production and check of robot work. This project is aimed at getting pupils confident with materials manipulation, stimulating their curiosity, dealing with new challenges. Moreover, it is important to transmit the feeling of group spirit and working together towards a common goal. This activity helps children to understand how to solve a problem or mistakes in their work by finding alternatives, and at the end to understand the necessity of respecting the three laws of robotics in building and programming robots. The final test of this activity wants to verify how the children create the Robot according to the assignment. They are required to produce a text where the process is explained. The above composition can be done individually or collectively.

The last activity involves the elaboration of fantasy texts in which the protagonists are the constructed robots. The aims are: collaborating with classmates, bringing positive contributions to the group, learning to accept other people ideas, to respect differences, understanding the necessity of rules that safeguard the well-being of everybody and finally increasing creativity and fantasy through the production of a coherent text. The enhanced skills are instead to understand and to execute deliveries and instructions, communicating own experiences in clear way, interacting in a conversation through questions and narrating direct experiences, observing and confronting.

These scholastic activities will emphasize the importance of the prefixed objectives for children and it is very important stimulating logic and ability of analysis. The continuous exercise encourages them to stimulate the curiosity in specific cognitive instruments, to reinforce the abilities to attention and concentration and to observe experiments with the use of the scientific method.

### **3.Instruments and times**

The time established for these activities is placed within the “hours for the optional disciplines” established by Ministry in the regular timetable weekly magazine of the curriculum activities. The plan include didactic trips, beginning from second-third class of the primary school, inherent to the programmed activities, in science museums or research institutes, where the pupils will be involved in more specific workshops about mechatronics and robotics.

The hardware and software involved in this project for the children training include five kits of LEGO WeDo® (Fig. 1) for the first and second classes, five Kits LEGO MINDSTORMS® NXT (Fig. 2) in the other classes.

Università Politecnica delle Marche, LEGO Education and National Instruments together provide the framework for learning how to systematically and creatively solve problems. This means understanding key science, technology, engineering and math concepts. The UNIVPM, LEGO Education and NI platform helps teachers with the power of robotics, useful to create learning opportunities for students for developing the skills like creation, problem solving and contribution to a global society.

Fig. 1. Lego WeDo® kit

Fig. 2. LEGO MINDSTORMS® NXT kit

National Instruments and LEGO, sharing a vision of inspiring creativity and innovation in children, have already partnered to develop the next generation of LEGO MINDSTORMS® - programmable robots that are smarter, stronger, and more intuitive. Starting from LabVIEW, graphical system design software used by scientists and engineers, a more user friendly desktop software has been developed which turns any LEGO MINDSTORMS® Education set into a full-feature science and engineering learning station, preparing students for high grade school, university courses and engineering careers where LabVIEW is already used.

LabVIEW for LEGO MINDSTORMS® is the most advanced software environment for programming the NXT. LEGO MINDSTORMS products take maximum advantage of NI's world-class software for their latest hardware innovations, delivering LabVIEW software to applications spanning from kindergarten to rocket science. The WeDo Robotics Construction Set is a set of pieces and mechanical parts that can be used to build robots. The WeDo is designed to teach simpler concepts to slightly younger kids, and it uses many recognizable Lego pieces. The WeDo Software allows programming the robots, controlling its actions, sounds and responses. All the programming is drag-and-drop; just line up programming blocks to tell the robot what to do. The educational training is focused to a specific knowledge of the robotic subject and the base language for programming its functions. The teachers also will gain these specific competences, so they will be modernized on the topic of computer science, industrial and theoretical robotics. Educational developing meetings with the teachers about the construction of activities for the pupils in the class will be scheduled.

#### 4. Preliminary results

Preliminary results are based on activities described in the second Section, carried out in a given period of time. The proposed criteria have been able to teach new concepts to children, to attribute coherent purpose to a constructed robot, and to teach the roboethics with the introduction of the Asimov's three robotics laws. Selected groups of professional operators will have also invited to attend and to take part to intermediate tests and experiments.

The first experimental Robotics subject has been taught in the Istituto Comprensivo Largo Cocconi in Rome – Italy. The primary school teacher Mariantonietta Valzano and the University professor David Scaradozzi developed the experimental

project after their observation about primary pupils. They focused the project on increasing and pursuing logical and creativity, important educational skills in modern school. They succeeded in starting the project four years ago in the mentioned school.

During the project, a responsible role has been assigned to one teacher of the Primary school (Mariantonietta Valzano). Her main role has been the definition of educational objective, the localization of the learning strategies, and the organization of formative activities with the pupils involved. The second person involved in the project is Cinzia Vergine as adviser of didactic activities, with the role of controlling the participation to these learning strategies. She has been responsible of formative activities with the pupils. The third person involved has been David Scaradozzi, as the technical designer supervisor. He has studied and developed the technical instruments and he head the technical training for teachers and pupils.

The team project during this term has collaborated whit Scuola di Robotica di Genova and Mondo Digitale di Roma, attending diffent kind of situations and skills.

Actually, at the middle of the fifth year, the preliminary results concerns:

- Definition of educational objectives;
- Creation of strategies to learn;
- Planning of formative activities with the pupils in classes;
- Planning of the times to release software, hardware and technical training for the teachers.
- Verification and validation of the didactic program
- Technical and computer science training to learn the bases of robotics.

Fig. 3. Children programming with Lego Mindstorm

Fig. 4. Children constructing a simple robot with Lego components

Fig. 5. Children during their trip at University

Improvements registered by teachers are very relevant and have demonstrated the great value of using robotic system in each aspect of teaching. Pupils have been always curious, receiving the single aspects of the training, from the pure robotic construction and programming to the importance of working together, in group, of achieving new skills, and facing new problems. Fig. 3 and 4 show some students directly involved during the practical activities, in particular the visual programming and the mechanical construction of the robots.

The last figure shows students during the planned trip to Università Politecnica delle Marche in May 2014, where they were introduced to the world of administration and learning at University, and they participated to a workshop about the LabVIEW professional framework. Teachers have scheduled to complete training LabVIEW Professional the next school year, giving to students the basis of professional robot programming.

Teachers have stated positive differences in educational results if compared with other classes not involved in the project.

## 5. Conclusion

In September, the fourth year of the pilot project "ROBOTICS IN SCHOOL" has been started in the Institute Comprensivo Largo Cocconi in cooperation with engineers from Università Politecnica delle Marche and National Instruments, who believed in the validity of the training project providing the tools used in these years.

In October 2012 the project received "la medaglia del Presidente della Repubblica", an Italian award recognizing the most innovative project of the year during the Global Junior Challenge competition event.

The project allows children to get awareness of the robotic science and to develop a good knowledge of the technology they are using. Lessons are aligned with the students' curriculum. This project showed a great upgrade in the children education, in particular to develop general skills necessary in their life. The curriculum involves the entire engineer design process from ideation, to construction and implementation. This innovative way of transmitting skills revealed to be useful for all types of academic pursuits. This program helped students to develop the skills that will be necessary to be successful in the 21st century.

## Abstract

The paper is focused on the method of teaching of logistics by using simulation methods. The aim is to describe a new way of teaching by using simulation software with a practical example. The main part of this article consists of a description of an actual application in education including graphic illustrations of work in the simulation software Witness and Captivate. In conclusion, the authors point out the benefits of learning by using simulation software for students of logistics and possibilities of applying their gained knowledge in business practice.

## Introduction

Simulation is a method often used in both business practice and in the educational process, where it is in the form of strategic simulation games beginning to occupy a very important position in the last decade. There are many requirements on graduates applying their first job, the practical experience is often among them. Many students, however, lack practical knowledge.

The universities equip their graduates with very good theoretical background, which is however necessary to be applicable in practice. Simulation allows students to explore patterns of simulated reality in a safe environment and systematically analyze and evaluate the current situation and verify the decisions which should lead to the improvement of the condition.

The aim of this paper is to describe the introduction of a new way of teaching using simulation software Witness and Captivate at the Faculty of Economics, VSB-TU Ostrava and to demonstrate a practical example.

The use of dynamic simulation in education provides students deepening of their knowledge in three broad areas. The first area is the implementation of the acquired theoretical knowledge into specific, in this case the logistic, problem, simulated implementation of the proposed solutions within the given simulation model and finding of consequence of these solutions. Another large area is to improve communication, teamwork and an individual's ability to defend and enforce the proposed procedure within the research team. The last and equally important area is to understand the principle of simulation and an eventual familiarization with the particular simulation program, which can be very useful in practice.

The first part of the paper is dedicated to the theoretical introduction to the basic notions and understanding of the benefits of simulation in the teaching process. The following part contains a brief description of the used software tools. The next part presents the current situation and the proposed application of the new way of teaching. Finally, this paper focuses on the debate regarding the future direction of development of teaching logistics by using simulation.

## Literature review

According to Macurová et al. (2011) the dynamic simulation can be understood as a transfer of real process into the virtual environment where time runs much faster than real time. Thanks to this attribute the simulation can quickly evaluate different variants of the proposed solution of the problem. The principle of the simulation is thus mimic of the behavior of real system using the model in a given time period. It is the only method that enables to describe the behavior of complex systems in dynamic contexts into account all relevant internal links and external influences, and considering the randomness of the ongoing events.

According to Matúšová, Hrušková & Javorová (2011) the simulation model is dynamic model, in which the individual

---

\* Corresponding author. Tel.: +420 596 992 352; fax: 596 110 026.

E-mail address: leo.tvrdon@vsb.cz

essential elements are arranged as in the system which is modeled. Fishwick (1995) defines the computer simulation as a discipline of creation of computer simulation model of an actual or theoretical physical system, converting this model into digital form, simulation, and analysis of the obtained results. Institute for Simulation & Training of University of Central Florida (2013) introduces simulation in a broader perspective as an imitation, abstraction of the real system, while it is a specific application of the model to achieve any result. The methodology of simulation describe for example Lenort & Tvrdon (2010). Number of authors has been dedicated to the issue of simulations and their use in the educational process since the 70s. Neuhauser (1976), Wolfe (1976) or Sims et al.(1976) can be mentioned as examles.

The simulations are now used in the educational system in the large number of fields. These include simulations used in the training of doctors, pharmacists and other health care disciplines, see Burns & Reeves (2013), Kerr et al. (2013), Cant & Cooper (2010) and many others.

At the economic faculties are, of course, used other types of simulations. For the acquisition of management skills and interconnection of knowledge of marketing, management, investment management, accounting, etc. are suitable managerial simulation games, see Peterková (2011), Leemkuil & de Jong (2012) or Zantow et al. (2005).

There are also simulations that help to deepen knowledge in a particular sector. These include simulations used in the preparation of accounting specialists, even these students must be able to deal with unforeseen circumstances within the simulation and develop their ability to appreciate the ambiguous situations (Riley et al., 2013).

The extensive list of benefits of using simulations and the concept of simulation in the learning process, including a comprehensive literature review provides for example Cojocariu (2009). Heuer (2010) also notes that there may be the data from teaching with simulation software used to identify the strengths and weaknesses of students, which can be taken into account when drawing up the curriculum for future years.

## Witness and Captivate

Information about the software tools Witness are taken from company Dynamic Future, s.r.o., (2010). Software Witness is a product of the British company Lanner Group Ltd. This software is used to simulate business processes. It focuses on simulation and optimization of servicing, manufacturing and logistics systems. It allows to test a large number of variants, for a reasonably low cost in a safe environment and selection of the optimal variant.

It is used for business process improvement, process optimization, quality improvement, more efficient use of available resources, etc.

The software can model business work environment and simulate the consequences of each decision, which allows to predict the outcome even more before the implementation of the decision.

Witness software is available in two industry versions. Version Manufacturing Performance Edition is designed for use in logistics and production, Service and Process Performance Edition is aimed at the services.

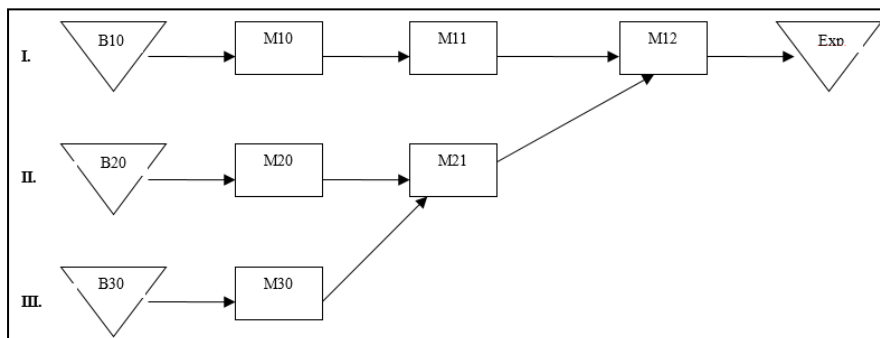

Captivate software (Adobe Captivate) is the output of Adobe Systems Software Ireland Ltd. It is used for creating e-Learning courses. It allows the user to add to the course - presentations – inter alia, YouTube videos, and direct links to Web browsing. It also provides the ability to record audio including the explanation of the topic (Adobe, 2014).

## Description of an actual situation

Logistics has been taught by using simulation software Witness at the Faculty of Economics, VSB – TUO, business administration department already five years. This software is used in the course Logistics C in exercises where students apply theoretical knowledge and use the illustrative model to process the term paper. It involves the use of the investment to increase production when the investigators (students) decide how large sums to invest into particular areas so as to maximize production, increase profits and increase the maximum efficiency of the entire production process.

Students have already created a simple production model in the simulation software Witness, demonstration see Fig.1 and 2.

Fig. 1. Outline of the production model

Key:	I., II., III. ....	Production line
	B <sub>x</sub> ....	Buffers
	M <sub>x</sub> ....	Machines
	Exp ....	Expedition of finished products

The entries are defined by the following parameters:

- input data: price, delivery date, purchase quantity,
- machine (workstation): operating times, intervals and times of adjustment, timing failures and their time repairing,
- finance: costs of production for individual machines, the price of the product, the price of corrections and adjustments,
- investment: the total possible investment, the prices of individual potential improvements (e.g. reduction - operating time machine, time adjustment and repair; increase - interval adjustment and repair, etc.).

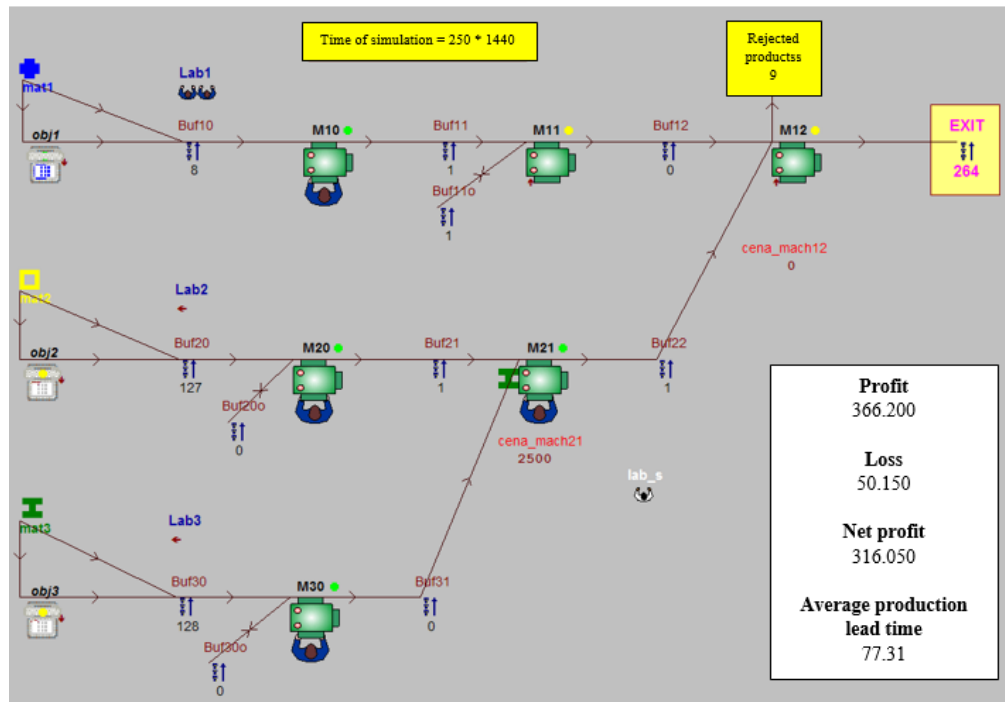

Fig. 2. Printscreen of model created in software Witness

The following parameters are monitored in the created model:

- profit (selling price - production costs - the cost of rejected products),
- loss (costs of non-conforming and non-repairable products),
- rate of use of labour,
- average production lead time,
- average value of capital tied up in work in progress.

The aim is to streamline the working of the entire system using the investment, with a focus on maximum production, minimizing the value of tied up capital, maximizing net profit and shortening production lead time. Furthermore, it is necessary to determine the method of ordering raw materials, including determining the size of purchase quantity.

## New way of education

Students solve a task that was described in the previous chapter, in a pre-made model, because they have no experience with Witness. That is the reason why the project is processed. The aim is the introduction of a new course Simulation in logistics in which the basic skills of building models in the Witness will be also teaching. Students will get familiar with the theoretical foundations of simulation and the simulation software Witness during lectures. At the seminars, a simulation model according to the requirements of term paper will be built, using the Captivate.

Due to the number of students, the capacity of computer classrooms and minimum capacities of teachers who have knowledge of working with Witness, the solution is to use software Captivate. It is the processing of video clips describing practical tasks such as defining components, machines, buffers, variables, etc., including narration, which describes how to work in the simulation program. Samples video clips are in Figure 3 a and b.

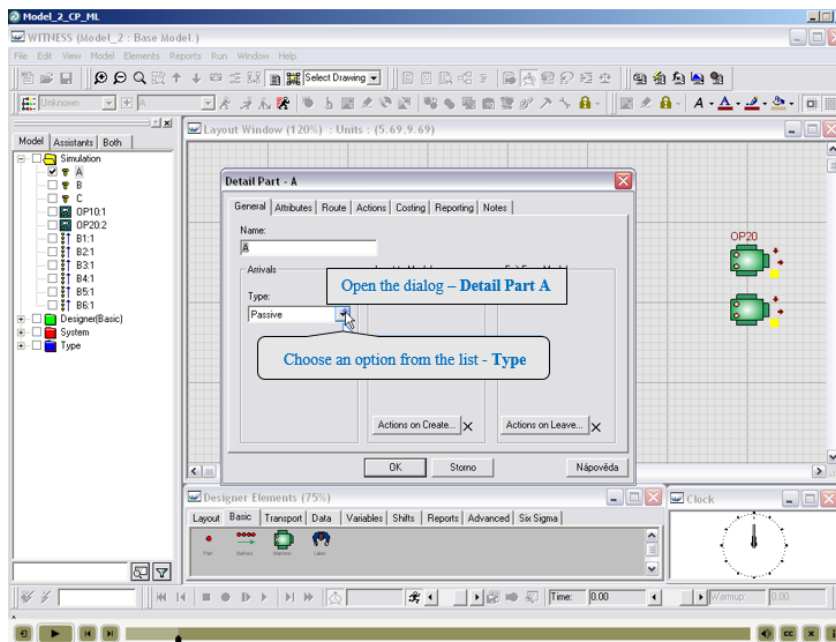

Fig. 3. (a) Samples video clips in Captivate

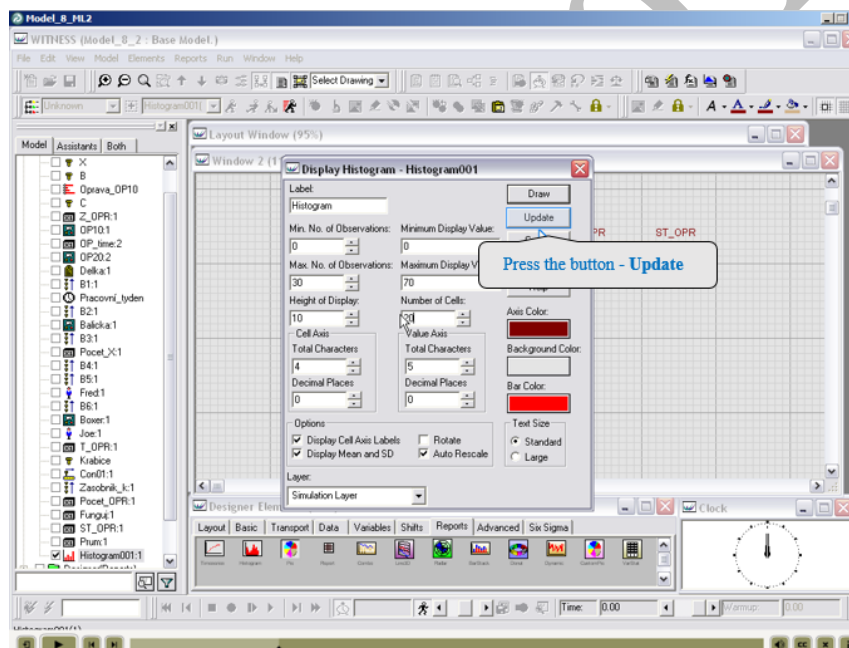

Fig. 3. (b) Samples video clips in Captivate

The benefit of this solution is that it enables interactive teaching program, if necessary, in several classrooms simultaneously. The lecturer in this case does not explain individual acts, but becomes advisor during the difficulties encountered and students can work independently according to the individual skills.

After completion of both these subjects, students will have a basic knowledge of the dynamic simulation and its capabilities, including ideas on how to create models. The aim for graduates of this field is to understand how dynamic simulation can be used in practice.

## Conclusion and discussion

The article outlined a new way of teaching a new planned course Simulation in logistics, which will focus on teaching using simulation software Witness and product Captivate. This course should be included in training at the end of the first year of the master's degree as students in the second year have a subject Logistics C, for which the mastery of the Witness is prerequisite. At the same time, students can use their knowledge they have gained in the courses Logistics A and B, which are included in

bachelor degree.

The given practical example is not the only one we can solve in exercises with student. There can be also created models which relate to the storage, transport, distribution, layout etc. It is also possible to combine several problems to solve during the semester.

The question is, how many data should be used in student's simulations. Complex simulations provide a better idea of simulated reality but they increase the time consumption and solution evaluation. Students must consider the consequences of their decisions, it is necessary to understand the causal connection between elements of the simulated system. The more of these elements, the more difficult the understanding is.

Students within lessons understand the advantages of simulation and its limitations. They should be able to imagine what types of problems can be solved by using simulation and to understand its principles. At the same time they gain knowledge on how to create simulation model, including ideas about what the phase prior to the simulations includes, mainly data collection and validation of the simulation model.

The enterprises' demand for the use of simulations is growing, and it is a big advantage for the students of this course that they understand and are able to use simulations in practice. At the same time, students can use dynamic simulation to solve their thesis.

# Teaching teachers to teach physics to high school learners

Naven Chetty

*School of Chemistry and Physics, University of KwaZulu-Natal, Pietermaritzburg, 3201, South Africa*

---

## Abstract

To address the past inadequacies of high school teacher education in South Africa a course was taught to equip teachers with a basic understanding of Physics. This work discusses measures implemented in this module to increase cohort pass rates from around 40% to over 80%. The measures implemented include Problems Based Learning (PBL), technological learning (TL) and group learning (GL). This increased pass rate has a significant impact on throughput and also a far-wider reaching impact - that of improving the quality of education at high school level. In this work, we also highlight the difficulties faced by the students who are all in full-time employment with language barriers consequent of English being a second language. The methods employed while lecturing this cohort have been adopted by the cohort in their own classrooms with significant results noted. The study employs a mixed modal approach to quantify all data with qualitative responses.

## 1. Introduction

The Apartheid regime in South Africa (1948-1994) resulted in the oppression of non-white citizens and severely curtailed their rights (Allen, 2005; Beck, 2000; Du Pre, 1994; Lacour-Gayet, 1977 & Geldenhuys, 1990). This significantly impacted all aspects of their lives and more especially the educational system suffered severe setbacks (Prew, 2009). The South African educational system, although significantly improved since the fall of apartheid, can best be described as a high-cost low-performance one (Prew, 2009 & Modisaotsile, 2012). It does not compare favorably to other educational systems in Africa or indeed worldwide with other educational systems in countries with a similar developing economies (Prew, 2009 & Modisaotsile, 2012).

Year-on-year the enrolments at high schools increase but yet the exit level Grade 12 output continues to decline quite substantially (Modisaotsile, 2012). In fact the number of learners exiting the schooling system with adequate numeracy in mathematics and physical sciences has been steadily declining since democracy (Modisaotsile, 2012). Further the majority of learners who do pass Grade 12 are unable to access tertiary education at universities as they have failed to meet the minimum entry requirements of these institutions (Prew, 2009 & Modisaotsile, 2012).

The statistics show a far greater problem, that of a 50 % drop-out rate of learners from enrolment in Grade 1 to exiting in Grade 12 (Prew, 2009 & Modisaotsile, 2012). Part of this is a direct consequence of a shortage of teachers, underqualified teachers and poor teacher performance (Prew, 2009 & Modisaotsile, 2012). These issues permeate the classroom environment and result in poor learner performance due to questionable standards of the teachers and lack of learner discipline (Prew, 2009 & Modisaotsile, 2012). Inadequate resources and infrastructure further exacerbate the problem.

Closure of teacher training colleges and low levels of commitment to teacher training provided by higher educational institutions has worsened the crisis in an already dysfunctional educational system. Financial constraints for human capital development, resources and infrastructure development have also hampered the deployment of a quality educational offering by teachers to learners (Prew, 2009 & Modisaotsile, 2012). Prew (2009) suggested that the educational crisis in South Africa is further complicated by the low-erosion rate of teachers.

Being underqualified but holding positions within the educational sector make change for these teachers difficult (Prew, 2009). The problem intensifies when new teachers enter the foray at schools with these seasoned educators. The new recruits are often better qualified and skilled in modern educational methods. They meet vehement opposition from the seasoned teachers at the school and are thus unable to practice their modern teaching methods (Prew, 2009). This causes situations of immense conflict which ultimately results in many new teachers resigning and the rest following the rut of the seasoned educators and thus the cycle of inadequacy continues (Prew, 2009).

After democracy in 1994, a structured plan for educational development (SED) was implemented. This had however not achieved the outcomes it was anticipated to. A very disturbing position considering that 18.5 % of GDP was invested in education (Modisaotsile, 2012). Mji and Makato, 2006, showed the dismal failure of these initiatives to improve the results of learners in the mathematical and physical sciences. Data shows that from early as Grade 6, most teachers have below basic levels

of content knowledge (Spaull, 2013). A high proportion of the teachers were unable to answer content questions aimed at their learners (Spaull, 2013)

In 2004, ten years after the implementation of SED, two major initiatives were launched to replace SED. The first was the teacher developmental framework and the second was the review of teacher education programmes (TESA, 2005). The main thrust of these initiatives were to increase supply and demand of teachers and to improve the attraction of teachers into the profession. Included in this was the re-skilling (or improving qualifications) of teachers already in the system. These initiatives also paved the way for the design and delivery of initial teacher education programmes for the South African context and with the hope of changing the dismal landscape of education in the country (TESA, 2005).

As part of this strategic development of programmes, the University of KwaZulu-Natal's Faculty of Education launched the advanced certificate in education (ACE) to provide a quality teacher education programme for existing educators and those who wished to specialize in a particular subject area. The programme was designed to not only help teachers improve their subject content knowledge but to also gain some management and administration skills to help them develop for progression beyond simply teaching if they so desired.

This work will only focus on the delivery of the Physics component of the ACE programme. Three modules were offered in the Physics component over a two year period. These modules were designed to align with the school syllabus as defined by the educational system at the time (NCS, 2003 & CAPS, 2010) so that the teachers gained sufficient subject content knowledge to effectively deliver lessons at school and thus help improve the skills and knowledge base of the learners. Teachers enrolled in the ACE programme had to pass all three Physics modules in order to graduate. The modules were structured on the distance learning concept and thus were offered part-time, over weekends and during the teachers school term breaks. The details of the module will be discussed in the following sections.

## 2. Research context

### 2.1. Outline of the module structure

The ACE Physics programme was split into three modules which collectively covered the Physics curriculum for learners from Grade 10 – 12. Table 1 lists these modules and enrolments over the research period. The enrolment numbers varied due to the number of centres where the contact sessions were offered. This work focusses entirely on the researchers class and not the other centres offering the same contact sessions. The distance learning concept (O' Lawrence, 2007) of the module dictated that only a minimal number of contact sessions were run. The distance learning method of instruction balances the need for full-time employees to acquire new skills without interrupting their working lives for extended periods of time and the need to reduce the cost of such education (O' Lawrence, 2007). These contact sessions were full-day programmes that ran for at least 8 hours in duration and were spread-out over a typical university semester (3 months) which translated to approximately a session once every three weeks. For the purposes of this study, we will present the results for the PHYSED1A 2010 and 2012 cohorts only.

Table 1. Structure of the ACE Physics programme.

Module Name	Content	No. of contact sessions	No. of students registered in 2010/2011	No. of students registered in 2012/2013
PHYSED1A	Mechanics and Elasticity	7	14	14
PHYSED2A	Electricity and Magnetism	7 (including 1 practical session)	14	11
PHYSED2B	Waves, Light & Sound and Nuclear physics	8 (including 1 practical session)	20	29

The students were provided with a study pack when they registered in the module which highlighted the dates of the contact sessions, the module outline of topics to be covered in each session, the assessment schedule together with the sections to be tested in each section and a comprehensive set of summarized notes. The summaries were based on the prescribed textbook: Physics principles with applications (Giancoli, 2010).

At the first session the teachers were acquainted with the structure of the module and the distance nature was again emphasized. A detailed work plan was then handed out to each teacher which prescribed the work that they would have to accomplish before the start of each of the subsequent contact sessions. They were also made aware that the contact sessions were to be used to cover the more difficult concepts in depth and to focus on problem-solving techniques. This thus implied that they

would need to cover the bulk of the work on their own before the session. The quantity of material that needed to be covered in each session was substantial and thus impossible to cover in detail in a single session.

The assessment was made clear at the start of each module and consisted of three tests approximately a month apart interspersed with written assignments that they could take home and complete either alone or in groups. The idea behind the assignments was again to promote the concept of problem solving techniques.

## *2.2. Research methodology*

The effectiveness of a particular educational approach (in this case the ACE Physics programme) and its teaching effectiveness (as demonstrated by student knowledge of the subject matter and evidenced by performance in the assessments) needs to be determined (Chetty, 2014). The aim of this study was to determine the knowledge gained by the teachers in terms of factual knowledge, conceptual understanding and functional proficiency in physics to effectively teach their respective school classes.

A mixed model (qualitative and quantitative data sets) approach (Tashakkori & Teddlie, 2003, Creswell, 2003) was used in this study to garner information and thus answer the above research question. The quantitative data was obtained from the results of the formal assessments (tests) in the module and the qualitative data resulted from the interviews with the teachers (either individual feedback or group discussions). The research spanned four year duration (2010 – 2013) for two cohorts of teachers. The teachers had all been teaching the subject at high school level for a minimum of 4 years in both cohorts and the mean age of the cohorts was in the upper 30's. Various teaching mechanisms were employed to assist the teachers in understanding the material and thus improve their knowledge base. The assignment, test and exam results were used as measures to gauge the effectiveness of the academic interventions.

## *2.3. Researcher context*

The researcher has a PhD in Physics and had been teaching for many years at University level. The 2010 cohort was the first adult class he had taught since joining the academic fraternity. In a mixed model study such as this one, the researcher plays an integral role in the research despite attempts to remain an impartial observer (Maxwell, 2005, White *et al.*, 1995) and as such the observations and interpretations of the researcher are represented in the qualitative part of the study (Creswell, 2003, Tashakkori & Teddlie, 2003, Maxwell, 2005, White *et al.*, 1995).

## **3. Results and discussion of teaching interventions**

The first contact session in 2010 (the first adult class for the researcher) was pre-planned to follow the following order based on the researcher assumption that since the teachers had already been teaching the subject as part of their duties, they would understand the content (at least the basics):

- 1) Brief discussion of the course and plan for the subsequent sessions (20 mins)
- 2) Discussion of the basics of the section (2 hours)
- 3) Highlighting and emphasizing problem subject material and key points (3 hours)
- 4) Tutorial work and problem solving techniques discussion (2 hours)
- 5) Recap and summary (40 mins)

This did not happen. The class was completely un-prepared and not a single teacher had been through the material requisite as background for the contact session, even though they had been told to go through the material in advance. This highlighted the challenges with distance education for the first time to the researcher. To understand the reasons for the non-compliance with the instruction the following question was posed to the cohort:

*Why did you not complete the assigned reading and tutorial work before the contact session?*

The majority of the class indicated that a lack of time to focus on the material was the main reason for not having attempted the task. Family time and work commitments weighed heavily on the teacher and left little time for study. This is replicate of the study by Kerka (1986) where it was shown that no single factor prevented students in a distance learning programme from completing the work but rather that it was a myriad of life circumstances and individual attitudes that contributed to non-participation.

The teachers also indicated that they were unaware of what was required of them even though they had been through the instructions for contact sessions. Most were unable to dissect what "self-directed learning" required. Norman (1999), Attri (2012)

and Keegan (1996) approached the idea of self-directed learning and highlighted the problems associated with it: to be successful in self-directed learning, the individual needs to be able to assess their weaknesses and to harness their strengths.

Further probing of the class of teachers revealed that while most taught the subject regularly, many had never had any formal training in the subject and relied solely on textbooks for their information. Further many could easily understand and explain applications of the subject matter but had very little understanding of the theory thereof and thus could not understand their weaknesses or strengths. The successful distance learning student needs to have a number of characteristics such as tolerance for ambiguity, a need for autonomy, and an ability to be flexible (Threkeld & Brzoska, 1994). Inman and Kerwin (1999) found that distance learning requires students to be more focused, better time managers, and to be able to work independently and with group members, traits that many of the cohort had not encountered before.

Attri (2012) suggests that the development of the study guides must reflect the distance nature of the module. He also suggests that since materials are prepared for all the teachers in the modules, rural and urban teachers would dissect these differently. In the ACE Physics programme this was not considered an issue since the summaries had been designed to be of a distance nature and to encourage self-directed learning. At a particular level we have to attain similar learning experiences so the actual content for all teachers was the same but examples, activities and experiments were included in learning material according to their needs, learning experiences and expectations (Attri, 2012).

The course summaries included a large selection of question and answers for the teachers to gain experience with, the questions were arranged to test the basic assumptions (single concepts) and then to progressively get more difficult and to test multiple concepts. To assist the students to understand the requisite of the module, the researcher proceeded to explain to students the nature of self-directed learning and the need for completion of reading beforehand. Further to assist the teachers, the researcher allowed contact session venues to be open two hours earlier than start time to allow students to do some work before the session began. The students were then taught how to use the summaries and subsequent questions. The links with the textbook was emphasised. Teachers requested solutions to the problems to aid their studying and these were also provided.

The teachers were then assigned to groups based on their work and/or living proximity to each other to encourage group learning and peer motivation (Attri, 2012). They were also provided with email, telephone and facsimile details of the researcher to encourage communication with the researcher other than just during contact sessions (Attri, 2012). The students were asked to provide an email and/or cellphone number for the lecturer to provide feedback and to facilitate regular communication between the teacher and researcher. The researcher would after the first session send out emails or text messages to students on a weekly basis to remind them of the material they should have covered so far and the material still to cover. It would also remind them of upcoming deadlines and impending tests. The students were given an assignment to complete based on the work they had been expected to cover before the next contact session.

The second contact session for the 2010 cohort was in sharp contrast to the initial one, more than 75% of the class admitted to having managed to complete a significant portion of the material (>50% of content and tutorial questions completed). This was evidenced by the students submission of their attempts at the questions. The second contact session also heralded in the first test. The test was written at the start of the session. Figure 1 shows the results for the first test and assignment.

Fig. 1. First test and assignment results for the 2010 PHYSED1A module

It is very interesting to note that the students outperformed in the assignment than the test. The average mark for the assignment was 78% while the test average was just 38%. Quite shocking results considering that the test questions were based largely on concepts covered in the assignment and in a small percentage (<10 %) the questions in the test and assignment were repeated with mere numeral changes. Dissecting this further Figure 2 shows the assignment results plotted for all the students.

Fig. 2. First assignment results for the 2010 PHYSED1A module

It shows that for many students the marks were similar and with quite a few students having the same mark. It was determined further that the bulk of students with similar or exact marks for the assignment were in the same study groups. When the teachers' were questioned on this they indicated that they had all worked together and thus had similar solutions (or the same solutions). Clearly this highlighted a further problem in that students working in groups were reliant on the group for assistance with solving problems but had not mastered the technique and theoretical basis to do so on their own and without study materials. To remedy this the teachers were advised that although they could work in groups, they would need to submit their own work or face punishments for plagiarism and copying. Beaman (1998) highlighted assessment as one arm of deterrents to adult distance education. She indicated the need for assessments to be meaningful to the students and their lives otherwise they felt it irrelevant and subsequently performed poorly.

The teachers were then questioned on their poor performance in the test through either individual interviews or group sessions to determine if Beaman's (1998) comments had merit here. Their responses to various questions are detailed below.

*What factor/s affected your performance in the test?*

*a) Time*

Most of the students (>78%) of the class indicated that they found the time restrictions quite disturbing. They worked on the assignment at leisure and thus were ill prepared for the test conditions and fixed duration for the completion of the test. They spent disproportionate amount of time on long and short questions and in most cases did not finish the last question of the test. It was also noted that the students were unaware of how to relate the marks allocated to a question to a corresponding time allocation per question. Chetty (2014) showed that a similar problem arose with first year university students. There seems to be a trend for assessments not to be rigidly adherent on time in the school system.

**Solution:** The teachers were coached on time management for tests and exams. The students were provided with a clock in the classroom so that they always had a time reference. All examples were timed so that the students were aware of the time allocation to questions and the relevance of the mark allocation to the overall time allocation. All assessments set were time allocated so as to facilitate time management even outside the classroom. This was heavily based on the students self-directed learning outside the contact session but they had been provided with the tool to make time management possible. Chetty (2014) considered measures such as these and found them to be highly successful.

*b) Language*

A large fraction of the class (>82%) found the language used in the assessment not clear. Being second language English speakers (the language used in the module was English) the teachers found the language used in the tests confusing, difficult and hard to interpret. Chetty (2014) found such problem permeate the scientific world and should not be construed as barriers to education.

**Solution:** The students were coached on the language and grammar of test questions. Phrases such as “define”, “explain”, “justify” and “derive” were explained and further demonstrated in the contact sessions. The use of non-traditional words (as used in the textbook) in example questions, such as elevator and ferris wheel were replaced with South African equivalents such as lift and big-wheel. Questions were simplified so as to minimize the complications of language from hampering question solving (Chetty, 2014). In the technological ambit, the teachers were introduced to the use of online dictionary sources and mobile google via their cellphone web browsers. Valk, Rashid and Elder (2010) have emphasized the important role cellphones (mobile phones) play in improving educational outcomes.

The enhanced searching capabilities of search engines was also explained, demonstrated and used extensively during contact sessions to help students use this important tool in their own self-directed learning. For example, during a contact session, the researcher would ask students to find the value of a constant such as the speed of sound by using their cellphones, or to search for the meaning of a word that may be problematic to the teacher. Many of the teachers indicated that they had subsequently introduced the use of mobile internet into their own classrooms. In South African schools are under-resourced and internet and computers are non-standard in most school whereas most learners at schools own a wap enabled cellphone making such use common and practical.

*c) Visual tangibility*

Students cited the lack of demonstration of concepts impeded their understanding of the concept. Most were learners who preferred experiential learning as opposed to just textbook knowledge. O’Neil, Singh and Donohue (2004) showed the benefits of introducing e-learning programmes for higher education. Tarbin and Trevitt (2001) showed the success of online e-learning which made online learning a means of providing tangible visualization for the students.

**Solution:** PhET (PhET, 2014) simulation links were given to the students for their viewing in their self-study time. During contact sessions the researcher would introduce the students to the online learning possibilities such as PhET and leave them to further explore outside of the formal contact session. The MIT (MIT, 2014) open courseware site was also provided to the teachers, although the previous language barrier was highlighted and the students were asked to use with caution. The UC Berkley Physics (UC Berkley, 2014) demonstration site was also recommended.

*d) Not having seen the questions before*

Many of the students reported that they found the test difficult as they had not seen the questions before and thus the time constraint coupled with the unseen questions cost them marks.

**Solution:** The students were then made aware of the similarity of the test questions to the assignment questions. This again highlighted the problem that students completed the assignment in groups without really paying attention to the questions and thus they were unable to correlate the test questions to previous assignment questions and thus demystify the test questions. The students were then coached on the importance on the assignments and the need to answer them individually as well as to understand the principles, method and concepts of the assignment, class examples and tutorial questions.

*e) Test run at the start of the contact session*

The students believed that the test being administered at the start of the contact session disadvantaged them, they complained that there was no time to cover questions that they may have had regarding the material as well as for complicated theory or applications to be explained.

**Solution:** The test was moved to 2 hours after the start of the contact session. This allowed the students to ask questions and complete some revision before writing the test.

The problems faced by the students indicated the need for an educational reform to take place in the classroom. This reform was the introduction of Problem-Based Learning (PBL). PBL is a student-centered pedagogy in which students learn about a subject through the experience of problem solving (Hmelo-Silver, 2004). Students learn both thinking strategies and domain knowledge (Hmelo-Silver, 2004). The PBL format originated from the medical school of thought, and is now used in other schools of thought too. The goals of PBL are to help the students develop flexible knowledge, effective problem solving skills, self-directed learning, effective collaboration skills and intrinsic motivation (Hmelo-Silver, 2004).

In problem-based learning (PBL) courses, students work with classmates to solve complex and authentic problems that help develop content knowledge as well as problem-solving, reasoning, communication, and self-assessment skills (White, 2001). PBL is an effective method for improving students’ problem-solving skills (Chetty, 2014, White, 2001). Students will make strong connections between concepts when they learn facts and skills by actively working with information rather than by passively receiving information (Gallagher, 1997; Resnick & Klopfer, 1989).

In the contact sessions the students were asked to work in their study groups to solve problems while making use of the technological learning tools such as mobile phones and e-learning. The groups were then asked to present their solutions and each group member was tasked with doing a small part of the presentation so that all members of the group had to work. This prompted the teachers to take responsibility for their own learning and work with information and link concepts with skills and facts, an integral part of the PBL method of instruction (Chetty, 2014).

This enhanced the teacher’s self-confidence and further aided with their self-directed learning (White, 2001). The teachers were also asked to develop simple experiments that they could use to illustrate some basic concepts from the module itself. This was useful not only in increasing their own understanding of the topics but also helped them to improve their classroom delivery and thus positively impacting on teaching and learning of their own school learners. The contact sessions took the form of PBL sessions interlaced with salient theory discussions as necessary.

Fig. 3. All test results for the 2010 PHYSED1A module

Fig. 3 shows the results for test 2 and 3 in relation to test 1. There is a marked improvement in the test 2 and 3 results with test 3 being better than test 2. Clearly the interventions seemed to have worked to help improved test performance. Fig. 4 shows a strong correlation to the students’ assignment and test marks, a stark contrast to the initial results. This shows more evidence of students having understood the material better and further highlights the improvement in their self-directed learning. A similar pattern between test 3 and assignment 3 results is shown in Fig. 5 which further enhances the results confirming the success of the interventions.

Fig. 4. Test 2 and Assignment 2 results for the 2010 PHYSED1A module

The strong correlation between Assignment 3 and Test 3 is shown in Fig. 5. It is interesting to note that the average for the test and assignment are quite similar at 73% and 65% respectively. Impressive given that Test 1 lagged behind Assignment 1 by almost 40%. When questioned after the assessments, the students commented that the use of technology, dictionaries and the

PBL approach had helped them understand the work much better. They felt more confident and their results reflected this confidence.

The final test of success lays in the final exam results. The final exam was based on concepts covered in the tests and assignment but was mostly unseen applications of the respective theory. For example if in class the student was asked for the velocity in a certain problem, a similar concept was tested in the exam but now required the acceleration to be determined instead. Fig. 6 represents the final exam and class mark results for the cohort. There results shown that most of the students achieved final results that were fairly similar to their class mark results. The class mark is a combination of the students' test and assignment results.

Fig. 5. Final exam and class mark results for the 2010 PHYSED1A module

Armed with the knowledge of the problems experienced in 2010, the researcher was able to start the module initially in 2012 using the same interventions as in 2010. The results for the initial assessments show a marked improvement when compared with those of 2010. It must be noted that the maximum marks for the tests and assignments remained constant for both cohorts which makes direct comparison possible. Further the content tested in each was the same. The 2010 cohort showed an average mark of 68% for the assignment and 56% for the test. This is a very different to that of the 2010 cohort and may be the direct result of the interventions in place.

Fig. 7 shows a comparison of the first test results for both cohorts and this clearly shows that the 2012 cohort performed better initially than the 2010 cohort which may in large part be attributed to the interventions learned from in 2010. Fig. 8 shows the exam and class mark distribution of marks for the 2012 cohort. The discrepancy between the two is approximately 10% with the class mark being higher. This is indicative of the students having performed fairly well in the exams and displaying a strong understanding of the subject material.

## 4. Conclusion

The results of this work have shown that the use of PBL, Group learning and technological learning have helped to significantly improve the retention and knowledge of teachers learning Physics. This then translates to better and more knowledgeable teachers educating the learners in our public schooling system. This will greatly improve the quality of learners who exit the high school system. This study has been limited to adult learners being taught via distance education but it is in no way restricted to this. The methods employed will be of benefit to all educational scenarios.

We showed that the results of the teachers increased significantly when they were allowed to work in groups as prescribed by the PBL method. Further the use of technology helped reduce the anxiety of teachers as they had resources on hand to attempt their prescribed work. Further the communication between the researcher and the teachers helped improve the results since the teachers were able to query problems and resolve them once they arose rather than waiting for the contact session by which time the problem may have been forgotten altogether.

The social problems of funding, food security and health related aspects have not been discussed in this work. Their impact on the teacher performance may be significant however the researcher is not equipped to deal with the psychological ramification of these. It is not possible to delve into these problems without offering some counselling or emotional assistance.

These results do open the way for further research into the PBL method of instruction and its context with adult learners. It definitely in this study help improve the self-directed learning of the cohorts and thus improved results and throughput. Ultimately increased throughput is important however the tangibles of this throughput are qualified teachers who can make a marked difference in improving standards of school education.

Technological learning and mobile learning in developing countries such as South Africa are becoming more and more necessary especially in the increase of distance educational offerings. Meeting the need to improve education in the country will only be possible if the current cohorts of teachers are helped to improve their qualifications. Given the full-time nature of the employment, distance education makes educational sense.
