Team-based learning (TBL) is a learning-centred teaching strategy used with small groups primarily in medical courses. A new perspective is the application of TBL to a psychology course. The aim of the present work is to study the effects of TBL (modified version: MTBL) on improvement in student performance. Taking part in this study were 76 psychology students from the University of Genoa (Italy). Findings show that MTBL improves academic performance. Furthermore, participants identified it as a very constructive experience, improving their academic results and stimulating a deeper learning. They suggest greater implementation of MTBL in university courses.

### Introduction

Team-based learning (TBL) is an active learning-centred teaching strategy that employs small groups to offer an alternative to traditional lecture classes. TBL was originally developed by Larry Michaelsen for instructing business students in the 1970s (Michaelsen, 1982). The method is used for large classes divided into small groups (called teams), and fosters individual, small group, and class accountability (Michaelsen, Parmelee, McMahon, and Levine, 2007). Students working in small groups, usually consisting of five to seven students, communicate and learn from each other, and are actively engaged with the course materials. After working together for several sessions, a group could become a team (McMahon, 2010).

Simply creating a student group and telling them to work together is not enough to reach the goals. The teacher must work to transform the group into a team, explaining the importance of teamwork, defining clear objectives for the team project, creating a psychological contract between members and a positive interdependence, and recognising and reinforcing their work (Page and Donelan, 2003). A team is different from a small group because of the high level of trust among the members and a commitment to the benefit of the group. A group becomes a team when the members spend time interacting, working on a task that becomes a common goal, and receiving frequent feedback on their performance. If those conditions are present, a teams will work efficiently and successfully achieve their goals. Each member can tolerate a high level of effort, and they can challenge each other without taking offence, because they appreciate honest communication (Fink, 2004). The aim of TBL is for students to use the concepts they learned in class to solve practical problems that are comparable to those they will face in the working world (Sparrow and McCabe, 2012).

The teacher must redesign the course to use TBL (Michaelsen and Sweet, 2008). This teaching method requires students to study the class topics in advance using texts selected by the teacher. In class students must demonstrate their knowledge by answering a set of multiple-choice questions individually. The questions point to the concepts that the students need to know in order to solve the team application problem. After that, students also answer the same set of questions, but this time as a group, reaching a consensus on the answer. Then the instructor provides clarification to the students about the concepts they have been working on during class. Students have to feel prepared to solve problems similar to the ones they will encounter during their careers. In the final step they have to solve each problem, and if asked, defend their choices to the class. A group can request that the teacher consider an alternative answer to the one that was chosen as the best, so the group must explain why their answer is should be chosen as the best (Parmelee, Michaelsen and Cook, 2012). At the end of those steps, groups have learned how to apply the course contents to real problems. Furthermore, because they worked together, groups become more cohesive and committed to team success (Michaelsen, Knight and Fink, 2004). Michaelsen and Sweet (2008) argue that a teacher's task is also to consolidate and extend the students' understanding of the course content and group processes by fostering their reflections about what the TBL experience has given them in terms of the course concepts, interaction promoting real teamwork, the value

E-mail address: nadia.rania@unige.it

of teams, and how some aspects of the course have encouraged positive group norms.

TBL enhances different kinds of learning, usually generated by the use of small groups (Fink, 2004). According to the author, TBL is different from the other approaches of small group teaching because it is a specific instructional strategy, not a set of small group activities. Furthermore, it develops a team, which is a social unit different from small groups. Small group activities are employed to help students understand the course content and also strengthen the learning of the content by applying these, and by working on assignments that require them to use their acquired knowledge. Moreover, TBL offers students the occasion to understand how to apply course concepts, by both a quantitative (due to the time spent in application activities) and qualitative improvement (the ability to solve increasingly difficult problems). These improvements are possible because working in a large group provides more intellectual resources to employ in solving problems, and also because spending time together makes the group more capable of working together as a high-performance team. Furthermore, grading the group work provides incentives to the teams to spend time and make an effort to do their best to obtain a good result. TBL develops one more kind of learning: team skills. Providing feedback about individual and group work makes students aware of their works' quality, their learning, and how they are working as a team. Finally, the teaching technique helps students understand the value of working on a team to solve complex problems (Fink, 2004).

## **1. The aim of the present study**

Many other studies support the purpose of our study—that is, the value of the TBL method (Zgheib, Simaan and Sabra, 2010; Nieder, Parmelee, Stolfi and Hudes, 2005) and how it improves student performance (Koles, Stolfi, Borges, Nelson and Parmelee, 2010; Koles, Nelson, Stolfi, Parmelee and Destephen, 2005). These studies typically investigate TBL in healthcare courses, whereas the present work enriches the literature by studying a modified version of TBL (MTBL) in teaching psychology.

## **2. Method**

### *2.1. Participants*

Taking part in this study were 76 undergraduate psychology students (63 female and 13 male; 27.3 years old) from the University of Genoa, in northern Italy. They were in the Qualitative Research Methodology course in the academic years of 2011 (Group\_2011,  $n = 29$ ) and 2012 (Group\_2012,  $n = 47$ ), when MTBL was employed.

### *2.2. Measure*

A university office provided the following academic performance data for the students that took classes conducted with the MTBL course (Group\_2011 and Group\_2012): the point average before taking the exam for Qualitative Methods where the MTBL method was employed; the point average of the three basic exams in the psychology curriculum (General Psychology, Developmental Psychology, and Social Psychology); the grades of different students that took the course in 2009 (Group\_2009) and 2010 (Group\_2010), when the MTBL method was not employed. The teacher was the same for both the classes of 2009 and 2010 that used lecture lessons, as well as the classes of 2011 and 2012 that used MTBL. Additionally, the subjects of the lessons and the evaluation method adopted were the same; in fact, the final exam was considered the draft of a research project that employed the qualitative instrument presented by the teacher during the course. Group 1 and Group 2 students also filled out a personal, academic and demographic form with information such as their gender, age, point average, and residence. Finally, at the end of the MTBL, they wrote down their opinion of their experience with this teaching method.

### *2.3. Procedure*

In both Group\_2011 and Group\_2012 classes, student small groups (called teams) were created to allow them to be enriched by the different peculiarities and perspectives of each member (Michaelsen and Sweet, 2008). The following criteria were used: gender, residence, curricula of studies (Development Psychology or Community Psychology), age, graduation exam's grade, high school they attended, grade point average of exams. The teams were the same for the duration of the course so they could be considered a stable group. For the present work, Michaelsen's original method was modified (MTBL). In fact the students were not required to study before class started, because was the teacher to give general indications about principal concepts of the course of Qualitative Research Methods: different instruments employed in qualitative research. During class, the structured activities proposed were to build each instrument of research introduced by the teacher: semi-structured interview, EFI (Ecocultural Family Interview), diary, focus group, participant observation in natural environment, photovoice, audio-tour, and video-tour. In class, while they were working, participants could ask the professor for clarification. The work was then presented to the whole class and discussed, which allowed the professor to evaluate the students' level of comprehension of that lesson. This was followed by a more practical phase. Students made a simulation of a research project submitting some potential participants to the different instruments created during classes, audio-recording and videotaping the process. Then the class discussed the recorded material that was obtained. Lastly, participants had to create a research project and discuss it during the final exam with a group presentation to the professor.

#### 2.4. Data analysis

Data were analysed by SPSS (2008) software. The performance of groups that attended MTBL classes (Group\_2011 and Group\_2012) were considered for the analysis, not those of each team. Independent sample t-tests were conducted to examine if the academic performance of Group\_2011 and Group\_2012 were improved by the MTBL method. To evaluate this, the grade achieved on the final exam of each participant was compared with their point average before taking the course that used MTBL; the grade achieved on the final exam of each participant was also compared with the grade points from courses that provided basic skills in a psychology curriculum, taken during the first year of academic studies: General Psychology, Developmental Psychology, and Social Psychology. Furthermore, we compared the point average to the Qualitative Methods exam (Group\_2011 and Group\_2012), and the point average of other students that took the same exam, taught without using the MTBL method (Group\_2009 and Group\_2010).

### 3. Results

Data were used to evaluate the academic performances of participants, and to verify whether the MTBL method improved their performance. In an intergroup perspective (Table 1) the grades achieved on the MTBL final exam (Group\_2011 M= 30.31, SD= 1.07; Group\_2012 M= 29.85, SD= .88) were compared by paired sample t-test with the exams' point average before the same students took the MTBL courses: Group\_2011 (M= 28.31, SD= 1.12) and Group\_2012 (M= 27.78, SD= 1.38).

Table 1. Comparison between the grades achieved in the MTBL final exam and the exams' point average before taking MTBL courses.

	M	DS	T
Group_2011 grades achieved on the MTBL final exam	30.31	1.07	9.43**
Group_2011 exams' point average before taking MTBL courses	28.31	1.12	
Group_2012 grades achieved on the MTBL final exam	29.85	.88	9.33**
Group_2012 exams' point average before taking MTBL courses	27.78	1.38	

\*\* p<.05

The comparison of the grades achieved on the MTBL final exam with the exams' point average before the same students took the MTBL courses highlights that in both groups, there was a significant difference (Group\_2011  $t(28)= 9.43$   $p<.05$ ; Group\_2012  $t(46)= 9.33$   $p<.05$ ). The grades achieved on the MTBL final exam of Group\_2011 and Group\_2012 were also compared with their average exam scores of the three basic exams for a psychology course (General Psychology, Developmental Psychology, and Social Psychology). Table 2 shows a significant difference in both groups (Group\_2011  $t(28)= 9.86$   $p<.05$ ; Group\_2012  $t(46)= 15.46$   $p<.05$ ).

Table 2. Comparison between the grades achieved on the MTBL final exam and average exam scores of the three basic exams.

	M	DS	T
Group_2011 grades achieved on the MTBL final exam	30.31	1.07	9.86**
Group_2011 exam scores of the three basic exams	26.52	2.17	
Group_2012 grades achieved on the MTBL final exam	29.85	.88	15.46**
Group_2012 exam scores of the three basic exams	24.71	2.31	

\*\* p<.05

Furthermore, to have an intragroup perspective and corroborate the hypothesis that MTBL could improve academic performance, an independent t-test was conducted, comparing the grades achieved on the MTBL final exam by Group\_2011 and Group\_2012, with the grades achieved in the final exam by students who took the course of Qualitative Methods in 2009 (Group\_2009 n= 35, M= 28.37, SD= 1.92) and 2010 (Group\_2010 n= 16, M=28.68, SD= 1.57), when the MTBL method was not employed. Referring to the comparison with Group\_2011, there was a significant difference with both Group\_2009 ( $t(62)= 4.83$   $p<.05$ ) and Group\_2010 ( $t(43)= 4.09$   $p<.05$ ), as illustrated in Table 3.

Table 3. Comparison between the grades achieved on the MTBL final exam in 2011 and grade achieved on the final exam in 2009 and 2010.

	M	DS	T
Group_2011 grades achieved on the MTBL final exam	30.31	1.07	
Group_2009 grades achieved on the final exam	28.37	1.92	4.83**
Group_2010 grades achieved on the final exam	28.68	1.57	4.09**

\*\* p<.05

A significant difference is highlighted also in Table 4 concerning the comparison of Group\_2012 with Group\_2009 ( $t(80)=4.65$   $p<.05$ ) and Group\_2010 ( $t(61)=3.66$   $p<.05$ ).

Table 4. Comparison between the grades achieved on the MTBL final exam in 2012 and grade achieved on the final exam in 2009 and 2010.

	M	DS	T
Group_2012 grades achieved on the MTBL final exam	29.85	.88	
Group_2009 grade achieved on the final exam	28.37	1.92	4.65**
Group_2010 grades achieved on the MTBL final exam	28.68	1.57	3.66**

\*\* p<.05

#### 4. Discussion

Results indicate that MTBL improves the academic performance of participants. The grades taken during the course using the MTBL method are compared by a paired sample t-test with the individual exam scores that each participant had before taking the Qualitative Methods course, along with their exam scores on the three basic exams for a psychology course (General Psychology, Developmental Psychology, and Social Psychology). These analyses reveal significant differences and an improvement in the students' performance, demonstrated by a higher exam scores. The hypothesis that MTBL improves academic performance is also proven by independent sample t-tests, which compared the grades of the students who took the Qualitative Methods course when MTBL was employed, with the students that took the course during the two years previously, characterised by lecture classes. In this case, a significant difference is found, and there is an improvement in the results of the students that took courses where MTBL was employed. Even if in Social Psychology the group experiences are characterised not only by cooperative experiences but also by conflicts, LeDoux (2012) explains that interpersonal incompatibilities between team members can develop, or the team members can have divergent opinions about the achievement of their tasks. However some conflicts, if moderate, can be functional and can contribute positively to the performance (Kozlowski and Ilgen, 2006).

From the impressions written by participants about their MTBL experience, a very positive opinion emerges. Many students felt that this method should be implemented at the university. Gianni, declared: "*The group is a very powerful tool that I would like to use in the future and beyond.*" This finding is in line with other research. Vasan, DeFouw and Compton (2009) affirm that a large majority of their sample expresses positive feelings about working on a team. Kim (2008) reports that most students are very satisfied with the content of the course and also with the MTBL format. Zgheib et al. (2010) find that students want more MTBL courses in the future.

Further studies could apply the MTBL method—modified or the original one—to other psychology courses, and in general, to promote and extend its use within the university. Furthermore, it would be important to conduct a more quantitative study to verify the benefits of the MTBL method, making a comparison between the performance of students who took the same course with or without the use of MTBL, and to examine if this method improves the university system in order to verify if the general academic performance is better than the years before, when MTBL was not used.

## Abstract

24 Seasons Drums performance began at Foon Yew High School, Malaysia and it has been a popular performing art genre since. The art combines a fusion of elements from Chinese culture such as martial art, dance, music and Chinese calligraphy. There is still a lack of literature concerning its transmission method and therefore, this article highlights its training approaches by examining how a music co-curriculum activity with physical exercise along with elements of philosophy and culture has been transmitted along with an emphasis on team-building. Research was carried out at Foon Yew High School in Johor. Data were collected through observation and interview along with video recording. The troupe playing the 24 Seasons Drums consists of sixty-nine team members who are students at the school. Practice sessions were recorded to encompass the instructional activities in the training system. The outcome shows how various elements are combined in this co-curricular activity: physical fitness exercise, music theory, Chinese cultural elements and team-building.

## Introduction

24 Seasons Drums, more commonly known among the Chinese community in Malaysia as *Ershisi Jieling Gu* in Chinese Romanization (二十四节令鼓) was invented in 1988 by music teacher, Tan Hooi Song with poet Tan Chai Puan, at Foon Yew High School in Johor, Malaysia. Since then, it has become a popular Chinese performing art genre, as seen from virtual field visits such as YouTube, it is frequently performed not only in Malaysia but also in other countries, including the West. The success of Foon Yew's troupe and its fame continues today, with local press reporting receipt of an award and invitations to perform aboard (New Straits Times, 2012). Also, their performance in the promotional tour of Malaysia for Taiwanese celebrities Ethan Juan and Joe Chen's promotional tour in Malaysia for their television drama *You Are My Destiny* (The Star, 2008) received positive feedback from viewers.

Instrumentation consists of twenty-four membranophones called *shigu*, a large Chinese drum commonly seen in lion dance performance. The drums are played using two wooden sticks, striking the drum on its surface, at the side of the drum, or hitting the two sticks together, resulting in a timbre with strong resonance such as 'dung' or sharper tones of the latter 'tak' and 'tik' (see Matusky and Tan, 2004). The performance involves choreographed movement and rhythmic patterns based on Chinese elements such as martial arts, calligraphy, and music. The initial concept was based upon agricultural activity during the four seasons of the Chinese lunar calendar used in traditional farming in mainland China. The four main seasons are subdivided into six seasons (*jieling*) to make a total of twenty-four. Choreography ideas are included in drumming and are actually a reflection of farmers' movement.

Literature concerning Chinese performing arts in Malaysia includes Tan (1984) on Ko-Tai, Tan (1989 & 2007) on lion dance, the *huayue tuan* (Tan 2000), Loo and Loo (2012a; 2013) on innovation of Chinese folk tunes for a modern multiracial Malaysian audience, Buddhist music and musical theatre by Loo, Loo and Lee (2012), Loo & Loo (2012b), Loo (2013), and Loo, Tee and Loo (2014), and Chinese *shidaiqu* re-contextualized in Malaysia (Loo and Loo, 2014). Study of 24 Seasons Drums is very limited. Ethnomusicologists Matusky and Tan (2004) and Chan (2006) introduced the 24 Seasons Drums, its founder and its concept. Chan (2006) describes the 24 Seasons Drum and its rote-learning method in nurturing creativity in students. However, there is still a lack of research looking at a detailed training approach and transmission of the 24 Seasons Drum. Therefore, this article focuses on the transmission method of the 24 Seasons Drum by reporting on research carried out at Foon Yew High School, where the genre was founded. Discussion highlights its synthesized teaching method from a co-curricular activity that involves physical exercise and Chinese culture and music, and how this musical kinetic activity and its training approach lead to soft skill achievement such as team-building.

## Methodology

In this qualitative study, observation and interview were carried out to collect primary data. Observation took place at Foon Yew High School in Johor where the 24 Seasons Drum was founded by Tan Hooi Song and Tan Chai Puan. Weekly training sessions were observed for a period of two months in 2009 and revisited in 2014 to identify any changes in training method. Video recording was used to capture their training system. During the training session of the 24 Season Drum, 120 students and two trainers were involved.

Trainers were interviewed in 2009 and also 2014. Informants who were interviewed include the founder Tan Chai Puan, and trainers Ong Ee Wei, Ting Deng Siang and Hong Ye Yi. Semi-structured interview was employed in gathering information about the training system.

## Analysis and Discussion

24 Seasons Drum began when its founder was requested to deliver a performance for the Tionghua Association of Johor Bahru for its 9<sup>th</sup> Dance Festival (Chan, 2006). The teaching methods of the 24 Seasons Drum include basic theory in music, marching, stamina training, group practice and rote-learning. Nowadays, the 24 Seasons Drum is practised and performed by other troupes all over the world, adding creativity in choreography and drumming patterns. However, Ting (2014) states that it is very important that Foon Yew's troupe retains its original concept which the farmer's movement is the model behind its choreography, because as the founders of the 24 Seasons Drum it is important that they preserve the original philosophy. A typical training schedule at Foon Yew lasts for three hours divided into three main levels: teaching theory of music, physical exercise and drumming session (see Table 1).

The music theory class was held in a classroom where the students first sang their team song and the tutor marked down attendance. A general knowledge of Western music notation and theories was taught. Instead of Chinese cipher notation, Western notation was used. The music theory class lasted for forty-five minutes, the students then proceeding to the field for physical training that included warming up exercise and stamina training.

Table 1. Training Schedule of 24 Seasons Drums at Foon Yew High School.

Time	Activity
3.00pm	Singing the team song <i>Gu Dian Ciannian</i> Attendance report Theory of music
3.45pm	Warm-up exercise Stamina training: running, up and down stairs, sit-ups, push-ups, star-jumps.
4.30pm	Marching
5.00pm	Group division Drumming session
6.00pm	End of session

Physical exercise and training took up one hour and fifteen minutes of the three-hour session, which reflects its importance as part of the training to play the 24 Seasons Drums. Simple warm-up exercises were taught and after that students needed to complete eight laps of a 400 meters track and field. A stair-climbing exercise followed. While doing this, students were trained to run up and down stairs in a line, but there was an obligatory rule that they must wait for their team members who were left behind. Therefore, the nature of this training creates a sense of belonging and collaboration among team members. Other activities included push-ups, sit-ups, and star jumps. Achieving stamina, strength and agility is an important prerequisite for the 24 Seasons Drum. In addition, the following session of marching is also a compulsory activity in training unity, strength and discipline.

The drumming session and teaching lasted for an hour. The students were divided into three groups: advanced, average and beginners. The first group consisted of senior students at advanced level with experience in performance. These students practiced at the basketball court and focus on coordination between the striking rhythms and choreography. A team leader plays an important role in choreographing movement and coaching, including improving the students' technique in drumming. The second group was made up of students at a moderate level of skill. The assistant chief and senior are responsible for guiding the second group. Beginners belong to the third group, in which lower high school students are guided by one of the senior students.

Rote-learning is employed in teaching the 24 Seasons Drum. The teaching members found that this is an effective method of transmission. Students imitate and play the rhythm patterns demonstrated by the seniors and along the way they try to memorize

the rhythmic drumming pattern. They are not bound by a musical score, so they can fully concentrate on mastering techniques and specific skills.

It was evident during the observation period that the teaching of the 24 Seasons Drum consists of strategies in fostering relationships, teaching team members to take care of each other and strongly reflecting the importance of team-work, emphasizing success from a working team rather than any individual who can outrival another. A high demand on discipline in collaborative exercise such as the stairs routine, marching and drumming is effective as a team-building training model. Unlike the more sedentary nature of practising other musical instruments such as the piano, violin, or playing a drum set alone in either a standing or sitting position, playing the 24 Seasons Drum includes a high level of fitness due to executing fast choreographed movements that involve the whole body in action, along with commanding virtuosic technique in beating the drums in perfect synchronized rhythm with a team of twenty-four members.

## Conclusion

The 24 Seasons Drums and its training reveals the success of its founders Tan Hooi Song and Tan Chai Puan. The popularity of this drumming genre has increased since its inception in 1988. Its teaching method, involving rote-learning, physical exercise and teamwork, is perhaps the hook that has become the reason for its popularity, not only as a co-curriculum activity in a school setting, but also as a genre performed by professional performing arts groups. It was evident during the observation period that the teaching of the 24 Seasons Drum consists of strategies in fostering relationship among students, team-building, coordination of movement and rhythmic drum patterns, and stamina building. The training method of the 24 Seasons Drum reveals benefits in soft skills, physical exercise and music.

## Abstract

Technical and entrepreneurial training was provided for two groups of young adults to prepare them for commercial production of horticultural goods under greenhouse conditions. Most participants (90%) had only basic formal education and no experience in agriculture. Both teachings were done simultaneously. Thus, they learn how to produce based on market demands, and how to operate as a business. This educational experience resulted in a high satisfaction for the participants, and gave them the skills needed for commercial production because they were able to produce and market one harvest. Their main challenge is to develop an enterprise.

## 1. Introduction

Inequity is the main problem of Mexico. Its most regrettable outcome is poverty. CONEVAL (2013) reports in 2008 and 2010, 11.7 million of people in extreme poverty. However, the number of inhabitants with insufficient food access increased from 23.8 million (21.7% of national population) in 2008 to 28 million (24.9%) in 2010.

Poverty is widespread in rural areas. Chiapas is the state with the highest percentage of paupers (78.4%). It also has six of the ten municipalities with the greater rate of poor people. The states of Guerrero (67.9%), Oaxaca (67.2%), and Puebla (61%) are next in line (CONEVAL, 2012).

Several factors are contributing to the poverty concentration in rural regions. Most of their inhabitants are devoted to primary activities. They work part-time in a non-intensive way, with low or none value aggregation, and small productivity. Consequently, the rural average income is only 27% of the national one (SIAP, 2010), or 7% of the 2012 U.S.A. minimum wage.

An alternative to reduce poverty is self-employment with higher remuneration to promote arraignment in countryside communities, and the improvement of their way of life. Horticultural production under greenhouse conditions is a good option. It allows the production of several harvests per annum, with better yields, lower risks, best quality, and usually higher prices. It creates more jobs, with increased stability. It also uses water and input in a more efficient manner than open field cultivation (Velasco *et al.*, 2011).

Greenhouse agriculture is more complex, and more man dependent than conventional one. Thus, training is the best strategy to increase the success of this cultivation technique. Manrubio *et al.* (2007) found 65% of greenhouse production units with Mexican federal or state subsidies were unproductive. The main cause was insufficient training or technical assistance.

The Mexican federal government program “Young entrepreneurs” recognized such fact. It provided technical and business training to augment the achievement of its supported projects. It runs on two stages. In the first one denominated, “school project” such preparation is provided. The objective of this paper is to analyze the planning, development, and results of the technical and the entrepreneurial training for horticultural production, within the “Young Entrepreneurs” Program, in two communities at the state of Puebla, Mexico.

## 2. Materials And Methods

Two nearby communities were selected for this study. They are located in near contiguous municipalities in the southern part of the state of Puebla, Mexico. The region is denominated “Mixteca Poblana.” The first one was San Martín Tecuautitlán, Piaxtla

municipality. It is located at 18° 12' latitude North, and 98° 16' longitude West. Its altitude is 996 m above sea level (asl). The second one was San Pedro Yeloixtlahuaca, with the same name municipality. Its situation is 18° 07' latitude north, and 98° 06' longitude west. Its elevation is 996 m asl. The average temperature is 24.3° C. The mean maximum is 32.8° C, and the average minimum 15.8° C. The annual rainfall mean is 1,607 mm. It is concentrated from July to October. Only in those months, the precipitation is higher than the evaporation

Those communities were selected to be benefited for the “Young Entrepreneurs” Program of the Ministry of Agrarian Reform of the Mexican Federal Government, because they could constitute groups of young people (18-39 years old) willing to participate in productive projects. Under the supervision of the program’s personnel, they decided to be involved in horticultural production under greenhouse conditions. At San Martín Tecuautitlán, the cucumber crop was selected. In San Pedro Yeloixtlahuaca, tomato was chosen.

The funds for the technical and the entrepreneurial training, and the scholarships for the Younger were provided by Program mentioned above. It also provided subsidies to construct a 300 m<sup>2</sup> greenhouse, and for the basic equipment and input for one crop cycle in each community.

The projects were monitored from the initial diagnostic of the participants, until the final evaluation of the technical and the entrepreneurial training. Surveys were done to determine the opinion about the activities performed.

### 3. Results And Discussions

#### 3.1. Initial diagnostic

In order to increase the efficiency of the training, an initial diagnostic of the participants was conducted in the two groups. The occupation, the education, the knowledge about the crop to be installed, and about greenhouse agriculture, were questioned. Furthermore, their entrepreneurial experiences, and their expectations about the training were inquired.

Thirty people formed the San Martín Tecuautitlán group. Forty-five percent were women. Most of them had household occupations (70%). Fifteen percent were involved in construction. Only 10% were peasants. There were big differences in schooling, from people with no formal education, up to one with a bachelor degree. The majority did not know about greenhouse agriculture (60%), or about the cucumber crop (75%). No one worked in a formal business. Only 25% had entrepreneurial notions, and 30% concepts about marketing.

Figure 1. Occupations of the Martín Tecuautitlán group.

The group of San Pedro Yeloixtlahuaca had the same number of members (30). Sixty percent were women. Half had a household labors. Almost one-third were wage earners. One tenth was students, and a similar proportion was self-employed. For 60% greenhouse agriculture was unknown. However, 7% have been working on greenhouses. Only 40% had some knowledge about the tomato crop. One fifth have participated in an enterprise. Half had some marketing notions. All participants had some formal schooling. The students were getting a bachelor's degree.

Meteorological data from the 1971-2000 period. From the Mexican National Meteorological Service. Station located at Piaxtla, state of Puebla. <http://smn.cna.gob.mx/climatologia/normales/estacion/pue/NORMAL21063.TXT>

Figure 2. Occupations of the San Pedro Yeloixtlahuaca group.

### 3.2. Training development

Both groups hired their trainers based on an analysis of proposals submitted by professionals. The former Ministry of Agrarian Reform, the entity responsible of the “Young Entrepreneurs” Program, accredited those selected. The process involved review of academic records. A bachelor degree and training experience in a similar endeavor was a minimum requirement.

Due to the scarce knowledge about greenhouse agriculture and entrepreneurial aspects of most participants, the training was planned to start since the basic concepts of both areas. The horticultural production in soil under hydroponics was selected, because it had lower production costs and require fewer specialized skills. Therefore, it is easier to obtain and to market products with profits. The soil acts as a buffer. It helps to compensate for possible mistakes in nutrient solution formulations.

The technical training was provided jointly with the business education. This allowed focusing the production on market demands. Another objective was to teach them how to operate as an enterprise. The group’s members had productive or family-related activities during weekdays. Thus, the training was conducted in weekends. The participation of students of elementary and secondary schools, sons and daughters of the groups’ adherents, were encouraged to participate in the sessions. This helped some mothers of the San Martín Tecuautitlán group, with no schooling, to learn better. The children read them the manuals provided and collaborate to answer the exercises and homework.

The technical training was 30% classroom theory, and 70% practice in the in the field and greenhouse. The skills needed for commercial production were developed this way. The entrepreneurial classes were conducted as workshops in order make them more amenable. It also developed a business plan for the next phase.

Figure 3. Entrepreneurial training at San Pedro Yeloixtlahuaca, state of Puebla, Mexico.

In the technical training, the following subjects were taught:

- Soil identification and profiling
- Soil and water analysis
- Greenhouse construction and operation
- Soil tillage
- Bed preparation
- Greenhouse sanitation
- Planting and nursery care
- Mineral nutrition
- Tutoring
- Harvest and packaging

The entrepreneurial classes included:

- Emotions management and communication styles.
- Twelve skills for conflict resolution
- Norms and rules
- Team work
- Leadership and communication
- Marketing
- Business plan
- Organization manuals, and work organization
- Quality assurance, continuous improvement
- Management
- Book keeping
- Result's analysis

The training was conducted under a positive and enthusiastic environment with great participation of both groups. They have the hope to develop a business with the potential to provide them with remunerative jobs. An option seldom found in the region. Similar experiences have been developed in Mexico (Cuevas-Contreras)

The final evaluation showed high satisfaction among participants regarding the knowledge learned and instructor's performance. In a scale from 0 to 100, the average grade for the training was 91.2.

#### 4. Conclusions

The technical and entrepreneurial training provided to the members of the groups of San Martín Tecuautitlán, and San Pedro Yeloixtlahuaca, at the state of Puebla, Mexico, was planned and conducted based on their knowledge. It resulted in a high satisfaction of the participants, and gave them the skills needed for commercial production because they were able to produce and market one harvest. Although they have the basic knowledge, the major challenge is to develop it as an enterprise.

## Abstract

This article explores the effectiveness of Alexander Technique in reducing tension in piano playing. Much of the literature regarding the Alexander Technique tends to be guide books for various uses targeting actors, musicians, sportsmen and so forth. There are also a growing number of alternative medical research studies that examine the effectiveness of the Alexander Technique in reducing disability in Parkinson disease, improving postural equilibrium, and relieving back pain. However in the area of music performance, little empirical research has been carried out. In this study, fifteen undergraduate piano majors from a local university in Malaysia were recruited as research subjects. Four major principles of the Alexander Technique were employed in this test. Observation was carried out and a report of tension in certain body parts was recorded. The subjects went through fourteen week of lessons taught by an Alexander Technique instructor, and a survey was carried out. The results indicate a positive outcome that Alexander Technique may help pianists to reduce tension.

## Introduction

The actor Frederick Matthias Alexander (1869-1955) discovered and created the Alexander Technique as a response to chronic hoarseness that could not be resolved by the medical field. Through years of self-observation, the actor developed a method to improve the use of self, which is known today as the Alexander Technique (Alcantara, 2013). Gelb (1996) expresses that defining the technique with words may be limited as Alexander Technique is an experience that involves liberation from the manipulation of fixed or faulty habits. Existing literature states that the Alexander Technique is not only useful to actors but can also be effective for musicians and athletes such as McEvenue (2001), Harer and Munden (2008), Leibowitz and Connington (2011). Though, after reviewing the studies in sportsmen, Frontera (2007) explains that “although there are theoretical benefits of this type of technique to athletes, there are no scientific studies on the effect of the Alexander Technique on athletic performance. Despite the lack of evidence, the technique continues to be used widely by performing artists, in particular” (p. 318). A broad definition of the Alexander Technique is as follows:

1. A technique that teaches how to use oneself more efficiently
2. A technique that teaches how to inhibit the habitual pattern of misuse (tension and contraction), and how to consciously redirect oneself toward a more beneficial use (expansion and flow)
3. A technique that teaches how to create space between stimulus and reaction so that a different and more beneficial choice can be made regarding the use of oneself (Alcantara, 2013).

These definitions imply a wide potential application of the Alexander Technique. For example, there is a growing number of research concerning its medical use such as Stallibrass (1997), Dennis (1999), Stallibrass, Sissons and Chalmers (2002), Ernst and Canter (2004), Stallibrass, Frank, and Wentworth (2005), Cacciatore, Horak and Henry (2005), Little, Lewith, and Webley *et al.* (2008), and Woodman, J. P., & Moore, (2012). Studies by Dennis (1999), Cacciatore *et al.* (2005) and Little *et al.* (2008) examine the Alexander Technique relating to postural equilibrium and reducing back pain. On the other hand, research by Stallibrass and Hampson (2001), Stallibrass *et al.* (2002) and Stallibrass, Frank, and Wentworth (2005) explored the effect of Alexander Technique in Parkinson patients. Though in a 2004 review, Ernst and Canter (2004) noted that not every test in Alexander Technique is proven effective in patients with Parkinson and back pain, while Woodman and Moore (2012) found that there is solid evidence that demonstrates the effectiveness of the Alexander Technique in relieving back pain but only moderate proof in reducing disability in Parkinson's patients. The researchers also assert that although there is early evidence stating potential in improving postural equilibrium for the elderly, back pain and respiratory system, evidence is not adequate for recommendations as an alternative medicine.

In terms of relaxation and tension release for musicians, Watson (2009) explains that all relaxation technique can help deal unconscious muscular tension. However, Berman (2002) points out the dilemma regarding the balance between the absence of physical effort and the need to execute movement. Literature reviews concerning relaxation techniques for the piano such as by Whiteside (1961), Leimer and Giesecking (1972), Bomberger (1991), Ortiz (1997), and Berman (2002) reveals that there is no straightforward approach to define passivity in activity (see Loo, 2010; Loo and Loo, 2011; Loo and Loo, 2012; and Loo and Loo, 2013). Loo and Loo (2011) suggest the application of *taiji yin* and *yang* principles in understanding the balance between tension and relaxation. However, there has been a lack of literature considering a quantitative approach in examining relaxation technique. After reviewing various relaxation technique and principles, this study examines the effect of Alexander Technique to fifteen undergraduate piano majors who reported tension in playing.

## Methods

The aim of this research is to test the effectiveness of Alexander Technique in reducing tension in piano playing. A pretest score reporting tension in certain body parts was collected before the first session, and after fourteen weeks of intervention, a posttest score was gathered and compared. Fifteen volunteer piano major undergraduate students were selected participants after a pretest score identified problems of tension. The pretest score was gathered using an evaluation instrument of eight items (fingers, hands, arms, wrists, shoulders, back, legs, and neck) where the participants identified where tension occurs using a five-point Likert scale (1 = Severely tensed; 2 = Tensed; 3 = Somewhat tensed; 4 = Mildly tensed; and 5 = Very mild tension). The participants then received an intervention of Alexander Technique training in a group class where each session lasted three hours. The lesson was conducted once per week by an AmSAT-certified Alexander Technique instructor (second author) and the participants went through a course of fourteen weeks. A one-to-one session of ten minutes was given to each participant while others observed.

A guide book from Gelb (1996) was used throughout the fourteen weeks intervention by the instructor. During the intervention, the participants were taught four major principles from the Alexander Technique: recognition of habit, inhibition, direction and primary control (Kleinman and Buckoke, 2013, p. 184):

- 1) Recognition of habit: The participants gained awareness of the force of habit that governs all of their actions. Specific attention was brought to the movements related to playing the piano.
- 2) Inhibition: After gaining some awareness of the habitual tension related to their movements, the participants were taught to inhibit faulty habits such as excessive tension so that they could ultimately move with more freedom.
- 3) Direction: After recognizing the force of habit and then learning how not to react, the participants were taught how to redirect themselves to effect a positive change in their use of self.
- 4) Primary Control: The participants discovered how the relationship between the head, neck and the back constitutes a primary control for the organization of whole body, and that if these parts were used poorly, there is a general instability throughout the whole body.

A posttest evaluation instrument was used after the participants completed fourteen weeks of intervention with the same items as in the pretest. A paired-sample *t* test was used to analyze the difference between the pre- and posttest score.

## Results

In the pretest score, the participants reported tension in their fingers, hands, arms, wrists, shoulders, back, legs and neck (see Table 1). In the posttest score (see Table 2), the participants reported a significant decrease in tension.

Table 1. Pretest score

Items	<i>N</i>	<i>Mean</i>	<i>SD</i>
Fingers	15	2.40	.986
Hands	15	2.53	1.060
Arms	15	2.53	.990
Wrists	15	2.87	1.302
Shoulders	15	2.00	1.195
Back	15	2.27	.799
Legs	15	3.53	1.060
Neck	15	3.07	1.163

Table 2. Posttest score

Items	N	Mean	SD
Fingers	15	3.67	.724
Hands	15	3.67	.617
Arms	15	3.87	.743
Wrists	15	3.73	.594
Shoulders	15	4.07	.884
Back	15	3.87	.640
Legs	15	3.67	.724
Neck	15	3.60	.828

The data in Table 1 shows that the mean score obtained during the pretest evaluation ( $M=2.6500$   $SD=.62714$ ) while Table 2 shows a higher score obtained after the intervention of the Alexander Technique for fourteen weeks in the posttest evaluation ( $M=3.7667$   $SD=.37460$ ). A paired  $t$ -test analysis was carried out to test if there is any significant difference between the score before and after the intervention of the Alexander Technique. Based on the results gathered in Table 3, there is a significant difference in tension that occurred in various body parts of the participants between the pre- and posttest ( $t=-5.738$ ,  $p=.000$ ).

Table 3. Results of paired  $t$ -test between pre and post test scores

Items	Mean	SD	$t$	$p$
Pretest	2.6500	.62714	-5.738	.000
Posttest	3.7667	.37460		

## Discussion and Conclusion

In summary, after a fourteen-week intervention of the Alexander Technique, the outcome reveals a positive effect in reducing tension in pianist. From the posttest score, we gather that there is a significant reduction in tension that was reported by the participants relative to their pretest survey. The results of this study highlight the potential of the Alexander Technique in aiding the relief of tension in piano playing. However, in future studies a higher number of participants should be recruited to give a more accurate quantifiable justification and stronger evidence in showing the effects of Alexander Technique. Further research could also be carried out in testing its long-term effect by performing a longitudinal study.

# Tensions and dilemmas in teacher professional development

Aik-Ling TAN, Chew-Hung CHANG, Paul TENG

*National Institute of Education, 1 Nanyang Walk, Singapore 637616, Singapore*

---

## Abstract

This paper presents the reasons why teachers engage in professional development as well as the tensions and dilemmas that arise from professional development. The voices of 14 teachers are heard through individual semi-structured interviews. The transcripts of the interviews were analysed using thematic coding to uncover the themes related to the tensions that teachers feel when they are faced with decisions pertaining to professional development matters. Three dilemmas surfaced from our analysis and in this paper, we present them in a dualistic manner to highlight the tensions that resulted from these dilemmas faced by the teachers. The first dilemma concerns the issue of needs that are served through engagement in professional development activities. Here we discuss whether professional development should serve the needs of individual teachers or whether it should serve organizational needs. We highlight the forms of professional development activities that teachers should engage in and how they often find themselves torn between the urge to attend professional development activities that they personally enjoy and those that their peers and school would like them to attend. The second dilemma is related to teachers' sense of responsibility to their pupils when they are engaged in professional development activities. The question that teachers commonly ask themselves before they decide on professional development activities is whether their students' learning will be affected in their absence. The last dilemma is related to the first and it deals with whether professional development activities should be made compulsory or whether it should be voluntary for teachers. Understanding the tensions and dilemmas of professional development as experienced by teachers allows the policy makers and professional developers to make better decisions so that the fidelity of professional development policies and programs can be enhanced.

## 1. Introduction

Teaching is nestled within a complex ecology of people, policies, systems, social practices and social norms. As part of the complex ecosystem of school and teaching, teachers have to grapple with expectations and demands that are made *of* them and *on* them by various stakeholders. Teachers are expected to teach the child, deliver the curriculum, understand the national policies, work with parents to help them understand their child as well as school, and design innovative practices to suit the ever changing social landscape. This list of demands that are made of a teacher is not exhaustive and often times, it is difficult to quantify what a teacher needs to do, or even just describing the range of tasks that a teacher needs to perform. These multiple and varied things that a teacher needs to be able to do suggests that teachers need to stay current in their practices and hence a need to constantly update and upgrade themselves. Teacher professional development (TPD) is thus an important aspect in the life of a teacher. As TPD is strongly coupled with the lives of teachers, it is inevitable that it is also entangled in the complexities of school, people, policies and practices. Research in the area of TPD has delved into areas in motivation of teachers to engage in professional development (Gorozidis & Papaioannou, 2013), ways to make professional development sustainable and meaningful (Tan, Lim, & Teng, 2012), teachers' satisfaction with professional development (Nir & Bogler, 2008), ways to design professional development in various domain areas (e.g., Hismanoglu, 2010; Loughran & Gunstone, 1997), and frameworks that support and enables us to understand teacher learning and professional development (e.g., Cochran-Smith & Lytle, 1999; Wenger, 1998). To understand the various aspects and issues related to TPD, research studies commonly use methods such as large scale questionnaires (see Gorozidis & Papaioannou, 2013), documentary analysis (Sato & Kleinsasser, 2004), video analysis of behavior during professional learning (Tan & Towndrow, 2009), action research (O'Sullivan, 2002) and interviews (Lepage, Boudreau, Maier, Robinson, & Cox, 2001). These methods are commonly applied to study TPD as the construct of TPD is one that requires the teacher to connect between his/her practice in the classroom and their learning experiences. As such, it is largely reflective in nature and hence the common methods used deploy retrospective recall of teachers' experiences. Similarly, in this paper, we interview teachers on their personal experiences with professional development activities and using their interview replies to answer two research questions — “What are reasons for teachers to engage in TPD?” and “What are the tensions and dilemmas that are faced by teachers when they make decisions related to involvement in professional development activities?”

The notion of tension and dilemma can be understood better when they are mapped onto what TPD encompasses, the purposes of TPD as well as the teachers' lives and roles. As such, in the next three sections, we discuss the definition of professional development, the purposes of professional development and the lives of teachers in relation to the tensions and dilemmas in teaching.

### *1.1. Defining teacher professional development*

The notion of TPD is diffused since it is a multifaceted construct with multiple definitions of what constitutes TPD. To add to the complexity, the scope of TPD is also wide. Generally, TPD falls under the overarching umbrella of in-service teacher education (Tan, 2014) and refers to the process of improving teachers' skills and competencies for producing stellar educational outcomes for students (Hassel, 1999). More specifically, TPD also includes the various aspects related to the practices of teachers — beliefs of teachers, identity of teachers, teachers' epistemologies (Hewson, 2007) and other aspects that pertain to the professional practice of teachers and teaching.

Theoretically, some argue that TPD should be a process (Loucks-Horsely, Love, Stiles, Mundry, & Hewson, 2003) while others view TPD from a product perspective and focus on what teachers can do as a result of attending TPD activities. These different perspectives of TPD have resulted in debates about what the end goal of TPD ought to be. As a result of these debates, tensions surrounding design and evaluation of TPD arise. How does one evaluate the effectiveness of TPD? Is teacher change the most significant measure or gains in students' scores? Amidst the diversity of views, most scholars agree that TPD needs to result in some form of improvement in the practice of teaching and ultimately advancement of students' learning. We argue here that the debates and tensions related to TPD do not merely occur at a theoretical level but have also cascaded to the level of teachers' experiences. As such, these theoretical debates and the resultant tensions form the motivations behind this paper as we examine the teachers' reflection of their TPD experiences.

### *1.2. Purposes of teacher professional development*

Education is a public enterprise in which the voices of many parties need to be heard. As tax dollars are often used to fund education, there is often pressure for accountability. Consequently, the resources channeled to TPD are also under close scrutiny by policy makers, parents, and schools. The purposes and impact of TPD hence need to be visible for the general population. A review by Desimone (2009) highlighted the components of meaningful and impactful TPD which ultimately result in improvement in students' performance. These five critical components are (1) the need for focus on content; (2) the opportunities presented for active learning; (3) coherence of the professional development program; (4) duration (minimum of 30 hours) of the program; and (5) opportunities for collective participation. Besides these five critical factors, research evidence also points to the need to incorporate structured, sustained follow-up activities to enhance the effectiveness of any professional development program.

The next important issue for any teacher professional learning program to address is the effect of the professional development program on students' learning. In other words, what is the evidence of change as a result of teacher professional development? Osborne, Simon, Christodoulou, and Howell-Richardson (2013) argued that currently, in educational research, the evidence of change is scant. Few studies to date are able to show causal, direct and convincing evidence of teacher professional development impacting and improving students' learning. This difficulty of obtaining direct evidence of change in students' learning is understandably so since learning in schools and teacher learning are two domains that are influenced and shaped by a multitude of interacting factors. While it may be possible to link the success of TPD to improvement in students' learning, it is nevertheless difficult to establish a causal relationship. As such, this presents a potential area where tensions might arise since teachers might be torn between their own development and the measurable change in students' learning.

### *1.3. Teachers' lives and roles in teaching*

Beliefs are deep seated ideas that result from one's experiences within a specific cultural and societal context. As such, it is difficult to change and often influences one's actions and decision. Pajares (1992) argued that teachers' beliefs are intrinsically rooted within their own experiences and cultural resources and hence are different from knowledge in terms of their potent affective nature. As such, teachers' beliefs have a powerful influence on their interpretation of things happening around them, on the decisions they make and on the eventual actions to be taken. Consequently, teachers' beliefs about their roles and responsibilities in their practice have impact on their participation in TPD activities. In light of the complexities of teachers' beliefs and practice, attention needs to be given to inspect the dialectical relationship between teachers' beliefs and assumption based on the context that they live in, their decision making and practices. As such, listening to teachers' lived experiences with TPD to understand the intricacies of their beliefs about their roles and how these perceptions shape and influence their decision making with regard to their professional practice is illuminating.

Similar to many economies, Singapore values teachers and the role they play in developing the workforce and the society for the future. Teachers are valued for their role to "Lead, Care, Inspire" students (Academy of Singapore Teachers [AST], n.d.).

Teachers are expected to play a key role in nurturing the children and to inspire the next generation of Singaporeans. They are also expected to maintain the trust and respect of parents and the community. Finally, as professionals, teachers in Singapore are “responsible for reflecting on our own conduct, developing our practice, and ensuring that we meet the standards of the profession.” (AST, n.d.). The value proposition with respect to TPD for a teacher in Singapore is therefore one that empowers individual teachers to develop themselves and to take ownership for the teaching profession. The interaction between societal expectation and personal beliefs potentially presents grounds for differing ideas and hence tensions. This paper will also explore how personal beliefs and societal expectations interact in TPD.

## 2. Research Method

This research is qualitative and interpretative in nature. We believe that the realities of social life are collectively formed by members in the community (fellow teachers, administrators, teacher educators, students, parents etc) and the artifacts from these interactions (ideas, knowledge and even physical artifacts) are products (Vygotsky, 1986) from these interactions. This stance is adopted because we believe that to understand how and why teachers make decisions related to their professional lives, we need to hear what they have to say. Teachers’ personal ideas about their professional development are developed through their lived experiences (popular media, home life, religious beliefs, exposure to different ideologies, interaction with peers etc) and as such are diverse and likely to differ. What teachers believe to be important for them to develop professionally may not be aligned with what researchers or policy makers think as important. So the important question to consider here is where teachers obtain their ideas from and what their beliefs and ideas are important to them. This sociocultural perspective shape and guide our decision on the means of data collection and analysis.

### 2.1. Research context

This research is carried out in Singapore where education is a highly prized and valued enterprise as can be seen by strong government support and generous funding for education. In Singapore, TPD is not a compulsory requirement for teachers. TPD is also not considered work duty and there are usually no monetary rewards in the form of salary increment for participating in TPD. Rather, teachers are encouraged to be reflective and are given autonomy for their own practices and professional development. Teachers in Singapore have an entitlement to professional development that is sponsored by the Ministry of Education and the area of professional development is largely aligned to one of the three career tracks of teachers. The three tracks are teaching track, specialist track and leadership track. There is a special unit set up by the Ministry of Education (MOE) to take care of TPD and this unit is the AST. The AST has experienced officers and master teachers who work closely with schools and teachers to take care of teachers’ growth through professional development. Such an autonomous culture for professional development of teachers can potentially be a test-bed for ideas as well as diversity for practices in TPD. It is in this culture of support for TPD that the research participants are selected.

The 14 participants in our research are full-time trained teachers teaching in Singapore schools. The participants consented to the interview after they were being approached by the research team upon recommendations by peers. Out of the 14 participants, there were six males and eight females. The participants are teachers from primary schools to junior colleges and they have teaching experiences ranging two years to 29 years. The wide range of grade levels and teaching experiences allows for a diversity of views to be heard. Table 1 summarises the profile of the participant teachers.

Table 1. Profile of teachers (all names used are pseudonyms)

Teacher	Gender	Years of Teaching	Subjects Taught	Grade level Taught
Mr H	M	5	Geography	Junior College
Mr AH	M	10	General Paper	Junior College
Ms AY	F	11	General Paper	Junior College
Mr XR	M	3.5	Geography	Secondary
Ms FE	F	26	Geography	Secondary
Mr N	M	8	Biology	Secondary
Ms KN	F	10.5	Biology	Secondary
Ms KK	F	29	English	Secondary
Mr JS	M	7.5	Physical Education	Primary

Ms F	F	1.5	Mathematics, Science and Music	Primary
Ms N	F	8	English and Mathematics	Primary
Ms P	F	7	English, Mathematics and Science	Primary
Ms V	F	1	English, Mathematics and Science	Primary
Mr K	M	12.5	Physical Education	Primary

## 2.2. Data collection and analysis

Interview data was transcribed and analyzed using the process of open coding and axial coding as originally suggested by Glaser and Strauss (as cited in Flick, 2006). Although the original intention of this coding was to generate grounded theory, our purpose here is to search for integrated themes among the research data so that we can understand (1) the concerns of teachers as they plan for TPD, and (2) the dilemmas that they faced when they are engaged in TPD.

For open coding, we will go through the entire data corpus to surface frequent ideas and stories that emerged in participants' responses. For axial coding, we looked into relationships among the frequent ideas and stories and later developed possible themes of how they make sense of evidence based on their stories. During this step, we will attempt to note integrated, coherent themes by categorizing and regrouping the themes and ideas several times. In this way, we attempted to re-examine the themes that we categorized in the previous coding to enhance the credibility of data thematisation.

Our objectives for generating insights from the data is to ensure that our interpretation is not perceived as a univocal truth of the data to be revealed or as a definitive conclusion to be reached, but rather as possible understandings to reopen new and generative instances of thinking about TPD under different contexts in different spaces. In other words, we aim at interpreting other possible discourses of TPD than simply describing their difficulties.

## 3. Results and Discussion

### 3.1. Teachers' ideas about TPD

In this section, we present teachers' ideas about TPD and the reasons why they engaged in TPD. These two aspects are important to help us understand where the tensions and dilemmas (which will be presented in the next section) arise. While all the participants serve in the Singapore school system, they differ slightly in what they think TPD should focus on. The participant teachers' ideas of TPD are generally visible and closely coupled with their school practices. When asked for their idea of TPD, all of them made some reference to improving themselves. The areas that they identified for improvement include (1) content knowledge in the discipline that they teach, (2) pedagogical skills, (3) teaching skills to enable them to better engage and motivate their pupils, and less commonly (4) different ways of doing things. It was interesting to note that they hardly made reference to notion such as developing teacher identity or notions such as increasing the professional image of teachers as part of TPD. One teacher (Mr H) sums up the diversity of perspective very well – *“Professional development is very broad, all encapsulating sort of idea.”*

Despite having diverse ideas about what TPD is, all the 14 teachers recognized the importance of TPD in their practices. Reasons cited for engaging in TPD include:

1. keeping their discipline knowledge current

*“Gaining new knowledge, skills, competencies, that is obviously the fundamental reason why teachers want to develop themselves.” (Mr H)*

*“skills obviously pedagogical skills, knowledge because the subject that I am teaching is a very dynamic so the information becomes obsolete, knowledge becomes obsolete very quickly, and hence really a lot of time is spent on, development in terms of the knowledge.” (Ms AY)*

2. staying abreast of the latest changes in educational landscape through networking

*“In schools, I really feel that we are in a in a tortoise shell. If I, if I can quote like that. I wouldn't know what's going on if I don't upgrade myself. I need to go out and talk to at least the other heads in my subject to know what's going on.” (Mr K)*

*“By going for professional development, you get to see and interact with people of the same interest, of the same, uh, of the same capability or the same industry and you get to learn from them and network and ultimately reflect where you stand in this area, where does the school stand where does the company stand in this competitive world.” (Mr J)*

*“The other is networking that I think. Finding out about how different institutions do different things, or do the same, do the same things differently and how you can actually apply that to your new learning and apply it to your school and do things differently” (Mr XR)*

3. role modelling life-long learning

*"to recognise that learning is a life-long thing, and as much as you are a role model for your students." (Ms F)*  
*"role model this thing as a, this thing, I mean this idea of a life-long learner. Because if we teachers stop learning, then, it seems hypocritical to go to tell our students that they need to learn, because we ourselves have stopped to learn." (Mr N)*

4. motivating themselves to stay passionate in teaching

*"Because I want to stay motivated. I want to make sure that when I leave this career I want to feel, I want to feel fulfilled, I want to feel my journey counts for something." (Ms N)*

5. fulfilling their responsibility of being professional

*"so I feel it is a responsibility as a professional teacher to participate in professionalizing activities. Whether it is training, whether it is studying, whether it is workshop, whether it is conferences, I think it is a responsibility." (Ms KK)*

*"my students will be shortchanged, and I don't think I've done enough for myself for the students and the school." (Mr K)*

### 3.2. Tensions and dilemmas

During the interviews with the participant teachers, it was evident that the teachers' experiences with TPD were not free from difficulty decision making. During the dialogue, teachers showed that they were cognizant of expectations by administrators, peers and students for them to develop professionally. Yet, they were also aware of what their personal capacity and interests are with regard to their professional practices and growth. We surfaced the notion of tensions and dilemmas as we noticed the high frequency (average of 38 times per interview with the highest frequency of 80 times usage) of use of speech tags such as "but". We argue here that the usage of "but" is indicative of the participants' attempts to justify their decisions/ideas with the knowledge that there are alternative views or expectations that they are unable to fulfil. We present the tensions and dilemmas that surfaced using a dualistic format to illustrate how dichotomous perspectives, when present can potentially be problematic.

**Individual needs versus organisational needs.** The question that demands an answer here is whether TPD should serve individual needs or the needs of the organisation. Theoretically, these two need not be antagonistic but a balance can be achieved. However, in reality, when these are not in sync, tensions or dilemmas arise. For example, if the school culture is to strongly encourage teachers to engage in TPD, and if a teacher is not willing to do so, then there will be a clash between individual needs and that of the organisation. Alternatively, if a teacher does not identify with a particular way of teaching and the school is embarking on a new curricular innovation using the specific framework, then a potential tension arises when TPD is set up. Another issue that is raised showed that teachers think about personal benefits when attending TPD and these personal benefits may or may not be aligned to the goals of the organisation.

*"...ton of bricks falling on my head because sometimes you are forced to go to a course which you think is ridiculous and useless but you have to go because your head or your principal or MOE says you must go. (Ms FE)"*

*"prevents teachers from attending TPD, could be.. there's a lack, probably be a lack of culture, lack of encouragement from the middle management for such teachers to attend TPD. Firstly, because middle management may not believe in these pedagogies. Secondly, there- there could be, high stake assessments involved, so in terms of the short term priorities is really to ensure that students are equipped with the skills and relevant contents to handle national examinations." (Mr XR)*

*"because we are very pragmatic, we have a value to things that we do. At this stage of your life, is it worth it to go for this, what value would it add to your promotion?" (Ms KK)*

*"whatever professional development that they are interested in may not benefit them. Some do look at promotions. So as long as it doesn't not help them in their promotions then they may not want to be engaged in that area of professional development. They rather spend time doing something that brings them gains in that way." (Ms P)*

Some teachers like to be empowered to decide *when* and *what* types professional development to attend. As such, administrators may need to consider taking into consideration teachers' preferences into account when designing TPD opportunities. What are some platforms that can be made available for teachers' needs and preferences to be made visible? Is there a comprehensive range of TPD activities that teachers can choose from? AST emphasises the concept of teacher ownership of learning as well as the responsibility to lead others in learning. Teachers may have interests that are unique and does not match all the TPD opportunities that are presented to them. As such, these teachers have to decide if they should engage in TPD simply

to fulfil their TPD requirement or if they should wait until the right opportunities come along. Ownership of learning comes with responsibility on the part of the teacher to also take organisational needs and students' interest into consideration. These interacting factors need to be aligned to ensure that tensions do not arise.

*"I only choose course that give me additional value, and differentiates me from other teachers. Something that is not so conventional." (Mr XR)*

**Responsibility to stay current versus being there for students' learning.** This dilemma is the most obvious one mentioned by all the teachers. They seemed to be constantly torn between developing (or not developing) themselves for the students. Their main concern is that being away from the classroom will have a negative impact on students' learning. Hence, the question raised here is whether a teacher should be taken out of classroom so that they can attend to their professional development. What is the balance to achieve between disruption to students' learning and teachers' professional development? Research is also not able to offer any solutions to this issue since it is difficult to establish the cause-and-effect relationship between the inputs of TPD and the resultant change in teachers (Nicol & Turner-Bisset, 2006). As such, it is often difficult to justify taking teachers away from classes to attend TPD since the evidence for effectiveness is often weak. The discussion of this dilemma ultimately points to the timing of TPD activities. However, the teachers in the interview also were not able to agree on when TPD will be ideal. Teachers cited tiredness after school hours or need to spend time with family members during school vacations as reasons for not having TPD activities during these times.

*"I'll look at time, as well as whether it fits into my schedule. There are many many courses and workshops which I am interested in but unfortunately it doesn't fit into my schedule, alright, because you know, you can't be away for too long and I don't want to miss too many classes otherwise, you know, you have problems with catching up with students." (Mr XR)*

*"Let's face it, a teacher cannot teach well if he or she is away from class." (Mr J)*

*"...but if you attend too many hours of training at the expense of your students, I think a teacher needs to draw the line somewhere." (Mr XR)*

**Compulsory professional development versus voluntary on need basis.** As presented earlier, TPD is non mandatory in Singapore although it is encouraged. There are views that TPD should be made compulsory so that teachers stay current and relevant to their profession. Others think that compulsory professional development enables teachers to have a greater awareness of the other fields of knowledge that might be helpful for teaching. Yet others think that the notion of licensing as a requirement for teaching re-certification would increase the competencies of teachers. The idea of compulsory professional development has far reaching implications of funding and time for TPD to take place. While some teachers impose on themselves to engage in TPD to ensure that they are current in their knowledge, others engage in TPD only if they can find time to do so. This results in a highly heterogeneous state where some teachers are excessively engaged in TPD while some never attempted to participate in any TPD actively.

*"So I feel it's a responsibility to professionalize. At different points of your career. It's not something where, should I do it, should I not do it, etc. I feel that I wouldn't be surprised a few years down the road where it is something where, this is your 3<sup>rd</sup> year, okay off you go. This is your 5<sup>th</sup> year, off you go. Because, information content knowledge, is already shifting and so fluid. We need to keep on engaging with it at different points to keep ourselves current. To keep ourselves credible." (Ms KK)*

*"But in Singapore, a 19 year old can go into a school and do relief teaching, which is an insult to our profession. Which means what? What is the message that they are sending? That anybody can come to a class to, to keep a class quiet, as long as we allow relief teachers to enter a classroom, to teach with no experience at all – just fresh from high school, we are not considered professional." (Ms FE)*

*"all the courses I go through, I realise that teaching is a very complex process, and you really need to have a lot of skills. And these skills cannot be acquired in one day. Like a one, two day course, you know." (Ms FE)*

#### 4.Implications of Study

Teaching is nestled within a complex ecology of people, policies, systems, social practices and social norms. As such, as teachers progress in their teaching profession, they need to be cognisant of the various factors that influence their actions and

decisions in the classroom. Consequently, the complexities of teaching are mapped onto teacher education and TPD. The noble task for developing a teacher professionally is also faced with tensions and dilemmas. In this paper, we presented five reasons for teachers engaging in TPD – (1) keeping discipline knowledge current, (2) staying abreast of the latest changes in educational landscape through networking with other like-minded teachers, (3) role modeling life-long learning, (4) motivating themselves to stay passionate in teaching, and (5) fulfilling the responsibility of being a professional. These reasons cited for engaging in professional development are both cognitive as well as affective. Teachers are well aware of areas that they need to develop and grow and at the same time are also aware that improvements in cognitive domain can potentially enhance their motivation and passion in their jobs. This is aligned to what Avalos (2011) defined in her review of professional development research in 10 years from 2000 to 2010 that professional development is a complex process that engages both cognitive as well as the emotional domain of teachers, both individually as well as collectively. Knowing that teachers can possibly be motivated through enhancing their practices through TPD, perhaps there ought to be more concerted effort in TPD activities to connect the learning to improving and applications in the classrooms. This way, teachers will not feel that the time and resources spent on TPD is wasted.

With reference to the second research question, we presented tensions and dilemmas in three inter-related areas of – (1) individual needs versus organizational needs, (2) responsibility to attend TPB versus being in school for students' learning, and (3) compulsory professional development versus voluntary professional development. These areas are flagged because of the “embedded or situated nature of TPD and development” (Avalos, 2011). Factors that affect TPD can occur within the school environment and culture and this is further mapped on to how educational systems and policies work. The dialectical toggle between individual growth and organization development, between the quest for individual uniqueness and being moulded to be “like a teacher”, between being an informed and absent teacher and a less informed and present teacher are all struggles that teachers face and experience as they make the seemingly simple decision of being engaged in officially planned TPD activities. Administrators and policy makers need to be aware of the struggles faced by teachers in TPD and be able to provide a platform for teachers to articulate their concerns and struggles without the fears of being judged.

## Acknowledgements

This work is supported by a grant (OER24/12/CCH) from the Office of Educational Research (OER) in the National Institute of Education (NIE). Any opinions, findings, conclusions, or recommendations expressed in this publication are those of the authors and do not necessarily reflect the position, policy, or endorsement of the funding agency.

The authors acknowledge the contribution of research team members Ms Sara Joiko and Mr David Han for transcribing the interviews. The authors especially thank the teachers who participated in the research.

## Türkiye'de yüksek din eğitiminin kurumsallaşma süreci

Şeref GÖKÜŞ\*\*\*\*\*

*Akdeniz Üniversitesi Dumlupınar Bulvarı 07058 Kampus Antalya / TÜRKİYE*

### Abstract

The institutionalization of religious higher education in Turkey is a complex process that emerged rather late and was frequently disrupted. This paper deals with this process following its historic traces starting from the Law of Integration of Education unto now. In 1924 with announcement of the Law of Integration of Education, all madrasas were shut down and a brand new theology faculty was launched within the body of Darulfunun (the University). Like others previously, this was a new start but came with its own problems, created new unexpected and unresolved hurdles with several disruptions. The paper will try to make a comprehensive evaluation by covering the positive developments throughout the process, the underlying reasons for the delay or disruption of the process of institutionalization, how the problems faced were resolved, the significant people who contributed to the process and the present status of religious higher education.

**Keywords:** Religious higher education; the Law of the Integration of Education; Tanzimat; Darulfunun; institutionalization.

### Giriş

Yirminci yüzyılın sonlarına kadar Osmanlı İmparatorluğu'nda yapılan yüksek din eğitim-öğretimi sadece medreseler aracılığıyla yürütülüyordu. Fatih Sultan Mehmet ve Kanuni Sultan Süleyman dönemlerinde en şaşalı günlerini geçiren bu kurumlar, bu süreçten sonra, idari yapıları, ders programları, müderrisleri, öğrencileri ve fiziki özelliklerinde yaşanan bazı olumsuzluklar neticesinde yavaş yavaş gerilemeye ve eski önemlerini yitirmeye başladılar. Her ne kadar medreselerin bu kötü gidişatını durdurmak için III. Murat, III. Mehmed ve I. Ahmed dönemlerinde bazı ıslahat çalışmaları yapılmış olsa da, istenen olumlu sonuç bir türlü alınamadı. Neticesinde ise bu kurumlar hem bireylerin hem toplumun hem de devletin isteklerine cevap veremez bir hale gelmişlerdir (Bkz. Atay, 1983: 133-155).

Tanzimat'ın ilanıyla birlikte başlayan batılulaşma veyahut modernleşme hareketleri neticesinde eğitim-öğretimdeki geleneksel anlayış yavaş yavaş terk edildi. Bu dönemde medreselerin yanında modern eğitim-öğretim yapan yeni okullar açıldı. Açılan bu yeni okullarla birlikte medreseler, zamanla devletin adli ve idari elemanlarını yetiştiren bir eğitim-öğretimi kurumu olmaktan çıkarak, daha çok, din eğitim-öğretiminin icra edildiği bir yapıya dönüştü. Aslına bakılırsa bu durum bize, Tanzimat'la şekillenen bu yeni dönemde, eğitim-öğretim konusunda takip edilen iki genel yaklaşımın ipuçlarını da vermektedir. Bu yaklaşımlardan birincisi geleneksel olarak varlığını devam ettiren eğitim-öğretim kurumlarının ıslahı; ikincisi ise bu geleneksel yapı karşısında yeni eğitim-öğretim müesseselerinin tesis edilmesidir. Başlangıçta birbiri ile paralel bir şekilde devam eden bu bakış açıları kısa bir süre sonra bozulmuş; medreselerdeki ıslah çalışmaları gerilerken diğer okullardaki yenileşme faaliyetleri ise daha hızlı bir seyir izlemiştir. Nitekim II. Abdülhamit dönemine kadar medreselerle ilgili birkaç ufak ıslahat girişimi dışında başka herhangi ciddi bir çalışmanın yapılmadığını görmekteyiz (Zengin, 2002: 15-28; Bilgin-Selçuk, 1997: 7-11; Doğan, 1998: 410-431).

II. Abdülhamit'in tahta geçmesiyle birlikte, o ana kadar açılan Batı tarzındaki ilk ve orta dereceli okulların dışında, yeni bir yükseköğretim kurumunun teşkil edilmesi için ciddi girişimlerde bulunuldu. Bu girişimler neticesinde 1863 yılında ilk defa İstanbul'da eğitim-öğretim faaliyetine başlayan bu yeni üniversite (Darülfünun), yaşanan bazı olumsuzluklar nedeniyle, birkaç kez açılıp-kapandı. 1900 yılında tekrarlanan üçüncü denemede Darülfünun-ı Şahane ismiyle yeniden eğitim-öğretime başlayan üniversitede Ulûm-ı Âliye-i Diniye, Ulûm-ı Riyaziye ve Ulûm-ı Edebiye adı altında üç farklı şube bulunuyordu (Zengin, 2009: 53-167). Ulûm-ı Âliye-i Diniye şubesinin açılmasıyla birlikte medresede yapılan yüksek din eğitim-öğretimi, 1914 yılında hazırlanan Islâh-ı Medâris Nizamnâmesi'ne binaen kurulan Dârü'l-Hilâfeti'l Âliye Medresesi'nin teşkiline kadar, kısmen Darülfünun'un bünyesine geçti. Ancak bu yeni medresenin tesisiyle Darülfünun'daki Ulûm-ı Şer'iye (Ulûm-ı Âliye-i Diniye şubesinin yeni adı) şubesi eski fonksiyonunu icra edemediği için kapandı. Akabinde İstanbul Darülfünun'u için hazırlanan 1919 tarihli nizamnamede yüksek din eğitim-öğretimi ile ilgili herhangi bir şubeye yer verilmemiş ve böylece bu süreç Tevhid-i Tedrisat'ın ilanına kadar devam etmiştir (Buyrukçu, 2011: 88-94).

### 1. Tevhid-i Tedrisat Kanunu'nun İlanı ve Darülfünun İlahiyat Fakültesinin Kurulması

Tevhid-i Tedrisat Kanunu'nun ilan edilmesiyle birlikte Tanzimat Dönemi'nden itibaren başlayan ve II. Meşrutiyet

Dönemi'nde de devam eden eğitimdeki bu karmaşa ortadan kaldırıldı. 3 Mart 1924 tarihli bu Kanunun ilk üç maddesine binaen bir yandan ülke sınırları içerisinde bulunan resmi ve özel bütün eğitim-öğretim kurumları Maarif Vekaleti'ne (Milli Eğitim Bakanlığı) bağlanıp tek çatı altında birleştirilirken diğer yandan birleştirilen bu kurumlara ait bütçeler üzerindeki yönetim ve denetim yetkisi de yine Maarif Vekaleti'nin (Milli Eğitim Bakanlığı) emrine bırakıldı. Aynı kanunun 4. maddesinde ise Maarif Vekaleti'ne (Milli Eğitim Bakanlığı) ülkenin ihtiyacı olan “yüksek diniyat mütehasşısı yetiştirmek üzere Darülfünun'da bir ilahiyat fakültesi tesis” (TBMM Zabıt Ceridesi, 1340: 26) etme yetkisi verilmiştir.

Bu yetkiden hareketle 21 Nisan 1924 tarihli ve 493 sayılı İstanbul Darülfünununun Şahsiyeti Hükmiyesi Hakkında Kanun'un birinci maddesi ile bu kanun hükümlerine binaen yayınlanan 7 İlkteşrin 1925 tarihli Darülfünun Talimatnamesi'nin birinci maddesinde Darülfünun'da kurulan beş fakülteden biri olarak ismi zikredilen İlahiyat Fakültesi 1924 yılının Nisan ayında üç yıl süreli olarak eğitim-öğretime başlamıştır (Ayhan, 1999: 41). Eğitim-öğretime yeni başlayan bu fakültedeki müfredat programı ise Tefsir ve Tefsir Tarihi, Hadis ve Hadis Tarihi, Fıkıh Tarihi, İctimaiyat, Ahlak, Dini-i İslam Tarihi, Arap Edebiyatı, Felsefe-i Din, Kelam Tarihi, İslam Feylesofları, Tasavvuf Tarihi, Felsefe Tarihi, İslam Bediiyatı, Halihazırda İslam Mezhepleri, Akvam-ı İslamiye Etnografyası, Türk Tarih-i Dinisi, Tarih-i Edyân (Zengin, 2011: 139-144) gibi derslerden oluşuyordu.

Darü'l-Hilafeti'l-Âliye medreselerinin yüksek kısımları ile Medresetü'l-Mütehassisin/Medrese-i Süleymaniye'de tahsil gören yaklaşık 400'e yakın talebe müfredat programı bu şekilde belirlenen yeni fakültenin bünyesine alındı. Ahmet Hamdi Akseki'ye göre alınan bu talebeler “Arapça ve âli tahsillerini bitirmiş, müsbet ilimleri, garp ve şark felsefelerini görmüş, garp dillerinden laakal birini okumuş gençlerdir.” (Akseki, 2001: 143). Bunun yanında Darülfünun İlahiyat Fakültesi'nde ders veren Mehmet Ali Ayni, İsmail Hakkı Baltacıoğlu, Şemsettin Günaltay, Fuat Köprülü, Babanzade Ahmet Naim, M. Şerefeddin Yaltkaya ve Yusuf Ziya Yörükân gibi öğretim elemanları da dönemin en tanınmış ilmi şahsiyetlerindendi.

Darülfünun ilahiyat fakültesinin kuruluş aşamasındaki bu olumlu şartlarının yanında; müfredat programının amacı, programdaki dersler ve bu derslerin içeriği, pedagojik formasyon derslerinin programda yer almaması, fakülte talebelerinin iaşeleri ve mezun olan öğrencilerin mesleki anlamda yeterli olup-olmadıkları vb. ile ilgili yaşanan bazı tartışmalardan dolayı fakültenin öğrenci sayısında kademe kademe bir düşüş yaşanmıştır. Tabi bunda batılı bir bilim adamı olan Albert Malche'nin İlahiyat Fakültesi hakkında hazırladığı olumsuz rapor ile dönemin siyasi iradesinin bu okullara olan negatif bakış açısının da katkısı olduğunu söylemek mümkündür (Doğan, 1999: 261-268). Yoksa dönemin aydınları tarafından sıkça dile getirilen Darülfünun İlahiyat Fakültesi'nin öğrenci yetersizliğinden dolayı kapandığını söylemek daha doğrusu kapanma nedenini sadece tek bir sebebe indirmek çok doğru bir yaklaşım değildir.

Bütün bu olumsuz gelişmelere binaen 1933 yılında yapılan üniversite reformuyla Darülfünun kapatılmış; yerine İstanbul Üniversitesi ihdas edilmiştir. 2252 sayılı kanunla kurulan bu yeni üniversitede doğrudan bir İlahiyat fakültesine yer verilmezken; onun yerine Edebiyat Fakültesinin Şarkiyat Enstitüsüne bağlı bir İslam Tetkikleri Enstitüsü tesis edilmiştir. Ancak bu enstitüye kayıt yaptırmak isteyen öğrencilere izin verilmemiştir. Çünkü Edebiyat Fakültesi meclisinin 1936 yılında aldığı bir karara göre İslam tetkikleri Enstitüsü bir bölüm olarak kabul edilmemiş; sadece araştırma yapılan bir enstitü olduğundan söz edilerek mevcut haliyle buraya herhangi bir öğrenci kaydının yapılamayacağına karar verilmiştir. Böylece Tevhid-i Tedrisat'la kurulan ve 9 yıl varlığını devam ettiren Darülfünun İlahiyat Fakültesi fiilen kapanmıştır (Bahçekapılı, 2012: 143; Aydın, 2000: 45-49; Çelik, 2013: 59-61). Aslına bakılırsa bu durum sadece yüksek din öğretiminde yaşanan olumsuz bir süreç değildir. Nitekim diğer örgün eğitim kurumlarından din derslerinin kaldırılması da, genel olarak, 1930 yılından itibaren uygulamaya konulmuştur.

## **2. 1940-1982 Yılları Arasında Yüksek Din Eğitimiyle İlgili Gelişmeler**

Yaşanan bu gelişmeler neticesinde hem bireysel hem toplumsal anlamda halkın din eğitim ihtiyacının giderilememesi hem de yeteri kadar din görevlisinin yetiştirilememesi 1940 yılından itibaren kademe kademe bu meselenin tekrar gündeme getirilmesine neden oldu. Tabi bunun yanında İkinci Dünya Savaşı ve akabinde ortaya çıkan fikir akımlarının Türk toplumu üzerindeki olumsuz etkilerini de bu nedenler arasında saymak gerekir. Hatta yaşanan bu süreçte Bilgi'nin (1980: 49) de dediği gibi “artık dinin elden gitmekte olduğuna hükmedilmiş, elde kalana gerçek ile hurafe ayırt edilmeksizin kuvvetle bağlanan bir devreye girilmiştir.”

Bu olumsuz devrenin neticesinde başlayan yeni tartışmalardaki sürecin ilk somut çalışması 15-21 Şubat 1943 tarihli “İkinci Maarif Şurası”nda alınan her kademedeki örgün eğitim kurumlarında yapılması gereken ahlak eğitimiyle ilgili kararlardır. Söz konusu kararların dayandığı ahlak ilkelerine baktığımızda okullardaki ahlak eğitiminin amacının kendi kültürünü tanıyan ama aynı zamanda gelişmiş toplumlardaki yüksek ahlaki değerlerin de farkında olan; kendine ve başka bireylere hürmet gösteren; onurlu ve şahsiyet sahibi insanlar yetiştirmek olduğu görülmektedir (Maarif Vekilliği, 1991: 104). Kanaatimizce Şura'da alınan bu kararlar din eğitiminin 1924 yılından itibaren devlet eliyle yürütülmesi düşüncesine tekrar bir geri dönüş isteğini yansıtmaları bakımından ayrı bir öneme sahiptir. Nitekim dört yıl sonra Türkiye Büyük Millet Meclisi'ndeki Aralık ayı toplantılarında din eğitim ve öğretimiyle ilgili milletvekilleri arasında çok ciddi tartışmalar yaşanmasını da bu düşüncenin en belirgin göstergesi olarak kabul etmek gerekir.

TBMM'nde cereyan eden bu tartışmaların yanında, Cumhuriyet Halk Partisi'nin 1947 yılında yaptığı 7. Kurultay toplantısında yer alan komisyon üyeleri tarafından din eğitim-öğretiminin geleceğinin nasıl olması gerektiği üzerinde de benzer tartışmalar yaşanmıştır. Kurultayda yer alan bazı parti delegeleri ile bazı milletvekilleri okullarda din eğitim ve öğretimine yer verilmesinin laiklik ilkesine aykırı olmadığını aksine mevcut durumun ve halkın din eğitim-öğretime ihtiyacının itiraz götüremeyecek derecede elzem bir konu olduğu üzerinde görüş belirtmişlerdir. Bu konuda olumlu görüş belirten ve kurultaydaki en uzun konuşmayı yapan kişi Hamdullah Suphi Tanrıöver'dir. Tanrıöver, konuşmasında konuyla ilgili hem tarihi hem hukuki hem de sosyal hususlara değinip birçok örneğe yer vererek açıklamalarını ilmi bir zemine oturtmaya gayret etmiştir. Cemil Sait Barlas, Behçet Kemal Çağlar ve Tahsin Banguoğlu ise din eğitim-öğretiminin gerekliliğini kabul etmelerine karşılık, bu eğitimin resmi

okullar yerine özel okullar aracılığıyla yerine getirilmesi ve okullarda yapılması istenilen din eğitim-öğretiminin laiklik ilkesini zedelememesi gerektiği hususlarında ise Tanrıöver'den ayrı bir görüşe sahiptirler. Ancak kurultaydaki delegeler ile milletvekillerinin büyük bir çoğunluğunun din eğitim ve öğretimi konusuna olumlu yaklaşımları neticesinde dönemin hükümetine, bu konulara ait, bazı tavsiyelerde bulunulduğunu görüyoruz. İlkokullarda din eğitim ve öğretimine yer verilmesi ve imam-hatip okullarının açılması gibi tavsiyelerin yanında bildirimizi de doğrudan ilgilendiren üniversitelerde İlahiyat Fakültelerinin yeniden kurulması da söz konusu kararlar arasında yer almaktadır (Ayhan, 1999: 91-111)

### **2.1. Ankara Üniversitesi İlahiyat Fakültesi**

Cumhuriyet Halk Partisi'nin 7. Kurultayında yüksek din eğitimiyle ilgili alınan bu tavsiye kararı ancak 1949 yılında uygulama imkanı bulabildi. Bu amaçla ilgili ilk resmi girişimi Van Milletvekili İbrahim Arvas (TBMM Tutanak Dergisi, 1948: 22-23) ile Konya Milletvekili Fatin Gökmen ve arkadaşlarının (TBMM Tutanak Dergisi, 1948: 3) yaptığı bilinmektedir. Nitekim bu milletvekilleri 14 Ocak ve 2 Şubat 1948'de TBMM'ne sundukları kanun tasarılarında "...üniversitede İlahiyat Fakültesinin/Yüksek Din Okullarının açılması..." için gerekli görüşmelerin yapılmasını istemektedirler. Milletvekillerinin ilgili kanun tasarıları meclise sunulduğu andan itibaren ciddi bir şekilde tartışıldı. Bu tartışmalar daha çok açılacak olan fakültenin hangi üniversiteye bağlı olacağı ile fakültenin isminin ne olması gerektiği üzerindedir. Söz konusu tartışmalarda fakültenin isminin "İslam İlahiyat Fakültesi" veya "Türk İslam İlahiyat Fakültesi" olması ile ya Ankara ya da İstanbul üniversitesi bünyesinde kurulması gerektiğine dair öneriler ortaya atıldı. Hatta bu tartışmalara dönemin Diyanet İşleri Başkanı Ahmed Hamdi Akseki de katılarak ilgili konulardaki görüşlerini beyan etti. Akseki'ye göre kurulacak yeni fakülte "İslam İlahiyat Fakültesi" olmalı ve fakültenin ders programları da buna göre dizayn edilmelidir (Ayhan, 1999: 211-213).

Üniversitede açılması düşünülen bu yeni fakülteyle ilgili Milletvekilleri ile Diyanet İşleri Başkanlığı'ndan gelen önerilere rağmen dönemin hükümetinden meclise gelen tasarı ve akabinde TBMM'nde kabul edilen kanunla Ankara Üniversitesi bünyesinde yeni bir İlahiyat Fakültesi kurulmuştur. Dönemin Başbakanı Şemsettin Günaltay tarafından Türkiye Büyük Millet Meclisi'ne sunulan Ankara Üniversitesi İlahiyat Fakültesi hakkındaki kanun tasarısının gerekçesi: "Din meselelerinin sağlam ve ilmi esaslara göre incelenmesini mümkün kılmak, mesleki bilgisi kuvvetli ve düşüncesinde ihatalı din adamlarının yetiştirilmesi için lüzumlu şartları sağlamak maksadıyla memleketimizde de garptaki örneklerine benzer bir İlahiyat fakültesinin kurulmasını kararlaştıran Ankara Üniversitesi Senatosu, bu fakültenin şimdilik geniş tutulmasında zaruret olmayan kadrolarını ilişik cetvelde görüldüğü şekilde tespit etmiştir..." (Koştaş, 1989: 8'den aynen alıntı) şeklindedir.

Ankara Üniversitesi Kuruluş Kadroları hakkındaki 5239 sayılı Kanuna ek Kanun olarak sunulan bu kanun TBMM tarafından 4 Haziran 1949 tarihinde kabul edildi (TBMM Tutanak Dergisi, 1949: 284). Mecliste kabul edilen bu kanuna binaen 21 Kasım 1949 tarihinde açılan Ankara Üniversitesi İlahiyat Fakültesi'nin 1949-1950 yılındaki ders programı Arapça, Farsça, Yabancı dil, Sosyoloji, Mantık ve İlimler Felsefesi, İslam Dini ve Mezhepleri Tarihi, İslam Sanatı Tarihi ve Mukayeseli Dinler Tarihi'nden ibaretti. Dört yıllık bir programla eğitim-öğretime başlayan fakültenin ders programında ikinci yıl Hadis Usulü, İslam'da İlimler Tarihi ve Din Psikolojisi derslerine yer verilirken Sosyoloji dersi ise programdan kaldırılmıştır. 1953-1954 yılında ders programlarında yeni bir düzenleme yapılan fakültede, 1972-1973 yılından itibaren beş yıllık bir fakülteye dönüştüğü için ilk üç yılında daha çok dil eğitimine önem verilirken; son iki yılda ise "Tefsir ve Hadis Bölümü" ile "Kelam ve İslam Felsefesi Bölümü" şeklinde bir alanda uzmanlaşmaya yönelik bir eğitim sistemi takip edilmiştir (Koştaş, 1999: 151-158).

Ders programları bu şekilde belirlenen fakültenin öğretim kadrosunu oluşturmak için Ankara Üniversitesi Rektörü Hikmet Birand başkanlığında hem İstanbul hem de Ankara'da bulunan bazı üniversitedeki hocalardan bir komisyon kuruldu. Hilmi Ziya Ülken, Mükrimin Halil Yinanç, Esad Arsebük ve Şinasi Altındağ'dan oluşan bu komisyon yaptığı çalışmalar neticesinde ilahiyat fakültesindeki yeni öğretim kadrosunu seçtiler. Yusuf Ziya Yörükân, Esad Arsebük, Hilmi Ömer Budda, Remzi Oğuz ve M. Tayyip Okiç gibi dönemin önemli ilim adamlarından oluşan bu yeni kadronun aynı zamanda İlahiyat Fakültesi'nin ilk kurucu öğretim üyeleri olarak da kabul edilmesi gerekir (Ayhan, 1999: 261-264).

### **2.2. Yüksek İslam Enstitüleri**

Ülkemizde yüksek din eğitime paralel olarak ilkokul ve ortaokullarda din derslerine yer verilmesi; akabinde imam-hatip okullarının açılması ve bu okullara yönelik toplumun ilgisinin çoğalması nedeniyle Ankara İlahiyat Fakültesi mezunları bu okullardaki öğretmen ihtiyacını karşılayamadılar. Bununla beraber halihazırda tek olan İlahiyat Fakültesi'ne sadece lise mezunu olan öğrenciler başvurabilirken imam-hatip okulu mezunu öğrenciler ise tercih yapamıyorlardı. Lise mezuniyeti sonrasında böylesi olumsuz bir durumun yaşanması mevcut İlahiyat Fakültesi dışında yeni bir yüksek din eğitimi kurumunun ortaya çıkmasına neden oldu. Neticede bu amaçla 1959-1960 yılında İstanbul'da ilk Yüksek İslam Enstitüsü açıldı. Öğrenim süresi dört yıl olan bu yeni fakülteye sadece imam-hatip okulu mezunu öğrenciler alınıyordu. 1961 tarihli "Yüksek İslam Enstitüleri Yönetmeliği"nde bu okulların açılış amacı: "Yüksek İslam Enstitüsü, İslam dininin esaslarına sadık kalarak müspet ilim ışığı altında İslam ilimlerini ve bunlara yardımcı ilimleri öğreterek İmam-hatip okullarıyla ilköğretim okulları ve diğer ortaöğretim müesseselerine öğretmen yetiştirmek ve aynı okullardaki din dersleri öğretmenlerinin mesleki gelişimlerine yardım etmek suretiyle Milli Eğitim Bakanlığı'na kurulmuş bir yüksek okuldur. Bu müessese Milli Eğitim Bakanlığı'nın ihtiyaçları dışında Diyanet İşleri teşkilatına müftü, vaiz vb din elemanları yetiştirmekle de vazifelidir" (Cebeci, 1996: 167'den aynen alıntı) şeklinde ifade edilmektedir.

Kuruluş amacı bu şekilde belirlenen Yüksek İslam Enstitüleri'nin kurumsallaşma süreci 1980 yılına kadar hızlı bir şekilde devam etmiştir. İstanbul Yüksek İslam Enstitüsü'nden sonra sırasıyla 1962-1963'de Konya'da, 1965-1966'da Kayseri'de, 1966-1967'de İzmir'de, 1969-1970'de Erzurum'da, 1975-1976'da Bursa'da, 1976-1977'de Samsun'da ve 1979-1980'de de Yozgat'ta olmak üzere toplamda sekiz Yüksek İslam Enstitüsü daha açılmıştır. Ancak bunlardan Yozgat Yüksek İslam Enstitüsü açıldıktan

kısa bir süre sonra kapanmıştır (Aydın, 2000: 106-107).

Yüksek İslam Enstitülerinin temel görevi mevcut örgün eğitim kurumlarının öğretmen ihtiyacını karşılamak olmasına rağmen; 1959 yılından 1972 yılına kadar takip edilen ders programlarında pedagojik formasyon dersleri yoktur. 1959-1960 öğretim yılından itibaren uygulamaya konulan ders programı 1972 yılında yürürlüğe giren yeni Yüksek İslam Enstitü Yönetmeliği çerçevesinde tekrar gözden geçirilmiş ve 1972-1973 öğretim yılından itibaren yeni ders programında eğitim psikolojisi, ruh sağlığı ve rehberlik, ölçme ve değerlendirme, eğitim sosyolojisi ve öğretim bilgisi gibi pedagojik formasyon derslerine yer verilmiştir. Yüksek İslam Enstitüleriyle ilgili 19.02.1979 tarihli ve 2021 sayılı Milli Eğitim Bakanlığı Tebliğler Dergisi'nde yayınlanarak yürürlüğe giren son ders programına göre öğrenciler ilk iki sınıfta ortak dersler alırken üç ve dördüncü sınıfta ise "Tefsir-Hadis", "Fıkıh-Kelam" ve "İslam Dini ve Esasları" bölümlerinden herhangi birini tercih edebiliyorlardı (Buyrukçu, 2007: 94-102; Bahçekapılı, 2012: 143-145).

### 2.3. Atatürk Üniversitesi İslami İlimler Fakültesi

Ankara İlahiyat Fakültesi ile Yüksek İslam Enstitüleri yanında, 1972 yılında, Erzurum'da kurulan bir diğer yüksek din eğitimi kurumu Atatürk Üniversitesi İslami İlimler Fakültesi'dir. 1971-1972 öğretim yılından itibaren öğrenci almaya başlayan bu fakülte daha önce kurulan İlahiyat ile Yüksek İslam Enstitülerinden farklı olarak hem imam-hatip hem de diğer liselerden mezun olan öğrencilerin okumasına imkan tanıyordu. Öğrenim süresi beş yıl olan fakültenin kuruluş amacı "İslami ilimlere ve Türk kültürüne vakıf ve bu alanlarda araştırma, inceleme yapabilecek elemanlar yetiştirmek ve bu alanda araştırmalar yapmaktır" şeklinde ifade edilmektedir. Belirlenen bu amaç doğrultusunda eğitim-öğretime başlayan fakültenin 1971-1972 yılındaki ders programı 1. ve 2. sınıflarda ortak bir eğitimi öngörürken; 3, 4 ve 5. sınıflarda ise "Tefsir ve Hadis", "Kelam ve İslam Felsefesi", "Fıkıh ve İslam Hukuku" ile "İslam Dili ve Edebiyatları" olmak üzere 4 farklı bölümden müteşekkildi. Ancak mevcut program bazı aksayan yönleri nedeniyle henüz mezun vermeden değiştirilmiştir. Akabinde ise 2.8.1975 tarihli ve 15314 sayılı Resmi Gazete'de yayınlanarak yürürlüğe giren ve 1975-1976 öğretim yılından itibaren uygulanan yeni ders programında ilk üç yılda ortak bir eğitim yapılırken 4 ve 5. sınıflarda ise daha önce dört olan bölüm sayısı "Tefsir ve Hadis" ile "Kelam ve İslam Felsefesi" bölümü şeklinde ikiye indirilmiştir.

Programlardaki aşırı yığılma, ders çeşidi ile fakültedeki bölümlerin sayısının çok olması ve derse giren öğretim elemanlarının program üzerindeki eleştirileri ile mezun öğrencilerin işe girme sürecinde yaşanan sıkıntılar nedeniyle İslami İlimler Fakültesi'ndeki program geliştirme süreci 1975 yılından sonra da devam etmiştir. Nihayetinde 3.11.1977 tarihli ve 16102 sayılı Resmi Gazete'de yayınlanarak yürürlüğe giren ve 1977-1978 öğretim yılından itibaren uygulanan yeni ders programında bütün öğrencilerin ortak ders görmesi hedeflenerek bölümleşme uygulaması tamamen ortadan kaldırılmıştır (Buyrukçu, 2007: 102-108).

### 3. 1982 Yılından Günümüze Kadar Yüksek Din Eğitiminde Yaşanan Gelişmeler

1980 ihtilalinden sonra ülkede bulunan bir çok kurumda olduğu gibi eğitim-öğretim alanında yer alan örgün ve yaygın din eğitim hizmetleri ile bu hizmeti veren kurumların mevcut durumlarıyla ilgili de yeni bir düzenlemeye gidildi. Bu yeni süreçte seminerler yapıldı; oluşturulan komisyonlar aracılığıyla raporlar hazırlandı. 23-25 Nisan 1981 yılında yapılan Türkiye 1. Din Eğitimi Semineri ve Ankara Üniversitesi İlahiyat Fakültesi Dekanı Hüseyin Atay'ın 1981'de dönemin Milli Güvenlik Konseyi'ne sunduğu rapor ile 6 Şubat 1981 yılında MEB Din Eğitimi Çalışma Grubu'nun hazırladığı rapor, kanaatimizce, bu çalışmaların olumlu bir seyir izlemesinde büyük bir katkıya sahiptir. Nitekim bu faaliyetler neticesinde 1981 tarihli ve 2547 sayılı kanun ile 20 Nisan 1982 tarihli ve 41 sayılı kanun hükmünde kararnameye binaen Erzurum Yüksek İslam Enstitüsü ile Atatürk Üniversitesi İslami İlimler Fakültesi birleştirilip İlahiyat Fakültesine dönüştürüldü. Yozgat Yüksek İslam Enstitüsü dışındaki diğer Yüksek İslam Enstitüleri de İlahiyat Fakültelerine çevrilerek bulundukları yerdeki üniversitelere bağlandı (Ayhan, 1999: 246-256; Aydın, 2000: 125-127; Cebeci, 1996: 167-168; Gökaçtı, 2005: 268-269; Altaş, 2002: 146-147).

1+4 yıl şeklinde öğretim veren yeni ilahiyat fakültelerine dönemin ÖSYM sınavından yeterli puan alan genel ve mesleki bütün lise mezunu öğrenciler başvuru yapma hakkına sahipti. Öğretim süresi ve fakülteye öğrenci kabulü bu şekilde belirlenen İlahiyatlarda bölümler ve bu bölümlerin altında anabilim dallarına bağlı yeni bir teşkilatlanmaya gidildi. Aslına bakılırsa bu durum öğrenciden ziyade fakültelerdeki öğretim elemanlarının idare ve sevkine yönelik bir uygulamadır. Yoksa öğrencilerin mezun olduklarında istihdam olacakları alanlara yönelik bir bölümleşme veya bilimsel araştırma ve inceleme verilerine dayalı bir yaklaşım tarzı yoktur. Bu bakış açısında aslolan yapılan tek bir eğitim-öğretim programıyla birden çok hedefe ulaşmaktır.

İlahiyat fakültelerinde oluşturulan bu yapı ilerleyen yıllarda kısmi değişikliklere uğramıştır. 1983-1984 öğretim yılında "Tefsir ve Hadis", "Felsefe ve Kelam" ile "İslam Medeniyeti ve Din Bilimleri" adı altında üç olan bölüm sayısı; 1992-1993 yılında yapılan yeni bir düzenlemeyle aynen korunmuş fakat ilgili bölümlerin isimleri "Temel İslam Bilimleri", Felsefe ve Din Bilimleri" ve "İslam Tarihi ve Sanatları" şeklinde değiştirilmiştir (Öcal, 1998: 256-257; Buyrukçu, 2007: 108-121; Aydın, 2000: 125-156; Cebeci, 1999: 233-235).

Bir yandan ilahiyat fakültelerindeki bölümleşme çalışmaları devam ederken diğer yandan ülkedeki ilahiyat fakültesi sayısında da ciddi bir artış yaşanıyordu. Nitekim 1997 yılına gelindiğinde, 1982'deki yeni düzenleme ile açılan sekiz ilahiyat fakültesine ek olarak, yeni 16 fakülte açılmıştır. Açılan bu 16 fakülte içerisinde Akdeniz Üniversitesi İlahiyat Fakültesi hariç diğerleri eğitim-öğretim faaliyetine hemen başlarken adı geçen fakülte ise ancak 2010 yılından itibaren eğitim-öğretime başlayabilmiştir. 1997 yılında toplamda 23 olan bu ilahiyat fakültelerinde öğrenim gören öğrencilerin % 60'ı alan bilgisi yani dini bilimler, % 30'u genel kültür, % 10'u ise pedagojik formasyon derslerini ortak bir şekilde okuyarak mezun oluyorlardı. Mezun öğrenciler ise hem Milli Eğitim Bakanlığı'ndaki örgün eğitim kurumlarında öğretmen olma hem de Diyanet İşleri Başkanlığı'na bağlı yaygın eğitim kurumlarında din görevliliği yapma hakkına sahipti.

1997 yılına kadar yüksek din eğitimi alanında yapılan nicelik ve niteliğe yönelik iyileştirme çalışmalarının sürdüğü bir esnada Yüksek Öğretim Kurulu aynı yıl aldığı bir kararla ülkedeki mevcut ilköğretim ve ortaöğretim alan öğretmenliğiyle ilgili yeni bir yapılanma süreci başlattı. Buna göre İlköğretim, ortaöğretim ve dengi okullardaki öğretmen yetiştirme modeline benzer bir uygulamanın mevcut ilahiyat fakültelerinde de yapılması kararlaştırıldı. Alınan bu karar üzerine YÖK tarafından dönemin ilahiyat fakültelerinden bazılarının dekanları ile öğretim üyelerinden oluşan 9 kişilik bir “İlahiyat Milli Komitesi” kuruldu. Kurulan bu komisyon yaptığı çalışmalar neticesinde bir rapor hazırlamış ve hazırladığı raporu YÖK’e sunmuştur (Bahçekapılı, 2012: 147-149; Aydın, 2000: 157-160; Cebeci, 1996: 180-184). Bunun üzerine YÖK aldığı 11.07.1997 tarihli ve 97.23.1660 sayılı kararıyla ilgili komisyon raporunu hayata geçirmiştir. Söz konusu karara göre;

- İlahiyat fakültelerindeki tek programlı yapı “İlahiyat Lisans Programı” ile “İlköğretim Din Kültürü ve Ahlak Bilgisi Öğretmenliği Programı” olmak üzere ikiye çıkarıldı. İlahiyat fakülteleriyle eğitim fakültelerinin aynı şehirde olduğu Ankara, Atatürk, Çukurova, Dicle, Dokuz Eylül, Erciyes, İstanbul, Marmara, Ondokuz Mayıs, Selçuk ve Uludağ üniversitelerine bağlı 11 ilahiyat fakültesinde bu yeni iki programa göre eğitim-öğretim yapılması planlandı. İlgili üniversitelerin dokuzunda bu planlama hemen hayata geçirilirken; İstanbul Üniversitesi İlahiyat Fakültesi ile Dicle Üniversitesi İlahiyat Fakültesi’nde “İlköğretim Din Kültürü ve Ahlak Bilgisi Öğretmenliği Programı”na geçiş sırasıyla 1999-2000 ve 2006-2007 öğretim yılında gerçekleşmiştir.
- Ortaöğretim din kültürü ve ahlak bilgisi dersi öğretmenleri ile imam-hatip lisesi meslek dersleri öğretmenleri Ankara Üniversitesi İlahiyat Fakültesi ve Ankara Üniversitesi Sosyal Bilimler Enstitüsü’nde ayrı ayrı açılan bir buçuk yıllık “Tezsiz Yüksek Lisans Programı”na göre yetiştirildi.
- Söz konusu programların faaliyete geçmesinden bir yıl sonra ilahiyat fakültelerindeki pedagojik formasyon sertifika programları tamamen kapatıldı (Bkz. 11.07.1997 tarihli ve 97.23.1660 sayılı YÖK Kararı).

1997 yılında alınan bu kararlar 1998-1999 öğretim yılından itibaren uygulamaya konuldu. Ancak bu düzenleme yapılmadan önce eski programa göre okula başlayan mevcut öğrencilerle birlikte 2001-2002 öğretim yılının sonuna kadar ilahiyat fakültelerinde eski ve iki yeni olmak üzere üç programa devam edildi. Tabi devam edilen bu iki yeni programın bazı avantajları olduğu gibi bazı dezavantajlı yönleri de ortaya çıktı. Şöyleki “İlahiyat Lisans Programı”nın öğretim süresi dört yıldır. Bu dört yıl içerisinde öğrencilerin pedagojik formasyon dersi alma hakları yoktu. Öğrenciler bu programdan mezun olup Milli Eğitim Bakanlığı’nda öğretmen olarak görev almak istediklerinde öncelikle merkezi bir sınava girip, sınavda başarılı olmaları ve akabinde Ankara’da açılan 1.5 yıllık pedagojik formasyon derslerine katılmaları gerekiyordu. Bu resmi prosedürleri tamamlayamayan öğrenciler ise istedikleri takdirde Diyanet İşleri Başkanlığı’nda istihdam ediliyorlardı. Ancak bu istihdam edilen öğrenciler temel islam bilimleri konusunda belirli bir bilgi birikimine sahip olmalarına rağmen insanların gelişim ve öğrenme özelliklerini tanıma ve ona uygun bir yaklaşım tarzı geliştirmede ise ciddi sıkıntılarla karşılaşılıyorlardı. Her ne kadar il ve ilçe müftülükleri tarafından hizmet içi eğitim faaliyetleriyle sözü edilen pedagojik formasyon eksiklikleri giderilmeye çalışılsa da istenilen olumlu sonucun tam olarak alındığını söylemek mümkün değildir.

Diğer bir program olan “İlköğretim Din Kültürü ve Ahlak Bilgisi Öğretmenliği”nin öğretim süresi de dört yıldır. Bu programdan mezun olan öğrenciler doğrudan ilköğretim din kültürü ve ahlak bilgisi öğretmenliği olabiliyorlardı. Bir başka ifadeyle öğrenci fakülteye başladığı ilk andan itibaren mezuniyet sonrası hangi görevi yapacağını biliyor ve ona göre bir hazırbulunuşluk seviyesi içinde bu programı tercih ediyordu. 26 Mayıs 2006 tarihinde YÖK’ün aldığı yeni bir kararla o tarihe kadar ilahiyat fakülteleri içerisinde bulunan bu program eğitim fakültelerinin bünyesine alındı. YÖK’e göre ülkemizdeki öğretmenlerin yetiştirildiği yegane müesseseler eğitim fakülteleridir ve söz konusu öğretmenlik dallarından ilahiyat fakülteleri hariç diğer 28’i bu fakültelerin içerisinde yer almaktadır. Bu ise hem öğretim birliği yasasının ruhuna hem de bütün öğretmenlerin belirli bir hedef ve amaca göre yetiştirilmesine uygun değildir. Görüldüğü üzere YÖK, yüksek din eğitimiyle ilgili-aynen önceki yıllarda olduğu gibi-yeterli alan araştırmalarına dayanmayan ve sadece 2005’de gerçekleştirilen bir kaç çalıştay ve kurultay ile 2006’da öğrenciler üzerinde yapılan bir araştırma raporuna dayanarak böyle bir karar almıştır. Ancak 2006-2007 öğretim yılından itibaren hayata geçirilen bu durum istenmeyen bazı olumsuz sonuçların ortaya çıkmasına neden olmuştur. Eğitim fakülteleri dekanları ile öğretim üyelerinden bazılarının bu değişikliğe çok sıcak bakmamaları; bu fakültelerin bünyesinde yer alan dersliklerin yetersizliği; ilgili bölüm öğrencilerinin ibadet mekanlarının bulunmaması; ilahiyat fakültesi öğretim üyeleri dışındaki diğer hocaların öğrencilere karşı mesafeli davranışları gibi benzer bir takım sorunlar YÖK’ün aldığı bu kararın çok da isabetli olmadığını açık bir şekilde göstermektedir (Bkz. Altaş, 2009: 908-919; Koç, 2003/2: 25-28).

YÖK’ün aldığı 2006 tarihli bu karar kurulduğu ilk andan itibaren öğretmenlik mesleğine aday elemanlar yetiştirmeyi temel amaçlarından biri olarak kabul eden ilahiyat fakültelerinin, bu hususta, işlevsiz kalmalarının da yegane sebebidir. İlerleyen yıllarda YÖK, “İlahiyat Lisans Programı”nı bitiren öğrencilerin alması gereken tezsiz yüksek lisans programının süresi ve içeriği hakkında bazı değişikliklerde bulunmuştur. Buna göre eğitim fakültelerine geçmeden önce adı “İlköğretim Din Kültürü ve Ahlak Bilgisi Öğretmenliği Programı” olan öğretmenlik alanının ismindeki “program” ibaresi 2010 yılında “bölümü” olarak değiştirilmiştir. Adı bu şekilde değiştirilen bölümün ders programında yine 2010 yılında yeni bir düzenleme yapılmış ve hazırlanan bu program 2010-2011 öğretim yılından itibaren uygulamaya geçirilmiştir.

İlköğretim Din Kültürü ve Ahlak Bilgisi Öğretmenliği Bölümü” hakkında YÖK genel kurulu 10 Mayıs 2012 tarihinde aldığı yeni bir kararla ilgili bölümün eğitim fakülteleri bünyesinden alınarak tekrar ilahiyat fakültelerine aktarılmasını sağladı. Aslına bakılırsa bu durum YÖK’ün 2006 yılında yaptığı yanlış düzenlemeden bir geri dönüş anlamına da gelmektedir. Çünkü bu girişimle ilahiyat fakülteleri tekrar ilköğretim okullarına din kültürü ve ahlak bilgisi öğretmenliği yetiştirmeye başlayarak eski mahiyetine kavuştu. Ancak YÖK genel kurulu 17 Nisan 2014 tarihinde DKAB Eğitimi Bölümü’nün 2014 yılından itibaren öğrenci almamasına ve bir bakıma ilgili bölümün fiilen kapatılmasına karar vermiştir.

## Sonuç

Darülfünun İlahiyat Fakültesi'nin kurulmasından günümüze kadar geçen uzun zaman diliminde ilahiyat fakülteleri hem kemmiyet hem de keyfiyet açısından bazı olumlu ve olumsuz süreçler geçirmiştir. Eski ve yeni yapılan çalışmaların geneline baktığımızda kemmiyete ait sorunların keyfiyete ait problemlere göre daha az bir mahiyette olduğu görülmektedir. He ne kadar bilim ve teknoloji alanındaki gelişmelerin eğitim-öğretime yansımalarından kaynaklanan niteliksel faaliyetler halihazırdaki mevcut durum üzerinde belirli bir iyileştirme sağlasa da yine ilahiyat fakültelerinde; müfredat programlarından ve bu program içerisinde yer alan derslerin sayısı ve kredi dağılımından; öğretim üyelerinden; öğrenci yapısından; öğretim teknolojileri ve materyal tasarımlarından; fakülte binalarındaki yetersizliklerden vb. kaynaklanan eksiklikler devam etmektedir.

1980'li yıllardan itibaren ülkemizdeki yüksek din eğitiminin kalitesinin artırılması için sempozyumlar, çalıştaylar, kurultaylar ile diğer bazı ulusal ve uluslararası bilimsel toplantılar yapılmaktadır. Yapılan bu toplantıların sonuçları ilahiyat fakülteleri mezunlarının istihdam alanı olan Milli Eğitim Bakanlığı ve Diyanet İşleri Başkanlığı ile koordineli bir şekilde ele alındığı gibi; eğitim-öğretim işiyle ilgilenmesi gereken diğer resmi bütün kurumlarla da paylaşılmaktadır. Tarihi sürece baktığımızda YÖK tarafından bu çalışmaların kısmen dikkate alındığı ancak büyük bir kısmının ise göz ardı edildiği bilinmektedir. Tabi bunda ülkedeki mevcut siyasi, sosyal, ekonomik ve kültürel bazı durumların etkili olduğunu da söylemek gereklidir. Bugün geldiğimiz noktada neredeyse her ilde bir ilahiyat fakültesinin açıldığı dikkate alınırsa sayısal anlamdaki bu ciddi büyümenin uygulamada ne gibi sıkıntılar doğuracağının hesabının da iyi yapılması gerekmektedir. 2013-2014 öğretim yılı itibarıyla ilahiyat fakültelerinden yaklaşık onaltı binin üzerinde bir öğrenci grubu mezun olacaktır. Mezun olan bu öğrencilerin nerede ve nasıl istihdam edileceğine dair önlemler alınmadığı takdirde, bir kaç yıl içinde, ilahiyacılarıdan oluşan bir işsizlik ordusunun Milli Eğitim Bakanlığı'nın ve ilgili diğer kurumların kapısına dayandıklarını görmek mümkündür. Kanaatimize göre yüksek din eğitimindeki bu istenmeyen hususların giderilmesi için tarihi süreç içerisinde yaşanan tecrübeler ile günümüzdeki gelişmeler her yönüyle ele alınmalı ve akabinde ortaya çıkacak yeni bakış açısına/yeni yol haritasına göre ilahiyat fakültelerinin kurumsallaşma sürecine kaldığı yerden devam edilmelidir.

# The "Service" model of the competences of the municipal employee as the basis of vocational training: Russian experience

S.E. Martynova, O.G. Maslennikova

Tomsk State University, 36 Lenin Ave., Tomsk 634050, Russian Federation

---

## Abstract

Competences of the municipal employee are considered in a context of the "service" concept of the public and municipal administration. The results of the sociological researches reflecting estimates and expectations are the basis for a model of the competences, connected with local authorities. In the article the technology and the results of the selection of the applicants for a reserve for the municipal positions are presented on the basis of the offered model of the competences also. From the point of view of the purposes of the vocational training the offered model of the competences can act as a basis for a formation of the curriculum.

## 1. Introduction

Societal transformations of the post-industrial period motivated the emergence of a certain trend for the administrative and state reforms which have captured the countries of the different continents [2; 5; 13; 16, etc.], including Russia. In order to comprehend an essence of the administrative transformations and to project their further development, we will address to the characteristics of a post-industrial sociality.

So, during the post-industrial period knowledge, intelligence, creativity became the main productive forces. As a result the independent, active personality, capable to define and realize own vital strategy acts as the main subject of the social development. Such factor is in need to be guarded not only by the state, but also in a creation of the conditions for the realization of the personal potential. Therefore, the model of the public management is transformed from paternalistic into "service", considering authorities as the organizations for providing public services. The specified meanings «public service, public service-oriented organizations», including at a local level, are revealed in a set of scientific works [1; 4; 6; 9; 10; 14; 15, etc.] . Public service activities are normalized and measured due to the standardization and the regulation that removes subjectivism of the service quality in a servant's understanding.

The "service" concept logically causes new requirements to the civil and municipal servants. A new definition "public service motivation" has been appeared in the scientific literature [3; 8], taking into account the statement of "altruistic motives" for the sake of the society interests. From the positions of the competence-based approach we set the purpose to go further and to create the complete model of the competences of the municipal employee, corresponding to the "service" concept of public management. Practical application of this model is based on the diagnostics of the applicants' competences for involving them into the reserve of the leading municipal positions and the curriculum for the selected candidates is planned. The technology described in this article can be used not only for the solution of such task. We believe that the presented experience can be applied for the diagnostics of the key competences, and also for the development and correction of the students and employees' curriculum who already work at the bodies of the municipal management. The approach to the formation of the reserve of the municipal employees, based on the "service" model of the competences, in principle, will promote development of a new concept of the public management. And as this concept is focused as we have already mentioned, on the creation of the conditions for the realization of the potential of the society members, this model will promote also to the social development as a whole.

The done work preceding a formation of the model of the competences included carrying out the sociological research. Opinion of the citizens was put in the basis of the determination of the competences of the municipal employees. In particular, we used data of the sociological research of the population satisfaction about the activity of the local governments of the city districts and municipal areas. The research was conducted under the leadership of S.E. Martynova in Tomsk region in 2010. 18 city districts and municipal areas out of 20 were surveyed; the total amount of the selection came to over 10 thousand people. The selection is proportional to gender and age and territorial structure of the population (aged from 18 years), the error on each

area and the city district doesn't exceed 4% at a confidential probability 0,95. The method of the data collection was interviewing "face to face".

## 2. Main text

Satisfaction and dissatisfaction with the activity of the administrations and the heads of the municipalities were served as the most significant information for the formation of the model of the competences. So, the most important characteristics of the representatives of the bodies of the municipal management for citizens became: 1) orientation to the requirements of the society; 2) orientation to the achievement of the result; 2) empathy, responsiveness; 3) competence and responsibility. These characteristics noted by society, are agreed with the main principles of functioning the "service" model: orientation to the citizens, management by results.

The specified characteristics initiated the foundation to the formation of the model of the competences of the municipal employee. In the determination of the competences we share the point of view that those are abilities, the purposes, values, motives, knowledge, skills, the strong-willed and emotional qualities promoting effective professional activity and defining models of the behavior [7, page 298-299; 12, page 22]. Concerning a set of the elements in the model of the competences we adhere to the number which doesn't exceed 12 [11, page 171].

In order those competences could be revealed, we offered the dictionary of the competences (their definitions). The sense is in the basis of the definitions which is the most adequate to the public estimates and expectations. For example, the first competence is defined as follows: orientation to the requirements of the society is a psychological readiness acts disinterestedly for the use of others and to make a choice for the socially significant decision in case of the conflict of the personal and public interests (that is defined by society as "to work not for itself, and for people").

Additions to the offered set of the competences are caused by the following circumstances: productivity, increase in activity efficiency is connected, in our opinion, with cognitive and strong-willed characteristics of the personality. If the strong-willed component is presented rather expressive in the definitions, the cognitive component can be developed in several competences. So, productivity and efficiency of the work depend also on the professional knowledge. The person should have the corresponding motivation for getting and expanding it. Besides, the activity of the modern municipal employee is carried out under the conditions of the innovations as a new model of the public management is being implemented. In particular, organizational and process innovations are spoken about since they have a direct relation to the activities for providing municipal services: changes in the working procedures and the processes with the orientation to the service quality improvement are provided.

As a result it is expedient to include understanding of the features of the modern municipal management into the number of the necessary competences (understanding of the actual problems of the municipal management connected with the improvement of the quality of the municipal services, knowledge of the modern technologies as organizations of their presentation and direct rendering) and readiness for the development.

Thus, the main set of 6 competences (orientation to the requirements of the society, orientation to the achievement of a result, responsibility, empathy, understanding of the features of the modern municipal management and readiness for the development) in a context of the "service" public management can be considered as the basic model of the competences of the municipal employee. The variants of the model are related to the positions of a different level and a different profile of the activity. For example, for the heads, except the listed competences, managerial abilities and skills of the strategic thinking are important. In the process of the vocational training it is expedient to take into account options of the model for ensuring more individualized training. As a whole, the set of competences causes the list of educational disciplines and technologies.

Thus, it is advisable to conduct training of municipal employees noting the specified competences which are necessary in modern conditions of the professional activity and answer population expectations. Part of these competences is cognitive or active and can be developed in the course of the assimilation of knowledge and skills. But the major part has valuable, strong-willed, i.e. personal character and it is problematic to create such competences. Taking into consideration this circumstance in 2010-2012 for the selection of the applicants in a reserve of the administrative staff for the municipal positions it was recommended to pay more attention to the personal qualities. Therefore, those who possess such competences were selected. Their further training was generally directed to the development of the cognitive and activity competences.

The 4-score scale was used for a degree assessment of the competence intensity during the selection:

- 0 score - competence is absent;
- 1 score - it is expressed in a weak degree;
- 2 scores - it is expressed sufficiently;
- 3 scores – it is expressed in a superlative degree.

For example, the degree of the competence intensity "readiness for the development" can be estimated as follows:

- 0 score – the candidate doesn't show nor in the speech (declaratively and unconsciously (in the latter case - at the expense of keywords)), neither in the behavior of readiness to improve knowledge, skills, the active application of new technologies and tools in the activity; the person isn't capable to offer or perceive modern ways of a solution when performing estimated tasks;
- 1 score - the candidate shows in the speech readiness to improve knowledge, skills, an active application of new technologies and tools, but gives single examples of self-development of previous experience; the person isn't capable to realize estimated tasks for the solution even if it offers modern technologies;

- 2 scores - the candidate shows in the speech readiness for a continuous improvement of knowledge, skills, an active application of new technologies and tools; he can confirm such readiness with several examples from previous experience; he isn't capable to offer or perceive new ways of solving a problem when performing estimated tasks;

- 3 scores - the candidate often shows in the speech readiness for continuous improvement of knowledge, skills, an active application of new technologies and tools; he can easily confirm the use of various opportunities for increasing qualification level and regular tracking of the changes happening in the professional sphere with numerous examples from the previous experience; he is capable to prove reasonably an actual character of the estimated tasks and to perform them for the solution of the task fully when performing and offering modern technologies.

The opinions of the experts concerning competitors were generalized for each competence by a method of the definition of an arithmetic average of the value. Then the total integrated mark of the competitor multiplied by 100% was put down taking into account coefficients of ponderability. Based on the sufficient level of this or that competence which is equal to 2 points, the applicants who have gained 200 and more points were enlisted in a reserve.

The determination of the weighting coefficients was done by experts, but besides on the basis of the dominants in the public expectations. So, as a rule, foremost and with a huge percent of answers the estimates and the expectations were connected with a persistence of the heads, desire to work, existence of exact affairs appeared in the settlements, i.e., using the definition of the competences, with the orientation to the achievement of the result. The answers "disinterested, does everything for people, tries for people" were taken the leading places from the point of view of the positive estimates, and work "on itself", absence of the help to people were negatively estimated, on the contrary. These characteristics are reflected in the competence "orientation to the requirements of the society". The leading characteristics, as a rule, were among estimates "attentive to people, sympathetic, human, kind, careful" that found the reflection in the competence "empathy". Owing to such priorities in social expectations in the model of the competences these qualities received the biggest weighting coefficients. Besides, the purpose of the selection of the applicants in a staff reserve supported, as it was already mentioned, the great importance of the personal competences. As for training, the weight of competence caused number of the subject courses and the credits allocated on the formation of this or that competence.

Concerning methods of diagnostics of the competences it is possible to say the following: the priority was given to the activity methods (to performances, role-plays and business games, interview), capable to show behavior models.

The analysis of the documents (questionnaires) and the psychological testing had auxiliary character.

Each competence was diagnosed not less than with two methods. The experts estimated the competences of the applicants. Successful heads of the municipalities were among the experts, whose productivity allows them to act as competent appraisers. The high positive estimates of these heads received during sociological researches, allowed to assume, besides, that if there were a psychological projection; socially desirable installations would be projected.

It should be noted the openness of all process of the formation of a reserve: the publications in mass media and on the official sites of the municipalities about the announcements of the applicants; a possibility of the participation on the basis of a self-promotion, and not only by the recommendation of the municipal commission.

The selection of the applicants in a reserve for leading municipal positions on the basis of the specified technology, passed by the leadership of S.E. Martynova, became rather strong "filter". So, for example, only 12 people got standard number of points out of 50 applicants in a reserve at the positions of the heads of the settlements. The adequacy of the offered technology to public moods is confirmed by the results of the municipal elections. As a whole, those persons included in a reserve who have stood for elective offices, were chosen (heads of municipalities or deputies). At the same time, the applicants who haven't passed selection tests didn't receive also electoral preferences among the population.

And still other people have also vocational training: students, employees who already work in the bodies of the municipal management. In this case the problem of the formation of the personal competences remains actual. For the solution of this task it is possible to suggest the use of personal and activity methods as a training technology. We mean the involvement of the trainee into any kind of activity demanding the existence of the personal competences. For example, for empathy formation – the involvement into the projects aimed to help children's homes, the senior generation. For the formation of the contact establishment skill – the work as an interviewer when carrying out inquiries and so forth. The inclusion of such activity technologies changes significantly habitual ideas about the training and sets new tasks for a teacher. As a whole, in our opinion, the problem of the formation of the personal competences needs further detailed development.

### 3. Conclusions

We summed up the results of the said above as follows:

1. A new model of the "service" public management logically predetermines a number of competences of the municipal employee.

2. As a principle it is expedient to take those qualities of representatives of the bodies of the municipal management for the "service" model of the competences which are important for the population. The relations with public are especially actual for the municipal management which is "on a first line". It is possible to name such model of the competences "socially caused".

3. A set of 6 competences is possible to be considered as a basic model of the competences of the municipal employee in a context of the "service" public management: orientation to the requirements of the society, orientation to the achievement of the result, responsibility, empathy, understanding of the features of the modern municipal management and readiness for the

development.

4. The model of the competences plays a key role for the organization of the process of the vocational training of the municipal employees. In particular:

- a set of the competences predetermines the list of training courses which will allow to create or develop necessary qualities;
- a specific character of the competences which can have both professional, and personal character, cause the training technologies;
- a weighting coefficient of the competence predetermines "specific weight" of the academic subjects and the credits by the principle "the more competence weight, the more labour-intensiveness of its formation";
- a determination of the competences (their contents) cause the maintenance of the training courses and technology of training;
- the options of the model predetermine contents of the programs of the individualized training.

5. The most problem issue of the reflection of the competence model of the vocational training program is the possibility of the development of the personal competences.

# The analysis of intercultural conflicts between students of tertiary education

Michaela Lukešová

*Department of Pedagogical Sciences, Faculty of Humanities, Tomas Bata University in Zlín, nám. T.G.Masaryka 1279, 760 01 Zlín, Czech republic*

---

## Abstract

The study focuses on analysis of intercultural conflicts between students of tertiary education. The author focuses on the definition of intercultural conflicts as a consequence of interculturally incompetent behavior. Intercultural competences are important part of intercultural education and their development is very important to archive intercultural dialogue between people without intolerance and disrespect.

## 1. Main text

With globalization, the constant interactions between people, cultures and civilizations will increasingly become and the mobility and migration will create an intercultural society and the question of peaceful coexistence in the context of the cultures will be an ongoing challenge. Intercultural society is one in which there is a mutual meetings, cultural exchanges, cooperation and dialogue of people who are culturally different. This difference can be understood as an opportunity to enrich themselves, but can also be a potential source of conflict. Intercultural misunderstandings and conflicts arise because interculturally incompetent behavior during the dealing with people who are different. Intercultural conflicts are also the subject of our study. The theme is intercultural conflicts in the school environment, respectively at a university environment. Scientists, teachers, and students agree that the world around them changes both politically and economically, culturally, socially and technologically (Janebová, 2009). The population of students in higher education doubled<sup>+++++</sup> and it opens the way to increase their skills and qualification and thereby improve the labor market, but provides to tertiary education on the other hand, a new element of socio-cultural variability of students. Variability of students at Czech universities with different cultural backgrounds, values, personality, increases the probability of interpersonal conflicts. According to Crawford & Bodine (1996), many conflicts in the school environment arising from differences - ethnic, ethnicity, gender, class, physical and mental. Such conflicts are called intercultural conflicts, which may take the form of prejudice, discrimination and harassment. However, these conflicts must be viewed comprehensively, because their nature is not only prejudice and discrimination, but are also the result of the structure and relationship of inequality and privilege. Their occurrence should be seen as a very serious problem that affects the environment of the whole institution and thus must logically be reflected in the student performance. According to Vallaster (2005) the ways how people interpret their environment, how they think, feel and act, are often too divergent and creates barriers to the smooth cooperation. If people of different cultural backgrounds are more likely to achieve the objectives in different ways, the more this diversity can cause conflicts, which hampers the efficient development of a "shared understanding" (Vallaster, 2005). The impact of conflict on student achieve academic success - from the performance of a task to the work ethic - is undeniable and interests of teachers to teach students effective and non-violent methods of conflict resolution increases.

### 1.1. Theoretical background

The aim of this article is to present results of our research. Aim of the research was to analyze intercultural conflicts among university students, to analyze the occurrence of intercultural conflicts among students and find out how students are informed about intercultural conflicts, and the awareness about intercultural conflict. Intercultural conflict is defined as a perceived or actual discrepancy of cultural values, norms, customs, habits and traditions. Ting-Toomey & Oetzel (2001) define intercultural conflict as "emotional experience of frustration in conjunction with the perceived incompatibility of values, norms, goals, scarce resources, processes and / or outcomes between at least two people from different cultural communities in an interactive

+++++ [http://www.czso.cz/csu/redakce.nsf/i/studenti\\_a\\_absolventi\\_vysokych\\_skol\\_v\\_cr\\_celkem/\\$File/1\\_VS\\_studenti\\_celkem\\_11.pdf](http://www.czso.cz/csu/redakce.nsf/i/studenti_a_absolventi_vysokych_skol_v_cr_celkem/$File/1_VS_studenti_celkem_11.pdf)

situation." Intercultural Conflict arises from differences between the groups and their socio-cultural misunderstanding. We are often poorly informed about the differences between the various socio-cultural groups and their different behavior, which leads to mutual verbal and nonverbal misunderstandings. Some of the conflicts can begin trivial, because one side interprets the behavior of the other wrongly: I. Confirmation own position ("I got the truth"), II. Verbal abuse and devaluation on a personal level, III. Disallowing of communication, IV. Breakdown in communication and absence of willingness to further communication.

Intercultural conflicts usually occur between two or more opposing parties and we are engaged in conflicts more often because of the differences that exist between our environment and ourselves (Ting-Toomey, 2009). According to Bronfenbrenner (1979) relationships between organisms and their environment, studying social ecology and represents social-ecological framework and he categorize environmental influences to the four levels of the system: *micro* (face-to-face interaction in specific situations - interpersonal conflict), *mezo* (the relationship between different microsystems - organizational conflict), *exo* (forces within the higher social system - community conflicts), *macro* (cultural beliefs and values - international conflicts). Oetzel, Ting-Toomey & Rinderle (2006) they have inspired by the framework and implemented socio-ecological framework to the study of conflict. The framework emphasizes that the environment has several levels and contexts, and the relation of these coherence (eg. intercultural conflict) is complex. For understanding of the communication during the conflict in the whole context is this integrated framework necessary. Oetzel, Ting-Toomey & Rinderle (2006) present the four levels of social ecological model of conflict communication: I. Interpersonal, II. Organizational, III. Community, IV. International. During the specific communication always come into play two individuals whose identity is woven of belonging to different groups, from past experiences, the influence of the environment, personal characteristics, etc. (Janebová, 2009). Therefore, for the purposes of our research, we focus just on an interpersonal level, respectively on intercultural conflicts in interpersonal dimension (conflicts between two people) arising due to lack of understanding of different cultural, ethnic and religious values, different social class, or gender inequality, and most of these conflicts are the result of intolerance and ignorance of these differences, because of the intercultural incompetent behavior. According to Dědina & Odcházel (2007) intercultural conflicts arising from the lack of intercultural competence. Intercultural conflict arises from differences between the groups and their socio-cultural misunderstanding. Often we are not aware of the differences between the various socio-cultural groups and about their different behavior, which leads to mutual verbal and nonverbal misunderstanding. This occurs if the observed behavior is seen as a personality characteristic than the cultural character and vice versa. This leads to misinterpretation and misunderstanding. In most cases, this misunderstanding is basis for future reuse misunderstanding and following the creation of the stereotype. Ting-Toomey & Oetzel (2001) they see the source of intercultural conflict in different expectations in relation to appropriate or inappropriate behavior during conflict situations. If individuals from different cultures continue during the conflict in an inappropriate and ineffective behavior, misunderstandings can easily result in complex and polarized conflict. In such a polarized conflict, respect and trust are at risk and rapidly towards others distorted perceptions and prejudices may exhibit. Intercultural competence is the optimal integration of knowledge, mindfulness and communication skills during problem solving interactions appropriately, effectively and adaptively. The criteria of communication appropriateness, effectiveness and adaptability can be serve as evaluation criteria to determine whether a conflict of intercultural communication is perceived as competent or incompetent (Ting-Toomey, 2009).

### 1.2.Design of the research

In this part of the paper we will introduce research objectives, research sample, data collection methods and measurement properties.

#### Aim of the research

The primary objective of the research, which result from the relationships and connections between intercultural conflicts and intercultural incompetent behavior, was to determine whether students have experience with intercultural incompetent behavior. Intercultural incompetent behavior is based upon the definition of multicultural competence according to Bennett (2003) and Morgenšternová & Šulová (2007) see intercultural competence as the ability to communicate effectively and appropriately in different cultural contexts. This model of multicultural competence consists of a set *mindset* (cognitive variables), *skillset* (skills to behave appropriately) and *heartset* (affective variables).

#### Methods

The research sample was N=97 respondents, students studying at the university. The selection of the research sample was available. For data collection was used a questionnaire consisting of three parts, which examined students' awareness and knowledge about intercultural conflict, experiences of students with intercultural incompetent behavior at the universities and the nature of intercultural conflicts which the students experience and they are based on the socio-cultural differences.

The first part of the questionnaire was mainly informative and consisted of eight items in that examined students' awareness of intercultural conflicts, the perception of the seriousness of intercultural conflicts and personal experience with intercultural conflicts at universities.

Part of the questionnaire, investigating students' experiences with intercultural incompetent behavior, contained in a total 60 items and these items were divided into three sets according to Bennetts' (2003) model of intercultural competence and model of multicultural competence of Morgenšternová & Šulová (2007). For each item the respondent stated level of experience with

behavior on the Likert scale ranging from 1 - least apt, 5 - the most apt.

The nature of intercultural conflicts which students experience, analyzed part of the questionnaire, which contained a total of 9 items. Items of the questionnaire were created based on the definition of intercultural conflict according to Janebová (2010) intercultural conflicts arise due to misunderstanding of different cultural, ethnic and religious values, different social class, or gender inequality, and most of these conflicts are the result of intolerance and ignorance of these differences. The nature of intercultural conflict was examined in a area of national, ethnic, religious, gender conflicts, conflicts arising from intergenerational differences, conflicts arising because of different sexual orientations, different subcultural orientation, physical handicap or differences of social class.

### *1.3. Results of the research*

#### **Awareness of students about intercultural conflicts**

The first part of the questionnaire investigated students' awareness of intercultural conflicts. Due to the limited scale of article the graphically processed results are not presented. Awareness of intercultural conflicts without this phenomenon was defined by respondents ahead, have 19% of respondents, 51% of respondents weren't sure of what exactly this term means and 30% of respondents said that they have met with this term already. After presenting the definition of intercultural conflicts in the questionnaire answered by 37% of respondents that they knew what this term mean, 50% of respondents said they thought that this is the phenomenon, but were not sure and 13% did not know this term. It also offer interesting findings and the fact that 62% of respondents believe that they have no enough information about intercultural conflicts. As a fairly serious problem it sees 66% of respondents and 33% perceive intercultural conflicts, but rather a normal part of life.

Intercultural conflicts at universities 4% is considered as insignificant and unimportant matter, 46% of respondents considered as a normal part of school life, 40% is perceived as a relatively serious problem and 10% of respondents as a very serious problem.

On the question whether students think that this phenomenon occurs at Czech universities, 48% of students inclined to the positive responses, therefore, that the intercultural conflicts occur at Czech universities and 52% said, that they are not occurs at universities. A total of 21 students said they had already met with intercultural conflicts at their current high school and 76 students said that probably no, or not yet. All respondents evaluated their relationships at university as positive.

#### **Interculturally incompetent behavior**

Experience of students with interculturally incompetent behavior was analyzed on the base of model of Bennett (2003). According to this model we created a battery of questionnaire items investigating interculturally incompetent behavior at the cognitive, affective and behavioral level. Due to the limited scope of this article we present a graphical representation for those items for which more than 10% of respondents rated the experience of intercultural incompetent behavior on the scale level 5.

In the **cognitive dimension**, we achieved these results and graphical representation of the results can be seen in the figure number 1 Cognitive variable of intercultural competence - mindset. *Item No. 2 Lack of interest to approach a different way of thinking (to approach a foreign culture)*, 10% of respondents rated on a scale 1, ie. they meet with such behavior at least, 12% of respondents rated the experience on a scale 2, 42% decided to rate the experience on a scale 3, 26% on the scale 4 and 10% on the scale 5, and it means that they have experience with this behavior very often.

*Item No. 6 Maintaining a negative attitude towards socio-cultural groups*, 9% of respondents rated on a scale 1, so they encounter with such behavior at least, 19% of respondents rated the experience on a scale 2, 30% rated on a scale 3, 24% on the scale 4 and 16% on the scale 5, so they have an experience with the behavior very often.

*Item No. 7 The ignorance of minority groups in society (history, traditions, values and customs)*, 6% of respondents rated on a scale 1, 36% of respondents on a scale 3 and 19% of respondents said that with this phenomenon they have the most experience.

*Item No. 8 The tendency to compare myself with other individuals*, rated minimal experience with this behavior 4% of the respondents, 41% average experience, on the scale 4 rated experience 30% of respondents and 10% of the respondents meet with this behavior very often.

*Item No. 10 Lack of knowledge of foreign languages*, rated at the lowest scale 1 6% of the respondents, 21% of respondents on a scale 2, 32% of respondents indicated a moderate level of experience, and 26% rated the experience on a scale 4, and 15% of respondents encountered this phenomenon very often.

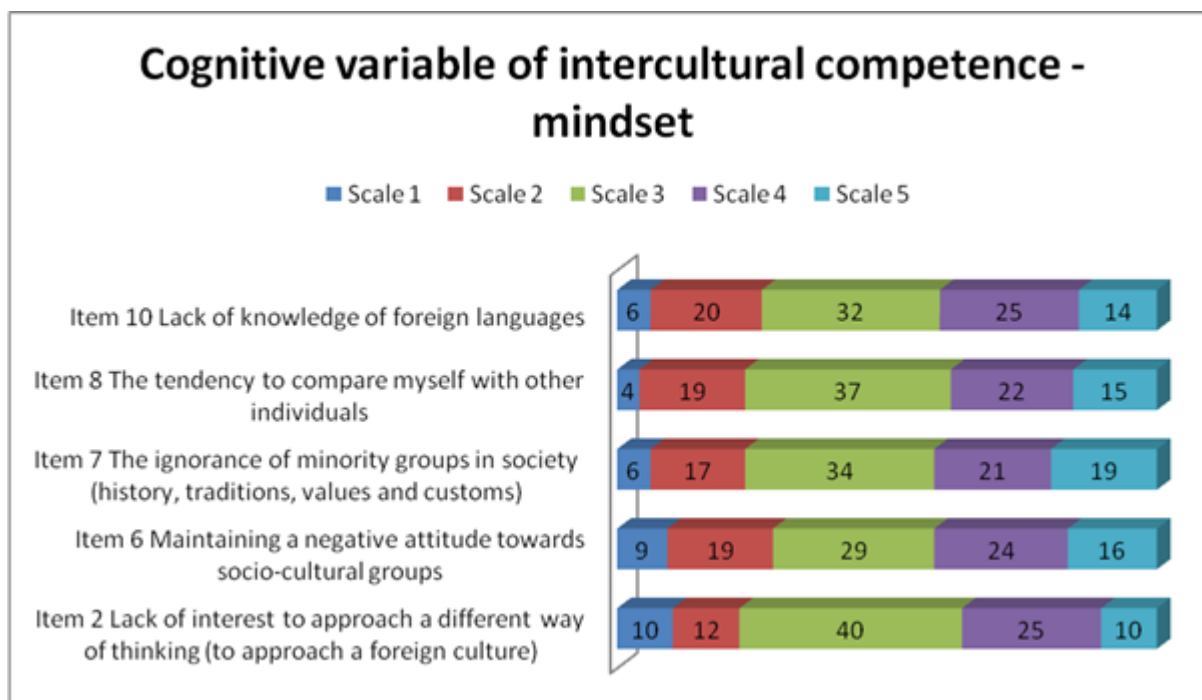

Fig. 1 Cognitive dimension of intercultural competence - mindset

In the **affective dimension** respondents rated these items as the most serious. *Item No. 4 Incorrect identification, perception and interpretation of emotions*, rated by 3% of respondents in the lowest scale 1, 19% of respondents on a scale 2, 36% of respondents rated the medium scale, 31% rated on a scale 4 and 11% of respondents said that this phenomenon they experience very often.

*Item No. 5 Misunderstanding of emotions*, have a minimum experience 5% of the respondents, 37% of respondents rated on the scale 3, so that is the middle position and 15% of respondents are with such a phenomenon frequently encountered.

*Item No. 6 Unawareness of interpersonal distance (remoteness) and close (too personal touch)*, 6% of respondents meets with this phenomenon at least, 30% of respondents were familiar with the behavior meets more frequently and reported ratings on a scale 2, the mean value, the scale 3 rated the behavior 26% of respondents, on the scale 4 rated 25% of students and very often meets with this behavior 13% of students.

*Item No. 7 disregard for the feelings of others*, is similar item to Item No. 5 and there we achieved almost identical results. Here it is clear that the affective dimension, respectively affective competencies, it is important to develop because is not enough to study in detail the history and attributes of a given culture, but also to develop cultural sensitivity. According Morgensternová & Šulová (2007) it means to learn how to correctly interpret emotions in a given culture, to be aware of the interpersonal distance and closeness in a given culture, or other specifics.

*Item No. 8 insulting people through humor and irony*, 9% of respondents rated on a scale 1, on a scale 2 rated 22%, the middle scale rated 33% of students, scale 4 rated 21% of students and inflammatory form experience has 15% respondents.

Score of the *Item No. 9 Accusation (based on hostility)* and *Item No. 14 Verbal abuse (devaluation on a personal level)* was very similar, as it can be seen in Figure number 2. Affective dimension of intercultural competence – heartset.

*Item No. 13 A misunderstanding and embarrassment* were rated at the lowest scale by 8% of the respondents, 20% of respondents rated on the scale 2, the mean value rated 33% of students, scale 4 rated 24% of students and 15% of the students experience the inflammatory form.

## Affective variable of intercultural competence - heartset

■ Scale 1 ■ Scale 2 ■ Scale 3 ■ Scale 4 ■ Scale 5

Fig. 2 Affective variable of intercultural competence – heartset

In the Figure number 3 **behavioral dimension** of intercultural competence – skillset, we can see, that it is clear that respondents identified the most experience that relates to inappropriate and ineffective communication. Probably because it is a behavior which is the most easily identifiable. According to Deardorff (2009) is behavioral dimension a desirable outcome of intercultural competence and on the basis of a model of intercultural competence, we also created a list of items to questionnaire which investigated the behavioral dimension of incompetent behavior.

Among the behaviors to which students have the most experience include:

*Item No.2 Absence of natural speech and sincerity of expression (speech inauthenticity), Item No. 3 Absence listening to each other (not to suspend their own ideas and not to make a conscious effort to understand the position of others), Item No. 4 Indifference towards an awareness and respect for formal rules, Item No. 5 Inadequate use of humor or irony, Item No. 7 Ignorance of conflict resolution strategies, Item No. 8 Ignoring and lack of interest of my person, Item No. 10 Reluctance to contribute to the development of the team and create an environment for efficient and secure communication, Item No. 11 Avoiding the different communication styles, depending on the purpose of communication and status of communicators, Item No. 13 unfair treatment, Item No. 15 Inability to save face (managing emotions), Item No. 16 Disrespect for traditions, traditional values (family, age, honor), Item No. 17 Ignoring the social hierarchy (loyalty, humility), Item No. 18 Ignoring the order in which the representatives speak, Item No. 22 The practice of discrimination and prejudice (this is different to others because of their membership of a particular group), Item No. 25 Conflict at metacommunication level (speculation on how it is said), Item No. 28 Insulting slurs or demeaning statements, Item No. 29 Ridicule or slander others, Item No. 32 Threats of physical violence and Item No. 33 Oral, telephonic or written threats.*

Fig. 3 Behavioral variable of intercultural competence – skillset

The final goal that we set was to find out the nature of the intercultural conflicts which the students experience. In the Figure number 4 Dimensions of intercultural conflicts we can see the frequency of responses by respondents on the scale 1 minimum occurring – to the scale 5 the most commonly occurring. The nature of intercultural conflicts was analyzed from the perspective of *international, religious and ethnic conflicts* which students experience, than we focused on *gender differences* and their impact on development of conflict, *intergenerational differences*. Nature of intercultural conflict was analyzed from the point of view of *different sexual orientation or belonging to a different subculture*. We did not forget the conflicts arising due to *differences in physical disability or a different social class*.

Fig. 4 Dimensions of intercultural conflict

## 2. Conclusion

In the context of the previously mentioned findings, we can say that students encounter interculturally incompetent behavior, especially in relation to the affective dimension of intercultural competence, and it is a lack of intercultural sensitivity, adaptability and empathy. The second major dimension of intercultural competence is behavioral competence, where most students met with the inability to communicate without communication noise and confusion, inauthenticity of expression and inefficient use of nonverbal communication. Finally, we should say that universities should therefore further strengthen and develop values that will develop intercultural dialogue among students through respectful and open communication regardless of their origin.

# The analysis of pre-service teachers' beliefs about mathematical problem solving

Gunes Yavuz, Hatice Nur Erbay\*\*\*\*\*

*Istanbul University, Hasan Ali Yucel Education Faculty, Istanbul, Turkey*

---

## Abstract

There are many extracurricular and classroom factors that should be considered in developing problem solving skills of students in teaching Mathematics. Students who acquired the ability of problem solving will not only be successful in their lessons but also will have skills to overcome problems that they will experience in their real lives. Problem solving includes the combination and coordination of various skills, beliefs, attitudes, intuitions, knowledge and previous acquisitions. For this reason, it has a key role in teaching mathematics. The purpose of this study is to analyze pre-service teachers' beliefs about mathematical problem solving in terms of various variables. For this purpose, the data was collected from 310 third-year students who are studying in teaching mathematics, classroom teaching and teaching science departments from two public universities in Istanbul. Belief Scale about Mathematical Problem Solving was used as a data collection instrument (Haciomeroglu, 2011). The data were analyzed by using statistical software. The correlation of some variable to pre-service teachers' belief about mathematical problem solving was analyzed.

## Introduction

The social structure which is getting increasingly complex and technological developments, political, social and economical crises make an individual to encounter with constantly increasing problematic situations. Therefore, problem solving is an important issue which becomes the centre of attention in psychology for many years. Many concepts have been introduced about problem solving process in many studies. These concepts include a variety of features from traditional Gestalt approaches among different learning methods to recent computer simulations and mathematical models.

It was seen that while researchers such as Gagne and Skinner (1964; 1974) tended to analyze the previous lives of individuals as the most important variable in problem solving process, the other researchers such as Kohler and Maier (1925, 1970) advocated individuals' perception regarding the experienced situation as the most important factor in solving a problem.

A problem is defined as "a situation, quantitative or otherwise, that confronts an individual or group of individuals, that requires resolution, and for which the individual sees no apparent or obvious means or path to obtaining a solution" (Polya, 1962). The problem from a mathematical perspective is defined as "a situation where something is to be found or shown and the way to do this is not immediately obvious to the solver" (p.218, Grouws, 1996, cited in. Kayan & Cakiroglu, 2008). And mathematical problem solving is expressed as a situation which occurs from the experiences of the students (Schoenfeld, 1985). Problem for a mathematics teacher means an outstanding question which students have the necessary pre-information but which they do not know the ways and steps which will lead them to solution beforehand (Schoenfeld, 1989). From this perspective, problem solving means not only finding the solution of a mathematical problem but also confronting with new situations and finding flexible, useful and elegant solutions to these situations (Gail, 1996).

Gur and Korkmaz (2003) emphasize that posing and solving problems enable students both to gain experiences regarding how to express mathematical ideas in written or verbal and to discover mathematical situations. Students' skills to use problem solving strategies regarding mathematical problems are helpful to them for making correct choices for the situations that they encountered in their daily lives (Altun, 2008).

In recent years, it is seen that problem solving is considerably emphasized in studies for improving teaching primary mathematics programs both in Turkey and worldwide.

Mathematical beliefs are defined as value judgements which are composed of the past experiences of an individual (Raymond, 1997). These beliefs have an important place in teaching and learning process as they affect the perceptions of individuals (Pajares, 1992; Thompson, 1992). For instance, the beliefs of a teacher is effective in his/her immediate decisions when he/she needs to make a decision in a difficult situation that he/she faces during teaching and learning process (Abrosse, Clement, Philipp & Chauvot, 2004). Kloosterman and Stage (1992) points out the fact that mathematical beliefs of an individual

---

\* Corresponding author. Tel: +90 553 463 3053  
E-mail address: [hatice.erbay@istanbul.edu.tr](mailto:hatice.erbay@istanbul.edu.tr)

effect learning and problem solving. Concordantly, the studies which analyze the beliefs about mathematics shows that students perceive problem solving as finding the correct answer and think that learning mathematics requires memorizing (Picker & Berry, 2000; Raymond, 1997; Schoenfeld, 1989; Thompson, 1984; Toluk Ucar, Piskin, Akkas & Tasci, 2010).

Hart (2002) analyzed the effects of mathematical prospective teachers' beliefs about teaching mathematics. The findings show that the beliefs of prospective teachers advance positively at the programs that they studied. Accordingly, Kayan & Cakiroglu (2008) analyzed the beliefs of prospective primary school mathematics teachers regarding mathematical problem solving. It was determined that prospective teachers had positive beliefs about problem solving. Besides, it was specified that prospective teachers had internalized traditional views such as the importance of routine calculation skills in teaching mathematics and the necessity of following the pre-specified steps in problem solving. The studies (Frykholm, 2003; Kayan & Cakiroglu, 2008; Lloyd & Wilson, 1998) show that the beliefs of prospective teachers about mathematical problem solving is an effective factor in organizing learning environments as a teacher and in the achievements of students. For this reason, determining the beliefs of prospective teachers will be informative about the practice of a future teacher (Kayan & Cakiroglu, 2008).

In this regard, the main purpose of this study is to analyze the beliefs of prospective teachers about problem solving. The beliefs are defined in terms of educational studies as basic assumptions, arguments and insights that an individual has in his/her mind and that he/she develops for the facts around him/her (Richardson, 1996). The beliefs of teachers; is an important factor affecting both the classroom environment that they created and the beliefs of students about mathematics (Ball, 1998; Grouws, 1996; Schoenfeld, 1992; Wilkins & Brand, 2004).

For this reason, analyzing the beliefs of prospective mathematics teachers and having an extensive understanding about them will enlighten teaching mathematics and the studies regarding improving students' learning and will contribute to the training studies which will be organized for teachers. The research subject in this study was worth investigating for the reasons stated above.

The purpose of this study is to analyze the beliefs of prospective teachers who are studying in teaching mathematics, classroom teaching and teaching science departments about problem solving. In this sense, the answers of the following sub-problems were searched:

1. How are the beliefs of prospective teachers about problem solving?
2. Do the beliefs of prospective teachers about problem solving vary according to universities that they study?
3. Do the beliefs of prospective teachers about problem solving vary according to their departments?
4. Do the beliefs of prospective teachers about problem solving vary according to the types of high schools that they graduated from?
5. Do the beliefs of prospective teachers about problem solving differ according to gender?

## Method

The descriptive survey model among qualitative research methods was used in this study. The descriptive survey is suitable for describing a case which exist in the past or present without influencing it (Karasar, 2003). Since the purpose of this study was to present the beliefs of students who are studying in teaching mathematics, classroom teaching and teaching science about mathematical problem solving, descriptive survey model was used.

**Study Group:** The sample of the study is composed of third-year prospective teachers who are studying in educational faculty, teaching mathematics, classroom teaching and teaching science and technology majors of two different universities in 2013-2014 academic years. The distribution of the sample group can be seen in Table 1.

**Table 1:** Study Group

Majors	1 <sup>st</sup> University		2 <sup>nd</sup> University		Total
	F	M	F	M	
Teaching Mathematics	50	6	32	5	93
Teaching Science and Tech.	44	6	43	7	100
Classroom Teaching	39	13	49	16	117
Total	133	25	124	28	310

**Data Collection Instruments:** Belief Scale about Mathematical Problem Solving was developed by Kloosterman and Stage (1992) and adopted to Turkish by Hacımeroglu (2011). This scale was developed for revealing the beliefs of students about mathematical problem solving. When the whole scale was analyzed, the Cronbach alpha internal consistence coefficient was

calculated as 0.768. The scale was consisted of 24 items and it was in five point likert type.

## Findings

In order to answer for the problem, teachers' average beliefs about problem solving was displayed in Table 2.

University	N	$\bar{X}$	SS	T	p
The First Univ.	158	81,00	5,91	1,09	0,27
The Second Univ.	152	81,72	5,75		

search for an first sub-prospective scores regarding

**Table 2:** Average Scores of Prospective Teachers' Beliefs about Mathematical Problem Solving

N	$\bar{X}$	SS
310	81	5,83

The beliefs of prospective teachers about mathematical problem solving were collected through a likert type form which was scored between 1 and 5 and consisted of 24 items. The total score differed between 24 and 120. The findings show that the level of beliefs of prospective teachers about problem solving is high ( $\bar{X}=81$ ).

The first item of the findings regarding the second sub-problem was displayed in Table 3.

**Table 3:** T-Test Results of Prospective Teachers' Belief Scores about Mathematical Problem Solving according to their Universities

As it can be seen from Table 3, there was not a significant difference between the beliefs of prospective teachers about mathematical problem solving according to their universities ( $p>0.05$ ). This finding showed that the beliefs of prospective teachers about mathematical problem solving were not affected by the university that they studied.

The average scores of the students were analyzed in order to understand whether or not the level of their beliefs about mathematical problem solving varied according to their majors and the findings obtained were given in Table 4.

**Table 4:** T-Test Results of Prospective Teachers' Belief Levels about Mathematical Problem Solving According to their Majors

Majors	N	$\bar{X}$	SS	F	P
Teaching Mathematics	93	83,26	4,89	7,79	0,00
Teaching Science and Tech.	100	80,19	5,63		
Classroom Teaching	117	80,82	6,34		
Total	310	81,35	5,83		

As it is seen in Table 4, there was a statistically significant difference between average belief scores of prospective teachers about mathematical problem solving as the average scores of teaching mathematics students were higher than teaching science and classroom teaching students ( $p<0.05$ ). The reason of this difference was because of the fact that the average belief scores of mathematics prospective teachers about mathematical problem solving were higher.

The other sub-problem was 'Do the beliefs of prospective teachers about problem solving vary according to the types of high schools that they graduated from?' The findings regarding this sub-problem are given in Table 5.

**Table 5:** F-Test Anova Results of Prospective Teachers regarding the Belief Levels about Mathematical Problem Solving according to the type of the high school

Type of High School	N	$\bar{X}$	SS	F	p
Anatolian High School	124	81,04	5,58	2,83	0,06
Teacher Training High School	81	82,65	5,83		

Gender	N	$\bar{X}$	SS	T	p
Female	257	81,55	5,6	1,34	0,18
Male	53	80,37	6,45		
Other high schools		105	80,72	6,03	
Total		310	81,35	5,83	

According to this finding, it can be said that the level of prospective teachers' beliefs about mathematical problem solving did not differ depending on the type of high school that they graduated ( $p>0.05$ ).

Whether or not the level of prospective teachers' beliefs about mathematical problem solving differed according to their gender is given in Table 6.

**Table 6:** T-test results of Prospective teachers' Belief Levels about mathematical Problem solving according to their Gender

According to Table 6, there was not a statistically significant difference between the average belief levels of prospective teachers about mathematical problem solving by their gender. ( $p>0.05$ )

## Conclusion, Discussion and Suggestions

The basic purpose of this research is to determine the beliefs of prospective teachers about mathematical problem solving in terms of various variables. Within the scope of this basic purpose, the following results have been obtained.

It can be said that the beliefs of Mathematics, Science and Classroom Teaching prospective teachers about mathematical problem solving is generally high. This finding of the study is supporting Kayan and Cakiroglu's (2008) study in which they stated that primary mathematics prospective teachers had positive opinions about problem solving.

It was concluded that beliefs of prospective teachers about mathematical problem solving did not differ according to their universities. The reason of this situation may be the fact that both universities are located in the same region. Different universities may not have an effect since students' environments do not differ in general terms. It is necessary to repeat this study with a broader sample to see whether or not different universities have an effect by selecting universities from different regions of Turkey.

When it was analyzed whether beliefs of prospective teachers about mathematical problem solving differed according to their majors or not, it was seen that the difference was in favour of students from teaching mathematics major. It can be said that the beliefs of mathematics prospective teachers about problem solving is higher than science and classroom teaching prospective teachers. The reason of this situation may be the fact that problem solving is occupationally vital for the mathematics prospective teachers. Besides, the university education of mathematics prospective teachers may have an effect on their problem solving skills.

The beliefs of prospective teachers about mathematical problem solving did not differ according to the type of high school that they were graduated from is another finding of the study. The reason of this may be the fact that educational faculties are mostly preferred by Anatolian High School or Teacher Training High school graduates. Since a few of the prospective teachers were graduated from science high schools, private high schools or vocational high schools, this number was not enough for creating a difference. In other words, it cannot be talked about any kind of difference since a homogenous sample could not be created according to high schools. By using purposeful sampling, it can be possible to understand whether this situation will create a difference or not.

The beliefs of prospective teachers about mathematical problem solving did not differ according to gender is the final finding of the study. Kayan (2007) concluded in his study which was carried out in five universities that the beliefs of primary mathematics prospective teachers about problem solving did not differ according to gender but Soy Turk (2011) concluded in his study about classroom teaching prospective teachers that the beliefs of prospective teachers about problem solving differed in favour of female students. When the literature was analyzed, it was stated that whether or not the beliefs of female and male students about problem solving differed according to gender might change according to sample group (Arli, Altunay & Yalcinkaya, 2011).

The following suggestions can be offered in accordance with the findings.

1. The beliefs of prospective teachers about problem solving can be searched with different and broader samples. The sample can be decided by considering different geographical regions.
2. Comprehensive studies can be carried out in which the beliefs of prospective teachers about mathematical solving can be evaluated in terms of gender.
3. More comprehensive studies can be carried out by considering other subject teachers.
4. Studies based on qualitative data about the beliefs of prospective teachers about mathematical problem solving can be carried out. In this regard, prospective teachers can be evaluated by considering separately each sub-factors of the 'Belief Scale about Mathematical Problem Solving' that was used in this study.

# The analysis of pre-service teachers' beliefs about mathematical problem solving

Gunes Yavuz, Hatice Nur Erbay

*Istanbul University, Hasan Ali Yucel Education Faculty, Istanbul, Turkey*

---

## Abstract

There are many extracurricular and classroom factors that should be considered in developing problem solving skills of students in teaching Mathematics. Students who acquired the ability of problem solving will not only be successful in their lessons but also will have skills to overcome problems that they will experience in their real lives. Problem solving includes the combination and coordination of various skills, beliefs, attitudes, intuitions, knowledge and previous acquisitions. For this reason, it has a key role in teaching mathematics. The purpose of this study is to analyze pre-service teachers' beliefs about mathematical problem solving in terms of various variables. For this purpose, the data was collected from 310 third-year students who are studying in teaching mathematics, classroom teaching and teaching science departments from two public universities in Istanbul. Belief Scale about Mathematical Problem Solving was used as a data collection instrument (Haciomeroglu, 2011). The data were analyzed by using statistical software. The correlation of some variable to pre-service teachers' belief about mathematical problem solving was analyzed.

## Introduction

The social structure which is getting increasingly complex and technological developments, political, social and economical crises make an individual to encounter with constantly increasing problematic situations. Therefore, problem solving is an important issue which becomes the centre of attention in psychology for many years. Many concepts have been introduced about problem solving process in many studies. These concepts include a variety of features from traditional Gestalt approaches among different learning methods to recent computer simulations and mathematical models.

It was seen that while researchers such as Gagne and Skinner (1964; 1974) tended to analyze the previous lives of individuals as the most important variable in problem solving process, the other researchers such as Kohler and Maier (1925, 1970) advocated individuals' perception regarding the experienced situation as the most important factor in solving a problem.

A problem is defined as "a situation, quantitative or otherwise, that confronts an individual or group of individuals, that requires resolution, and for which the individual sees no apparent or obvious means or path to obtaining a solution" (Polya, 1962). The problem from a mathematical perspective is defined as "a situation where something is to be found or shown and the way to do this is not immediately obvious to the solver" (p.218, Grouws, 1996, cited in. Kayan & Cakiroglu, 2008). And mathematical problem solving is expressed as a situation which occurs from the experiences of the students (Schoenfeld, 1985). Problem for a mathematics teacher means an outstanding question which students have the necessary pre-information but which they do not know the ways and steps which will lead them to solution beforehand (Schoenfeld, 1989). From this perspective, problem solving means not only finding the solution of a mathematical problem but also confronting with new situations and finding flexible, useful and elegant solutions to these situations (Gail, 1996).

Gur and Korkmaz (2003) emphasize that posing and solving problems enable students both to gain experiences regarding how to express mathematical ideas in written or verbal and to discover mathematical situations. Students' skills to use problem solving strategies regarding mathematical problems are helpful to them for making correct choices for the situations that they encountered in their daily lives (Altun, 2008).

In recent years, it is seen that problem solving is considerably emphasized in studies for improving teaching primary mathematics programs both in Turkey and worldwide.

Mathematical beliefs are defined as value judgements which are composed of the past experiences of an individual (Raymond, 1997). These beliefs have an important place in teaching and learning process as they affect the perceptions of individuals (Pajares, 1992; Thompson, 1992). For instance, the beliefs of a teacher is effective in his/her immediate decisions

---

when he/she needs to make a decision in a difficult situation that he/she faces during teaching and learning process (Abrosse, Clement, Philipp & Chauvot, 2004). Kloosterman and Stage (1992) points out the fact that mathematical beliefs of an individual effect learning and problem solving. Concordantly, the studies which analyze the beliefs about mathematics shows that students perceive problem solving as finding the correct answer and think that learning mathematics requires memorizing (Picker & Berry, 2000; Raymond, 1997; Schoenfeld, 1989; Thompson, 1984; Toluk Ucar, Piskin, Akkas & Tasci, 2010).

Hart (2002) analyzed the effects of mathematical prospective teachers' beliefs about teaching mathematics. The findings show that the beliefs of prospective teachers advance positively at the programs that they studied. Accordingly, Kayan and Cakiroglu (2008) analyzed the beliefs of prospective primary school mathematics teachers regarding mathematical problem solving. It was determined that prospective teachers had positive beliefs about problem solving. Besides, it was specified that prospective teachers had internalized traditional views such as the importance of routine calculation skills in teaching mathematics and the necessity of following the pre-specified steps in problem solving. The studies (Frykholm, 2003; Kayan & Cakiroglu, 2008; Lloyd & Wilson, 1998) show that the beliefs of prospective teachers about mathematical problem solving is an effective factor in organizing learning environments as a teacher and in the achievements of students. For this reason, determining the beliefs of prospective teachers will be informative about the practice of a future teacher (Kayan & Cakiroglu, 2008).

In this regard, the main purpose of this study is to analyze the beliefs of prospective teachers about problem solving. The beliefs are defined in terms of educational studies as basic assumptions, arguments and insights that an individual has in his/her mind and that he/she develops for the facts around him/her (Richardson, 1996). The beliefs of teachers; is an important factor affecting both the classroom environment that they created and the beliefs of students about mathematics (Ball, 1998; Grouws, 1996; Schoenfeld, 1992; Wilkins & Brand, 2004).

For this reason, analyzing the beliefs of prospective mathematics teachers and having an extensive understanding about them will enlighten teaching mathematics and the studies regarding improving students' learning and will contribute to the training studies which will be organized for teachers. The research subject in this study was worth investigating for the reasons stated above.

The purpose of this study is to analyze the beliefs of prospective teachers who are studying in teaching mathematics, classroom teaching and teaching science departments about problem solving. In this sense, the answers of the following sub-problems were searched:

6. How are the beliefs of prospective teachers about problem solving?
7. Do the beliefs of prospective teachers about problem solving vary according to universities that they study?
8. Do the beliefs of prospective teachers about problem solving vary according to their departments?
9. Do the beliefs of prospective teachers about problem solving vary according to the types of high schools that they graduated from?
10. Do the beliefs of prospective teachers about problem solving differ according to gender?

## Method

The descriptive survey model among qualitative research methods was used in this study. The descriptive survey is suitable for describing a case which exist in the past or present without influencing it (Karasar, 2003). Since the purpose of this study was to present the beliefs of students who are studying in teaching mathematics, classroom teaching and teaching science about mathematical problem solving, descriptive survey model was used.

**Study Group:** The sample of the study is composed of third-year prospective teachers who are studying in educational faculty, teaching mathematics, classroom teaching and teaching science and technology majors of two different universities in 2013-2014 academic years. The distribution of the sample group can be seen in Table 1.

**Table 1:** Study Group

Majors	1 <sup>st</sup> University		2 <sup>nd</sup> University		Total
	F	M	F	M	
Teaching Mathematics	50	6	32	5	93
Teaching Science and Tech.	44	6	43	7	100
Classroom Teaching	39	13	49	16	117
Total	133	25	124	28	310

**Data Collection Instruments:** Belief Scale about Mathematical Problem Solving was developed by Kloosterman and Stage

(1992) and adopted to Turkish by Hacıomeroglu (2011). This scale was developed for revealing the beliefs of students about mathematical problem solving. When the whole scale was analyzed, the Cronbach alpha internal consistence coefficient was calculated as 0.768. The scale was consisted of 24 items and it was in five point likert type.

## Findings

In order to search for an answer for the first sub-problem, prospective teachers' average scores regarding beliefs about problem solving was displayed in Table 2.

**Table 2:** Average Scores of Prospective Teachers' Beliefs about Mathematical Problem Solving

N	$\bar{X}$	SS
310	81	5,83

The beliefs of prospective teachers about mathematical problem solving were collected through a likert type form which was scored between 1 and 5 and consisted of 24 items. The total score differed between 24 and 120. The findings show that the level of beliefs of prospective teachers about problem solving is high ( $\bar{X}=81$ ).

The first item of the findings regarding the second sub-problem was displayed in Table 3.

**Table 3:** T-Test Results of Prospective Teachers' Belief Scores about Mathematical Problem Solving according to their Universities

As it can be seen from Table 3, there was not a significant difference between the beliefs of prospective teachers about mathematical problem solving according to their universities ( $p>0.05$ ). This finding showed that the beliefs of prospective teachers about problem solving by the university were not affected that they studied. The average scores of the students were analyzed in order to understand whether or not the level of their beliefs about mathematical problem solving varied according to their majors and the findings obtained were given in Table 4.

University	N	$\bar{X}$	SS	T	p
The First Univ.	158	81,00	5,91	1,09	0,27
The Second Univ.	152	81,72	5,75		

**Table 4:** T-Test Results of Prospective Teachers' Belief Levels about Mathematical Problem Solving According to their Majors

Majors	N	$\bar{X}$	SS	F	P
Teaching Mathematics	93	83,26	4,89	7,79	0,00
Teaching Science and Tech.	100	80,19	5,63		
Classroom Teaching	117	80,82	6,34		
Total	310	81,35	5,83		

As it is seen in Table 4, there was a statistically significant difference between average belief scores of prospective teachers about mathematical problem solving as the average scores of teaching mathematics students were higher than teaching science and classroom teaching students ( $p<0.05$ ). The reason of this difference was because of the fact that the average belief scores of mathematics prospective teachers about mathematical problem solving were higher.

The other sub-problem was 'Do the beliefs of prospective teachers about problem solving vary according to the types of high

schools that they graduated from?’ The findings regarding this sub-problem are given in Table 5.

**Table 5:** F-Test Anova Results of Prospective Teachers regarding the Belief Levels about Mathematical Problem Solving according to the type of the high school

Type of High School	N	$\bar{X}$	SS	F	p
Anatolian High School	124	81,04	5,58	2,83	0,06
Teacher Training High School	81	82,65	5,83		
Other high schools	105	80,72	6,03		
Total	310	81,35	5,83		

According to this finding, it can be said that the level of prospective teachers’ beliefs about mathematical problem solving did not differ depending on the type of high school that they graduated ( $p>0.05$ ).

Whether or not the level of prospective teachers’ beliefs about mathematical problem solving differed according to their gender is given in Table 6.

**Table 6:** T-test results of Prospective teachers’ Belief Levels about mathematical Problem solving according to their Gender

According to Table 6, there was not a statistically significant difference between the average belief levels of prospective teachers about problem solving by (p>0.05) their gender.

Gender	N	$\bar{X}$	SS	T	p
Female	257	81,55	5,6	1,34	0,18
Male	53	80,37	6,45		

## Conclusion, Suggestions

## Discussion and

The basic purpose of this research is to determine the beliefs of prospective teachers about mathematical problem solving in terms of various variables. Within the scope of this basic purpose, the following results have been obtained.

It can be said that the beliefs of Mathematics, Science and Classroom Teaching prospective teachers about mathematical problem solving is generally high. This finding of the study is supporting Kayan and Cakiroglu’s (2008) study in which they stated that primary mathematics prospective teachers had positive opinions about problem solving.

It was concluded that beliefs of prospective teachers about mathematical problem solving did not differ according to their universities. The reason of this situation may be the fact that both universities are located in the same region. Different universities may not have an effect since students’ environments do not differ in general terms. It is necessary to repeat this study with a broader sample to see whether or not different universities have an effect by selecting universities from different regions of Turkey.

When it was analyzed whether beliefs of prospective teachers about mathematical problem solving differed according to their majors or not, it was seen that the difference was in favour of students from teaching mathematics major. It can be said that the beliefs of mathematics prospective teachers about problem solving is higher than science and classroom teaching prospective teachers. The reason of this situation may be the fact that problem solving is occupationally vital for the mathematics prospective teachers. Besides, the university education of mathematics prospective teachers may have an effect on their problem solving skills.

The beliefs of prospective teachers about mathematical problem solving did not differ according to the type of high school that they were graduated from is another finding of the study. The reason of this may be the fact that educational faculties are mostly preferred by Anatolian High School or Teacher Training High school graduates. Since a few of the prospective teachers

were graduated from science high schools, private high schools or vocational high schools, this number was not enough for creating a difference. In other words, it cannot be talked about any kind of difference since a homogenous sample could not be created according to high schools. By using purposeful sampling, it can be possible to understand whether this situation will create a difference or not.

The beliefs of prospective teachers about mathematical problem solving did not differ according to gender is the final finding of the study. Kayan (2007) concluded in his study which was carried out in five universities that the beliefs of primary mathematics prospective teachers about problem solving did not differ according to gender but Soyuturk (2011) concluded in his study about classroom teaching prospective teachers that the beliefs of prospective teachers about problem solving differed in favour of female students. When the literature was analyzed, it was stated that whether or not the beliefs of female and male students about problem solving differed according to gender might change according to sample group (Arli, Altunay & Yalcinkaya, 2011).

The following suggestions can be offered in accordance with the findings.

5. The beliefs of prospective teachers about problem solving can be searched with different and broader samples. The sample can be decided by considering different geographical regions.
6. Comprehensive studies can be carried out in which the beliefs of prospective teachers about mathematical solving can be evaluated in terms of gender.
7. More comprehensive studies can be carried out by considering other subject teachers.
8. Studies based on qualitative data about the beliefs of prospective teachers about mathematical problem solving can be carried out. In this regard, prospective teachers can be evaluated by considering separately each sub-factors of the 'Belief Scale about Mathematical Problem Solving' that was used in this study.

## Abstract

Problem posing means either posing new problem situations in terms of given conditions or re-formulating an already written problem. In this study, the aim is to evaluate problems written by prospective mathematics teachers about ratio and proportion subjects in terms of criteria specified according to problem posing methods. According to this purpose, 'Problem Posing Form about Ratio and Proportion Subject' including questions for determining the tasks of free problem posing, semi-structured problem posing, structured problem posing and for determining which one is the most challenging problem posing task, was developed by the researchers. The data form was applied to 45 sophomore students who are studying in Kocaeli University, Teaching Primary School Mathematics department. The data collected throughout this study was evaluated by considering; *i) Problem text (language and expression), ii) The compatibility of the problem with the mathematical principles, iii) The type/structure of the problem and iv) The solvability of the problem.* In conclusion, it was concluded that prospective mathematics teachers posed clear and understandable problems which are compatible with the mathematical principles in the form of activity and which can be solved by students. The challenging sides of problem posing appeared as the hesitation on posing problems which are suitable to students' levels, the difficulty in remembering the subject clearly and not having sufficient information about problem posing.

**Keywords:** Ratio, proportion, problem posing, analysing posed problems

---

## 1. Introduction

Problem posing which is a special case of problem solving (Christou, Mousoulides, Pittalis, Pitta-Pantazi & Sriraman, 2005) is re-formulating a given problem or creating new problems in accordance with the given situation. Problem posing is cognitively a more difficult task than problem solving (Mestre, 2002) and it is accepted as problem finding or formulation (Dickerson, 1999). Problem posing can be practised before solving a given problem as well as while solving a problem or after problem solving (Lavy & Bershadsky, 2003). In this sense, when the previous research about this subject was analyzed, it was seen that there are various problem posing methods (Abu-Elwan, 2007; Dickerson, 1999; Grundmeier, 2003). They are methods such as; *i) free problem posing, ii) semi-structured problem posing, iii) structured problem posing* (Stoyanova, 2003) and *iv) What if ... What if not?* (Abu-Elwan, 2007).

*In free problem posing*, students are given a situation or a subject from daily life. Students generate problems by using them. (Akay, 2006). It is the case of asking students to pose problems about any subject without providing them any data, figure or problems (Ergün, 2010).

*In semi-structured problem posing*, an open-ended situation is given to students and students are asked to generate problems about this situation by using their own skills, knowledge and mathematical experiences (Akay, 2006). The semi-structured problem posing strategies are mathematical situations, posing open-ended problems and interpretation (Dickerson, 1999).

*In structured problem posing*, the matter is posing a new problem by changing the known (Akay, 2006). Students pose problems by considering the limitations determined by their teacher. For instance, the teacher can ask students to pose a problem including a mathematical concept such as multiplying decimals (Dickerson, 1999) or to only change the numbers in a given problem. "What if? ...What if not?" method is in the scope of structured problem posing method (Brown & Walter, 1993). In this study, prospective teachers were asked to pose problems about 'Ratio and Proportion' subject in compatible with all the methods other than the method of "What if? ...What if not?".

In order to improve students' problem posing skills, it is necessary to evaluate all the products obtained about the topic of problem posing (Ergün, 2010). In this sense, the evaluation in problem posing can be practiced in two ways. The first one is to evaluate students' problem posing skills, concept knowledge and proficiencies with the help of posed problems. And the second one is to evaluate problems and process (Silver & Cai, 2005).

This research were supported by Marmara University, Scientific Research Commission (BAPKO)

Silver and Cai (1996) considered the following determined criteria in the evaluation of posed problems as; i) *the solvability of the problem*, ii) *problem text*, iii) *mathematical complexity* and iv) *the relationship between posed problems*. Albayrak, İpek and Işık (2006) evaluated the problems in their studies by considering the following criteria, i) *writing nothing*, ii) *using all the given material*, iii) *adding new materials* or iv) *the process of creating samples from the data*. Cai, Moyer, Wang, Hwang, Nie and Garber (2012) used rubrics for evaluating posed problems. Ergün (2010) paid attention to following criteria in the evaluation of problems; i) *the clarity of the problems*, ii) *the compliance of the problem with physics principles*, iii) *the structure of the problem*, iv) *the number of questions*, v) *the type of problem* and vi) *the solvability of the problem*. Grundmeier (2003) in the evaluation of problems considered the following criteria; i) *reasonableness and plausibility* ii) *whether the problem consists sufficient information or not* and iii) *the number of operations required for the solution*. Işık and Kar (2012) evaluated the problems in their studies according to criteria as stated by Silver and Cai (2005) “*quantity*” and “*originality*”.

The purpose of this research is to analyze problems posed by prospective teachers about the subject of “Ratio and Proportion”. In this sense, the aim is to evaluate problems posed by prospective teachers about the subject of “Ratio and Proportion” within the framework of criteria specified in accordance with problem posing methods. The answers of the following sub-problems were searched for this purpose.

1. How is the situation of prospective teachers about posing free problems about the subject of Ratio and Proportion?
2. How is the situation of prospective teachers about posing semi-structured problems about the subject of Ratio and Proportion?
3. How is the situation of prospective teachers about posing structured problems about the subject of Ratio and Proportion?
4. How is the general problem posing profile of prospective teachers?
5. Which is the most challenging problem posing method for prospective teachers? Why?

## 2. Method

### 2.1. Research Design

Qualitative research is a search for demonstrating perceptions and events in a holistic and realistic manner in natural environments and a qualitative process is followed (Yıldırım & Şimşek, 2008). In this sense, this study is a qualitative research which is aimed to demonstrate results of a particular situation and includes the analysis of the written worksheets. The document analysis involves the analysis of written documents about the case or cases which are intended to study (Yıldırım & Şimşek, 2008). In this study, data forms which were filled by prospective teachers were used as document.

### 2.2. Working Group

The work group of this study consisted of 45 prospective sophomore students who are studying in Kocaeli University, Teaching Primary School Mathematics. 40 of the prospective teachers are female (88,89%) and 5 (11,11%) of them are male.

### 2.3. Data Collection Tools and Collecting Data

The data of this study was collected by using “The Problem Posing about Ratio and Proportion Form” which was prepared by the researchers. This data form consisted of four sections. These sections are as in the following; i) *free problem posing and the task of solving posed problem*, ii) *semi-structured problem posing and the task of solving posed problem*, iii) *structured problem posing and the task of solving posed problem* and iv) *In which problem posing task did you have difficulties? Why?.* This form which was prepared by the researchers distributed to prospective teachers and prospective teachers were asked to fill in this form. Prospective teachers had one hour (60 minutes) to fill in this form.

### 2.4. Data Analysis

First of all, the researchers specified four criteria to evaluate the data obtained in this study. These are; i) Problem text (language and expression), ii) The compatibility of the problem with the mathematical principles, iii) The type/structure of the problem and iv) The solvability of the problem. When the data obtained was analyzed within the framework of this given criteria, it was appeared that the specified criteria needed to involve sub-dimensions. In this sense, sub-dimensions were added to the specified criteria by each two researchers separately. Later on these sub-dimensions were compared and an agreement on dimensions was reached.

This evaluation tool that the dimensions and sub-dimensions were determined by the researchers was given to two expert researchers other than the researchers of this study in the field of teaching mathematics for taking their opinions. The experts were asked to evaluate the compatibility of the dimensions for evaluation and the compatibility of the sub-dimensions to the dimensions as “applicable” and “not applicable”. After the evaluation results, the level of agreement between experts and researchers was calculated by using the formula “*Agreement Percentage = [Agreement / (Agreement + Disagreement)] x 100*” as stated by Miles and Huberman (1994). It was decided that the agreement percentage regarding the compatibility of each dimension for evaluation changed between 0,89 and 0,92 and the agreement percentage regarding the compatibility of the sub-dimensions to dimensions changed between 0,86 and 0,90.

Although the evaluation form took the form of a rubric, the evaluation criteria was not decided by considering the purpose of the study. In this sense, an evaluation form involving 4 dimensions and 3 sub-dimensions for each dimension was developed for evaluating the problems posed by prospective teachers. The data obtained was evaluated by using this evaluation form. The researchers and two experts from the field of teaching mathematics evaluated each problem separately and evaluation results were compared. The differences appeared were discussed and then an agreement was reached. In conclusion, the evaluation results as being related with each sub-dimension was presented on the basis of frequency (f) and percentage (%).

### 2.5. The Reliability and Validity of Study

The validity in qualitative research means observing the searched issues objectively as much as possible and as it is (Kirk & Miller, 1986). In order to present a holistic picture of the searched topic, the researcher should confirm the data and outcomes of the study through variation, participant confirmation and colleague confirmation (Yıldırım & Şimşek, 2008). In this regard, data of this study was analyzed by two experts in the field of teaching mathematics other than the researchers and the validity of the study was provided through colleague confirmation.

The qualitative research begins with the thought that realities constantly change according to individuals and to environments and repeating the same study with similar groups may not create the same results. In this regard, in order to provide reliability to qualitative research, the researcher should define the individuals who are the source of information clearly (Yıldırım & Şimşek, 2008). In this study, to get reliability, the study group defined in details.

In addition to that, the data obtained were frequently given in the study. Besides, the results of the evaluation were presented on the basis of frequency (f) and percentage (%). The purpose here is to increase the reliability of the data, to reduce bias and to provide a chance to make a comparison between the data. Besides, the data presented in numbers in order to have an opportunity to repeat this small scale study later on to reach a wider sample with tools such as surveys (Yıldırım & Şimşek, 2008).

### 3. Findings and Comments

Findings and comments regarding the first research problem which was specified as “How is the situation of prospective teachers about posing free problems about the subject of Ratio and Proportion?” are as in the following;

Table 1. The evaluation of the task of posing free problems

Evaluation Criteria		f	%
Problem Text (Language and Expression)	The text of the problem is not clear and understandable.	1	2,22
	The text of the problem is relatively clear and understandable.	10	22,22
	The text of the problem is clear and understandable.	34	75,56
The Compatibility of the Problem with the Mathematical Principles	The problem is not suitable to Mathematical Principles.	1	2,22
	The problem is relatively suitable to Mathematical Principles.	2	4,44
	The problem is suitable to Mathematical Principles.	42	93,33
The Type/Structure of the Problem	Exercise.	21	46,67
	Simple normal problem.	11	24,44
	Normal problem.	13	28,89
The Solvability of the Problem	The problem cannot be solved.	0	0
	Problem can be solved but it is erroneous.	1	2,22
	It can be solved.	44	97,78

When Table 1 is analyzed, it is seen that 34 of the posed problems (75,56%) have clear and understandable texts. It is determined that 42 (93,33%) problems are suitable to mathematical principles. 21 (46,47%) prospective teachers posed problems in exercise type, 11 (24,44%) prospective teacher in simple normal problem type and 13 (28,89%) prospective teachers in normal problem type. It is understood that all the posed problems are solvable. An example regarding the task of posing free problems stated below.

Ayşe Hanım elindeki 74 tane şekeri 4,5 ve 6 yaşlarındaki üç çocuğuna yaşları ile ters orantılı olarak paylaşmak istiyor. Buna göre çocukların her birinin kaç tane şeker aldığını bulunuz.

Mrs. Ayşe wants to share her 74 candies inversely proportional to 3 children aged between 4,5 and 6 years old. According to this, please find how many candies each child will get.

Fig. 1. Task of posing free problem of prospective teacher with number 29

Findings and comments regarding the second sub problem which was specified as “How is the situation of prospective teachers about posing semi-structured problems about the subject of Ratio and Proportion?” are as in the following;

Table 2. Evaluation of the task of posing semi-structured problems

Evaluation Criteria	f	%
---------------------	---	---

Problem Text (Language and Expression)	The text of the problem is not clear and understandable.	0	0
	The text of the problem is relatively clear and understandable.	6	13,33
	The text of the problem is clear and understandable.	39	86,67
The Compatibility of the Problem with the Mathematical Principles	The problem is not suitable to Mathematical Principles.	0	0
	The problem is relatively suitable to Mathematical Principles.	5	11,11
	The problem is suitable to Mathematical Principles.	40	88,89
The Type/Structure of the Problem	Exercise.	41	91,11
	Simple normal problem.	4	8,89
	Normal problem.	0	0
The Solvability of the Problem	The problem cannot be solved.	0	0
	Problem can be solved but it is erroneous.	0	0
	It can be solved.	45	100

When Table 2 is analyzed, it is seen that 39 (86,67%) of problems posed by prospective teachers have clear and understandable texts. In addition to that, it is seen that 40 (88,89%) problems are suitable to mathematical principles. It is determined that 41 (91,11%) problems out of 45 posed problems are in exercise type and 4 of them (8,89%) is in normal problem type. It is understood that all the posed problems are solvable. An example regarding the task of posing semi-structured problems stated below.

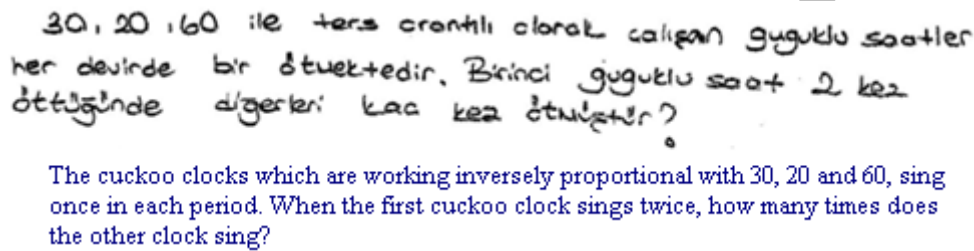

Fig. 2. Task of posing semi-structured problem of prospective teacher with number 7

Findings and comments regarding the third sub-problem which was specified as “How is the situation of prospective teachers about posing structured problems about the subject of Ratio and Proportion?” are as in the following:

Table 3. Evaluation of the task of posing structured problems

Evaluation Criteria		f	%
Problem Text (Language and Expression)	The text of the problem is not clear and understandable.	0	0
	The text of the problem is relatively clear and understandable.	6	13,33
	The text of the problem is clear and understandable.	39	86,67
The Compatibility of the Problem with the Mathematical Principles	The problem is not suitable to Mathematical Principles.	0	0
	The problem is relatively suitable to Mathematical Principles.	7	15,56
	The problem is suitable to Mathematical Principles.	38	84,44
The Type/Structure of the Problem	Exercise.	38	84,44
	Simple normal problem.	7	15,56
	Normal problem.	0	0
The Solvability of the Problem	The problem cannot be solved.	0	0
	Problem can be solved but it is erroneous.	0	0
	It can be solved	45	100

When Table 3 is analyzed, it is seen that the text of 39 (86,67%) posed problems are clear and understandable. It is determined that 38 (84,44%) problems are suitable to mathematical principles. It is appeared that 38 (84,44%) problems are in exercise type. It is understood that all the problems posed by prospective teachers regarding the task of posing structured problems are solvable. An example regarding the task of posing structured problems stated below.

Kaplumbağa saatte 10 km yol alıyor. Çita ise saatte 95 km yol alıyor. Buna göre Çitanın 10 saatte aldığı yolu kaplumbağa kaç saatte alır?

A turtle makes 10 km per hour. And a cheetah makes 95 km per hour. According to this, when a cheetah moves 10 hours, how many kilometers does a turtle make at this same 10 hours?

Fig. 3. Task of posing structured problem of prospective teacher with number 36

Findings and comments regarding the fourth sub-problem specified as “How is the general problem posing profile of prospective teachers?” are as in the following;

Table 4. Evaluation of the problem posing task

Evaluation Criteria		f	%
Problem Text (Language and Expression)	The text of the problem is not clear and understandable.	1	0,74
	The text of the problem is relatively clear and understandable.	22	16,29
	The text of the problem is clear and understandable.	112	82,96
The Compatibility of the Problem with the Mathematical Principles	The problem is not suitable to Mathematical Principles.	1	0,74
	The problem is relatively suitable to Mathematical Principles.	14	10,37
	The problem is suitable to Mathematical Principles.	120	88,89
The Type/Structure of the Problem	Exercise.	100	74,07
	Simple normal problem.	22	16,29
	Normal problem.	13	9,63
The Solvability of the Problem	The problem cannot be solved.	0	0
	Problem can be solved but it is erroneous.	1	0,74
	It can be solved	134	99,26

When table 4 is analyzed, it is determined that 112 (82,96%) of the problems out of 135 posed problems have clear and understandable texts and 120 (%88,89) of them are suitable to mathematical principles. It is seen that 100 (%74,07) of the posed problems are in exercise type and 134 (99,26%) of them can be solved.

When the data is evaluated about the last sub-problem specified as “Which is the most challenging problem posing method for prospective teachers? Why?”, it is seen that 12 (26,67%) of the prospective teachers stated that they did not have any difficulties in any of the methods. 16 (%35,56) prospective teachers stated that they had difficulties in posing free problems and 13 (28,89%) of them had in semi-structured problem posing and only 4 (%8,89) of them had difficulties in structured problem posing. As for the reason of the difficulties of the prospective teachers, they expressed that they had concerns about posing problems suitable to middle school level. In addition to that, they stated that since they did not remember the ratio and proportion subject clearly, they thought that they could not pose suitable problems. Besides, it is seen that they expressed that they were away from problem posing and such studies have not been conducted.

#### 4. Conclusion, Discussion and Implications

As a result of the analysis regarding the task of posing free problems, it is concluded that the texts of the problems posed by prospective teachers were clear and understandable. It is appeared that the posed problems were suitable to mathematical problems and all the problems were solvable. As a result of the data about the task of posing semi-structured and structured problems, it is appeared that the texts of the problems posed by prospective teachers were clear and understandable, suitable to mathematical principles, in the type of exercise and solvable problems

In general evaluation of the research findings, it is concluded that prospective teachers posed problems which have clear and understandable texts, suitable to mathematical principles and all the problems were solvable. In addition to that all the posed problems are in exercise type. As a result of posing problems in the type of exercise, it was determined that this result echoed with the research findings as problems posed by prospective teachers are predictable, simple and well-structured problems (Albayrak, İpek & Işık, 2006; Crespo, 2003; Crespo & Sinclair, 2008; Işık, Işık & Kar, 2011).

The researchers such as Fetterly (2010), Silver & Cai (2005) and Yuan & Sriraman (2010) express that posing different problems is related with creativity. Işık and Kar (2012) concluded in their studies that prospective classroom teachers posed limited number of different problems. They also indicated that this could be a sign for prospective teachers' lack of creativity and their ability to associate. In this sense, it can be said in this study that prospective teachers pose problems in exercise type because they do not have enough creativity skills and they do not have conceptually well-structured basic mathematical concepts.

It is concluded that prospective teachers mostly have difficulties in free problem posing. In the study, it was asked to pose a problem according to the sample in structured problem posing task and posing a problem according to a figure in semi-structured problem posing task. However, in free problem posing it is expected from prospective teachers to pose problems by using their

current mathematical knowledge and experiences. In this sense, the reasons of prospective teachers have difficulties in free problem posing task can be thought as there is no help or information. Besides, it is determined that as for the reason of having difficulties, prospective teachers expressed that they could not remember the subject clearly. Moreover, prospective teachers stated for the reasons of difficulty that they had concerns about posing problems suitable to middle school level. It is thought that this difficulty can be overcome by making more problem posing studies. It is seen that prospective teachers indicated another reason for having difficulties as they did not have enough information about problem posing. In conclusion, it is seen that the reasons of having difficulties are the fear of not posing problems suitable to level, not remembering the subject clearly and not having enough information about posing problem.

The findings of the study point out the fact that prospective teachers need to gain more experience on posing problems. In this sense, it is suggested that problem posing subject should be included in programs more in educational faculties. Together with this study, problem posing situations of prospective teachers in a single subject in mathematics was evaluated. Different subjects in mathematics should be analyzed with bigger samples. Moreover, it can be analyzed experimentally in terms of different variables (academic achievement, gender etc.) by determining on which subjects prospective teachers are successful.

## Abstract

The levels of the professional skills development create a hierarchy where each of the higher levels includes the lower one. The margins are heterogeneous with many entrances and exits that ensure integration of new experience and judgements. The professional development process can change the nurse's personal attitude and values that form a holistic understanding of the situation followed by the approach in the education of patients. Proficiency is one of the highest levels of professional development, when the working process is enriched by experience, feedback, and reflection.

## 1.Introduction

Patient education is Article 25 of the universal Declaration of Human Rights, and Article 4 of Patients' Rights Law - The right for information, the ethical principle of respect and a component of the nursing professional standard that prove the examples of good practice. The patient, with the exception of life-threatening situations, and when the relatives or contact persons are not available, receives educational information on expected handling, treatment and care processes, medication, and all that is followed by the agreement on the part of the patient to receive treatment, rehabilitation or prevention process.

Nursing practice, including pedagogy, includes personal, professional, tacit knowledge (Moule, Goodman, 2009), which results in a multi-faceted body of knowledge. Nursing knowledge is synthesized into formal, non-formal and informal education, professional experience, and as a result these are integrated into patient health preservation, improvement or stabilization of the condition, patient safety, and positive outcome. Practical medicine is impossible without application of comprehensive technology to specify and determine a diagnosis and monitor patients' health. However, by all means, in the context of each case communication, the dialogue with the individual patient, his relatives or patients are designed. Verbal communication, complemented by educational strategies and selected educational resources appropriate for each situation, is a big part of the anticipated positive result in raising the patient's awareness or the replenishment of providing mutual understanding of the health / sickness framework. To achieve the objectives of the theory and practice of effective collaboration in the process of patient education, adequate communication should be chosen (Ivarsson, Nilsson, 2009) the patient's age and general state of health should definitely be considered. Communication can be seen as patient education centre (Kraszewski, & McEwen, 2010), both in educating individual patients and groups of patients.

The verbal and non-verbal aspects are important in the process of patient education, because it will help to reinforce the confidence of patients, which is the background for further cooperation and formation of expectations. Patient education is a multifaceted theoretical and academic knowledge, oratory, debate and set of artistic attitudes, which should be focused on the development of positive cooperation and understanding of patients.

In nursing practice pedagogical skills are based on the acquisition of interdisciplinary science, basics of medicine, in addition to communication and general psychology, sociology and philosophy, learning by studying, the theory (epistemology), topical problem solving and updating, as well as identification of the appropriate methods (methodology) applicable to different practices and situational dimensions.

Integration of organization skills of the pedagogical process in interaction with patients / relatives / public certifies the range spectrum of nurses' cognitive, affective, and psychomotor development. Pedagogical skills necessary to ensure patients' understanding of the factors and aspects that can be a discovery for them are significant in "here and now" perspective, short or long time range, allowing the patient's individual personal judgment of the assumption and autonomy.

Fig.1. Components of the implementation of pedagogical paradigm

It is important to clarify the patient's existing knowledge base in the patient education process to be able to move step by step towards the goal, but at first the goal is to be identified. The patient's existing knowledge and personal values should be considered and respected. Variable standpoints are possible in the cooperation / educational process. Not only the patient's physical ability range should be taken into account, but also the cognitive level of the individual areas of the personality, typological characteristics of the individual, the horizon of the individual and the patient's personal competence. A possible agreement in the realization of the set of goals is desired, because if patients have confidence in their abilities, it will contribute to the motivation and will serve as confirmation of proper educational tactics.

Combinations of methods should often be applied in the education process; the choice depends on the individual's comprehension abilities. The type of the interaction level chosen by a nurse should preferably be in a horizontal plane. That will ensure a successful influence on the educational process and the quality of performance of the activities. Involvement of biased predictions should be avoided in the educational process. It is important to emphasize the focus on cognitive learning based on awareness creation and through abstract concepts, but through active reflexive dimension. Situation modelling application in the form of "what if ... "is possible.

Patient educational process is partly affected by both the nurses' personal qualities – her initiative, cooperation, organizational skills and cognitive skills. The skill set focused on the critical thinking process and based on diversified competencies when assessing personally and offering the patient to choose the most appropriate form of cooperation is the beginning of professional proficiency.

Members of the public and patients, not always accept possible behavioural changes that ensure health improvement and maintenance suggested by nurses unambiguously. Sometimes a long-term collaboration with a patient/a group to encourage members to further action, to help them understand and apply adequately the knowledge of health and/or disease awareness using a variety of pedagogical methods based on education, psychology, and nursing theory aspects, which are based on aspects of human needs.

On the part of patients/members of society motivation is viewed as important in the successful implementation of the educational process:

- internal- internal locus of control - personal interest in activities, choice, belonging, participation, wellbeing, understanding of health as a value;
- external - external locus of control, external evaluation, influence of social processes.

During the practice, the totality of practical skills is viewed in the context of professional responsibility, empathy, and respect for the patient/individual as an independent person. Pedagogical activities are developed by a nurse when gaining experience, supported by intuition or hidden knowledge (Davies, 1993), which helps to provide an individualized approach specific to the context of the case. Teaching tools, appropriate methods and timely application of those are essential for patients'/relatives' cognitive enhancement (Halse, Fonnes, & Christiansen 2013) and goal achievement. Educational process can be transformative (Mezirow, 1997) and integrative creating new views and insights, activities and motivations, or reconstructive - modifying existing assumptions, beliefs, health challenges, consciousness about health improvement as a value. Patient education includes critical approach and substantiation of activities.

Campbell C. (Campbel, 2013) states that adult motivation for information and education, primarily arises from the need and a specific case, noting that age may contribute to individual motivations. In same health care institutions patient education is planned, sequenced and shared by doctors and nurses. Quite frequent are the cases when, thinking that a patient's doctor or nurse will educate the patient, providing him/her with the necessary information, the patient education is not acquired from the persons

involved in this case. One can also face a risk-averse, fast, non-specific communication implementation model when implementing patient education and as a result, the patient/relatives receive only a part of information, resulted by an incomplete information transmission / reception which can lead to negative consequences.

Pedagogical skills could be promoted already during the formal study process in nursing education by providing a simulation of patient participation (Saaranen, T., et all. 2013), improving the understanding of kinaesthetic, visual, auditory, communicative processes and their application possibilities, practical awareness of communication and significance of the outcomes of patient education.

The set of teaching practice focused on proficiency is formed by the integration of humanistic (Maslow, 1943 Heylighen, 1992), cognitive (Vygotsky, 1978) and constructive (Dewey, 1930, 1938) (Strode, 2003) theories.

## 2.Aspects of nurses professional proficiency

Proficiency as a concept is applied to the assessment of professional skills in a wide spectrum of professional fields, like technology, language learning, piloting aircraft and others. It should be noted that the concept is used in everyday life relatively infrequently. A simplified view of proficiency shows it as good governance of professional knowledge, skills and competencies. Foreign language translations do not point out any differences.

For researchers in scientific studies that analyse nurses` professional development, generally two professional development stages are compulsory, namely – a competent employee (Khan, Ramachandran, 2012; Bartolone, 2008) and an expert (Rivers, 2003; Gobet, Chassy, 2008, Underwood 2013, Cromley, 2000). They are relatively frequent as a focus of research. On the other hand, proficiency as the main focus of research is relatively uncommon.

Fig.2. Five stages of professional development of nurses.

The source adapted from P. Benner „From Novice to Expert”: Excellence and Power in Clinical Nursing Practice, Commemorative Edition” (2001)

Nurses` professional progress from one stage to the next depends on the quality of the experience of the previous stage and manifests in the personal skills capacity that transforms into a personal professional type of tactics. The nurse treats each case as a discovery in spite of a variety of possible factors affecting the case in the solution of which pedagogical skills are integrated. Different authors have viewed professional development stages creating their own theoretical ideas and confirming previous findings.

Table 1. Definition of proficiency in the view of different authors

Author	Main scientific opinions
H.&St. Dreyfus model (1986) Benner P. (2001) Benner, P Tanner, Ch., Chesla C. (2009) Harper, 2009; Jasper, M. (2011)	Define the levels of professional development when everybody has equal opportunities to develop step by step from a novice level to a worker with experience, a competent employee, proficient, often called a professional, followed by expert until the professional worker becomes a generator of new ideas, a master.
Robinson-Walker , C. (2013) Khan, K & Ramachandran, S. (2012) Lester St.(2005) Fiddler, M. (2000)	Holistic, analytical approach, rational decisions in defining knowledge, skills and responsibilities are described in the proficiency phase: knowledge - a deep, broad understanding of the field of work, working standard - fully met and regularly integrated in action, autonomy - is able to take full responsibility for his/her actions (if necessary for others), overcoming difficulties - safe decision-making, may act in difficult situations, contextual, holistic conception – see's the "image" as a whole and the individual action, in its in a particular case is able to decide independently and act analytically from the experience and awareness of the situational perspective.

Professional skill levels form a hierarchy where each of the higher levels includes all lower levels. Professional development is based on conceptual understanding and practical integration of effective operation to perform the duties in educating patients at the highest possible quality. The operational process and its result may be affected by external (work organization) and internal factors (nurse`s/patient's personality traits, values and motivation to learn something new).

Table 2. Definition of proficiency in dictionaries

Dictionary	Definition
Pedagogical terms glossary (2000)	The skill, based on professional experience, as well as understanding in a particular area, to use one's knowledge and experience in concrete action in the range of issues.
Latvian language dictionary (2006)	Knowledge, skills (in an issue, an area).
Merriam-Webster Online dictionary	Synonyms of proficiency - masterful, qualified, skilful or in related words – competent, clever
English – Latvian language dictionary (2007)	Proficiency – skill (māka), know – how (prasme) Proficient – proficient (lietpratējs), expert (eksperts), skillfull (prasmīgs), conversant (with) lietprasmīgs, competent (kompetents)

The explanations of the word "proficiency" in the range of dictionaries have similar trends, revealing the essential features, attributes, relationships, but giving no clear-cut explanation of the word, which allows the use of different interpretations according to the application.

Professional proficiency has no linear progression of development, but a spiral nature which provides access to new ideas, experience, knowledge, transformative recognitions (Mezirow 1978, Elliott, 2010; Renigere, 2012). As a result, nurses' professional attitudes and values increase based on knowledge and experience, which opens up a wide vision, allows understanding of possible alternative actions or solution methods.

Table 3. Levels of competences, the way of development and study process from novice to expert  
Resource adapted from Fiddler, M. (2000) *Developing Adult learners Strategies for Teachers and Trainers*

Levels of competences	Way of development	Study process
<b>Novice:</b> can appreciate and adapt to a deviation from the basic laws and procedure descriptions	There is no difference between rules and the context in which the rules are applied	<b>10%</b> transformation of own action <b>90%</b> grasping
<b>Novice with experience:</b> can assess and adapt to important aspects of situations	Transition from dictated activities to actions dictated by the situation	<b>30%</b> transformation of own action <b>70%</b> grasping
<b>Practicing (competent):</b> can assess and adjust to deviations from the model	Transition from activities dictated by the situation to actions dictated by the general plan	<b>50%</b> transformation of own action <b>50%</b> grasping
<b>Professional (proficient):</b> can assess and adjust to deviations from the model	Transition from activities dictated by the general plan to actions dictated by intuition	<b>70%</b> transformation of own action <b>30%</b> grasping
<b>Expert:</b> can evaluate and focus on critical factors in a situation	Actions and situations are synonymous	<b>90%</b> transformation of own action <b>10%</b> grasping

In order to improve their knowledge in the process of professional development, it is important for nurses, when continuing their education in a formal and informal way to supplement their knowledge in the field of pedagogy which can develop nurses' professional proficiency.

### 3. Proficiency aspects of patient education

Authors Morasha E.M. and Moynagh V.D. (Morasha, & Moynagh, 1998) emphasize that proficiency is formed by general skills in interpersonal relationships and communication, analytical and conceptual thinking as well as three levels of professional knowledge: basic knowledge, working knowledge and in-depth knowledge, skills and experience, the set of which includes the ability to apply concepts, principles and techniques appropriate to the situation.

The concept of proficiency includes conceptual, content (Rowan, et. all. 2001), procedural and strategic knowledge. Notable are the knowledge and understanding adjusted to the individual case based on observation, intuition or hidden knowledge, as well as empathy, flexibility and responsiveness of nurses.

It is essential to know when and how to communicate with patients, when and how to educate, understand the right timing for the provision of information, for information replenishment, ensure the provision of repeatability of information, change of the selected information methods, change or postpone part of the educational process till later. This kind of ethical, pedagogical, psychological and communicative aspect is also essential to testify to nurses' professional and pedagogical proficiency.

While ensuring the pedagogical process in the system "nurse – patient", the internal and external amplifiers of the cooperation should be identified and assessed to provide patient-centred education based on the individual's level of comprehensive and efficient information transmission, reception and evaluation.

Understanding the nature and regularities of pedagogy the nurse can actualize the emphases to be observed through the process of education. Nurses must assess patients' cognitive level, cultural differences (Danielson, 2013), develop the ability to make decisions in accordance with the patient's cultural values (Bednarz, et all. 2010), because one solution does not fit all cases. Individualized approach is essential in order to build the patient's expectations and confidence in their own abilities, to develop

patient collaboration in health maintenance, improvement or disease prevention.

The model of the professional development nursing profession's has been adapted by a nurse - Professor P. Benner (Benner, 2001). She describes the level of proficiency of a nurse as the ability "to feel the clinical situations." Professional level of proficiency is a stage between a competent staff- member and an expert, when the adjustment processes of meta-cognitive and ethical knowledge, moral responsibility, professional activity, communication and intuition balance are activated. Intuition as one of the defining characteristics of the proficiency stage and empirical experience extend the nurse's spiritual and intellectual platform. It allows them to deviate from the theoretical ideas, to adopt a decision that is analytical, deliberate, and appropriate to the situation, to apply an appropriate teaching method, a way of collaboration and to predict how the situation is going to progress. Intuition as a phenomenon is difficult to measure (Gobet, Chassy, 2008), whereas the experience factors build an individual's professional self-efficiency can be considered in the light of the social cognitive career theory (Brown, et al 2000).

In the context of proficiency a major emphasis is to be put on the nurse's individual skills to strengthen her personal cognitive balance and tolerance (Haider, 1958; Malle, 2008). Cognitive consequences of balance (Gawronski, Strack, 2012) have an essential meaning in interpersonal communication to exclude the situation 'like – dislike'.

In theory, the term proficiency could be partly attributed to the term wisdom (Uhrenfeldt, Hall 2007; Strode, 2010). A proficient nurse, having identified the expected performance and having supported it by the objective to be achieved, does not forget to evaluate possible achievement indicators that point to the progress of the process or the possible obstacles that require consideration of the repetition, suspension or reformation of the process. A nurse demonstrating proficiency in pedagogy integrates a high degree of self-reflection (personal and professional) based on the analysis of experience and critical action, thus demonstrating an understanding of educational activities and internalisation.

#### 4. Reflection as a component of proficient activity –a constituent part of pedagogical skills

The analysis of proficiency structure, focusing on the education work of the patient, is based not only on comprehensive knowledge, but also on individual values, responsibility, sequential and logical process accompanied by an intellectual skill of reflection. Reflection is based on the assessment of the evidence (verbal, non-verbal), the interpretation of which in the cognitive sphere provides an alternative activity, understanding the context of future relations. "Analysis of personal reflection is a challenge to improve the professional and personal experience" (Marilyn, et. al 2011). Reflection, within the framework of proficient patient education, is an analytical process of a regular "positive routine" activity, feedback from participants and of the personal performance based on cognitive, structural knowledge. Using reflection before action, if the action is planned, during and after the action integrating numerous reflection types according to her experience and knowledge, a nurse develops her personal expertise. Reflection expertise in the analysis of the content of the pedagogical process, the feelings based on the feedback received provide the opportunities for the modelling of the activity during its process. R. Harris (Harris, 1993) describes the diversity of reflection: reflection on the possibilities – putting forward the aim, reflection in action and internalisation or a follow-up reflection.

4. Table Reflection types in the situational context of planned patient education  
Resource adapted according to Valli (Valli's five types of reflection, 1997; Grant, S, Van Sledright, A. Bruce, 2014)

<b>Theoretical reflection</b>	The nurse plans and analyzes future communicative or procedural action using educational methods corresponding to the case, based on declarative (what to do), procedural (how to do) and conceptual (why exactly this method or strategy of activity) reflection in the context of planned patient education
<b>Technical reflection</b>	Each educator/ teacher develops their reflections on the experience and understanding through critical disposition applying large-scale problem solving capabilities
<b>Reflection on if to act and how to act</b>	Thinking involves continuous assessment creating a balance between new and critical information
<b>Cognitive reflection</b>	Holistic assessment of the situation, seeing and stating the total view of the current case, including non-verbal attributes
<b>Narrative reflection</b>	Analysis of patient dialogue, story (voice timbre, content)
<b>Critical reflection</b>	The assessment of patient's level of knowledge and perception, epistemological understanding of the volume of patient's knowledge (what and how he/she knows), detailed analysis of the components of the case and intuitive predictions of the development of the situation
<b>Evaluation reflection</b>	The nurse assesses the patient's verbal and non-verbal responses during and after the educational process, and makes certain that the communication, activities and teaching methods correspond to the case, sees intuitively basing on considerable experience and practice, and feels and specifies the questions the patient has not asked about the situation. Reflecting on her own assumptions, she analyzes the success of the case and imperfections, in general the need to repeat what has been said or to apply another educational method. Procedural autonomy and socially responsible behaviour, changing the tactics and educational methods if necessary.
<b>Personal reflection</b>	Listening to their inner voice

In case of an unplanned patient education situation, there is no theoretical reflection. "Reflection promotes professional, personal development, critical thinking, as well as the results of practice" (Jasper, 2006). Researchers (Strode, 2010; Jarvis, 1992) point out that reflection promotes creativity in pedagogical practice. In the evaluation activity in the context of pedagogical

practice proficiency a nurse integrates circular reflection or the model (Driscoll, 2007) of structured reflection described by the authors Bulman and Schutz (Bulman & Schutz, 2008, 2013), depending on the amount of time of the educational episode.

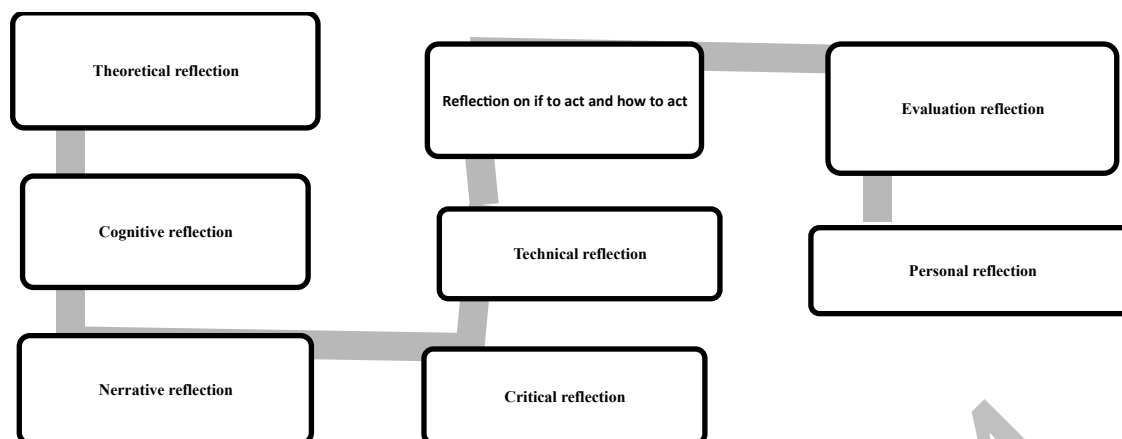

Fig.2. Schematic design of integrated reflection of the pedagogical aspect of proficiency

A nurse, whose professional skills meet the proficiency level, is able to apply different spectra of reflection with professional responsibility in order to optimize her activity, to reduce the patient's actual or potential cognitive dissonance. In the process of patient education synchronous or asynchronous communication is possible. Integration of reflections provides the analysis of the amount of patient understands (if the patient's condition permits) in connection with their feedback.

The professional development in the field of pedagogy in educating patients cannot develop in vacuum. The term – proficient is synonymous with high professionalism that is formed complementary by a high degree of nurses' competence development. Nurses' pedagogical proficiency is based on a set of competencies, which is supported by a wide range of regular activities in health maintenance, improvement or disease prevention, by continuous application of pedagogical skills, evidence-based learning in a formal, non-formal and informal way.

## Conclusions

In the course of Summarizing the theoretical material, as well as having conducted sub-analysis of the studies mentioned in the presentation, it can be concluded that professional proficiency is individually developed professional approach, where the activities focus on procedural, subjective, conceptual and meta-cognitive knowledge and integrate in experience and intuition.

Nurses' proficiency skills in the field of pedagogy promote the cognitive development of patients / relatives / public understanding of the current situation and prospects that can build motivation or reconstruct the system of values of the parties involved. Nurses can professionally position themselves as a knowledgeable health care team member, comprehensively transforming the knowledge necessary for patient /relatives/ public in to areas of health maintenance, improvement or disease prevention.

Carrying out the education of patients, apart from methodological knowledge of pedagogy verbal, non-verbal communication competencies and personal attitudes are crucial for nurses.

Diverse reflection competence is an inseparable component of proficiency when analysing the content of a planned and unplanned pedagogical process, perception and understanding, reactions of people involved in the verbal and non-verbal pedagogical process, that indicate the ability to mobilize for the perception of information, as well as perspective modelling of the potential educational process which promotes health maintenance, improvement or disease prevention.

# The aspects of spatial cognitive mapping in persons with visual impairment

Hana Majerova\*

*Palacky University, Faculty of Education, Institute of Special Education Studies, Žitkovo náměstí 5, Olomouc 771 40, Czech Republic*

---

## Abstract

Spatial mental mapping in an individual with visual impairment can be viewed from several perspectives, as in the case of a person regarded as a bio-psycho-socio-spiritual being. We speak of mental/cognitive mapping in terms of training spatial orientation and mobility on the one hand and psychology of persons with visual impairment, i.e. the process of development of a mental map, on the other hand. An important role is undoubtedly played by lower and higher compensatory functions. Hearing, touch, and partly also smell and taste are, together with mental processes, involved in perception of information, its processing and evaluation. Information perceived through sensorial channels is processed by means of mental processes. In the context of conscious processes, perception and imagination are integral parts of research on consciousness. The paper outlines the issue of spatial mental mapping in a person with visual impairment in the context of spatial orientation and mobility through a comparison of scientific literature and present research trends.

## 1. Introduction

In the first place, an individual with visual impairment is a human, a bio-psycho-socio-spiritual being. For such person, spatial orientation is considerably affected by visual impairment, external and internal aspects. At the same time, spatial mobility is dependent upon training lower and higher compensatory functions. For successful orientation, such person develops a spatial mental/cognitive map. In this sense, the mental mapping process and the form of the mental map have certain specifics. This paper outlines an analysis of scientific papers and contemporary research on the issue in terms of development of individuals with visual impairment. The paper is a theoretical basis of the issue of perception, which is addressed by the author in her dissertation. The possibilities of perception of the target group reach beyond current research and focus on new and quality-different perspectives, closely correlated with an ongoing project at the Faculty of Education, Palacky University, Olomouc (Ref. No. Pdf\_2014\_008).

## 2. Background for analysis of current research trends

According to Finková, Ludíková, Růžicková (2007) a person with visual impairment is any individual suffering an eye defect or disease that causes problems in ordinary life even after optimum correction. Vágnerová (2008) adds that an individual with visual impairment is a person who cannot perceive easily and precisely all visual information; this dimension of the outer world does not exist for such individual or is very limited. It should be noted that the outer world has many dimensions for a person with visual impairment. These dimensions are used to perceive and process information of various quality and quantity. According to the information theory this involves a comprehensive approach to an individual in the context of a bio-psycho-socio-spiritual information aspect. In special education of the visually impaired the information aspect is closely related to compensation. Compensation is understood as a substitute for decreased performance of an organ through increasing another one. Lower compensatory functions include hearing, touch, smell and taste; higher compensatory functions include memory, attention, thinking and imagination (Edelsberger, et al., 2000). This implies that the process of spatial mental mapping involves hearing, touch, smell and taste as well as memory, attention, thinking and imagination. Similarly, will and emotion significantly affect the way an individual uses information in the development of a mental map.

Apart from defining an individual with visual impairment from a holistic viewpoint and the concept of compensation, we should also comment on space, spatial orientation and mobility. Space can be defined as a phenomenon into which objects are inserted and certain boundaries are defined (Jesenský, 2007). In space an individual moves and performs daily routines. Successful orientation is subject to internal factors, the person, and external aspects, i.e. arrangements in traffic, public areas, buildings, etc. (Wiener, 1986). In English speaking countries, the concept of 'orientation and mobility' is, in an educational context, defined as learning concepts, abilities and techniques required for safe, efficient and elegant movement of a person with visual impairment in an environment, under various conditions and situations. At the same time, orientation is regarded an ability of an individual to

---

E-mail address: H.Majerova@seznam.cz

use the different senses to understand the location in an environment in a certain moment (Jacobson, 1993). Mobility is then a set of movements that allow body relocation and work (Hartl, Hartlová, 2000). In case of an individual with visual impairment this leads to re-capacitation in all life spheres (Wiener, 1986). Finková, Ludíková, Růžičková (2007) specify the methods of training spatial orientation and mobility; this includes learning the components of spatial orientation and mobility, long stick technique and orientation analytical-synthetic activity. The main components include walking with a sighted guide, and safety postures, so-called finger trailing. The white stick walking technique requires the ability of basic grasp, pendulum, trailing and diagonal technique. The orientation analytical-synthetic activity involves work with points and signs of reference perceivable through senses. It should be noted that in this 'orientation analysis and synthesis' includes a certain theoretical basis for spatial mental mapping by persons with visual impairment.

Spatial mental mapping in an individual with a disrupted dimension of visual perception of the outer world is very specific. A simple diagram below (Fig. 1) implies that the process of development of mental maps includes the individual with visual impairment as a distinctive entity using lower compensatory mechanisms, with an own internal dimension and potential for higher compensatory functions. Movement in a space then involves the dimension of the external environment, physical world that surrounds the individual. The process of development of a mental map involves the interaction of the internal and external dimension, these levels can overlap.

Fig. 1 Dimensions of mental mapping in spatial orientation in a person with visual impairment

The process of spatial mental mapping encompasses the perception and action space. The perception space is a subjective mental representation of the environment. Within such environment, each person chooses various stimuli (interest in various things, situations, orientation is subject to various environmental elements, various emotions are experienced, various memories created). The action space expresses representations currently considered by the person. The practice of spatial orientation and mobility further includes certain spatial stereotypes, which means that in most cases a human has a tendency to use routine habitual places. We speak of a certain space of activities, mental representations of an environment with specific and stereotyped way of using the space (modified according to [http://ucitele.sci.muni.cz/materialy/86\\_1.pdf](http://ucitele.sci.muni.cz/materialy/86_1.pdf)). This implies that special mental mapping in a person with visual impairment includes the external and internal dimension, perceived and action space.

It is obvious though that this is a process that can be divided into several logically following stages. This process of development of a mental map is based on information from the external environment perceived by the individual through the senses. This information is passed on to the brain for processing and development of an environmental representation. The process of spatial mental mapping is defined by the following four basic stages:

- Obtaining information through the senses.
- Selection and conscious processing.
- Storage in the form of spatial representation.
- Decision making, movement and orientation based on the stored representation ([http://ucitele.sci.muni.cz/materialy/86\\_1.pdf](http://ucitele.sci.muni.cz/materialy/86_1.pdf)).

Using the above in the context of our target group offers certain differences that can be summarized as follows in compliance with the methods of training spatial orientation and mobility in a person with visual impairment:

- Obtaining information through lower compensatory functions, or remaining vision.
- Use of higher compensatory functions in data selection and information processing.

- Storage of spatial representation with respect to differences in obtaining and processing information.
- Spatial orientation and mobility in an individual using spatial mental mapping.

The result of the process of mental mapping in the context of spatial orientation and mobility in a person with visual impairment is a mental map. The form of a mental map of an individual is subject to the level of development of lower and higher compensatory functions. In the context of the senses we anticipate some differences caused by disrupted visual perception. In terms of the higher compensatory functions the decisive aspect is the level of memory capabilities, attention and imagination (Majerová, 2014).

### **3. Theoretical assessment of possibilities of development of mental mapping in spatial orientation and mobility in a person with visual impairment**

#### *3.1 Selected trends in current research*

Research by Lahav and Moiduser (2011) was conducted at Tel Aviv University, Israel. The main objective of the research study was the development of haptic virtual environment for effective development of cognitive maps in individuals with visual impairment (supported by Microsoft and the Ministry of Education of Israel). Below are the published results of the study. In the development of mental maps an individual uses two main types of scanning strategies: route strategy and map strategy. The route strategy is based on linear spatial features, whereas the map strategy encompasses more perspectives of the target location. People with blindness tend to use the first strategy type although the perception of relevant spatial information through compensatory sensorial channels contributes to mental mapping of locations, which can improve the performance of these individuals in spatial orientation.

The authors correlate the issue of mental mapping with the following three areas: development of multi-sensory virtual environment (through which blind people can get familiarized the space); systematic study aimed at comprehensive activation of abilities in a blind person using the virtual environment; research of the benefits of this mapping for blind individuals with respect to the development of their touch.

In the study, the haptic virtual environment allowed an individual to actively learn to develop a mental spatial map through compensatory sensorial channels (compensatory functions). The true space in which the individual lives was simulated by means of a multi-sensory virtual environment. In the study the virtual environment included two operational modes: teacher mode and learning mode. The teacher mode was used to define the environmental characteristics (room size, type, objects and their characteristics, doors, windows, sound-differentiated surfaces such as wooden flooring, grass, etc.) The editor provided both haptic and sound response. The teacher mode involved operations for students as well as teachers. The user was allowed to go through the virtual environment using a feedback joystick, with tactile feedback being provided (as perceived through feet in an environment) by means of the joystick (texture, surface imitation), and auditory feedback (names of objects in an environment, sounds of windows, doors). The individual moved through the virtual environment using navigation that reacted to the individual being lost.

Based on the virtual environment the research focused on ways in which a blind individual can use an environment to construct cognitive maps and orientate in a real space. First the individual moved in a virtual environment according to instructions, then the person was supposed to move to a real space. The advantage of the virtual environment was a possibility to use repeated space (room) mapping, which provided the individual with sufficient information and varied feedback. Lahav and Moiduser (2011) assume that these virtual tools could become a sound support for the blind in the process of learning and understanding new phenomena of the real world. For more information on the research see the authors' text (<http://muse.tau.ac.il/publications/99.pdf>).

Although the world of technology is under constant development, we do not consider this trend the only way of development as far as special education is concerned. Special education of persons with visual impairment as a humanity field, despite a considerable technology influence, should not become a science of an artificial system. Special education is a science of a live system, not of an artificially developed one. We do not mean to exclude any technical devices from education, socialising, personality development promotion; however, care should be taken so that special education becomes a science of a human. Below are mentioned some ways of supporting the development of abilities of mental mapping in a person with visual impairment from a perspective other than information and communication.

#### *3.2 Mental training of higher compensatory functions*

In the context of spatial orientation a person with visual impairment must be capable of immediate concentration, evaluation and control of the actual spatial situation. Humans naturally use mental maps; however, it is assumed that the process of their development and application can be improved. In this respect we would like to highlight the importance of training the lower compensatory functions as well as the ability to concentrate, relax immediately and use all available information from the internal as well as external environment of the human body. Through various mental hygiene and visualisation based exercises the stimulation of higher compensatory functions can be supported, which in turn can be used to support the lower compensatory functions in practical situations. A key aspect is permanent and adequate encouragement of the nervous system. In her thesis, Majerová (2014) provides a list of practical recommendations in the form of training attention, imagination and memory. With a

reference to experiments described in scientific literature, Požár (2000) confirms that auditive attention in blind people is more differentiated and has a wider extent. These individuals are capable of fine differentiation and permanent concentration of attention. Nakonečný (1998) defines attention as a state of body activation that allows conscious adaptive reactions. It should be added that the training attention in a person with visual impairment requires external as well as internal stimuli. For immediate relaxation in a difficult spatial situation we can recommend the training of conscious attention through daily mental hygiene, e.g. in the form of breathing exercises, training of relaxation and meditation, training of concentration using an accumulation point (the term comes from yoga and refers to a point on which a person concentrates in line with conscious breathing), etc. Hypothetically speaking, regular performance of stimulation exercises has an influence on the central nervous system, improves attention, and secondarily allows more efficient development and use of mental maps in spatial orientation. Appropriate exercises support human development through own activity, not just technologies and computer systems that are widely used today.

In the context of imagination of a person with visual impairment, Lopúchová (2010) defines images as a higher degree of a sensory picture that reaches beyond a simple reproduction of sensory experience. Impaired or missing vision affects imagination, where the structure of visual perceptions consists of current visual perception and previous experience of an individual. As a result of impaired vision, visual perceptions differ. It should be noted that practical imagination training involves stimulation of this higher compensatory function, but can also be used to support the training of lower compensatory functions used in practical life.

Imagination improves throughout everyday activities performed by a person with visual impairment in line with compensatory functions by means of immediate experience. Accordingly, mental hygiene exercises can contribute to more effective use of imagination (mental maps). The application of images in autogenic training is familiar to almost all auxiliary professions. In practical concentration of attention, such person can add visualization in the form of mental involvement of a specific sense. A person blinded later learning the Braille can imagine e.g. clear perception of the Braille text as the person's fingers trailing on the paper and the individual perceives what is written. Similarly, such visualization can be applied in typhlography classes including reading of typhlographic maps, plans and their projections. Stimulation of a notion that an individual clearly recognizes typhlographic signs involves the skin-muscular system and touch; moreover it serves as positive stimulation for practical training as a motivation factor. Such everyday activity need not take more than a few minutes, during which the person performs a mental hygiene relaxing exercise and then involves visualization. It should be added that also the training of distinguishing sounds in spatial orientation should involve similar training (a person consciously recalls individual sounds that were distinguished in practical training, e.g. in a traffic situation). Accordingly, smell and taste images can be included, eventually all mentioned compensatory functions can be joined by the individual within a visualization exercise in a specific or model situation. Also, typhlographic training, i.e. work with typhlographic projections or own typhlographic work, contributes to better development of images. The same applies to a simulated virtual environment that combines an own individual activity and an information-communication tendency.

As far as memory is concerned, let us recapitulate the above mentioned process of developing a mental space map in a person with visual impairment with respect to memory mechanisms. The process is performed as follows: obtaining information through lower compensatory functions or remaining vision → application of higher compensatory functions in data selection and processing → storage of spatial presentation with respect to differences in data obtaining and processing → spatial orientation and mobility using mental space mapping. This process of using information and development of a mental map is specific in a person with visual impairment; however, it is not exempt from general biological and psychological principles. Therefore, generally promoted and existing approaches with minor modifications can be applied. For example Preiss and Křivohlavý (2009) defined a concept of 'Memory and cognitive function training' that can serve as a source for typhlopedia professionals. Lopúchová (2010) adds that especially acoustic verbal memory in persons with severe visual impairment softens as a result of increasing demands and improves in comparison with intact individuals. Memory and cognitive function training is thus an inseparable part of everyday life. By means of the above mentioned comparison of literature and practical exercises we have not used all opportunities in the area of supporting mental mapping. For the readers the text should become an inspiring source for further study and practice.

#### **4. Neuroscientific insight and results of theoretical analysis**

Information transfer in the nervous system is based upon synaptic and extrasynaptic transmission (glial cells communicate with neurons through ions in intercellular liquid). The processes generated by the brain in analysing an image or delivery of conscious statuses, etc. cannot be interpreted purely on the basis of neuronal or extraneuronal signal transmission. Quantum mechanics is a part of quantum physics but, contrary to Newton's mechanics, considers wave and probability character of particles that form mass described by energy, electric charge and spin. Each submicroscopic particle is of a dual nature, i.e. wave and corpuscular. At the same time, particles perform movement and take a position indefinite in space and time (non-locality). However, once they interact with the environment, the wavelength of the particle collapses. The collapse takes place at a single measurement moment and can influence an extensive area. Apart from the mentioned physical description of quantum phenomena, Dylevský (2009) adds that in the central nervous system quantum processes can take place in the intercellular space

bordered by cell membranes that are impermeable for a number of particles. The intercellular space presents an extensive communication channel that allows quantum particle transmission to any place of the system without particles moving between the places.

This is possible in quantum physics due to the mentioned collapse in the intercellular space (decoherence of particle wave function). This intercellular space is bordered by cell membranes with high ohmic resistance. The key aspect is that quantum phenomena take place at the scale of atoms, ions and all (some) small molecules. The central nervous system uses particularly calcium ions for intercellular communication but also electrons freely bound in ionized groups or smaller molecules of proteins and lipids, neurotransmitters and neuromodulators (peptides). Quantum changes take place incessantly in the brain structure, new connections emerge and those relevant to the system status are selected. It is likely that quantum connections transmit relatively simple information. Quantum principles of information transfer are still under research. According to the quantum theory, in the central system everything should be linked with everything. In human practice however, short-term connections are developed first, some of which might become long-term. The issue of reality of quantum images are associated with the period of brain development in fetuses and children. The activity of a child's nervous system is influenced by apheresis, i.e. dominance of information supply along with function and memory trend. At the beginning there is no trend in a child's brain – it only reacts to the current offer, gradually a continuity of functions is developed. This aspect of a child's brain rather corresponds to the quantum model, an adult's brain to the Newton's model (Dylevský, 2009).

Mensky (2010) further mentions quantum mechanisms in a close association with the research of consciousness (states other than full consciousness such as sleep, trans, meditation). A change in consciousness is a process of super-cognition; in respect to consciousness we refer to super-consciousness. Some of the phenomena associated with consciousness are linked with religion, oriental philosophies, parapsychology, esoteric doctrine. The author emphasises that the quantum concept links with the theory of consciousness similar to super-intuition phenomena, i.e. direct vision of truth. It should be noted that quantum mechanisms and consciousness were analysed in the past (Carl Jung, Roger Penrose). Gradually, efficient mathematic measuring tools were developed. The so-called Many-Worlds interpretation of quantum mechanics/Everett's interpretation could play an important role in the associations between quantum mechanisms and consciousness. This area undisputedly concerns neuroscience as well as quantum physics, which makes it a multidisciplinary topic (Panov, 2013).

In the context of the above it should be noted that a person with visual impairment cannot be excluded from the application of the quantum theory in terms of functionality of the nervous system. A significant aspect is the relation between quantum mechanisms and consciousness, as is the hypothesis of particle transmission into any place of the system without particles moving between these places, where in such system, in simple terms, everything is connected with everything. From this perspective, influencing the central nervous system in an active way embodies a new dimension. Adequate stimulation can support the development of those parts of the brain of a person with visual impairment with partial or none involvement. Attention should also be paid to the aspect of brain plasticity noted by Kulišťák (2011).

## 5. Conclusion

Targeted training of spatial mental mapping in an individual with visual impairment has theoretical as well as practical reasons. At the same time, this issue is related to the neuroscientific as well as special education dimension. The training of spatial orientation and mobility in persons with visual impairment is characterized by comprehensive methodology; however, spatial cognitive mapping has not been presented as a separate area in the Czech Republic. For this reason we would like to emphasise the definition of spatial mental mapping as an integral and distinctive area within the concept of training spatial orientation in a person with visual impairment.

# The assessment of drawings of 5 grade students in the state or private schools, according to the different variables

Pesent Dogan

Marmara University, Atatürk Faculty of Education, 34722, Istanbul, Turkey

---

## Abstract

Art education is a field of education which is given importance and regularly conducted throughout the contemporary and civilized world. At present, in the education of students of different age groups in every civilized country, capability development studies are conducted as drawing studies and it is an important subject. It is known that visual art education in public and private schools in our country will have a significant influence on the careers of students in their future lives.

The objective of this study was to evaluate the creative ideas of 5th graders who had visual art lessons using the same programs in public and private schools in 2013 – 2014 academic year and the evaluation was performed according to different variables.

This study was performed on 20 students from public schools and on 20 students from private schools and their studies in art education classes were evaluated with respect to their use of materials, techniques, themes and creative approaches, and the results were interpreted by means of qualitative research.

## Introduction

Contemporary and civilized countries in the world, have attached importance to the art education throughout their histories. Arts have taken part in the curriculums with scientific publications, conferences and courses.

Making the topic of culture is an importance factor for governments in order to show that they are advanced. Therefore, it has been an important decision to attach importance to art and culture in the education in the republic period. Visual courses of art education, without any doubt, will affect our students in the future when they have their jobs.

This is an important discipline in the cultural and scientific aspects that, there is no difference between the curriculum of painting lessons in state schools and private schools. When the cultural future of the country is taken into consideration, in order to keep the skills and achievements of generations and to maintain the equality of opportunity, it should be kept in mind that, the curriculum of state and private schools should be same and this policy should be continued.

Exhibitions, conferences, concerts, painting, music, drama lessons, activities of press are important events that organize the development of countries. If the painting, music, literature and science lessons are good from the beginning of the primary education, these events gain importance. Children, give messages about themselves, talk to us, with the works they do through painting, music, writing and drama. Children think multidimensional, have high self-esteem, have a sense of aesthetic, and become creative, civilized individuals. (Striker, 2005)

A child, at age of 11 and 5<sup>th</sup> grade and have normal skills, may not be able to use the scientific and technical concepts like perspective, light, shadow, volume in arts and science. As it is known, perspective is not taught at this age level because it has no place in the curriculum as a technical knowledge. But, if the teacher recognizes a special skill in the students about that he/she can help the students to enrich it. Besides, it is useful that, to give special attention to the students who have a special skill about painting.

It can be useful that, the teachers make work students about the topics, objects that are easier and building a lot of visual contact, in order to maintain the love and curiosity of students in painting if they have. Also, teachers should make five graders who are 11 years old, work relax, and keep the charm of painting lessons, with encouragement.

In addition, the concentration span increase and the actions become more independent. At this stage, friend relations start to gain a lot of importance (Pektuna Keskin, 2012).

Children at these ages, create their art with a tendency to reality. Children construct a relation between colors and objects, on

---

\* Corresponding author: Tel.: +90-532-663-1988.

E-mail address: present@marmara.edu.tr

the other hand teachers try to give information about colors. May be the best way is, to mature the relation of color and the children, with leaving them on their own (Kehnemuyi, 1992).

Researches on children at this stage show that, children are interested in details and they have less and less tendency about showing their paintings. They do not choose the colors randomly, instead, they start to choose colors in more realistic ways. (Yavuzer, 1992).

Therefore, teachers should work on to encourage the students to reflect their imagination to their arts. Improving students' imagination and hand skills can enable students to paint more successfully. In order to do that, student – teacher ratio should be low.

Drawing the fairy tales that children listen to from the early ages at home, is another important factor in the aspect of improving the imagination. It should be kept in mind that, cinema, the technical scenes of TV in today's world enrich the imagination of children and shadow plays like Karagoz – Hacivat in the past, enriched the imagination of children.

In addition, giving colored examples from the history of arts and mythology lessons, since mythology lessons stimulate the creative thinking, will be useful to enrich the imagination (Gurtuna, 2005).

## Method and Exemplification

This study has been made in a state school named Gazi Mustafa Kemal Pasa Secondary Education School and a private school Ahmet Yesevi in the 2013 – 2014 academic year, with five grade students who are 11 years old and take painting course, by using qualitative research methods related to different variables and assessing them.

20 students participated in the study. Free and colored drawings of participated students were analyzed in the study.

## Means of Data Collection

Works of five grade students who are 11 years old are taken as a basis and data were collected, assessed with qualitative research method and final report were prepared

## Evaluation Criteria

Table 1. Use of Material

Use of Material	Number of Students who use the materials – State School	Number of Students who use the materials – Private School
Pastel	15	2
Water Color	-	-
Dry Paint	4	6
Ink	-	-
Magic Marker	-	2
Mixed Material	1	10

About the criteria: In the use of material, the state school and the private school are different. For example; in the state school pastel use rate was %75 (15 students), in the private school that rate was %10 (2 students). If we take into consideration that, physical conditions are not enough and the number of students is higher in the state schools, students can paint with pastel more easily. Dry paint usage rate was, %20 (4 students) in the state school and %30 (6 students) in the private school. In the private school, magic marker use rate was %10 (2 students). In the use of mixed material, the rate of state school was only %5 (1 student), while in the private school the rate was %50 (10 students). It can be related to the more space and painting ateliers in the private school, and this creates better opportunities for students.

Table 2. Technique

Technique	Number of Students who use the technique – State School	Number of Students who use the technique – Private School
Pastel Technique	15	3
Water Color Technique	-	1

Collage	-	-
Dry Paint Technique	4	9
Scraping Technique	-	-
Pressing Technique	-	-
Lavi Technique	-	-
Mixed Technique	1	7

In the use of techniques, pastel technique usage rate; in the state school, it was %75 (15 students) and in the private school, it was %15 (3 students). Water color technique usage rate; it was %5 (1 student) in the private school, it was not used in the state school. Dry paint technique usage rate; in the state school, it was %20 (4 students), in the private school, it was %45 (9 students), mixed technique usage rate; in the state school, it was %5 (1 student), in the private school, it was %35 (7 students)

Generally pastel technique, was the most popular one; %45 (18 students). Dry paint technique was the second; %32.5 (13 students). Mixed technique rate was; %20 (8 students) and the last one was water color technique just %2.5 (1 student). Collage, scraping and pressing techniques were not used by any student. Maybe the reason for that, these techniques are relatively harder.

Table 3. Organization (Composition)

Organization (Composition)	State School Students		Private School Students	
	Yes	No	Yes	No
Using of Space	13	7	20	-
Proportion among objects	5	15	17	3
Using the whole paper	14	6	15	5
Using of figures	17	3	19	1
Written expression	8	12	17	3
Depth perception	4	16	10	10

#### Organization (Composition):

Using of Space in the state school and in the private school respectively: %65 (13 students) and %100 (20 students).

Proportion between objects in the state school and in the private school respectively: %25 (5 students) and %85 (17 students).

Using the whole paper in the state school and in the private school respectively: %70 (14 students) and %75 (15 students).

Using of figures in the state school and in the private school respectively: %85 (17 students) and %95 (19 students)

Written expression in the state school and in the private school respectively: %40 (8 students) and %85 (17 students).

Depth perception in the state school and in the private school respectively: %20 (4 students) and %50 (10 students)

Private school students achieved higher rates in all parts of the composition branches. It can be said that, opportunities like the ateliers in the private school, the concern of teachers, the transfer of information and the caution, skills of the students may have been the reasons.

Table 4. Use of Colors

Use of Colors	State School Students		Private School Students	
	Yes	No	Yes	No
Student used the real colors of objects	17	3	19	1

Use of colors: Private school students used the real colors of objects with the rate of %95 (19 students) and the state school students used %85 (17 students).

The skills and imagination powers of the students in both schools who painted the objects with unreal colors can be investigated.

Table 5. Creative Approach

Creative Approach	State School Students		Private School Students	
	Yes	No	Yes	No
Using of different perspectives	4	16	14	6
Using the colors in a free way	7	13	11	9
Diversion in the movements of figures	8	12	15	5
Details in the objects and figures	6	14	17	3

#### Creative Approach:

Using of different perspectives; in the private school: %70 (14 students), in the state school: %20 (4 students)

Using the colors in a free way; in the private school: %55 (11 students), in the state school: %35 (7 students)

Diversion in the movements of figures; in the private school: %75 (15 students), in the state school: %40 (8 students)

Details in the objects and figures; in the private school: %85 (17 students), in the state school: %30 (6 students)

In the criteria of creative approach, state school students could not reach %50 rate, the highest rate was %40 (diversion in the movements of figures). On the other hand, private school students passed %50 rate in all criteria.

#### Data Analysis

In the study, the topics that 5 grade students try to express, were assessed.

In the analysis and assessment of drawings, qualitative research methods were used. Understanding the drawings and making comments on them is an inseparable part of the qualitative research. Qualitative research is not a research that we degrade the data into numbers, yet numbers can be used in the qualitative research.

But numbers may not be sufficient, to assess the drawings of students, comment on them and show the difference between composition and thought. In order to make the final report descriptive, the qualitative research methods should be used (Glesne, 2012).

In the study, drawings of 5 grade students (40 students overall), were analyzed. There were 5 main topics and groups of topics related to them. These topics were proportionated with the number of participants.

#### Results and Implications

The differences between 40 students at five grade and go to a state and a private school in the 2013 – 2014 term, analyzed with different variables and qualitative method, are below:

In the aspect of classification of the topics there were obvious differences between the drawings of private and state school students. Private school students showed different numbers in the topics like using of materials, techniques, composition, using of colors, creative thinking.

In the state school, the numbers of the materials and techniques were limited, on the other hand in the private school, students used a variety of materials and techniques, with the help of financial possibilities.

These diversions enabled them to use the parameters that help the expression in composition. Private school students were more successful, in the organization on the drawing paper, space perception in the composition, depth perception, proportion among objects, using the whole paper, using of figures, written expressions, explaining the topic of the drawing and composing it with their imagination.

It was realized that, students in different school but go under the same curriculum, were different in the aspects of creative approach and using of colors.

In this study, the power of art education in self – expression, ateliers, providing of materials, visiting more museums and exhibitions, the lesser number of students in private schools and the relation between teachers and students, are thought to be effective.

## Abstract

When we talk about learning assessment, we refer to something extremely complex, then we usually reduce it to two main polarities: the result and the process of learning, the former referring to the learner's achievements, the latter to the process by which the achievements have been attained. In this work, we take up the concept of competence as the concept around which to organize the formative process, the key-word for the project and the evaluation, the standard direction for the didactic action. Without going into the merits of learning theories, relating to educational psychology, whose analysis is not within the sphere of this contribution, we will restrict our work to the analysis of the relation among the new learning paradigm, the concept of competence, developed in accordance with this paradigm and the process concerning the assessment.

## 1. Introduction

When we talk about learning assessment, we refer to something very complex which we usually reduce to two polarities: the result and the process of learning, the former referring to the learner's achievements, the latter to the process by which they are attained. Evaluating the formative product means to judge on the results of teaching and learning integrated process, whose effects can be controlled by considering the subject's specific performances. Teaching is a process whose aim is the attainment of the planned objectives, organized for guiding and developing learners' knowledge processes. These processes can concern both knowledge acquisition and the attainment of particular levels of ability and competence. The teaching results are, in this terms, the learners' performances by which we can infer the kind of abilities and competences achieved; to verify the performances is a fundamental moment as well as an essential step in scholastic and educational contexts, to check up the achievements of the programmed teaching in terms of abilities and competences acquired by learners.

The assessment is the complexity synthesis process and its aim is the comprehension of the variety and qualitative diversity of educational process, interpreting them by the light of singly and collectively assigned values and meanings (Notti, 2010).

In this work we take up the concept of competence as the one around which to organize the formative process, the key-word for project and assessment, the standard direction for didactic action.

Without going into the merits of learning theories relating to educational psychology, whose analysis is not within the sphere of the present contribution, we will restrict our work to the analysis of the relation existing among the new learning paradigm, the concept of competence developed in accordance with this paradigm and the process concerning the assessment.

## 2. Body

Pellerey defines competence as the ability to deal with a task or a group of tasks, by orchestrating one's internal resources, cognitive, affective and volitional, and using coherently and creatively the external ones (Pellerey, 2004). This definition is the final point of the evolutionary process that the concept of competence has encountered in the course of time, a process begun with the identification of competence with the measurable and observable behavior, up to the present conception of competence as complex and articulated learning, closely connected to an action context.

We are going to try to synthetize the main points of this evolution, briefly retracing the steps which, from the behaviorism and the tylerian programme, have led to the affirmation of CSSC learning new paradigm (de Corte, 2010), at present prevailing in the

field of educational psychology. Borrowing the expression which has affirmed itself worldwide, we can synthesize this paradigm by the term CSSC learning, to indicate its peculiarities: constructive, self-regulated, situated and collaborative.

Tyler (1949) singles out four principles to be followed in the construction of formative curriculum:

- the clear definition of the objectives to be achieved;
- the selection of formative experiences;
- the sequential organization of individuated formative experience;
- the objectives achievement assessment.

Beginnings from the tylerian programme, a movement starts in the English speaking world around the sixties, a movement particularly careful about the competences actually attained at the end of a formative process. In the range of this paradigm, the stress is laid on the precision with which to define the objectives in terms of observable and measurable behaviors at the end of a formative process. The following interpretations of this trend in the formative field, and we can quote authors like Mager, Tyler's disciple, Bloom, Briggs, Gagnè, have led to associate and use them as synonyms, the term competence with behavior, meaning by competence.

The behavior that the subject is able to put into action as regards a particular range of actions and in particular conditions the competences attained are assessed thanks to the observable behavior, stressing the performances and the analysis of the task connected with them. In these terms, competences prove to be similar to procedures obtainable through programmed forms of teaching. This kind of conception feels evidently the behaviorist mark and has carried on its explanatory effectiveness in regard to the concept of competence also in the following decades. In the sixties and the seventies, in the wake of the preceding consideration, some methodological structures come out such as learning by mastery, standards assessment, minimum competence assessment, the formation based on competences.

These different approaches present some common aspects, which can be synthesized in the following points:

- focus on the results to attain and not on the process;
- centrality of the context in order to single out the competences to develop;
- the expected results in terms of observable competences;
- the assessment is expressed in judgments on specific performances.

The subject's behavior as an element characterizing the competence is an aspect considered also at present in the approach by competence; nevertheless, thanks to the development of some tendencies in educational psychology, as the constructivism, more careful about the learning processes, when we talk about competence, we consider as central the subject's interior aspects as well as the external ones. the cognitive approach, for example, departing from the typical behaviorist concept which affirms the preminence of manifest behaviors, shifts the attention onto subject's internal processes (Pellerey, 2010).

The new learning paradigm starts from this point and develops in parallel with the socio-constructivist thesis, maintaining that learning can be defined: constructive, self-regulated, situated and collaborative. In particular, it defines itself as a reconstruction of what the subject already disposes (knowledge, skills, patterns of thought, etc.) therefore representing the definitive overcoming of the subject/object opposition, generant of two opposed views in the past. The objectivist view, centred on external reality and based on a learning concept as the subject's adaptation to the external reality, and the subjectivist view, centred on internal reality, based on the learning conception as evolution of subject's mental structures.

Therefore, stressing the relational nature of knowledge, constructivism cancels the subject/object antinomy (Castoldi, 2012). The subject plays an active role in the knowledge construction process ( self-regulated learning) because he directs his own learning process, thanks to metacognition, which allows him to conduct and monitor the workings of knowledge acquisition, and puts into relation the different learning dimensions: cognitive, affective, volitional (Pellerey, 2006). The learning is situated, that is anchored to the social context which the subject acts within and with which he sets up relations, and it is collaborative since it is generated from personal interactive process in social context as well as on the basis of the appropriation of the socially built knowledge (Mason, 1996). The cognitive process, therefore, is one of active meaning construction.

We have stated that the first definition of competence, recalling a behaviorist view, identified competence with a behaviour observable by the subject. When this view has developed in a socio-constructivist way, the concept of competence has progressively changed from three points of view, or evolutionary directions (Castoldi, 2009): from simple to complex, from external to internal, from abstract to situated.

The first direction refers to the fact that competence is by now largely conceived as integration of resources already in subjects possession not only as regards the sole cognitive dimension, but including also socio-emotional, motivational, meta-cognitive and volitional elements; secondly, we assist to the shifting from the external to the internal, that is the recognition of the centrality of the subject's interior dimension and the ways by which he performs a given task, rather than considering only the external aspect, the measurable behaviour. Finally, competence is compared to the ability of performing a task in a context and in specific operative conditions; in this term competence expresses itself in making use of one's knowledge, in order to attain an objective. In short, the definition of competence collects the different meanings implied in a perspective of construction and socio- cultural learning. Relating to the concept of competence, a heated debate has developed in the last twenty years, producing a variety of approaches and interpretations with remarkable effects on the perspective of educational and scholastic system.

We have witnessed a progressive shift of attention from acquired abilities to the abilities related to the integrate knowledge to perform complex tasks both external and internal to school. In accordance with an epistemological approach, modelled on

socioconstructivism, the competence construction has become central in educative field determining an important rethinking of teaching-learning process and remarkable changes related both the didactic praxis and the assessment methods used by teachers. The overcoming of a static concept of knowledge is being put into practice in favour of a new view which allows the subject to adapt to changeable conditions of social and working life, through the knowledge (Castoldi, 2011). States that the assumption of the competence construction as the barycenter of formative action, allows to retrieve an holistic and integrated view of the learning process, orientated to stress the importance of transferring knowledge in real contexts. Nevertheless, we must not forget that one of the main presuppositions of the competence is the knowledge construction, regarding the fact that the competent subject must dispose of a large and consolidated totality of acquisitions and dispositions, of a rich knowledge of which he can make use to solve problems and perform tasks appropriately.

Recalling Pellerey's definition, from the opening of this work, we remember that one of the most significant aspects of competence is the activation of the subject's own resources, with the utilization of context resources and the referring to a precise task. In the exercise of his competence, the subject has recourse to a multiplicity of resources, of which Le Boterf (2010) gives the following tripartition:

- to know how to act;
- to want to act;
- to be able to act.

A person is put in a position of being able to exercise competence if she/he knows how to act to tackle a task, but also if she/he is in the condition to be willing to display the necessary efforts required by the situation and when the context permits and legitimized his possibility of action (Maccario, 2012). At the basis of competence formation we necessarily consider the whole of the subject's external and internal resources, meaning by the latter, for example, the socio-relational and organizative aspect present in the context, where he has. Among the subject's internal resources, we can include motivation (conative dimension), metacognition and the different dimension implied in learning process (cognitive dimension): the abilities and the dispositions to action. To promote such a complex learning as competence, it is indispensable that learners acquire a basis of knowledge, in primis the knowledge which, in order to form a sound basis of knowing how to act must be organized in a steady and potentially available manner.

One of the main tasks of school is therefore to promote into learners the acquisition of knowledge, considered as the result of a learner's personal construction which the subject elaborates as a synthesis of external stimula and codified knowledge. According to a classic definition, knowledges can be: declarative, procedural and conditional. The first are factual and refer to phenomena, events, names, meanings; they can be organized as mere information or concepts and recall to "know that". The second make it possible to act, they refer to "how to make", that is to the algorithms to follow to perform a task and recall "to know how"; the conditional or contextual knowledges describe the conditions of utilization of declarative and procedural knowledges (Marzano, 2013).

In order to favour the acquisition of declarative knowledges, teachers can use specific strategies aiming to give meaning, organize and fix what the subject has learned. Primarily, students should be made capable to make previsions recalling the preceding experiences and linking the new knowledges to them; secondly the students should be capable to organize the declarative knowledges, recognizing the main elements of a subject and its possible connections with other subjects. Finally, in order to activate them, it is necessary that the students are able to memorize consciously the declarative knowledges. To construct the meaning of declarative knowledges and organize them coherently, are process which help learners's comprehension and memorization.

Procedural knowledges recall the Piaget concept of pattern; unlike declarative knowledges, in this kind of knowledges, the emphasis is on the dimension more closely connected to the concrete. Ness of action, since they are based on the acquisition of procedural sequences which, once obtained, allow the subject to solve situations more or less among them similar. Competence can be defined as the activation of complex patterns, therefore to favour the acquisition and the consolidation of patterns into learners, becomes a crucial objective in order to attain competence. Nevertheless, it comes in useful to make it clear that the pattern, as an invariable structure of an operation or an action, does not oblige to repeat identically.

On the contrary, it allows, through minor arrangements, to face a variety of situations which recall the pattern. It is almost a scheme, from which we depart to consider the specificity of each situation (Perrenoud, 2003). Therefore, from a didactic point of view, it is important not only to encourage learners' acquisition of schemes, but also the capability to enrich, adjust and integrate them pertinently, depending on the different conditions of use, in order to guarantee the operative efficacy of the patterns themselves.

The general sequence which describes the procedural knowledge acquisition process, provides the three following passages: the action patterns construction, the adjustment in the field, the internalization by practice (Marzano, Pickering & Coll., 2009). The starting point is given from a pattern thought guiding the practical activity; in other words, the procedural knowledges acquisition presupposes the existence of a starting model which can be given by the explication of a process, by the account of other people's learning experiences. Afterwards, the learner tests the pattern on the field, putting into action and eventually personalizing the learned model: in other terms, the learner knows whether and how to act to make a changes or adjustments.

The last phase of a procedural knowledge learning consists in the pattern internalization, which, sometimes, can become a real automatism, that is the immediate and unreflected utilization of the learned knowledge. The competence acquisition is based not

only on consolidate patrimony of declarative and procedural knowledges, but also on deeper learnings which allow the subject to make changes on his own knowledges, going beyond the simple reproduction of what he has learned. In other terms, the didactic action, whose aim is the competence development must be directed to the achievement on the learners' side of higher abilities and skills, indispensable to the autonomous handling of own's knowledge richness.

Recalling a classification proposed by Gilbert Paquette, Maccario (2012) presents the main abilities categories which, together with the knowledges form the foundations of competence and are implied in its application. The four skills (abilities) categories individuated are: reception, reproduction, production and self-management, subdivided in turn into one or more levels and applicable integrally to the cognitive, psychomotor, affective and social domain, according to the different nature of stimuli or reactions. The abilities levels referred to the four categories and applicable both to cognitive domain and the psychomotor, affective and social domain, are the following:

- perception skill: to pay attention, to integrate;
- reproduction skill: to specify, to transpose, to apply;
- production skill: to analyze, to adjust, to synthesize;
- self-management skill: to assess, to self-control oneself.

The perception skills are subdivided into two levels: paying attention and integrate. The former indicates a subject's response to external stimuli (interest), the latter presupposes a memory retrieval of information connected to the indications coming from the outside; in this way we can memorize new data and information associating them to our own contents. The reproduction skills denote procedures which the subject already knows, through which he can recall knowledge; for example he can specify concepts through exemplification or discrimination, he can redefine his knowledges through new definitions or apply knowledge models to new situations.

The production skills present a higher level of complexity, since they generate new knowledges and new models. For example, in regard to analysis, we have the breaking up of an acquired model, increasing or eliminating some components, for the evaluation of its functionality or its explanatory power. The synthesis does not need an existing model, since it emerges from the capability of constructing new knowledges beginning from partial cognitive elements. The self-management skill involves metacognition and the capability to regulate own's behavior. The assessment is an operation by which the subject expresses a judgement about a knowledge or a pattern, on the basis of a criterion (utility, pertinence, efficacy, functionality).

The auto-control skill recalls the capability of acting on oneself, to attain a given objective, for example: to acquire new knowledges, to develop an interest about social themes, to adjust to unforeseen circumstances. The acquisition of competence as a formative objective presents a remarkable complexity in regard to the other concepts with which the scholastic tradition has traditionally identified the formative targets in terms of knowledges and abilities. The main differences observable in a performance which involves only the subject's knowledges and abilities, in regard to the performances which presuppose the attainment of levels of competence, are traceable to three general aspects. Firstly, the knowledges and the abilities form a learning at the subject's disposal, a static repertoire, whereas competence recalls a learning which must activate itself, directed to perform a task, a learning into action. The second aspect to be considered concerns the fact that the competence marks the passage from a parcelled out view, in which the evaluation of knowledges has as an object, the possession of knowledges/abilities, to an holistic view of learning which considers globally the various constitutive elements. Finally, competence is situated in the context in which the action takes place, therefore learning is contextualized, unlike the knowledges and abilities which recall an abstract learning.

A series of evaluation views, drawing new guidelines and aiming to indicate a new assessment, has spread since the eighties, bringing into discussion the traditional scholastic evaluation procedures. Recalling the thesis at the basis of socioconstructivist learning conception (social dimension of learning, leading role of learners also into the assessment procedures, reference to evaluation tasks connected to real life situation), Castoldi (2009, 2012) synthesizes into some reflections the main criticism addressed to the traditional assessment:

1. The first criticism is about the kind of performances required by evaluative procedures (structured tests) they are prevalently marked by memorization and mechanical application of contents. In particular, criticism concerns the fact that this kind of evaluation risks to condition the teaching processes, inevitably planned in structure and contents in congruence with the specific requests coming from the utilized evaluation procedures.

2. Consequently, the ascertainment of learnings concerns the simplest and the most elementary cognitive processes, whose attainment is verified through structured instruments and therefore, the formative processes turn out to be directed to the accumulation of inert knowledges. This reciprocal conditioning of formative processes and evaluative processes favours the acquisition of competences disengaged from concrete living situations, significant only into the scholastic context.

3. In accordance with learning strategies focusing prevalently on the relation between learner and learning, rather than on the social and collaborative learnings construction, we tend to privilege the utilization of individual tests.

4. Such evaluation has not any orientative-promotional function and simply tends to classify students on the basis of their performances, diminishing their active role and so risking to contribute to take responsibility away from them.

As regards the debate on competences assessment, Castoldi (2009), Pellerey (2010), Maccario (2012), Trinchero (2012), Marzano (2013), and others stress the necessity to introduce a new and articulate approach which takes into account the polymorphous nature of competence, the numerous dimensions to be activated. The tendency in progress is that of aiming to

an authentic evaluation based on complex tests directed to learnings assessment in terms of competence, that is instruments by which to propose challenging situations complexity and novelty problems, which request for their solution an integration-activation of subject's external and internal resources.

An articulate approach, which considers differentiated assessment instruments, is required: for the evaluation of the expected competence and for the verification of necessary and essential learnings which are its components. In order to be able to distinguish all the shadows of competence concept's meaning, the co-presence of an observable part and a hidden one within it, it is necessary the adoption of a multi-level evaluation pattern, to guarantee a multiplicity of points of view. In this regard, Marzano (2013) recall the trifocal view, proposed by Pellerey, through which to observe the learners' competence development. In detail, the three angles of observation are the objective dimension, the subjective dimension, the intersubjective dimension.

The objective dimension draws on the necessity to point out measurably the subject's behaviour relating to the task performance and to the specific action field, the evidence observable in this case are traceable to the knowledges and abilities that the competence performance requires. The subjective dimension refers to the meanings that the learner gives to his learning experience, to his own adaption in performing the task, to decision-making processes as well as motivational and interpretative activated by the subject to perform adequately the task. In the intersubjective dimension we consider the complex system of social expectations towards the subject's capability to perform successfully a task or bring positively activities in the end. In this respect, teachers, learners, families and other representatives of professional world or social community are all involved, since they take part in formative and evaluative dynamics. The devices which meet better these needs and are able to reassemble as a whole the specificity of the different considered dimension are: the assessment index and the portfolio.

The competence, therefore, is not a mere whole of abilities and knowledges, but, as Trinchero (2012) states, it is a process in which the subject's resources are activated in order to produce effective responses to a contingent problem-situation, its evaluation must refer to:

- A) the possessed resources, in terms of personal knowledges, abilities and skills as well as social and methodological;
- B) to the patterns by which the subject interprets specific problematic situations;
- C) to the strategie with he uses in tackling them;
- D) to the ways he reflects upon his interpretations and strategies.

These aspects suggested by Trinchero allow us to indicate dimension on which we can place indicators referred to performance, to the subject's proceeding in facing a problem-situation. Through these elements, we can delineate, according to higher or lower degree of competence, profiles going from the beginner to the expert, passing through several intermediate profiles. Nevertheless, the evaluation must be centred on the way they interact when the learner manages to "act into a situation", thanks to the structured whole of his knowledges.

Synthesizing these statements, Wiggins affirms that: "It is a question of ascertaining what the student can do with what he knows not what he knows". Obviously, this is based on the awareness that the need to evaluate on various levels and using numerous instruments depends not only on the composite nature and structure of competence, but it must consider the main duty of school, consisting in encouraging the learners' personal growth and in preparing them to face tasks and problems connected to real life events.

### 3. Conclusion

The formulation of competence distinguishes itself from other conceptions that the scholastic culture has traditionally identified as learning targets, that is knowledges and abilities; we have tried, therefore, to synthesize the main implications of this concept, by indicating the results of teaching-learning processes.

From the point of view of evaluation, beginning from the eighties, some tendencies which criticized traditional assessments have spread, accusing them of an excessive focusing on the learning product. Beginning from this criticism, a new concept of evaluation has developed in the direction of an authentic evaluation. Synthetical expression of the different concepts of new cultural direction in the evaluation field: *alternative assessment* (Worthen et al, 1999), *authentic assessment* (Wiggins, 1991), *performance assessment* (Airasian, 1994), *dynamic assessment* (Brown et al, 1992).

The educational assessment must be based on authentic and significant tasks and must be able to provide feed back for the individuals involved in the assessment process, in primis teachers and pupils. The new assessment philosophy revolves around some key concepts (Castoldi, 2012) which are: significance, authenticity proceeding, responsibility, promotionality, recurrence, dynamism, globality, multifariousness. Inspired by these ideas, assessment procedures in scholastic field, are centred on significant performances relating to the learning goals whose attainment can be verified through tasks which offer the learners concrete and real situations. This kind of evaluation tends to catch the proceeding between product and processes, performance and its generative form, and to involve the learner into the different assessment phases, encouraging her/his participation through active forms of auto-assessment. In this view, formative process and assessment process turn out to be closely connected, and above all in continuous recurrent dialogue, the integration of the two phases is based on the promotional function that the evaluation action develops in order to attain the results foreseen by formative process.

The assessment process in its dynamism refers to the various cognitive and extra cognitive dimensions involved into learning processes and it aims to the recognizing of each single learner's potentialities. In accordance with the complex nature of competence, the assessment presupposes the integration coming from a multiplicity of sources, in order to distinguish the multifariousness of aspects at work in a multidimensional process as the assessment process is. Teachers can accept these challenges in view of a reshaping of evaluation modalities. An interesting proposal consists in diffusing in scholastic culture the so-called authentic tasks aiming to ascertain the possession of knowledges and skills but also learners' capability to activate and integrate their learnings to give an effective response to the problems they meet. Recalling the trifocal view to evaluate competence which includes the subjective, objective and intersubjective dimension, the authentic tasks find their place in objective dimension, the one which recalls the observable evidences and implies the learner's behaviours recording (empirical view).

The reality tasks required to the subject are part of a repertoire of performances analysis instruments aiming to describe entirely the learning experience, since they take into consideration both what the pupil has learned and how he has attained that learning level. The main challenge consists in managing to stimulate through these instruments a kind of performance which requires the learner's activation of cognitive and socio-emotional complex strategies, to be able to utilize properly his learning, and in which all the components of competence, such as knowledges, abilities, action dispositions, are recognizable.

A substantial difference between authentic assessment and traditional assessment is in the tendency to investigate the measurement of the learner's capability to solve concrete problems by using his learning and give a meaning to everyday life problems (Comoglio, 2004).

treated politics and political parties as fully the artificial field, we have to accept the existence of going hand in hand between their political stance and related social reality. Our basic aim in our declaration that starts from this acceptance is to analyze these parties' views toward education in a sample of three political parties' election declaration in 2011 elections and the socio-political reality that these views reflect. Our work towards this goal is discussed in discourse analysis methods and tried to be established a relationship of text context taking into account the parties' discourse on education at the micro level and the socio-political situation that the parties try to identify or reflect at the macro level. Related discourses have excess of meaning that is in excess of social context with dimensions to manipulate the masses idealized as abusive and discourses from the reality that the actual reality of a moving hand in hand in the methodological process are tried to solve in three main thematic categories related to the value of education, gain, trained human representations. In this categorization process, starting from a preliminary reading of texts political parties defined education as a process of building identity and human breeding that have certain gains and values in the context of specific social and universal values and within this framework it is based on the observation that education has adopted a subject for policies.

## 1. Education in the Election Declarations of JDP, RPP, and NMP

Table 1 Value, Gains and trained Human Representations featured in Party Politics

	REPRESENTATIONS OF VALUE	REPRESENTATIONS OF GAIN	REPRESENTATION OF EDUCATED PEOPLE
JDP	Modernity, equality, universality, innovation, self-reliance, competition, cooperation, dialogue, empathy, sharing, knowledge, science.	Critical and creative thinking, sharing and communication, a universal understanding and thinking, reasoning, practice the learned items, self, thought and business confidence, use of technology, recognition of Turkey, establish a dialogue, new ideas, openness to new ideas, seeing differences as wealth, diligence and productivity, be conscious, open and a pioneer.	An individual with critical and creative thinking, open to sharing and communication, a powerful sense of art and aesthetic, capable of universal insights and thought, open to new ideas, seeing differences as richness, adopting work and production as a virtue.
RPP	Equality of opportunity, universality, secularism, democracy, nation, rights, freedom, respect, ethics, innovation, openness, science.	Adopt democratic and secular values and the principles of Atatürk, treat with respect to human rights and freedoms, reading comprehension, use time effectively, body protection, others understand the feelings of others, healthy communication, thinking and express ideas freely, having social responsibility and ethical values, making scientific research freely, leadership.	Citizens connected to Atatürk's principles and revolutions, adopted democratic and secular values, respecting human rights and freedoms in line with the overall objectives of Turkish national education that will be revised.
NMP	Modernity, democracy, equality of opportunity, innovation, national-spiritual, Turkishness, Islam, morality, belief, competition, knowledge, and science.	To assimilate national-spiritual and cultural values, be democratic, protect and develop national identity, selection, planning and programming, ability of analysis and synthesis, critical and creative thinking, perception and problem solving,	The generation having pride and consciousness for being a membership of Turkish nation, assimilated with spiritual and cultural values, with improved thinking, perception and problem-solving skills, open to new developments, with a sense of responsibility and high social awareness, inclined to

		responsibility, feeling sensitivity, producing of science-technology-solutions, learning innovations, leadership for social development , entrepreneurship.	production of science and technology, entrepreneurial, democratic, cultured and faithful.

### 1.1 JDP: Individualist Education

JDP sees education as an activity that can be equipped for the country's human resources to compete with the contemporary world to cultivate a strong community and in JDP's election declaration, outstanding value representatives can be listed as modernity, equality, universality, innovation, self-reliance, competition, cooperation, dialogue, empathy, sharing, knowledge, and science. According to JDP, education that will be made within the framework of these value representations will enable skills and abilities for the target audience such as critical and creative thinking, sharing and communication, a universal understanding and thinking, reasoning, practice the learned items, confidence of self, business, and thought, use of technology, recognition of Turkey, establish a dialogue, openness to new ideas, seeing differences as wealth, diligence and productivity, be conscious, open and a pioneer. In the framework of these gains and the related education policies, individuals will be trained that can think critically and creatively, open to sharing and communication, have sense of a powerful art and aesthetic, have universal insights and thought, be open to new ideas, see differences as richness, see work and production as a virtue. (Election declaration of JDP).

In general terms it can be said that individualistic values and achievements occupy a central place in view of the JDP's education. If noted it can be seen that the values and gains listed above include personal autonomy and emphasis of self-realization without reducing individual to any social category or any collective identity and in the identification of individuals who are thought to be cultivated through education it can be also noted that identity is based on individual skills and achievements.

In fact, as its traditional structure Turkish society is individualistic rather than collectivistic. After the establishment of the Republic, a Durkheimian conceptualization of society was fully made. In this conception, the society is a moral asset. Society is a symbolic form that will determine the individual's moral obligations. In this form, the individual is reduced to a community or a nation (Sarıbay, 2001; Sunay, 1974). However, especially from 1980 onwards in Turkey, a new mentality and within this mentality individualism has begun to stand out within the framework of global and internal dynamics such as neo-liberal policies and postmodernity affecting Turkey (Kahraman, 2002). Capitalism that emphasizes on the autonomy of the consumer exceedingly and increases individuality (Sarıbay, 1994), and the developments in the field of civil society and human rights have led to the emergence of individuality along with the neo-liberal and post-modern wind in Turkey today. Being an individual, being himself, being for himself, has affected everyone at various levels. The congregations of traditional social forms, that the individual has joined with the system of values and sense of self-transcending and seen himself as a part of a exalted collectivity, are replaced by a new philosophy of life that starts gradually in individuals and ends up in them again (Bostancı, 1994). Although individualism shapes with the effect of global dynamics and processes and internal dynamics and processes show itself in an interaction of a complex and unexpected style, the number of individuals that find themselves independent of over purpose and find the ability to determine where they stand in life within the framework of his own subjectivity, being free of the guidance of any system, ideology or policy in Turkey are gradually increasing. The individual identity corresponding to this increase appears where inclusive narratives lost (Türkmen, 1999).

It is understood that JDP's basic education policy and education approach are formed in a reflecting plane or descriptive of social situations where inclusive narratives are lost. Especially in the election declaration there is an expression that fits this framework: "We gave up rote learning and implemented an understanding of learning that teaches." In the end, the founding staff came from a political Islamist tradition, being criticized for doing religion-based politics, and defined itself as "conservative democrat" but, avoidance of party's inclusive and traditional identity definitions is significant as far as it reflects the concerned social status. However, considering the social station in particular to JDP is controversial whether it is a local variation or strategic on behalf of an adapt to the environment or a conjectural in the sense of an organization.

### 1.2. RPP: Nationalist Education

The RPP considering education as a process in which a citizen is educated within the frame of Atatürk principles, secularism, democracy regards equal opportunities, universality, secularism, democracy, nation, right, freedom, respect, ethics, innovation, legibility, science, etc. as indispensable morals. The RPP promises adoption of Atatürk principles and democratic-secular morals by means of education, to be respectful to personal rights and freedoms, reading comprehension, using time effectively, protecting his body, feeling empathy, providing health communication, freedom of speech, having social responsibility and ethics morals, doing scientific researches freely, developing abilities and capabilities such as leadership. According to the RPP, the main purpose of education to be revised is to educate citizens in parallel with Atatürk principles and revolutions by adopting

democratic and secular morals and showing respect to personal rights and freedoms (RPP Election Bulletin, 2011).

The general analysis of the RPP's election return shows that the education policy of the RPP is determined by an ideological concept, nationalism. Nationalism emphasizes "individuals' relation with a series symbols and faiths including collectivism between members of a political order" (Giddens, 2008). It can be said that some concepts like national, secular and citizenship which are not mentioned in other parties' discourses are regarded as basic education morals of the RPP and the discourses of the party about education including some morals and gains consider individual identity as political category, a citizen who is a member of nation state. A citizen means simply a member of a political community in Latin and Greek. For instance, according to J.J. Rousseau, distinctive character of being a citizen is to exist as a part of the whole ; thus, its value depends on community (Saribay, 1994). School and education are significant ideological devices to determine citizen identity in the education policy of the RPP. Actually, in general terms, school is a place where individuals are educated according to the the basic principles of nation-state ideology; thus, they are included to the system gradually. This is the main reason of strict historical relation between the development of school as a mass institution which provides opportunity for individuals to become socialized and is not limited to specialized formations or culture of elites and national formation. Althusser was right about his definition of "ideological devices of state"; according to him, in bourgeois societies, the origin of dominant ideology changes from family-church pair to family-school pair ( Balibar and Wallestein, 2000).

Nation-state as a historical-sociologic category, emerging after French Revolution, is one of the significant devices of nationalism (Saribay,1998). According to Gellner, " nationalism is not a product of nations, but it is a concept by which nations emerge." (Gellner, 1992). There are a lot of discussions about how nation-state model is successful; however, the main ideological device of this aim is education. Education based Republic ideology aims to change Islam community to citizens of Republic (Kahraman, 2002). Education and school try to teach the basic principles of regime and educate individuals regarded as ideal in the history of Turkey ( Güngör, 1996).

The RPP which is the founder party of Republic and the representative of official ideology determines its education policy in parallel with the principles of the regime. However, general purposes of Turkish national education will be revised with reference to the discourses of the RPP. It can be said that changes are inevitable at this point. Authoritative and tough modernist aspects of Republic, the position of a citizen who has responsibilities more than rights, the effects of globalization, post modernity and neo-liberal policies, the process in which nation-states are in a crisis in literature of social sciences are main reasons of this change. The discourse of the RPP emphasizing that education process of a citizen must be in parallel with Atatürk principles, secularism and democracy (RPP Election Bulletin, 2011) means also 90 years education aim of official ideology has not be reached to a satisfactory level or official ideology is insufficient in political socialization by means of education.

### *1.3. NMP: Nationalist Education*

The NMP regards education as a process of educating generations who have national-moral, scientific and universal morals and the party suggests an education model based on some morals such as modernity, democracy, equal opportunities, innovation, national-moral, Turkishness, Islam, morality, faith, competition, knowledge, science,etc. Thus, some abilities and capabilities such as adoption of national-moral and cultural values, being democrat, protecting and developing national identity, to be able to make selection, planning, programming- analysis and synthesis, thinking critically and creatively, perception and solving problems, feeling responsibility and sensibility, science – technology - producing solutions , learning innovations, leadership for social developments, entrepreneurship will be gained by means of this policy. According to the NMP, the main purpose of education policy is to educate generations who are proud of being Turkish, adopt moral and cultural values, have ability to think, sense and solve problems, are open to innovations, have a sense of responsibility and social responsibilities, are inclined to science and technology productions, are entrepreneur, democrat, cultured and faithful (NMP Election Bulletin, 2011).

The general analysis of the election return of the NMP shows that the education policy of the NMP is based on nationalism and morality. Turk, Islam, nation, moral, cultural concepts which are not mentioned in other parties' discourses are regarded as basic morals of the education policy of the NMP. It can be said that common history and cultural-moral characteristics are significant factors for the education process of individuals in education policy of the NMP. An individual is valuable and significant if he is proud of being a part of Turkish identity.

Nationalism including conservative and rightist approaches, culture and custom has developed as well as nationalism including leftist and secular approaches. Turkish rightist nationalism especially emphasize the concept "national" including religious-moral and cultural values contrary to nationalism including leftist and secular approaches. According to this way of thinking, primary and secondary culture identities of citizens are supposed to be Turkish and Islam (Aktay & Kızılkaya & Osmanoğlu & Dilek & Yurdakul, 2010). The main aim of nationalist approach of this way of thinking is national culture union and political association (Güngör, 1996). Education policy of the NMP is based on two concepts, Turkishness and Islam, accepted in society as cultural identities; from this point of view, aim of national culture and political association are possible to be accomplished.

Religious discourses of rightist nationalist custom of the NMP, whose grassroots are inclined to religious effects, have been more apparent since especially 1970s (Çalık, 1995). The NMP considers society as historical, cultural, religious and linguistic community as stated in discourses and election return of the party. Education of history, culture, religion and language are emphasized in the election return of the NMP. In this respect, nation is not a case, but it is a process which can be understood in production-reproduction dialectic. The basis of this process is education, as a basic ideological device. According to the discourses of the NMP, education is a process of educating generations not individuals. Ideal of educating generations reminds of

the search for educating generations by Islamists and rightists in the past of Turkey. The concept, generation, indicates an ideal generation, faithful to the origin of Turkey.

## 2. Conclusion

The basic common item in the education policies of three parties we chose as sample is to educate individuals that have outstanding values in the number 1739 of Turkish National Education Basic Law ([http://mevzuat.meb.gov.tr/html/temkanun\\_1/temelkanun\\_1.html](http://mevzuat.meb.gov.tr/html/temkanun_1/temelkanun_1.html), 20.05.2014) and perform tasks and objectives intended in this law. For all three parties, education is a tool and adopting the desired values and gain to children is an objective. What is to be basically made through education is a social engineering by the government (for further information about this aspect of the education in Turkey, look Kaya, 2011). In these engineering attempts almost any solution of the problem from poverty to social integration can be seen to be sought in education. From this point of it can be understood that education in Turkey and hence knowledge that is instrumentalized for the community engineering by political hand will continue to be one of the fundamental problems of education. At this point, the risk or danger combined to it should be an adapt of the truth according to a fiction whatever the starting point of this rather than teaching the truth or what it should be. Another common point of education policies of the parties is that they take into account contemporary social and international values and processes. With this common point, JDP is willing to train individuals for the society, RPP citizens for nation-state and NMP generation for the nation. On this plane, we could actually argue that different sizes of three parties' education policy are released across "locality" and "universality". Traditions that come from within the party and in particular in recent years considering education policies in parallel of the discourse that we will raise a religious generation, the absence of policies and rhetoric about religious education in JDP'S election declaration is remarkable. Based on this fact, the education policy of JDP in the election declaration is conjunctural and strategic rather than a local variation, and to the extent that it takes into account the current social situation it is realist at the level of rhetoric. The education policies of RPP and specially NMP that attract attention with recommendations on the training of national-religious and spirituality can be said ideological.

## Abstract

There are a lot of processes in bringing up Phemon, Ban Pudsas, Putsa Sub-district, Thailand. Some Processes have the same purposes with different practices. This is for communicating meaning of being serene and destroying away bad luck. The destroying, stopping, releasing, and driving bad luck away are a complete process for getting rid of bad luck. The bad luck in bringing up Phemon, Baan Pudsas is to get rid of bad luck and illness of the people in the family. This is the reason for every ritual of bringing up Phemon. The processes in practices are washing the banana trees, walking across the bridge, extinguishing candle from a piece of cloth, breaking up coconuts, ordaining women, setting free the chicken and stealing the cow.

---

This article, as a part of my thesis entitled “Bringing up Phemon: In folklore knowledge” which is also a part of a Ph.D. curriculum in the field of folklore knowledge”, Naresuan University aims to study the ceremony of how to bring up Phemon at Baan Pudsas, Amphoe Muang, Nakhon Ratchasima Province. It is found that some steps of bringing up Phemon (Mon Spirits) shows the sign of behaviors in common. However, there is difference of shown behaviors. In order to let the readers know steps of bringing up Phemon (Mon Spirits). The data will be shown as follows:

### Steps of bringing up Phemon (Mon Spirits)

There are two days for bringing up Phemon at Pudsas district. The first day will prepare the ceremony hall. Men are normally responsible for the hall. The hall preparation ceremony will be responsible by men, relatives and neighbors. Preparation of various sweets for the tomorrow ceremony will belong to women. The second day will be a bringing up Phemon ceremony including collecting the belonging after the end of ceremony. Thus, this day is called “the real day”

There are many steps of bringing up Phemon in the real day. Passing steps or mixing the ceremony is not allowed. Each step is very vital for the whole ceremony because it is considered as a part of bringing up Phemon ceremony from the traditional heritage. Thus, I, as a researcher, would like to explain the step of bringing up Phemon at Baan Pudsas as follows:

After preparing various things for joining the bringing up Phemon ceremony, it is time for gamelan and medium to play Phemon songs. Before the beginning of the ceremony, when the gamelan and medium consider the proper time for the ceremony, they will ask the host for the show. Steps of Phemon ceremony are as follows:

#### 1. Steps of paying respect to gamelan teachers

This step is considered the most vital part of the ceremony. Before the ceremony, the head of gamelan band who is considered the oldest of the group will lead a group of musicians to pay respect to their teachers. This ceremony will consist of six flower cones, twenty four baht money, one white cloth, and a bottle of white liquor. Only white flowers will be allowed for the ceremony. It doesn't matter for the kind of flowers.

#### 2. Steps of inviting the ghost

For this ceremony, the old relatives will lead the ceremony because they are considered the oldest in the family. They will lead their descendants of the patients to invite the ghost of ancestors for joining the Phemon ceremony resulting in wellness of their descendants. The majority of the place for inviting ghosts will be shrines of ancestors' bone remains which may be put

on the top or under the house or in each part of the house. According to my observation as a researcher, some houses do not provide a shrine of bone remains in the same house of the dead people. Thus, during the ceremony, some outdoor places in the house will be used. The parade process will start from the big ceremony hall which is built up for that day ceremony. One joss stick will be lit inviting ghosts to join the today ceremony. There is no specific chanting, or rules. Normally, the old people will say “invite the ghost of all ancestors to eat descendants food which is well prepared as mentioned ahead”. While telling ghosts, there will be a spread of rice around the area. Korat language calls this ceremony “khuad”.

### 3. Steps of paying respect to teachers

The medium at Baan Pudsa will be women. Normally, there are only two mediums. However, everything depends on the host. The host may have more mediums than two to hasten the ceremony if he can support this expenditure. The ceremony finishes sooner or later depending on arriving of ancestors. After appearance of the ancestors, other ceremony will begin. Before communicating to the spirit, the medium has to pay respect to their teachers. This ceremony consists of a bowl with six cones, a bottle of white liquor, a white cloth, and a sum of money. The sum of money depends on the contract between the medium and the host. It is assumed as a total wage. After paying respect to teachers, one medium will be dressed up as a man by wearing Sarong with a white cloth on his waist and one cloth surrounding his head. The second medium is dressed up as a woman by wearing loincloth with a white cloth on the waist and one cloth surrounding the head. After that, both mediums hang the clothes turning their face to gamelan band and moving their heads down to the barrier stick to pay respect to their teachers and sacred things. At this stage, it is the end of paying respect to teachers ceremony.

### 4. Steps of communicating to the ghost

After the medium's paying respect to the teachers, the medium starts the ceremony by catching the clothes and swinging the clothes as a circle. It is sometimes found that the medium let their body swing along the hanged clothes. It is up to how powerful the spirit is. The ghost will be considered strong if it has much power. The medium lets the clothes free if he is haunted. Mentors or relatives will ask the ghost's status. The ghost will answer. After that, the ghost will choose clothes in basket. The clothes for women will be chosen if the ghost is a woman. At the same way, the clothes for men will be chosen if the ghost is a man. Moreover, each ghost or soul may show a so clear specific characteristic that their off springs can guess the status of the ghost.

After finishing the dress, the ghost will greet and bless descendants, especially the sick host by laying the white clothes with white flower on the top, touching the head of the sick and relatives and splitting water from the bamboo box and the top of Yitho tree. After that the gift (rice is prepared in the cup) will be given. The ghost will catch about one or three seeds or more than that, but only single letter will be chosen. The rice will be put in the hand of the sick and relatives. The rice given by the ghost will be put together in a bowl. After the ceremony, the bowl will be put on the top of the bedroom. In the morning, the rice has to be cooked to make a merit.

### 5. Steps of washing banana head

For washing banana head ceremony, the rice which is put in the bag when the sick's relatives promise that he or she will bringing up Phemon when he or she is fine will be cooked as popped rice. The rice is put in the tray for joining the ceremony of washing banana head. While washing the banana head, the washer will use their hands to clean up the banana. Moreover, while washing, the washer has to bless the patient to be healthy, pay respect again and moves back so that the others will wash the banana head.

After the end of washing the banana head ceremony, the leader will separate the banana into five parts, and cut leaf sheaf of banana tree. It is made of seven bridges. Relatives of the sick will be dressed up with the clothes prepared in the tray. Within the tray, there is a sword, and a candle. Those who want to dress up have to wash the hand of banana cutter. The banana

cutter has to wash the hand of clothes wearer. The cloth for the lower part is Sarong tied the waist with the loincloth. The upper part will hold the neck with the white cloth. At the end of wearing cloth, the right hand holds the sword at the right shoulder. The left hand of the cloth wearer holds the basket made from the banana cover, and walks to the banana head washing ceremony.

#### 6. Steps of crossing the bridge to blow out the candle

At this stage, the person who wants to blow out the candle walks to the leaf sheaf of banana tree as a bridge of seven steps, breaks them, and walks continuously to the big ceremony hall. Within the hall, the sword, and basket have to be put on the cloth which is laid with areca betel leaves, cigarette, and popped rice. The candle will be picked up and the ghost will be asked to bless the sick. After that, the areca betel leaves will be thrown out of the cloth. The five candles on the five trays of worshipping must be blown out. The cloth will be collected quickly. The candle will be lit and put in the rice bowl for putting in the empty basket for carrying water. After that, it will be hung at the top of the tree from the offering hall. At the same time, those who cross the bridge have to hold the hung cloth in order to make a risk if all ghosts of ancestors join the ceremony. The rest of the ghost will haunt the medium if some ghosts of ancestors do not come. The leader will hold the cloth pretending to row the boat around four directions on condition that each direction has to be rowed three times, and sits down to pay respect to gamelan brand which is considered the highest teacher in the ceremony. The core of five banana stalk will be cut to make minced smart fish and given to people who join the ceremony as a risk making. Making a risk depends on the taste of food. If the food tastes delicious, it is assumed that paying respect to Phemon is very successful. The sick will be recovered and healthy soon. In contrast, if the food tastes bad, it can be assumed that there is something wrong for the ceremony.

#### 7. Steps of eating the pig head

After blowing out the candle, next is a step of eating the pig head. Two mediums dress up as twin ghosts and come to eat the pig head in the big ceremony hall. At this stage, the mentor of two mediums will carry the twin ghosts held to the crossbeam under the roof to the big ceremony hall which is at the west. They will be laid on the tray prepared. The wrapped clothes will be unwrapped. In side, there will be two pieces of areca betel leaves. Both mediums have to eat each piece. Their mentors will use the white cloth to prevent being seen while the two mediums are eating the areca betel leaves. Next is a dressing up. The first medium will be dressed up as a man by wearing Sarong with his waist tied by the white cloth and one sword in his hand. The second medium will be dressed up as a woman by wearing Phasin and one Huahook stick in her hand. They walk to the ceremony hall. Their mentors cut the pig head into pieces. The man medium eats first. At the time of eating the pig head, the white cloth will be hung at the back of the medium so that nobody can see them. While the first one is eating the pig head, the second one will knock the stick in the ceremony hall in front of the gamelan brand. Moreover, the mentor also help knock the stick. When the two mediums finish eating the pig head, the mentors will separate the pig head and put them in Kratong (floating basket) for the other ghosts at the triangle area. After that, both of mediums carry banana and coconut in the tray on the offering shelf, dance according to the system of gamelan in order to pay respect to the ghost, and walk out to dance around the cow. One of the mediums will throw away the coconut behind the back without glancing. At the same, the mentor will hold the stick to hit the coconut into pieces when the coconut drops to the floor with the belief that destroying the coconut into pieces is like getting rid of bad things. After that, both of mediums will put the rest of banana and coconut into the old place and change their clothes. Next will be a step of calling morale and making a risk.

#### 8. Steps of calling morale and making a risk

Calling morale is also a very vital step for the recovery of the patient. The medium will walk around the patient's house followed by the patient's relatives. They will call morale of the patient. No litany or official chants are used during the morale call. Only local morale especially Korat dialect will be used. For example, come the morale...the patient's name. You have to come home no matter what happens to you. At the same time, the patient's relatives will use the word showing the

characteristics of the patient by saying “the morale of mum, sister or Mrs....please come back to live with relatives. At the end of calling morale, the medium will look sick. He does not have any energy to walk. The relatives of the patient will carry the medium to the big ceremony hall. The medium will sit in front of the big bowl of water in the center of the ceremony hall. After that, the medium will pray for the success of calling the morale of the patient. Later, the areca palm will be put into the water in order to make a risk whether calling the morale will be successful by observing the upside down or turn up of the number of the areca palm. There are seven pieces of the areca palm. If all seven pieces of the areca palm are upside down or turn up, it is considered as a failure of calling the morale. In contrast, if two pieces of the areca palm are upside down or two pieces of the areca palm turn up, it is considered as a success of calling the morale. After calling the morale, the bowl will be wrapped by the cloth supporting the bowl. Next, the relatives will give the bowl to the patient and keep it on the head of the bedroom for three days. Within three days, the patient has to drink water in the bowl resulting in a quick recovery.

#### 9. Steps of becoming a nun

The medium will wear the white clothes by assuming that he becomes a nun. Then, the nun will carry the basket. The first basket is filled with the bullet made of round sticky rice which is used to shoot the arrow. The second one is filled with the bottle of water. The medium will carry the basket, walks out of the ceremony hall, stands in front of the hall, and shoots the arrow into various directions with the bullets made from sticky rice. This shooting is considered as shooting bad things out of the body. After that, the medium will extinguish the fire in the stove with the water. The people will upside down the stove, and pour the water at all of the posts of the ceremony. The equipment will be kept in the big ceremony hall.

#### 10. Steps of letting the chicken free

For this ceremony, the medium will carry the house chicken prepared by the host, dance according to the rhythm of gamelan brand, and throw away the chicken in the west. After that, the pike, knife, and sword will be thrown away following letting the chicken free. At the same time, relatives or neighbors of the patient will try to prevent the chicken to run into the house or run back to the same way.

#### 11. Steps of stealing the cow

This ceremony will happen after letting the chicken free. One man pretending to be a theft tries to drag the cow out of the area of the house. It is believed that stealing the cow is like taking bad things out of the house. Next is a step of dancing groups. The descendants and relatives will join the dancing group by holding the tied clothes and dance around the clothes from the left until the gamelan brand finishes the song. At the end of dancing, everybody including two mediums have to be prostrate to the gamelan teachers. This is the last step of bringing up Phemon. At the end of bringing up Phemon, everybody has to have food together. Moreover, the host will pack rice, food, various dessert, and give them to those who join the ceremony. Keeping things used in the ceremony in the house is not allowed. Something bad will happen to everybody in the house or relatives if keeping some things used in the ceremony in the house. The ceremony hall has to be demolished within that day. The wood for making the hall will be brought to the temple or used by someone. But, it is not allowed to keep in the house because it is considered to be wrong to the ghost, thus something bad will happen. The hole of the pole has to be paved as usual in order to bring to the conclusion that bringing up Phemon has been completed. In conclusion, the ceremony of bringing up Phemon at Baan Pudsa has many factors of management including complicated steps. It is a belief of bringing up the ghost which is passed from ancestors to the present generation. The majority of job management depends on the old people as knowledgeable. Thus, it is a stage of showing importance, and respect to the old people who are intelligent.

Bringing up Phemon consists of many steps of ceremony. According to my analysis, it is found that some systems have the same purposes with different practices. It gives meaning to clean, to get rid of, to blow out, to drive away, and to take out which is considered to destroy bad things. Bad things in the meaning of bringing up Phemon at Baan Pudsa is sickness which

happens to everybody in the family. Data related to this story are analyzed as follows:

### 1. The ceremony of washing the banana head

**Picture 1** This ceremony implies to wash bad things. Thus, washing the banana head refers to washing the sickness of the patients.

### 2. Crossing the bridge and blowing out the candle

**Picture 2** shows how to step on the bridge to the big ceremony hall in order to blow out the candle. At this stage, breaking the bridge of leaf sheaf of banana tree refers to blocking bad things from returning. Throwing five groups of areca betel leaves out of the clothes refers to getting rid of all bad things. Blowing out the candles in the five trays of offering refers to stopping all bad things.

### 3. Pounding the coconut into pieces

**Picture 3** shows how to pound the coconut into pieces

Pounding the coconut into pieces refers to destroying so that there is no former pattern. The complete coconut comes to the end. This symbol refers to destroying bad things (sickness).

### 4. Becoming a nun

**Picture 4** steps of becoming a nun    **Picture 5** blowing out the stove

At this stage, there is a symbol of driving out in the form of shooting weapons. Another symbol is blowing out the stove. This implies that bringing up Phemon comes to end. The stove will not be used any more. Thus, blowing out refers to the end of sickness or bad things. Pouring the water to every pole of the ceremony is to demolish the ceremony hall. Demolishing refers to the end of sickness and bad things.

### **5. Ceremony of letting the chicken free**

According to this ceremony, the medium will carry the chicken prepared by the host, dance according to the rhythm of gamelan, and throw away the chicken in the west. The others will also throw away weapons such as pike, knife, sword, and Huahood wood. At the same time, relatives of the patient have to prevent the chicken to run back to the same way. This refers to throwing away bad things.

**Picture 6** the ceremony of letting the chicken free    **Picture 7** the medium is Letting the chicken free

### **6. Ceremony of stealing the cow**

This ceremony will happen after letting the chicken free. One man pretending to be a theft tries to drag the cow out of the area of the house. It is believed that stealing the cow is like taking bad things out of the house and the patient.

To sum up, bringing Phemon at Baan Pudsa consists of steps showing the symbol in the form of behavior of the same story with different systems of behavior. The behavior shown in each step of the ceremony shows many ways of how to solve the problems or how to make things better. There are many visions of the same story. They are ready to do everything to change bad things to be good things. It can conclude that bringing up Phemon at Baan Pudsa reflects the dimension of society, and culture of folklore to cooperate in solving the problem of health of people in the local area by the help of belief from the ancestors.

## Abstract

For business students at universities managerial simulation game is an effective tool supporting development of students' knowledge competencies. Simulation games provide a feedback between realized students' activities and results. In contrast with passive didactical techniques students reach an overview of an impact of realized changes in certain parameters that influence the whole market in the short period of time. Simulation games support system, interdisciplinary and strategic way of thinking. Aim of the paper is to point out contribution of selected simulation games in teaching process at the university.

## 1. Introduction

Managerial simulation game used for simulation of economic processes is an effective didactical technique. Using managerial simulation game is useful for business students of the third grade of bachelor study program and of the first grade of master degree study program at the universities. By using these games students are able to understand enterprise running and also have the possibility to collate existing theoretical findings thanks to experiential education. Systems thinking, interdisciplinary diagnostic and strategic thinking is developed in the case of master program students.

This paper points out the most significant benefits of simulation games using in teaching process at the university. There will be described the main steps of simulation games implementation used at the Faculty of Economics at VSB – Technical university of Ostrava (Czech Republic). The benefits come out of students' questionnaire. The most important results from the questionnaire are showed in graphs.

## 2. Benefits managerial simulation games in teaching process

Managerial simulation game (Mildeová, 2007), (Aldrich, 2009) simulates economic phenomena and conditions (settled parameters of decision), that must be considered by the student while managing virtual firm. Through managerial simulation game students experiment with an economic model which represents selected part of real economic system (it consists of selected relations, links between the elements). Simulation experiments (Tuleja, 2007), (Častorál, 2008) enable to confront and subsequently to combine results and to find a new variants of solutions. Simulation game does not substitute practical activities in the field of decision making. But it enables to acquire knowledge from the basic dependence among economic values and to reach skills of professional character (Powell, 2009).

Contemporary in the Czech Republic managerial simulation games are used in teaching process at the universities as well as in educational companies. Used managerial games can be divided into two groups:

- Managerial games that can be implemented (e.g. MARKETPLACE, JA TITAN, CELEMI etc.) without any adjustment (after installing in computer) implemented
- Managerial games that are the product of a particular institution (school, consulting or educational firm) after buying certain software (VENSIM)

Both groups of managerial games have own specifics by which they differ especially in decision parameters (levels of decision), in graphic possibilities (using graphs in decision making processes), in chosen product commodity, in price etc.

During managerial simulation game knowledge competency is ensured by team experience sharing, see Fig. 1.

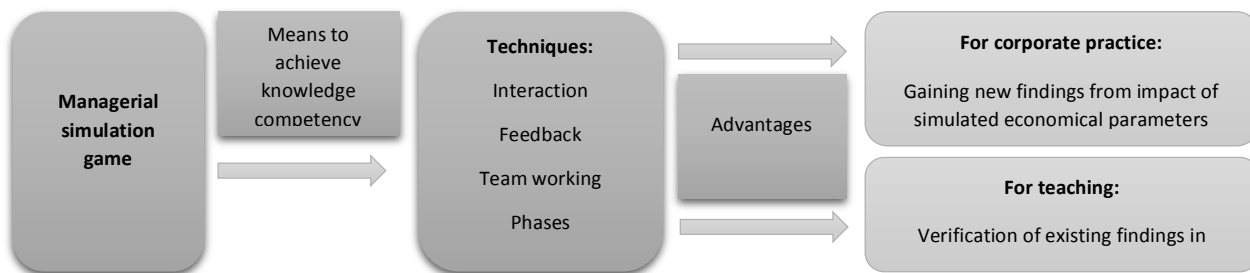

Fig. 1 Benefits of managerial simulation game

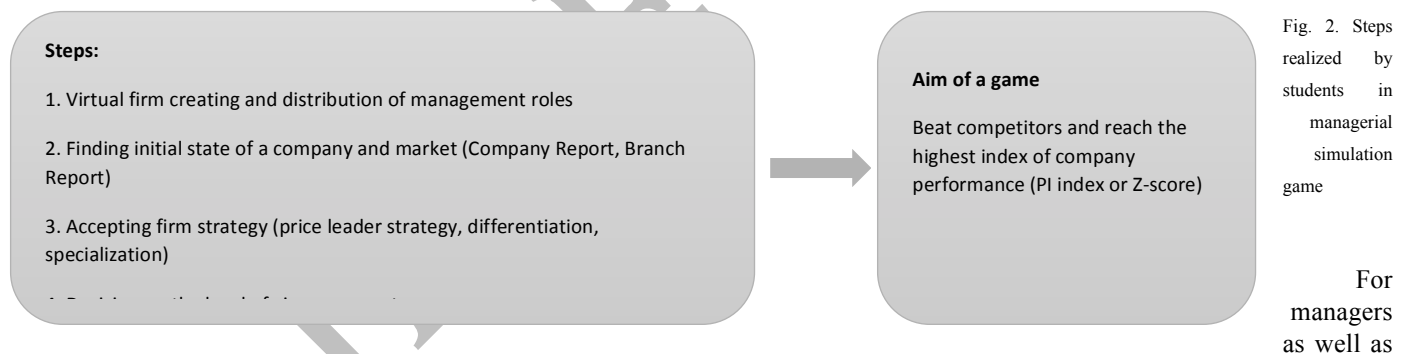

Source: Peterková, J., & Němčík, P. Managerial Simulation Game as a means of Development of Managers' Comp. Knowledge. Center for inVestigations into Information Systems (online). 2010, vol. 7, no. 1. Available from <http://www.cvis.cz/eng/hlavni.php?stranka=novinky/clanek.php&id=63>. ISSN 1214-9489.

### 2.1. Teaching process with managerial simulation game

Teacher (moderator) plays an important role in teaching process. He provides theoretical background in the sense of introduction of contemporary market situation in particular simulation game. He points out which parameters play the most important role in relation to the final results. The main steps in particular rounds including necessary calculation are worked out in the form of methodological instructions and located in LMS – Moodle.

At the same time teacher leads timing of a game and settles time of ending the round. One round is finished in the time of submitting economic parameters in simulation game. After finishing a round teacher (moderator) evaluates the teams according to determined criteria and comments results of each firm regarding PI index and revenues from the beginning of the game.

Despite existing specifics in managerial simulation games there can be described general steps in teaching process including goals. The basis of the game is creating virtual firms including identification of roles in students' teams, while particular virtual firms form one sector (competing firms). During firm existence students team decides price, production, marketing, capital investment, research and development, charity or some other parameters in simulated economy situation (recession, growth etc.). After each round the teacher discusses the list with team ranking. Company Report and Branch Report are basis for decision making. Managerial teams aim is to manage virtual firm in the way they beat competitors and overcome in profit, sales and market share. The firm with the highest index is the best one. Fig. 2 shows steps realized in managerial simulation game.

for the business students' computer simulations are an effective mean of teaching supporting holistic approach to problem solving.

### 2.2. Evaluation of the benefits of simulation games by using questionnaire survey

Evaluation of the benefits of computer simulations was realized by using questionnaire. This anonymous electronic questionnaire was used in 2010 (115 students) and 2011 (150 students). Participating students worked with simulation JA TITAN. The survey enabled to determine benefits of managerial simulation games for further study and future occupation.

Most of interviewed students in 2010 (63 %) and in 2011 (62 %) considered the game to be favored and useful for further study by the fact that the game enabled understanding relations among simulated economic values (answers examples: simulation enabled to verify market functioning, team work, competing among students teams etc.) see Fig. 3.

for further study

At the same time 56 % of students (2010) and 38 % of students (2011) regarded managerial simulation game beneficial for future occupation (examples of answers: opportunity to develop myself, not only to accept theoretical knowledge, perfect tool for managing real firm etc.), see Fig. 4.

Fig. 4. Benefits of managerial simulation games for further occupation

(answer examples: simulations helped me to understand company investment, to get practical skills in managerial decision making, complex approach to problems, connection of management, microeconomics, calculations etc.), see Fig. 5.

Fig. 6. Team work usefulness

Simulation game taught some students to communicate in a team and to enforce their decision. Students mostly preferred 2 – 3 member teams.

Realized questionnaire showed that students mostly consider managerial simulation games as beneficial for further study and also occupation. These simulations enable to know economic rules of market by using game.

### 3.Steps realized by the students in managerial simulation game JA TITAN and MARKET HERO 2

Two simulation games are used in teaching process at the Faculty of economics (VSB – Technical university of Ostrava). In simulation game JA TITAN companies produce generators and in simulation game MARKET HERO 2 students run their companies in the field of informational technology. The main aim of the game JA TITAN is to introduce impact of price changes, marketing, research and development and capital investments on final results of the firms. On the other hand simulation game MARKET HERO 2 shows what it means to run a business in the sphere of information technology.

#### 3.1. Playing managerial simulation game JA TITAN and its steps

This game is also based on team working. Each team must have at least two members. Before the game starts students create virtual firm choose management and roles. Firms produce generators and try to reach company balance, to beat competitors in the sense of amount of profit, sales and market shares.

Each game can be played by 8 virtual firms. These firms at the same time form generators market and offer the same product. During virtual firm running students team make many decisions (pricing, quantity of production, marketing expenditures, capital investments, research and development and charity, see Fig. 7.

Fig. 7. Simulation game JA TITAN

### 3.2. Playing managerial simulation game MARKET HERO 2 and its steps

Students form virtual firms, choose their names and get acquainted with the basic characteristics of IT branch. Firstly students recognize number of competitors and possibilities of decision making such as company fixed costs, available loans, distribution channels, form of advertising, way of forecasting etc.

Secondly students chose products or services that will represent their company portfolio. Managers must chose inputs (space, factory, machinery), employees, required skills, advertising of concrete products (e.g. banner advertising, advertisement in regional newspapers) for each type of product or service, see Fig. 8.

Fig. 8. Menu for decisions

After this part students settle concrete parameters of firm running including price calculation. This game is organized in several rounds and each round lasts three months. The whole game contain five years of company existence.

Once a round is finished, students can get the results in the form of balance sheet, sales report and income statement.

Reached results can be compared with the results from competitors realizing their activities in IT branch. Students can use Z-score. Companies with score higher than 2,9 have a good chance to survive at least next two years.

## 4. Conclusion

Simulation games represent ideal way of verifying and getting knowledge by using game. Teaching process is active and provides important feedback between students' activities and their results.

This paper contains the basic steps when playing simulation games JA TITAN and MARKET HERO 2, teaching process including role of teacher. The aim of the students' teams is to beat the competition and to reach the best economic results by using PI index and Z-score.

Realized questionnaire survey showed that students that have already used simulation games during their study at the university consider it to be beneficial both for their future study and also future occupation. Simulation games enable to understand relationship among economic values. Member of the students' teams also exercise their communicational skills. Survey also determined the main effects of using managerial simulation games:

- Visualization of strategic decisions realized by students
- Students' motivation support
- Complex overview of running business
- Usability of simulation game for practice

According to our findings we recommend using managerial simulation games in teaching process at the university especially for business students.

# The change from parent education to parent involvement in Korea

Hajeong Lee\*

*BK 21 Plus Eco-Edu Systm Research Team, Department of Early Childhood Education, Pusan National University, South Korea*

---

## Abstract

In the study of early childhood education, the relationship of teachers and parents is continuously discussed by the reason the connection of them helps children development. The range of the relationship includes diverse level. In the case of Korea, for example, when the parents take part in the activities that intended to network with teachers, the word of “Parent Education” was usually used in the kindergarten and daycare center, which expressed that parents are objects for education. However, recently the word of “Parent/Family Involvement” is widely started to use, which includes the meaning that parents stand equality with teacher.

---

## 1. Introduction

The purpose of this study is to examine research trend and reality on parent education and parent involvement in South Korea. What having close relationship between parents and teacher has positive effect on young children’s development and learning is being accepted as a natural fact in early childhood education area. What close relationship with family needs to be premised for young children’s growth and development in early childhood education area in South Korea has ever been emphasized already in many prior researches. Even in a report that OECD surveyed on the early childhood education and the child-care policy targeting 12 countries, the close interrelation between family and institution is being stressed. It is reporting which effort each country is making for this.

It was emerged the necessity that parents and teachers have cooperative relationship with an equal footing under the name dubbed “parent participation” with entering the 1990s from the viewpoint as saying of needing to educate by having parents as the subject of education under the name called “parent education” from the 1960s in South Korea. Many kindergartens and child care centers have developed the activity related to parents until now while using terminologies called “parent education” and “parent participation” or “family participation.” Accordingly, this study aims to suggest a new sight on parent participation as its improvement after analyzing the tendency of being changed into parent participation from parent education and after examining the reality of parent education and parent participation of being enforced now.

## 2. Needs for the relationship between parents and teachers

OECD that researches the education and care system in 12 countries reported that the close connection with teachers and parents is to enhance learning and experience of children. They show the types of relationship between institutes and parents; Marginal engagement, Formal engagement, Informal-organised engagement, Participatory engagement, Managerial engagement (Na & Jang, 2002). These types of relationship show the distance to be made by teachers and parents. These also mean many countries have a variety of parent involvement, and each country implements their activities according to their situation.

## 3. Tendency of Parent Education/Involvement in Korea

### 3.1 Tendency of parent education

The educational dictionary in South Korea defines parent education as education to purpose of helping parents have the connection to kindergarten, teaching development of children and curriculum to improve educational effect (Educational research institute in Seoul national university, 1994). Kim (2006) said that parent education is a word to emphasize comprehensive meanings of doing activity to teach parents. Kim and others (2012) stated that parent education is for parents to expand

---

E-mail address: hajeong.lee.kr@gmail.com

understanding and knowledge on developing and rearing children, to develop skills to care about them effectively by themselves, and to do a variety of activities to support adapting skills in reality. These studies show us parent education is offering information and knowledge on rearing children to them, and to make them do educational activities to perform their role.

Starting the Head Start program in America in 1960s, this program stressed parents need to participate in a variety of activity in kindergarten directly or indirectly, and have studies connected with parents education improved. Especially in Korea, parents are recognized that they need to know how they take care of their children. Most kindergartens suggest educational course for parents, because teachers think parents can't provide family environment properly, and have difficulties having desirable parenting attitude.

### *3.2 Tendency of parent involvement*

In 1990s, the word in terms of parent education in kindergartens changed to parent involvement. In Korea studies, parent involvement is defined as the activity for parents to make close collaboration to understand children in a correct way, to get high efficiency by participating in learning activities for children directly, and to intervene in educational field by taking the various roles such as decision-makers, supporters, assistants etc. This definition stressed direct involvement by parents. Park and others (2012) indicated that parents and teachers need to have equal partnership, interact each other, and get skills and activities where they can join program with children, decision-making in kindergarten.

In Korea Studies, the need for parent education or involvement has been taken as the necessary exists for teachers and parents. Teachers who plan and carry out activities with parents think that parent involvement is important for children to enhance children development. They also think that parents show changes to get positive interest and active attitude through the activities (Ahn, 2004; Jo & Bae, 2009). However, teachers indicated pressure because they have to set the activities for parents. Im (2010) reported that most parents could understand about their children and change their attitude in a positive way after they participate in parent involvement program.

## **4.The reality of parent education and involvement in South Korea**

The object of parent involvement in South Korea is to provide information about kindergarten program. As parents visited their kindergarten and joined the activities with children, they can understand the situation of children, teachers and institution. The activities with parents start with parent education and parent involvement. Because they set the time to start, the place to open, and the object and contents for parents to do when many kindergartens plans the activities that parents take part in, parents involvement are required to do activities uniformly and limitedly in their boundaries that teachers already set. The next activities for parents are the examples to show the reality of the parent education and involvement that the South Korean kindergartens carry out.

### *4.1.Lecture*

These activities are held in twice a year, the beginning of the semester because the object of lecture is to explain how teachers take care of their children in program, and to provide information on development of children. The lecture is carried out by the director or professional instructor, and the content of the lecture is determined by teachers and director. To hear the lecture parents converge on time and place.

### *4.2.Parent involvement activity*

Teachers invite parents to do special activities with children that teachers plan, prepare and practice activities. These activities also have a tendency to carry out only once a semester because these make teachers feel stressful. Because they lead parents act in their way they want in a special day when they set to do activities, parents show the similar activities and they also are eager to make same results whether parents want to do or not.

### *4.3.Joining the special event*

Because the kindergartens seek the participation of parents in every event such as sports day or concert. Parents participate in the event to see how their children grow not to help teachers or institute for making better event. Parents is not participants but observers

## 5. Discussion

As examined so far, the activity related to parents of being carried out at kindergarten in South Korea is being progressed with a method of being mixed parent education and parent participation. These activities aim at young children's physical, mental and cognitive development, but are those of being included even a burden of teachers and parents along with it. Thus, the activeness of parents' participation rate or the teachers' stress is also expressed in executing it realistically. Also, there are many cases of aiming at kindergarten's delivering knowledge to parents. Thus, there is even a case of being recognized as "event for show" that an institution introduces a program, rather than understanding about child care, and as a single event rather than being continuous. A doubt is created about which experience on earth the parents will be able to have through parent education and parent participation, which resulted in being recognized as this event. Also, more effort seems to be likely needed for which the parents worry about young children's development together with teachers with truly having equal partnership with teachers. Especially in modern society of South Korea, it is the real situation of being grown parents, who appeal for child-rearing stress, or parents, who are much concerned about how they will rear child. These parents are encountering countless materials of appearing on internet for obtaining its solution.

However, it is the real situation that the data in the extensive collection are throwing parent into more confusion. Trying to think a role of parent participation with considering the child-rearing state in this modern society, the necessity is being proposed that teachers will recognize parents as the existence of proceeding with promoting young children's better development and as the existence of proceeding with sharing even a joy and solving even a worry together while raising children together, rather than recognizing them as the passive existence of needing to be educated. Considering that parents are in a situation of needing to begin the first child care in the state of having no experience of facing a child before especially in modern society, the institutions like kindergarten and child care center, which are being in charge of child care, are thought to be likely needed even a role of leading in the future so that parents can proceed with being grown into true parents.

## Method

We worked with a questionnaire comprising 30 items, the answers being given using the five point Lickert scale ranging from 1 – perfectly satisfied to 2 – utterly dissatisfied. The sample comprised parents of upper high school students, whom we asked to state their sex and age plus the sex and age of their child. The total number of respondents was 176 (73 males and 103 females) and the research concerned 22 high schools in the region of Hradec Králové, Czech Republic. The parents were aged 30-57, while their children were aged 10-15 (there were 87 boys and 89 girls). The number of participating parents being relatively small, we involved a comparatively large number of schools so that the data would not be an evaluation of the same features of one of a small group of schools. There were never more than 10 parents – respondents from one school.

## Results

We performed factor analysis which rendered the following common variables (Varimax rotation, critical value /0,40/, Cronbach's  $\alpha = 0,81$ ):

The results give the total number of answers “completely satisfied” and “satisfied” expressed as percentage.

*Factor 1 – education, evaluation, knowledge and skills, social relationships*

Fig. 5 Factor 1: items in percentage (N=176)

ted positively by the majority of respondents. A surprising finding is the high degree of satisfaction of students with the relationships in their peer group as perceived by their parents. The item which received the lowest evaluation was the preparation for future studies and occupation. This finding might lead to better self-reflexion in the area of educational activities of the selected schools. The overall results seem positive, nevertheless, it is clear that the school will have to take the needs of contemporary society into account even more than before and adjust the curriculum accordingly.

*Factor 2 – education welfare officers, information for parents, secondary activities:*

Fig. 6 Factor 2 - items in percentage (N=176)

Being aware that teachers who work as education welfare officers often lack the right qualifications, we assume that this lack is the main reason why the score of the item concerning career masters suggests that a little less than one half of parents are satisfied with the service. Moreover, many teachers are not given sufficient professional training needed for the solution of the increasing number of educational problems and working with the parents. We were pleased by the fact that almost 80 % of parents feel to be well informed about the education of their children as well as the high percentage of parents satisfied with secondary activities of the school. Our schools have made a big step forward in this respect. The role of education welfare officers is often connected solely with the elimination of negative phenomena, while the ability to provide advice is failing. Both

students and parents do not trust the officer enough to consult him on a difficulty; they even often lack precise information about his/her competence.

*Factor 3 – material equipment, psycho-hygienic conditions:*

Fig. 7 Factor 3 - items in percentage (N=176)

One of the important factors of the education of an individual is the environment. In the case of schools, environment equals the building and equipment, decorations etc., however, other very important factors also include management, cooperation and climate of the school. Parents evaluated the material and psycho-hygienic conditions of the school relatively positively. The above items show that the satisfaction is lowest in the area of optional subjects. The parents' requirements in this area are perfectly justified. Contemporary society does not demand mere knowledge but also developed personalities with the desire to reach the best possible results. This is consistent with the finding of Haviger (2011) that personality and cognitive characteristics influence performance, such as in mathematics. Optional subjects above the framework of the so-called school subjects could bring a considerable contribution to the development of such individuals. It is evident that schools face limitations connected with the staff and financial matters, nevertheless, we must not close our eyes to this. The knowledge of the parents' wish for a larger and more diverse offer of optional subjects has to be taken into account and we have to attempt to change the current situation.

As for the overall evaluation of the school, 62 % of parents expressed their satisfaction with the good quality of the education process in the school which their children attend. This number appears relatively favourable, still, our future goal will be to focus more on the communication with parents and offer them closer cooperation with the school.

Analysing the obtained data further, we carried out the T-test, seeking the answers to more research questions.

1. Is there any connection between the age of the parent and the answers given in the questionnaire?  
No connection between the above items was identified.
  - Is there any connection between the sex of the parent and the answers given in the questionnaire?
  - Mothers feel to be better informed than fathers, mothers have greater awareness of the child's satisfaction at school (they know more about school him/her).
2. Is there any connection between the age of the child and the answers given in the questionnaire?
  - The older the child, the lower evaluation rating of the level of education given by the parents.
  - The older the child, the less satisfaction with the assessment of his/her performance on the part of the parent.

The above results suggest that parents of older students believe that their children are not educated and assessed well. It is necessary that the school should endeavour to maintain frequent and quality communication with all the parents of the students and that the teachers should offer more explanations, clarifications and justifications. This may prevent uncertainty and conflicts.

Is there any connection between the sex of the child and the answers given in the questionnaire?

- A considerably greater number of parents of girls believe that the school well prepares their children for the future.

Is there any connection between the school grades of the child and the answers given in the questionnaire?

- The lower grades, the less satisfaction with education, the student is not assessed well and the parents think that their child is not well prepared for further studies.

The fact that parents of children with lower grades regard the education and assessment as dissatisfactory is not surprising. Again, it is necessary to lead a constructive dialogue with the parent, to cultivate communication in general, reinforcing the

climate of trust and sympathy and seeking mutual understanding (Lašek, Loudová, 2013). The teacher should be able to present convincing arguments and suggest acceptable solutions.

The schools which enabled us to carry our research out were informed of the results, although (as mentioned previously) the sample of respondents from each school was small. Still, we considered it useful to inform the selected schools of the results.

## Conclusion

A young person leaving high school should be relatively well prepared to enter the society, whose requirements in the areas of education, social contact, independence and responsibility are more demanding compared with the past (Clark, & Starr, 1991). The objective of our research was to find out about the quality of the school's influence on the student in the eyes of the students' parents. It was not focused on the evaluation of specific knowledge and skills of the students but on the overall quality of the school. The school is a significant education phenomenon and the results of our study suggest that a relatively high percentage of parents evaluate the school of their children positively. The school and the family have a common goal: a harmonious development of the child's personality. The school acts as a kind of education service, while the parents are involved in the decision making concerning the way of education of their children. The attitude of the family towards education influences the position of this value in the child's value system (Chandra, & Sharma, 1996, p. 127). Parents and teachers are equal partners, however, the cultivation of this partnership requires a great deal of effort.

In accordance with (Epstein, Van Hooris, 2010, Pena, 2008), who formulated the principles of the relationship between the school and the family, calling it a sphere of overlapping influences, we propose the following practical recommendations based on our research.

Inform the parents of the school results of their children.

Clarify and justify what happens in the school.

Participation of parents as a form of support for teachers and the school.

Involve the parents in the matters of the curriculum and decision making.

Two-way communication between the teachers and the parents.

Counselling for parents, offering advice on the matters of home preparation.

Being a professional institution, the school should create and develop an exemplary and stimulating environment for the development of young people. Students regard their teachers as providers of social support (Křivohlavý, 2002) and trust them; therefore it is necessary to strive for a continuous improvement of the work with the student. This is a vital part of the never ending professional development of every teacher. Everyday work should involve a focus on the search for hidden potential and further possibilities of enhancing cooperation (Burešová, Havigerová, & Šimíková, 2012). All this necessitates mutual agreement between the participants of school life, so that school can be a place which makes students and teachers feel well and the parents satisfied.

# The comparison of collocation use by Turkish and Asian learners of English: the case of TCSE corpus and icnale corpus

Elif Tokdemir Demirel<sup>a</sup>, Semin Kazazoğlu<sup>b</sup>

<sup>a</sup>Karadeniz Technical University, Department of English Language and Literature, 61080, Trabzon, Turkey

<sup>b</sup>Karadeniz Technical University, Department of English Language Teaching, 61033, Trabzon, Turkey

## Abstract

This purpose of this study is to compare the use of collocations by Turkish learners of English and Asian learners of English. Two spoken learner corpora, namely the TC-SLE corpus (Turkish Corpus of Spoken Learner English) and ICNALE corpus (International Corpus Network of Asian Learners of English) are used in order to make comparisons. The TC-SLE consists of Turkish learners' spoken English in the form of classroom language, monologues and language used during group work and has been compiled by the researcher. The comparisons are based on the frequency counts of collocations, types of collocations commonly used by the two different groups of learners and the types of inaccuracies done by the two different groups of learners. Based on the comparisons, the study investigates whether first language background has an important effect on the use of collocations and whether different groups of learners have similar problems in the use of English collocations. It was inferred that collocation use is among the most problematic aspects of spoken English for language learners and that factors not limited to but including first language significantly affect the use of collocations.

## 1. Introduction

Collocations are defined as “The occurrence of two or more words within a short space of each other in a text” (Sinclair, 1991, p. 170). The accurate use of collocations carry importance for spoken language since they make speech more fluent and native-like. Therefore, mastery of collocations is an important aspect of spoken proficiency. Cowie (1981) distinguishes four types of combinations: free combinations (e.g. drink tea), restricted collocations (e.g. perform a task) and figurative idioms (e.g. do a U-turn).

Learner speech which lacks collocation use and other aspects common in native speech usually sounds “blunt, unnatural or monotonous” (Shirato & Stapleton, 2007). As language learners are not fully capable of using the target language culturally, socially, and situationally appropriate ways (Fung & Carter, 2007). It is also commonly accepted in the Turkish EFL context that there is lack of proficiency and fluency in speaking skills of learners. One reason for this lack of proficiency is that pragmatic sides of a language are always disregarded in pedagogic settings. There is a need for more thorough investigation of learner speech in Turkey which makes use of current technology and innovations in research. One of the approaches which provide opportunities over traditional research methodologies is corpus linguistics. In Turkey currently, a spoken corpus of learner English, which would provide a valuable resource for research into spoken performances of Turkish EFL learners, does not exist.

Spoken corpora studies, however are not very recent in other countries. For example, starting in the mid- 1970s, spoken language corpora came into existence in increasing quantity and variety (Leech, 2000).

Considering that it is an important first step to compile a spoken corpus of Turkish EFL learners, for the current study a corpus of EFL learner English was compiled. The purpose of this study is to compare the use of collocations by Turkish learners of English and Asian learners of English. Two spoken learner corpora, namely the TC-SLE corpus (Turkish Corpus of Spoken Learner English) and ICNALE corpus (International Corpus Network of Asian Learners of English) are used in order to make comparisons. Based on the comparisons, the study investigates whether first language background has an important effect on the use of collocations and whether different groups of learners have similar problems in the use of English collocations.

A corpus can be defined as a large, systematic and structured collection of natural texts in an electronic database (Biber, Conrad & Reppen, 1998). A corpus is comprised with written texts and transcribed speech samples, and they are core elements for linguistic analysis (Kennedy, 1998). The design, size and the nature of a corpus are influenced by the purpose for compiling it. Leech (1991) suggests that a corpus is generally designed for a particular representative function and that he defined corpus linguistics as the study of language and a method of linguistic analysis which relies heavily on the use of computerized texts of authentic language.

Compilation of a corpus for language research and using corpus linguistics methods for analyzing language provides several benefits over other traditional forms of language analysis. With the use of corpus linguistics methods it is possible to analyze complex association between samples of language use and to store huge database of language; furthermore, it provides reliable and unchanging analyses. Corpus linguistics also allows researchers to make empirical studies in many areas of linguistics such as, lexicography, sociolinguistics, studies of style and educational linguistics (Biber, Conrad & Reppen, 1998).

First generation corpora included The Brown Corpus (approximately 1,014,300 words), The Lancaster- Oslo/Bergen(LOB) Corpus (one- million words) and The London- Lund Corpus(LLC) (500,000 words of spoken British English). Other types of corpora compiled for studying spoken English include Lancaster/ IBM Spoken English Corpus (SEC) (52,600 words of spoken standard British English), Corpus of Spoken American English (CSAE) ( up to one million words) and Wellington Corpus of Spoken New Zeland English (one million words).

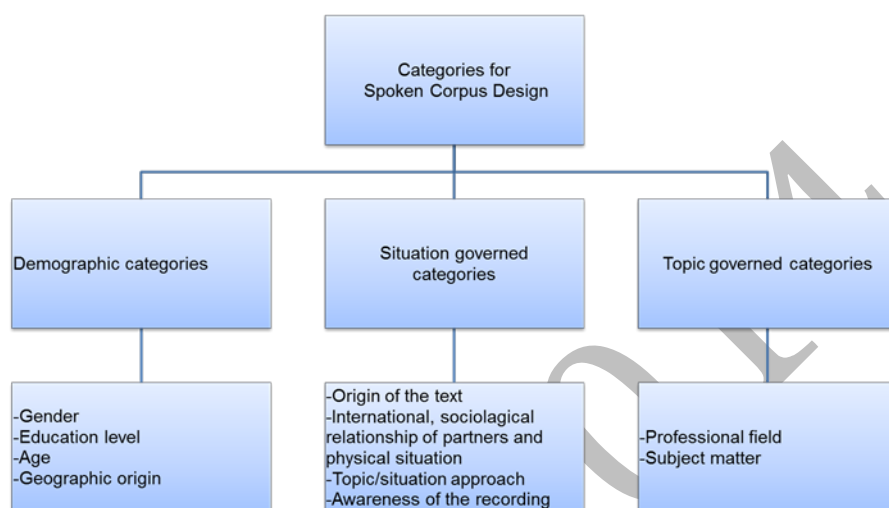

Figure 1. Design criteria for spoken corpora

Until mid- 1990s, the most widely known spoken corpus was LLC (London-Lund Corpus) with half million words. In his article “Spoken Corpora Design”, Čermák (2009) suggested basic design criteria for spoken corpora. His design consisting of three types of categories which also has a number of parameters is illustrated in Figure 1 above.

Linguistics studies using a spoken corpus have investigated various research questions such as the factors creating individual differences in the utterances of native and non- native speakers (e.g. Fuller, 2003; Fung and Carter, 2007; Aijmer, 2011) or regional differences in informal speech. (e.g. Torgersen, Gabrielatos, Hoffman and Fox, 2010). Authentic data provided by a carefully compiled spoken corpus provides important insights into the speech of native and non-native speakers since spoken language is different from written language and is more difficult and time-consuming to capture.

## 2. Methods

### 2.1. Corpus Compilation

The corpus compiled for the present study consists of, 58 spoken learner speech samples on two subjects chosen from among the IELTS spoken test subjects. The students whose voices were recorded were preparatory class students at the English Language and Literature department of a public university in Turkey. Their English level is between intermediate and advanced level. The corpus was compiled with the help of a digital voice recorder. Each student’s recording was made he/she wanted to talk about, was allotted some time to take notes and prepare themselves for the talk. When he/she was ready, the student was instructed to talk about their selected subject for 2 minutes. After the recordings were made, they were transcribed and coded for spoken discourse issues such as hesitations and false starts and given an identification number. The topics given to the students were one of the following:

Talk about a memorable childhood experience of yours

Talk about a big public event that you have attended

The Turkish Corpus was labeled TC-SLE (Turkish Corpus of Spoken learner English). This corpus consists of approximately 1500 words at present but work on compiling is ongoing. In order to make comparisons between Turkish EFL learners and other groups of learners and native speakers, two corpora which were available online were selected as comparison corpora. For learner comparisons the ICNALE corpus (Ishikawa, 2010) was selected. In order to make the ICNALE and TC-SLE comparable, a section of the ICNALE was randomly selected for the study. The size of the selected section is 1533 words and consists of a blend of Asian learners: Japanese, Indonesian, Chinese. Similar to the TC-SLE corpus, the ICNALE corpus selected consists of 2 minute short recorded and transcribed talks. In order to make comparisons with native-speaker speech the spoken

section of the BNC (British national Corpus) was used. Table 1 provides information on the corpora used in the study.

Table 1. Description of the corpora used in the study

	TC-SLE	ICNALE	BNC
<b>Corpus size (words)</b>	1500	1533	100.000.000
<b>content</b>	2-minute recorded EFL learner speech samples	2-minute recorded EFL learner speech samples	Spoken native speaker English from various contexts
<b>reference</b>	Demirel (2014), Karadeniz Technical University, Turkey	Ishikawa (2010), Kobe University, Japan	Brigham Young University (1980)

## 2.2. Data Analysis

For the analysis of the corpus data for TC-SLE corpus and the ICNALE corpus, AntConc concordance program was used. The steps of the data analysis is listed below:

- Step 1: Most frequently used words in the following categories were chosen from the TC-SLE by using AntConc 3.2.4.w concordancing program (Anthony, 2011). Figure 2 shows the lists of most frequently used words in three part of speech categories of nouns, adjectives and verbs.

Figure 2. Most frequent nouns, adjectives and verbs in the TC-SLE Corpus

- Step 2: Collocations of the words in the three word categories were found in the three corpora: TC-SLE, ICNALE and BNC
- Step 3: The collocations and their MI (Mutual Information) values through BNC and AntConc and compared across the three corpora. The MI value is a measure of collocational strength. The higher the MI score, the stronger the link is between two items. An MI score of 3.0 or higher to be taken as evidence that two items are collocates. The closer to 0 the MI score gets, the more likely it is that the two items co-occur by chance. A negative MI score indicates that the two items tend to shun each other. The MI scores were recorded for the analyzed collocations to see whether there are differences between the three corpora in terms of collocational strength.
- Step 4: The similarities and differences of the collocations were explored.

## 3. Results and Discussion

The purpose of the study was to compare the collocations of the most frequent nouns, adjectives and verbs across three corpora; TC-SLE (the main non-native EFL corpus), the ICNALE (the EFL corpus for comparison) and the BNC (the native-speaker corpus for comparison) to see whether there is a variation in collocation use between non-native EFL learners and native speakers.

As a result of the analyses differences were observed between the preferred collocates by learners and native speakers. For Example, for the selected ten most frequent verbs, a total of 57 collocates were found. Out of theses 57 collocates, 23 collocations were preferred only by native speakers and the remaining 24 were preferred by either only Turkish learners or by only Asian learners and sometimes by both. Table 2 shows the preferences for collocations with the past tense verbs went, started

and attended.

Table 2. Preferences for verb collocations

Native speaker preferences	Asian learner preferences	Turkish learner preferences
went into	went to	went to
went out	went into	
went down		
went back		
went round		
first started	started to	started to
started talking	I started	I started
started laughing		
people attended	I attended	I attended
attended by		
apparently attended		
attended conference		
members attended		

Secondly it was observed that the collocations showed more similarity between the two groups of learners than they did between learners and native speakers. For example, if we look at the collocates of “good” in the adjectives category. We can see that three words come out as preferred collocations of good in the EFL learner corpora, whereas they are not among the preferred collocates by native speakers.

Table 3. MI score comparison of collocates of “good” across three corpora

	MI scores		
	TC-SLE	ICNALE	BNC
adjectives	4,14	6,65	0
a good	1,15	2,15	0
good and	3,82	7,27	0
good for	0	-2	0
good relations	0	0	4,9
good actor	0	0	3,85
good afternoon	0	0	3,56
awfully good	0	0	5,47
good boy	0	0	

As can be seen in Table 3, collocates with strong MI values for both EFL groups do not show up as strong collocates in the native speaker corpus. This is an indication of the fact that EFL learners do not have enough competence regarding commonly used collocations in native speaker speech and tend to use free combinations of words instead of preferred chunks of speech which make speech more native-like and fluent. Figure 3 also illustrates that there is similarity between EFL groups and difference between the native speaker group and the EFL groups in terms of collocation use.

Figure 3. Comparison of collocates of adjective 'important' between the three corpora.

Another important finding is about the formation of collocates by EFL learners. The collocates preferred by learners are formed by usually core words such as articles, common prepositions or connectors. However, collocations formed with these words did not show up as strong collocates in the native speaker corpus. This result is in harmony with earlier findings by other researchers such as Altenberg & Granger (2001) and De Cock, Granger, Leech, & McEnery (1998). Similarly, Hasselgren (1994) argued that infelicitous collocations resulted from overdependence on the familiar—that is, structures that learners learned early, used widely, and with which they felt comfortable. She referred to these as "lexical teddy bears."

#### 4. Conclusions

Three main findings were reached as a result of the study. Firstly, it was found that preferences for collocates of the most common words show variation across native speakers and EFL learners. That is, EFL learners use vocabulary differently compared to other EFL learner groups and native speakers. This could mean that collocation use is problematic for learners regardless of their country of origin and that Turkish learners and Asian learners display similar use of collocations in spoken production when compared to native speakers. Secondly, it was seen that most of the variation in collocation use is existent between native speakers and EFL learners but not between the two groups of EFL learners.

Upon finding similar problems with advanced learners Laufer and Waldman (2011) suggest awareness raising activities for the use of collocations. For example supplementing communicative, task-based teaching with preplanned Focus on Form or Focus on Forms activities. With the current availability of online resources and user-friendly interfaces of corpora, teachers can also incorporate the exploration of corpora for collocations into their teaching. In order to get accustomed with the correct use of collocations, learners should be given more opportunities to explore native-speaker language through the use of online corpora. A hands on Data Driven Learning Approach (Johns, 2002) to teaching vocabulary should be followed in order to raise students' awareness of collocations and also to enrich their repertoire of vocabulary.

## Abstract

A review of the literature has shown that several aspects of hospital management in Malaysia do not comply with Islamic laws, for example, the choice of drugs and medical personnel-patient relationship of different gender. These two important issues need to be addressed wisely and discreetly in order to preserve Malaysia's status as an Islamic country. The first issue, regarding the choice of drugs, means that at times there is confusion and doubt on the halal status of certain drugs. For example, the allergy drug Red Tab Claritin and Ultratab Tablet Benadryl were reported to contain by-products that were of porcine and bovine origin. The second issue, which is the mu'amalah between a medical personnel and patient of conflicting gender, arises especially in cases of expecting mothers. Most were uncomfortable when male doctors handled the delivery process. These two issues have been a concern for Muslims and the reason why Muslim religious scholars (ulamas) have stressed the importance of consuming halal drugs (if available), and to be aware of boundaries between genders including the medical personnel-patient relationship. Thus, for the benefit of Muslims, who are the majority in Malaysia, this conceptual article will debate the rationale of establishing a syariah supervisory committee in Malaysian hospitals, especially dealing with modern biotechnology products. This paper will also look at some models that oversee the ethics of pharmaceutical management and medical personnel-patient relationships that are related with the proposed establishment of a syariah supervisory committee.

## 1. Introduction

Establishing a syariah committee in Malaysian Hospitals is one idea that has emerged in the course of adhering to two aspects of hospital operations according to the al-Qur'an and the hadiths. These aspects refer to the choice of medication and the medical personnel-patient relationship. The adherence to these two aspects is related to the establishing of a syariah committee because it was found that the financial institutions in Malaysia had adhered to the laws of the syarak after the syariah advisory committee began monitoring them. In addition, it would improve the implementation of Islamic teachings in a country that has proclaimed Islam as the federal religion.

## 2. The Significance Of Establishing The Syariah Supervisory Committee In Malaysian Hospitals

The literature review has shown that there are issues related to hospitals in Malaysia that need the establishing of a syariah committee. This committee needs to play a pivoting role in two matters, namely the issue of choosing medicines and the medical personal-patients relationship, especially in cases of conflicting genders (v Rispler-Chaim, 1989). From the aspect of choosing medicines or pharmaceutical products, there are suspicions on the halal-haram status of the medicines. For example, the medication for allergies such as Red Tab Claritin and Allergy Ultratab Tablet Benedryl, which have their origins from porcine and non-halal bovine (Syed Azhar, 2013). So too the anti-fungal drug Clotimazol, which is primarily sourced from porcine by-products (ibid). According to Professor Dr. Syed Azhar Syed Sulaiman (2013), the use of medication in hospitals is not only limited to oral medication but also various other forms of administering medication in different dosages. The use of vaccines for numerous diseases is based on its production from enzymes or protein by-products of porcine origin. Intravenous medicine of

E-mail address: adib@ukm.edu.my

various forms, especially insulin, which is often used in hospitals, is also a product manufactured from materials that are of a non-halal origin. Dr. Syed (2013), who is the Dean of the Pharmacology Faculty in University Science Malaysia, also added that 'vehicles' used in aerosol medicines might be produced from various materials that are not only suspicious but almost half of them have been indicated as non-halal but nevertheless still widely used in hospitals. From another perspective, although the active ingredients of some medicines are halal but the binding materials, the 'vehicles' and the dissolving or lubricating agents might not be produced according to halal protocols.

Hence, with the existence of the syariah supervisory committee that will focus on the halal aspect, the syariah concept will help put the national health system on a better threshold. Besides that, it would also be capable of assisting the enhancement of halal product services in the health field. The MS2424, which has been produced in this country, is capable of becoming the catalyst in the production of halal pharmaceutical products that would attract the interest of Muslims and other religions that lay importance on hygienic aspects in the manufacture of medicines. Besides the issue of medicines, the medical personnel-patient relationship also needs syariah supervision. This is because earlier studies have found complaints from female patients, especially in the delivery room. Some of them were not comfortable when male doctors handled the delivery (Anon., 2011). Forums on the internet have affirmed this phenomenon as one complaint from a member of the forum had stated that a trainee doctor was purposely asked by a specialist to place a urinal for a woman who was about to deliver (Anon., 2012). Hence, such a dishonourable act should not have occurred because the duty of placing the urinal could have been done by a female doctor or a nurse. Muslim scholars have iterated that female doctors must handle matters pertaining to gynaecology and obstetrics of Muslim women even though the woman is a non-Muslim, except during emergencies ('Atiyyah Saqr, 2002). Although doctors are bound by medical ethics under the Malaysian Medical Council, hence the enforcement of the halal-haram protocol is beyond their jurisdiction. Therefore, it is proper to establish the Syariah Supervisory Committee in hospitals to ensure that syarak in this context is implemented.

### **3. Definition Of The Syariah Supervisory Committee**

In a financial context, the syariah supervisory committee would mean (Husin Shahatah- date of reference unknown) supervision, research and analysis on all work, behaviour and ethical practices of an individual, group, institution or even units that adhere to the syariat of Islam. In other words, all the elements and monitoring activities are used to ensure the practice of a financial system based on the Islamic syariat (Hichem Hamza 2013; Mustafa Omar Mohammad & Syahidawati Shahwan 2013). Hence, the syariah committee in Islamic banking is a group of individuals comprising experts in Islamic law and economy that would be responsible for monitoring and supervising the implementation of Islamic law associated with the economy, thus ensuring its practise in financial institutions (Abdul Halim El-Muhammady 2012 & Mohd Nasran Mohamad et. al 2008).

Therefore, based on the definition above, a suitable definition for the syariah supervisory committee in hospitals would be a group of individuals comprising experts in Islamic law and a group of medical specialists responsible for monitoring and supervising the implementation of Islamic law associated with medical practices so that it is adhered to and practiced in hospitals.

### **4. The Justification For Establishing The Syariah Supervisory Committee**

Establishing the syariah supervisory committee does not conflict with the syarak as stated in the verse of the al-Qur'an, meaning "And let there be [arising] from you a nation inviting to [all that is] good, enjoining what is right and forbidding what is wrong, and those will be the successful" (al-Imran 3:104)

Referring to the verse above, Allah SWT had asked upon his followers to do good and abstain from travesties. This demand was not meant only for individuals but collectively to the whole Islamic community. This shows that establishing a committee that would monitor and supervise the adherence to the syarak in hospitals fulfils the context of the verse.

### **5. The Role Of The Syariah Supervisory Committee**

The syariah supervisory committee found in financial institutions has important roles to play. Among them are (Jamal al-Din 'Atiyyah 1413H; Nurhastuty Wardhany & Shaista Arshad 2012):

- a) To guide and monitor all activities in Islamic financial institutions in order to identify the rate of incorporating Islamic law that does not conflict with the common law of the country.

- b) To expose corruption, misguided ideas and opinions and to evaluate and reproof institutions in order to abstain from matters that transgress the syarak.
- c) To adduce Islamic alternatives for all forms of mu'amalah in Islamic financial institutions and reconfigure the investment system in accordance to the syarak.
- d) To support financial institutions, its staff and customers in their commitment towards the syariat Islam in all transactions and dealings by providing knowledge regarding the legal principles in the Islamic financial system.
- e) To have continuous supervision, auditing and solutions that guarantees the implementation of financial transactions in line with Islamic law.

Hence, in a hospital context, the suggested roles of the syariah supervisory committee are also similar, such as:

- a. To guide and supervise activities regarding the administration of the hospital especially in aspects pertaining to choice of medicines and the medical personnel-patient relationship so as not to conflict with the syarak.
- b. To expose corruption, misguided ideas or opinions and to evaluate and reproof the hospital in order to abstain from matters that transgress the syarak.
- c. To support the hospital, its staff and clients in their commitment towards the syariat Islam in all transactions and dealings by providing knowledge regarding Islamic medical procedures.
- d. To have continuous supervision, auditing and solutions that guarantees the implementation of hospital operations are in line with Islamic law

## 6. The Structure Of The Syariah Supervisory Committee

In Malaysia, the Malaysian Central Bank has set several minimal conditions that need to be fulfilled by financial institutions when establishing a syariah supervisory committee (Anon., n.d). For example, in regards to the appointment of committee members, at least three qualified members need to be appointed. The qualifications are determined based on the expertise, skills and experience in the field of principles of Islamic jurisprudence (usul fiqh) or Islamic jurisprudence related to mu'amalat.

In the context of the hospital, the researcher suggests the same method. The members of the syariah supervisory committee comprise a minimum of three persons who possess the expertise in the field of study such as principles of Islamic jurisprudence (usul fiqh), current principles of Islamic jurisprudence and being a medical doctor. This is because the medical issues encompass ethics and the use of biotechnology products that need the consensus of the syarak from time to time.

## 7. Conclusion

Islam is a divine deliverance intended to safeguard the global wellbeing of humans. The commands of Allah SWT, whether in the form of instructions or forbiddance, are to fulfil this intention. Therefore, every step and action that brings forth human bliss should be given due consideration and support.

# The decentralization of education at Paranaguá county

## Brazil (1985-2011)

Mary Sylvia Miguel Falcão\*\*\*\*\*

UNESPAR–Universidade Estadual do Paraná, Campus de Paranaguá. Rua Comendador Correa Junior, Número 117 - Centro, Paranaguá  
8320\*\*\*\*\* 3-560, Brasil

---

### Abstract

This paper aims to analyze the decentralization of at Paranaguá county in the time window 1985 to 2011, triggered by Paraná government. Changes in this county have been inquired based on enrollment and the number of teachers at each teaching systems. For that research, were taken in consideration the studies of Arelaro (1999); Camargo, (1997) those allege the countytization tendency as the strategy for deregulation of State and Gouveia(et-at2003; Santos(2003) demonstrate the impact of those decentralizations measures at educational finances in Paranaguá. Results points the countytization made an impact at the basic education of Paranaguá county.

### 1. Introduction

The goal that set this study In motion, was to analyze the process of educational decentralization established in the state of Paraná-Brazil specifically at Paranaguá county between 1985 to 2011, therefore sought for the quotation of enrollment at Elementary Schools, observing the variations in teacher transitions at Elementary School to the municipal network, diagnosing the procedures of what is called countytization of education, especially of the first four years of that level of education. A readback of those data was made with the political project of the government established in the State and their implications in municipal government in what concerns educational quotation in comparative data retrieval about the development in the municipal and state educational flux. In order to achieve the propose goal was noticed an increase on educational demand ,caused by the universalization of elementary education in one hand, and by the deregulation of the Stateon the other, keeping in sight the lack of an effective collaboration polity as proposed in 211° article in the CF of 1988. The theoretical l basis used in this analysis consider publication of researches such as Lisete Arelaro (1999), Rubens Barbosa Gouvêa (1997) stating that the municipal tendency as an strategy of State deregulation, others like Andréa Barbosa Gouvêa and Ângelo Ricardo de Souza (2004) and Jussara Maria Tavares Puglielli Santos (2003), demonstrates the impact of the decentralizing measures in the education finances of Paraná state. This being, this is an analytic research that resorts database from the Paranaense Institute of Researches and Economic development-Ipardes. The result indicates that the decentralization process unchained at Paranaguá county, lead this federal entity to put up to most of Elementary education educational finances.

### 2. The educational decentralization in the State of Paraná: Some remarks

In the state of Paraná the countytization process of the education went as an administrative-financer process, led only by the state's administration that resulted in the decrease of public expenses. (Gouvêa; Souza, 2004)

---

\* E-mail address: mary.falcao@unespar.edu.br

\*\*\*\*\* This term refers to the act of transferring the responsibility to finance and manage education from the union plan to the county one.

Even thou Brazil lived

In the early 90's many decentralization processes following the already strong educational countytization trend, those processes were, undoubtedly, very rich. They were developing intergovernmental discussion forums, that, even thou they were slow and hard to manage, they did point out to a further level of negotiation. Thus, the most notorious examples for this process were in the Rio Grande do Sul state (Winckler, 1996) and Paraná state (Raggio, 1996), that, already in 1995, saw the need for the implementation of a per capita cost for the enrollment that have been moved from a governmental level to another. (RODRIGUEZ, 2001, P. 46)

According to Jussara Maria Tavares Puglielli Santos (2003) the education countytization in the state of Paraná wasn't determined by the implement of the Basic Education Development and Maintenance and Magister Appreciation Fund (Fundef), contrary to other Brazilian cities (Pinto, 2007).

According to Santos (2003), the decentralization in the state of Paraná was effectuated from 1990. What is more, the author states, the first initiatives regarding the responsibility transfer of the education to the county, in Paraná, date back to the 60's.

As the literature regarding the subject states, there are three main moments in the countytization process of Paraná: The first, associated to the reconstruction and constitution of the Brazilian educational state system, consequence of the national education reform laws (1961 and 1971); the second, developed associated to the national project (1975-1981) and regional, with international funding, focused in rural education and the third, beginning with the student cost national studies that, with the tributary changes set by the 1988 Constitution, went on working as parameters for the Paraná's model that lasted from 1990 to 1997. (Santos, 2003, p. 257-279. My Highlights)

Santos (2003, p. 257-259) points that the first moment in the countytization process answers "to the educational system adjusts to the legal determinations from the decentralization orientation". On the other hand, in the second one "we watch the inductive action both from the federal and state administration through actions aimed to stimulate agricultural activities in a state where, until then, predominated activities from the primary sector." (Santos, 2003, p. 257-279)

However, states the doctor, the third moment begins in the second government of the Brazilian Democratic Movement Party (PSDB) post dictatorship from 1987 to 1990 and, in the third government of the same party, the process gets intensified from 1991 to 1994. Santos (2003) indicates that it was only in the third moment that the countytization was based on the technical rationality witch dominated the administrative-financer logic.

The main reasons to justify this affirmative, according to the author, were given by at least two main reasons, which are: "The increasingly deficit configuration of the state's administration accounts, that even reaches a deficit of 35% in the year of 1989, according to data from IPARDES (1992, p. 64) and the potential increase over the city's income due to tributary changes in the 1988 Constitution". (Santos, 2003, p. 257-279)

The countytization process proposed by the State's management found a strong opposition from the organized civil society compromised with the public school's defense. That is, considering, firstly, that the second administration of the PSDB in the Country was pressured by the growing deficit in the public accounts witch led, by its time, to the flattening of the teacher's salary, as well as the maintenance and support of the Basic Alphabetization Cycle targeted to reduce the retention rates on the primary levels. "In other words, the possibilities to define and implement effective and universal pedagogic actions were compromised by the precarious conditions of public funding." (Santos, 2003, p. 257-279)

Those things enabled a strike in the 1990's showing, as the author says, the collapse of the state's educational system as, in one way the resources diminished, and in the other the registration number increased. According to Santo's (2003) analyses, "the conflicting relations between educational professionals and the state's government were a main factor in the exclusion of those professionals from the process of defining the countytization program implanted from 1991." Also, representative entities which resisted to the decay of public education were dragged away from the process too, alongside with city which were considered "partners". From there on the political educational management concerns only the governmental sphere. Which would the motives leading the state to take those attitudes be? According to Santos (2003):

There would be many reasons, probably. Firstly, one might have to consider that the conflictive relations between educational professionals and state's administration had already configured itself very harshly since the 1988 strike and, from there on, only deteriorated, culminating with a 90 days strike in 1990. That means, the political onus was already absolutely and hopelessly configured and, despite that, the party had assured its victory for one more election in the year of 1990. Without a doubt, that victory played a major role in applying a measure that, as it would be proven later on, would represent, as a fact, expenses reductions for the state's management. (SANTOS, 2003, p. 257-279)

In the research made by the Ipardes in 1996, entitled “Avaliação do impacto da municipalização do Ensino Fundamental no estado do Paraná”, that intended to fulfill the demands from the treaties between the state of Paraná and the World Bank (WB), it is clarifying as far as the means by which the state's enrollment were transferred to the cities in Paraná is concerned. As the research showed

The union transferred to the cities the educational onus without giving the proper support, demanding, moreover, the adoption of a new theoretical-methodic proposal: The Basic Alphabetization Cycle. That proposal presents, in the state's school's scope, difficulties in its implement that are not yet solved, and that shouldn't have been ignored when the proposal was first made, as part of the countytization policy, to the city's education network. (p. 88) With a bigger urbanization of the scholar network, the cities would inherit all the problems regarding that network, such as the pressure for more spaces at schools and the lack of classrooms and decent space for the Basic Alphabetization Cycle, as the consequent lack of resources to fulfill future demands. (p. 89) the adoption of the CBA became a vulnerable choice as the union did not have to, effectively, supply the right amount of pedagogic orientation to the cities that took the educational partnership, and also excluded most teachers from theirs improvement courses. There is a clear sign that the state does not have a clear proposition to support the cities by capacitating the city's teachers. (IPARDES, 1996, p. 92)

As we can see in the educational context of Paraná, the choice for the countytization did not come alongside with the financing project as in many other cities in Brazil, (ARERALO, 2005) it targeted the private interests in Brazil and also instrumentalized educational policies in the state's level. Even thou may cities have shown a great deal of resistance to those policies (GOUVÊA; SOUZA, 2004), in the city of Paranaguá, main target of the study, we couldn't find leads that pointed to that resistance.

### 3. The city of Paranaguá: the educational decentralization induced

The city of Paranaguá was created by the Law number 5, in 29 of July of 1648, and was installed at that exact moment. Today's city of Paranaguá was dismembered from the state of São Paulo. It is the state's oldest city. It is settled in the coastal region, 86km from the capital. Has a population of 142,452 inhabitants (IBGE, 2010). Has an urbanization tax of 96.49%. Its illiteracy tax is of 3.88%. (IPARDES, 2011)

Considering the educational numbers of 2012, the city presented the enrollment tax shown in the chart 1 below:

Chart 1: Enrollment in Paranaguá's education network - 2012

Administrative Networks	Nursery	Pre-School	Elementary	High shool	University
Federal	-	-	-	291	176
State	-	-	10.965	6.833	449
City	940	1.991	10.625	-	-
Private	656	860	3.830		
Total	1596	2.851	25.420		

Source: MEC/INEP

The data points out an equal division regarding the educational services given by the state and the city as far as basic education is concerned, revealing the universality of that level of education when comparing with the chart 1. On the other hand, when looking at chart 1, one can conclude that the main absorption capability resides in child's education following the national trend. (PINTO, 2007)

### 3.1 The educational countytization in the city of Paranaguá

When talking about the countytization in the city of Paranaguá, we can point out that it receives the full impact of that project, still under the management of Álvaro Dias (1987-1991). The analysis of the decentralization policy in the state of Paraná allows us, alongside with Gouvêa and Souza (2004), to assert that it wasn't a consequence of the financial induction created by the Fundef.

In the years of 1987 to 1991, which referred to the management of Álvaro Dias, we can notice that, according to the chart 2, there was a growing number in the schools vacancies in the city's education.

The data analyzed corroborate with the analysis created by Gouvêa and Souza (2004), which affirms that even before the implement of the Fundef in the state of Paraná there was a reduction of the vacancies for the basic education, generated by the reduction in hiring for that level of teaching. This fact obligated the city's network to raise the vacancy offer in that level of education. As we can see in the following charts and graphics:

Chart 2 Enrollments 1985-2011 – County of Paranaguá-PR Brazil

Year	1985	1986	1987	1988	1989	1990	Source: Ipardes (1985-2011)
Enrollment at elementary school -state network	11.776	12.290	12.311	12.549	12.021	12.257	
Enrollment at elementary school - municipal network	5.980	6.248	6.242	6.522	7.319	7.384	
Year	1991	1992	1993	1995	1996	1997	
Enrollment at elementary school -state network	12.396	12.751	12.654	12.077	11.922	11.442	
Enrollment at elementary school - municipal network	7.917	8.624	10.482	10.405	11.421	10.469	
Year	1998	1999	2000	2001	2002	2003	
Enrollment at elementary school -state network	11.193	12.140	10.951	10.859	10.928	10.306	
Enrollment at elementary school - municipal network	10.825	10.112	10.980	11.072	11.561	11.837	
Year	2004	2005	2006	2007	2008	2009	
Enrollment at elementary school -state network	9.913	9.985	10.501	11.285	11.680	11.213	
Enrollment at elementary school - municipal network	11.953	11.882	11.586	11.734	11.863	12.601	
Year	2010	2011					
Enrollment at elementary school -state network	11.037	11.216					
Enrollment at elementary school - municipal network	10.790	10.293					

Source: Ipardes (1985-2011)

As for the number of vacancies per education network, the graphic suggests that the city started to offer a very big number after a very short period of time. This data helps in understanding that the countytization established though the transfer of early level of education vacancies got faster through the transfer of enrollment and teachers to the city's network, that is, following that logic the city was held responsible for all the enrollment in the early levels of basic education, fact that can be observed also in what regards the number of schools per educational network.

Chart 3 Teacher's numbers in the state and city network in Paranaguá - 1985-2011

Year	1985	1990	1993	1995	1998	2000	2011
Teachers at elementary school - State network	394	505	507	534	499	429	457
Teachers at elementary school - municipal network	334	421	499	471	413	467	523

Source: Iparides (1985-2011)

In the chart 3 we can see a remarkable increase in the teacher transfer to the city's network. It gets especially visible in the years of 1990 to 1995. Those years can be considered as the most critical moment as far as educational professional transfers from state to city education system. This represents the consolidation of the contizatilization in Paranaguá.

This trend can also be seen in the following graphic

INTE 2014

Graphic 2 Teacher's numbers in the state and city network in Paranaguá - 1985-2011

Source: Iparides (1985-2011)

We can notice that, as it has been discussed, the number of teachers from the basic education also was raised in the city, following the vacancy trend, which strengthens the thesis defending that the decentralization was induced by the center of the union, to the cities below.

#### 4. Final Thoughts

Analyzing the data presented regarding the city's demand for the earliest levels of basic education, we can state that the decentralization promoted by the state of Paraná resulted in many impacts to the service in itself, and also the funding of basic and intermediate education. This data, in one way, shows that the resources aren't enough to answer the demand and, in another way, shows the lack of investments of other spheres in basic education. In the state of Paraná the cities applied money values above the minimum. That reveals that the cities do not receive any kind of complement from the Union, or even from the state to invest in the educational levels under its responsibility, clearly undermining the Article 211 of the Federal Constitution which refers to the collaborative system. It was also noticeable that the number of city schools revealed the countyalization trend. Another relevant data is that there was no registry of spending with educational material in the analyzed period. That way, it's important to point out that according to Santos (2003) the decentralization process in the state was a rational measure that compromised the educational quality, once you consider that the cities are the weaker bonds in the federative pact settled in the 1990s. Despite the data presented do not show more in this way, we can, when looking at the enrollment chart of the city, the decentralization of the education followed the macroeconomic logic that was settled in Brazil since the 1990s. Looking at the big picture, it's important to remember that if the union doesn't give more concern to funding education, the local picture will probably get a lot worst very quickly.

# The design of a framework for cooperative learning through web utilizing data mining technique to group learners

Pensri Amornsirlaphachai<sup>\*</sup>

*Department of Computer Education, Faculty of Science and Technology, Nakhonratchasima Rajabhat University, Thailand*

---

## Abstract

The purpose of this research is to design of a framework for cooperative learning through web utilizing data mining technique to group learners. The research and development methodology is employed in this study; however simply the framework design phase is presented here. The design phase composes of 5 steps as follows: 1) Studying and analyzing the related principles and theories, 2) Studying the context of learning environments, 3) Designing a framework for cooperative learning through web using data mining technique to group learners, 4) Assessing the framework by six experts and 5) Improving the framework. Many theories and principles are employed in this research; for instance, data mining technique, constructivist theory and the principle of media symbol system. Two results are revealed as follows. Firstly, the learning model consists 5 components that are (1) forecasting and grouping module, (2) cooperative learning community, (3) expert community, (4) learning resources and (5) quiz module. Secondly, the results of the evaluation from 6 experts are expressed that the framework comply with computer science principles and learning theories and the experts accept to the usability of the framework in a high level at 71.15 percents overall. To summarize, the framework can be employed to design and develop a learning model appropriately.

## 1. Introduction

Nowadays, many educators believe that learners can construct their own knowledge (Slavin, R. E., Learvey, M., et al., 1986, Mayer, R. E., 1996a, Atherton, J. S., 2013, Amornsirlaphachai, P. and Deepring, K., 2012) that corresponds to Thai National Education Act 1999 and Thai National Economic and Social Development Act 2012-2016 stating that all learners are able to learn and develop themselves and the education system must promote lifelong learning by exploiting internet technology and human society. These notions conform to constructivist theory (Vygotsky, L. S., 1962, Spiro, R. J.; Feltovich, P. J.; et al., 1991). However in the real world, most of learning environments still concentrate on knowledge transmission instead of knowledge construction. Thus the researcher would like to take advantage from online social network and information technology to enhance learners' competency according to the concept of the current educators and Thai National Education Act as well as Thai National Economic and Social Development Act.

Today, cooperative learning is always used to develop learners; however instructors frequently group learners randomly or let learners organize groups by themselves. Often, instructors group weak and stronger learners together by using their judgment; nevertheless instructors' ideas may be incorrect because learners have different kinds of intelligences (Gardner, H., 1999) thus; learners with high GPA may have some weakness in some subjects. For this reason, if academic performance level of learners in each subject can be predicted before teaching, the cooperative learning will be more effective. From this reason, we will use a data mining technique to forecast the academic performance level since this technique has accuracy of prediction. The academic performance level will be used to group learners automatically according to the cooperative learning principle (Slavin, R., 1996, Stevens, R. J. and Slavin, R. E., 1995). This assists learners in constructing their own knowledge by dint of social mechanism that corresponds to Social Constructivist (Vygotsky, L. S., 1962). Besides learner interaction, tools to communicate with instructors are provided and learning resources are presented as a conceptual model to show a relationship between cause and reason of learning content to help learners comprehend the content easier (Mayer, R. E., 1996b).

## 2. The Purposes of Research

Two main purposes of this study are as follows.

---

<sup>\*</sup> Asst.Prof.Dr.Pensri Amornsirlaphachai. Tel.: +668-6100-3876  
E-mail address: kokkoy@hotmail.com

- 2.1 To design of a framework for cooperative learning through web utilizing data mining technique to group learners.
- 2.2 To evaluate the framework.

### **3. The Scope of Research**

The scope of research described here consists of the target group, the scope of content and the research variable as the following details.

#### *3.1 Target group*

The target group used in designing the framework comprises 6 experts in 3 facets that are (1) learning content, (2) design based on theories and (3) media and technology.

#### *3.2 Scope of Content*

The content utilized in this research is a part of the computer programming subject at Nakhonratchasima Rajabhat University, Thailand. The topics of the content are variable and control structures.

#### *3.3 Research variable*

The research variable studied in this study is a framework for cooperative learning through web utilizing data mining technique to group learners.

### **4. The Research Instruments**

- 4.1 The opinionnaire of learning environment and instructional context in the course of computer programming is used to study the opinion of lecturers and learners. The questions in the opinionnaire are open-ended questions.
- 4.2 The record form of document analysis comprising of 4 aspects of principles and theories that are (1) data mining technique, (2) psychology of learning, (3) science of teaching and (4) principles of media and technology.
- 4.3 The assessment forms to confirm quality and usability of the designed framework. The assessment form to confirm the quality of the framework is created by utilizing the principle of assessment in learning environment and web-based learning (Khan et al., 1997). Open-ended questions are employed in this form. For the evaluation form to confirm the usability of the framework, the percentage of suitability of the usability must be specified for each questions.

### **5. Data Collection and Analysis**

The data are collected and analyzed as follows.

- 5.1 The learning environment and instructional context is analyzed by summarizing interpretation.
- 5.2 The review of literatures are collected and analyzed by describing and summarizing interpretation. The result from document analysis is used to design the framework.
- 5.3 The designed framework is evaluated by the experts. Three facets of assessment are (1) learning content, (2) design based on theories and principles and (3) media and technology. For the usability of the model, the average of percentage is calculated for the proper of the usability. The result is analyzed by summarizing interpretation.

### **6. Results**

The results of the research in the phase of designing a framework for cooperative learning through web utilizing data mining technique to group learners are as follows.

#### *6.1 The framework for cooperative learning*

The framework for cooperative learning through web using data mining technique to group learners based on several major principles and theories composes of five components that are (1) forecasting and grouping module, (2) cooperative learning community, (3) expert community, (4) learning resources and (5) quiz module as shown in Figure 1.

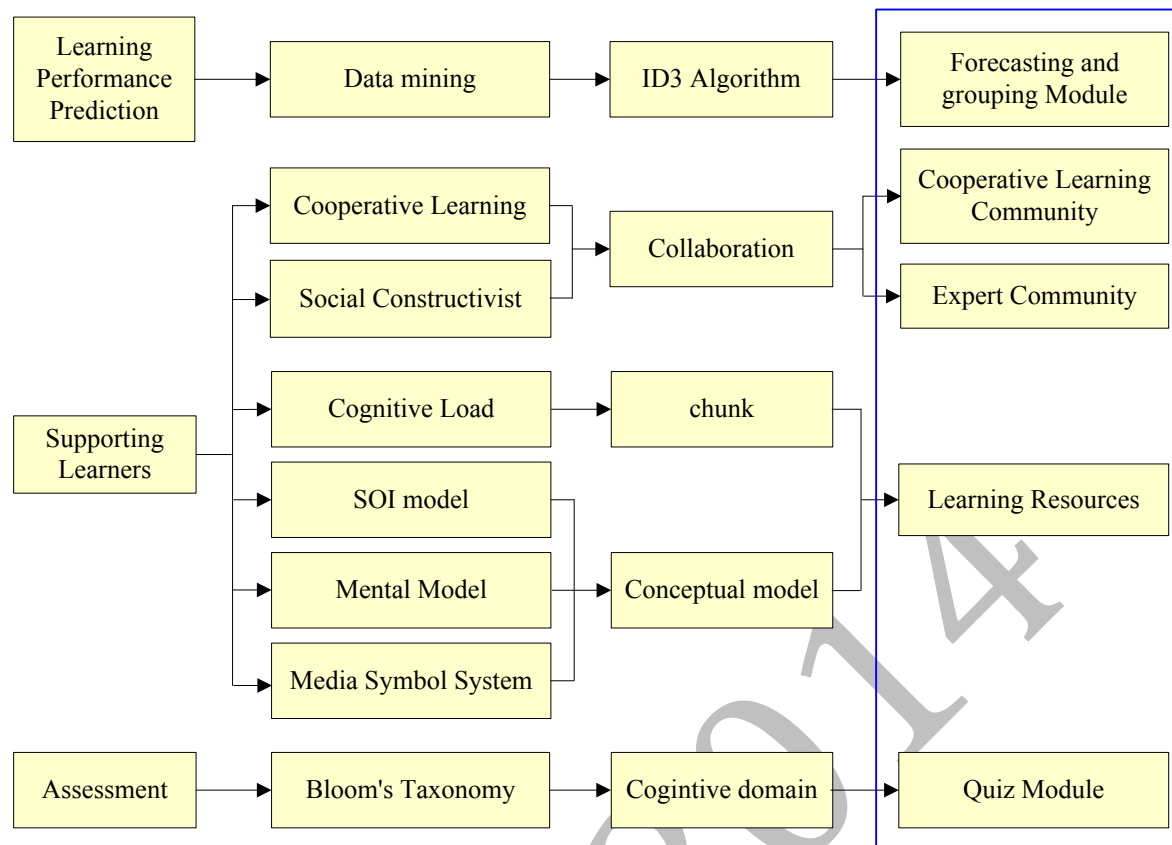

Fig. 1. Learning model framework

From Figure 1, five components in the framework which are the elements of the cooperative learning model have details as follows.

### 1. Forecasting and Grouping module

The prediction of learners' academic performance level in Forecasting and Grouping module is calculated by utilizing ID3 algorithm (Ross Quinlan, 1979), an algorithm in data mining technique, since this algorithm is appropriate for discrete value and the academic performance level can be classified as excellent, good, fair and poor. After forecasting academic performance level, this module will suggest how to group learners; nevertheless instructors can group learners based on the result of the prediction by themselves as well.

### 2. Cooperative Learning Community

Cooperative Learning Community consists of two genres of community that are social network and face-to-face meeting. The social network includes both synchronous and asynchronous communications (Amornsinlaphachai, P., Inpress). Learners of each group in the community comprise weak learners and strong learners predicted by data mining technique. Grouping Learners is based on cooperative learning principles (Slavin, R. E., Learvey, M., et al., 1986, Slavin, R., 1996).

### 3. Expert Community

Similar to Cooperative Learning Community, Expert Community composes of two types of community that are social network and face-to-face meeting. The social network includes both online and offline communications. Thus learners can communicate with instructors through online social networks such as face-book or twitter; besides they can leave messages to one another on a web-board as well.

### 4. Learning Resources

The design of Learning Resources is based on various theories and principles. The elements in the resources are rooted in the design principles of multimedia presentation media symbol system and cognitive load (Sweller, J. and Chandler, P., 1991). The

contents in the resources are selected, organized and integrated (Mayer, R. E., 1996b) to create mental representation (Frederiksen, J., White, B., et al., 1999) since information processing using audio, visual and animation can get more effectiveness than information processing by lecturing.

## 5. Quiz Module

Questions in Quiz module are classified according to the learning level of Bloom's Taxonomy theory. In Bloom's Taxonomy theory (Bloom, B. A., 1956), there are 3 facets of learning behavior that are cognitive domain, affective domain and psychomotor domain; however only cognitive domain will be evaluated by using Quiz module.

## 6.2. The results

The results of evaluating the framework by six experts are exposed as follows. Firstly, the algorithm used to anticipate academic performance level is suitable for data. Secondly, the framework complies with learning principles and theories employed as the foundation for designing the framework. Thirdly, the principles used as the fundamental of synthesizing the framework indicate the appropriateness of media utilizing; moreover the internet technology used in the framework is desirable, renowned and up-to-date. Finally, the learning content is essential for education in the computer field; thus the content is worthwhile to research to enhance learners' competency because computer programming courses are difficult for ungrounded learners; furthermore the content is general standard; hence this study can be used widely. The experts accept the usability of the framework in a high level at 71.15 %. To conclude, designing a learning model based on this framework is practicable and there is high feasibility to improve learners' competency by using the model derived from the framework.

## 7. Summary and Concluding Remarks

The design of the framework is bases on several theories and principles such as data mining technique, multiple intelligence, Bloom's Taxonomy, social constructivist, cooperative learning, cognitive load, mental model, SOI and media symbol system. The framework composes of five elements that are forecasting and grouping module, cooperative learning community, expert community, learning resources and quiz module. The results derived from experts' assessment are revealed that the algorithm used to foresee academic performance level is proper and the framework conforms to learning principles and theories. Moreover the media and technology used in the framework is in vogue and the learning content is worthy to study; furthermore the usability of the framework is accepted in a high level.

For the further work, a learning model based on the framework will be designed and developed. The developed model will be assessed by experts for internal validation (Deejring, K. and Chaijaroen, S., 2012). For external validation, the model will be tested with learners studying in a computer field at NakhonRatchasima Rajabhat University, Thailand (Deejring, K., Inpress). In addition, the developed model will be tested with learners of other institutes to insist upon the generalization of application.

## Abstract

Environmental pollution, which has risen rapidly due to increased production resulting from developments in science and technology, threatens all living beings and natural living spaces at the present time. It is emphasized that people's life styles and approach on environment are responsible for such disruption in the environment. Environmentally-conscious individuals displaying responsible behaviors should be cultivated in order to reduce dangers arising from environmental problems. In this regard, the present study attempted to determine the environmental attitudes of students. The study involved 1003 secondary education students. The New Ecological Paradigm (NEP) Scale was used for determining environmental attitudes. It was found out that the attitudes of students were closer to eco-centric perspective than anthropocentric perspective.

## 1. Introduction

It was realized in the late twentieth century that some widely-accepted rooted values, attitudes, and beliefs were the source of ecological problems. There are psychological, sociological, economic, and technological factors that give shape to the consumption behaviors and life styles of people (i.e. their manners of using the nature for meeting their needs). Values, attitudes, confidence and beliefs felt or adopted in regard to wealth, continuous development, and technological and scientific achievements (i.e. dominant social paradigm) have been described as the reason for little awareness of environmental problems (Dunlap and Van Liere 1978; Catton and Dunlap 1980; Trobe and Acott 2000). There is a shift from the dominant social paradigm, which is influential on defining the relationship between human and nature, to a more eco-centric paradigm in the individual or social interpretation of the nature within the system of all these values, beliefs, and attitudes (Dunlap and Van Liere 1978; Albrecht, Bultena, Hoiberg and Nowak 1982).

One of the scales developed for determining environmental approach is the New Ecological Paradigm Scale developed by Dunlap and Van Liere. Dunlap and Van Liere (1978) put forward the new ecological paradigm against the dominant social paradigm, which they defined as 'anti-ecological', and developed the above-mentioned scale in order to determine the degree to what such new paradigm was accepted. It was accepted to be a one-dimensional scale composed of 12 items. On the other hand, Furman (1998) described the dimensions of the same scale as 'balance of nature', 'limits of growth', and 'human over nature', and Taşkın (2009), similarly, put forward a three-factor structure for the scale ('steady-state economy', 'human exemptionalism paradigm', and 'limits of growth and balance of nature'). In the course of time, The New Ecological Paradigm Scale was revised to involve the change in environmental problems. Since global environmental problems came to the forefront more, two more dimensions were added to the original scale theoretically, thereby leading to a 15-item new form.

The degree to what such change of paradigm is achieved (determined in the Western communities) in the Turkish society should be investigated. This is because; vigorous efforts for growth, industrialization, and enrichment in Turkey, which is a developing country, may cause ignoring environmental problems. This study focused on investigating the degree to what secondary education students accepted the new eco-centric paradigm. In this regard, the primary goal of the study was to determine the environmental attitudes of secondary education students and to predict the degree to what the change in environmental approach, whose effect is felt throughout the entire world, was reflected in students. The secondary purpose of the study was to examine the factor structure of The New Ecological Paradigm Scale used as a one-dimensional scale.

## 2. Method

### 2.1. Study group

The study group consisted of 1003 students from all grades of secondary education. These students lived in Ankara, and their average age was 16. 55% of these students were male. While 57% of the students attended a vocational high school, the rest of them received education in an Anatolian high school. The students participated in the study on a voluntary basis. The study was carried out in the 2013-14 academic year.

### 2.2. Measurement and analysis

The 15-item revised form of the New Ecological Paradigm Scale was used as a measurement tool in the current study. The degree to what the new ecological paradigm was accepted was evaluated based on the percentage distribution of the answers given to each item and the average score. In addition, the Cronbach's alpha internal consistency coefficient of the scale was calculated.

The items were rated as follows; 1: I strongly disagree, 2: I don't agree, 3: I am unsure, 4: I agree 5: I definitely agree. While the items of odd numbers in the scale included opinions in favor of the new ecological paradigm (NEP), the items of even numbers involved those in favor of the dominant social paradigm (DSP). Thus, the above-mentioned rating was reversed for all statistical procedures except for percentage calculation in the items of even numbers.

## 3. Findings

Table 1 presents the evaluations of the participants regarding each item based on percentage (%) distribution and averages.

Table 1. Percentage and mean distribution of the NEP scale items

Items-Do you agree or disagree that	SD	D	U	A	SA	M
1. We are approaching the limit of the number of people the earth can support	12.0	14.1	29.8	22.8	21.3	3.28

control it

15. If things continue on their present course, we will soon experience a major ecological catastrophe	7.1	5.6	18.0	25.4	43.9	3.93
--	-----	-----	------	------	------	------

---

Cronbach's Alpha: 0.60						3.38
------------------------	--	--	--	--	--	------

---

SD: Strongly disagree, D: Disagree, U: Unsure, A: Agree SA: Strongly agree

The average score of the students participating in the study regarding their level of accepting the new ecological paradigm was found to be 3.38.

According to the table 1, the evaluation of many items contained 'unsure' by over 25%. Most of the items involving 'unsure' answers were those about the dominant social paradigm standing against the new ecological paradigm.

*Anti-exemptionalism*: It is one of the theoretical sub-dimensions covering the items 9, 4, and 14 of the New Ecological Paradigm Scale. It is based on the idea that the people who accept the New Ecological Paradigm are supposed to reject that human being is exempt from nature and the laws of nature. In the present study, the averages of the items included in this sub-dimension varied between 2.77 and 3.40, and most of the answers in this matter contained indecisiveness.

*Anti-anthropocentrism*: It is the theoretical sub-dimension involving the view that nature exists for meeting the needs of human beings in the first place (items 2 and 12) as well as the view rejecting it (item 7). In the present study, the most accepted item was found to be 'plants and animals have as much right as humans to exist' (M= 4.11). According to the examination of the student answers to the items 2 and 12, although more than half of the students delivered opinions against anthropocentrism, anthropocentrism was supported by 25% in the item 2, and by 28% in the item 12.

*Limits to growth*: The New Ecological Paradigm suggests that growth and development have a limit, which is based on the limitedness of the resources in the world. In line with this view, the item 1 puts an emphasis on population increase, and the item 11 highlights the limitedness of resources via an analogy likening the world to a spaceship. The item 6, which is based on this theoretical background, stands as a negative item suggesting that the world has plenty of resources. 30% and 33% of the participants said 'unsure' for the item 1 and the item 11 respectively. On the other hand, while almost half of the students agreed that population increase was about to exceed the capacity of the world, fewer students agreed with the world-spaceship analogy based on limited resources. In parallel with that, 68% of the students agreed, 'the earth has plenty of natural resources if we just learn how to develop them'.

*Balance of nature*: NEP claims the existence of a balance that can be disrupted by human beings. The items 3, 13, and 8 of the scale are about the theoretical sub-dimension of balance of nature. While 67% of the students agreed with the item 3 suggesting, 'When humans interfere with nature, it often produces disastrous consequences', 60% of the students agreed with the item 13 stating, 'The balance of nature is very delicate and easily upset'. On the other hand, while 32% of the students rejected, 'The balance of nature is strong enough to cope with the impacts of modern industrial nations' (a dominant social paradigm perspective), a considerable number of the students (30%) were unsure about it.

*Eco-crisis*: NEP argues that human intervention in nature may lead to negative results at a disaster level that might be described as an eco-crisis. The items 5, 10, and 15 of the scale are about the theoretical background of eco-crisis. 41% of the students strongly agreed with the item 5, 'Humans are severely abusing the environment' while 26% of the students agreed with it. 48% of the students rejected the idea, 'The so-called 'ecological crisis' facing humankind has been greatly exaggerated'. Likewise, 44% of the students strongly agreed with the item 15, 'If things continue on their present course, we will soon experience a major ecological catastrophe' while 25% of them agreed with it.

### 3. 1. Dimensionality of NEP-scale

Although the revised New Ecological Paradigm Scale was designed to be a five-dimensional scale, Dunlap et al (2000) stated that it might be considered one-dimensional as it had a high Cronbach's alpha value and a strong item total correlation. However, no high Cronbach's alpha value and no strong item total correlation were obtained in the present study conducted on Turkish population. Thus, the data set obtained from the scale was analyzed via the principal component analysis factor extraction method, and a Varimax rotation was applied. Through the analysis, a four-factor structure which explained 54% of the variance and where eigen values varied between 3.30 and 1.08 was obtained. However, the items were not distributed among the factors in accordance with the theoretical structure, and only one item was included in the fourth factor. Therefore, the scale was

considered to have a two-factor structure (one factor comprising of items in favor of NEP and one factor composed of items in favor of DSP against NEP). To determine the distribution of the items among factors, exploratory factor analysis was repeated to produce a two-factor structure. The two-factor structure explained 40% of the variance. The eigen values varied between 3.30 and 2.72. Table 2 shows the factor loadings and distribution of the items.

Table 2. The Factor Loading Distribution of the Items of the New Ecological Paradigm Scale

Items	NEP	DSP
7. Plants and animals have as much right as humans to exist	<b>0.720</b>	0.069
15. If things continue on their present course, we will soon experience a major ecological catastrophe	<b>0.697</b>	0.079
3. When humans interfere with nature, it often produces disastrous consequences	<b>0.678</b>	0.003
13. The balance of nature is very delicate and easily upset	<b>0.613</b>	-0.043
5. Humans are severely abusing the environment	<b>0.572</b>	0.081
1. We are approaching the limit of the number of people the earth can support	<b>0.569</b>	-0.053
9. Despite our special abilities, humans are still subject to the laws of nature	<b>0.530</b>	-0.259
2. Humans have the right to modify the natural environment to suit their needs	0.032	<b>0.701</b>
10. The so-called "ecological crisis" facing humankind has been greatly exaggerated	0.063	<b>0.698</b>
12. Humans were meant to rule over the rest of nature	0.125	<b>0.689</b>
4. Human ingenuity will insure that we do NOT make the earth unlivable	0.085	<b>0.682</b>
8. The balance of nature is strong enough to cope with the impacts of modern industrial nations	-0.183	<b>0.611</b>
14. Humans will eventually learn enough about how nature works to be able to control it	-0.170	<b>0.546</b>
Cronbach's Alpha:		0.75
M:		3.72
		0.74
		3.25

Since the loadings of the items 6 and 11 were not found to be as expected in the first exploratory factor analysis, both of these items were removed. Then the exploratory factor analysis was repeated, and it was seen that the items of odd numbers in the scale were distributed to support the new ecological paradigm while the items of the even numbers were distributed to support DSP against NEP. It was found out that the Cronbach's alpha values of two sub-scales (NEP and DSP) were higher than the internal consistency coefficients obtained in the one-dimension structure of the scale.

#### 4. Discussion and Conclusion

This study aimed at determining the environmental attitudes of the students within the framework of the new ecological paradigm. To this end, the students' levels of agreeing with each item were evaluated based on percentages and average scores through the theoretical sub-dimensions of The New Ecological Paradigm (NEP) scale. It was determined that more than half of the students agreed with the items in favor of the new ecological paradigm. Especially the average scores related to the items included in the dimension of the new ecological paradigm (NEP) determined through factor analysis demonstrated that the students agreed with such items in favor of nature. On the other hand, the items in favor of the dominant social paradigm (DSP) were neither accepted nor rejected by the students. In other words, there was indecisiveness about the dominant social paradigm among the students. Similarly, Erdogan (2009) carried out a study on university students by using The New Ecological Paradigm (NEP) Scale, and found out that while the new ecological paradigm items were supported, the dominant social paradigm (DSP) items were rejected. Thapa (2001) reported similar results, too.

The item 6 of the scale (The earth has plenty of natural resources if we just learn how to develop them) was the most-accepted item in favor of the dominant social paradigm. It was removed from the scale as it was found not to have the requested factor loading during factor analysis. Similarly, Taskin (2009) removed the item 6 from factor analysis. Erdogan (2009) argued that the

items 1, 6, and 11 were not determinative for Turkish culture, and thus suggested revising or removing them. In this study, the items 11 and 6 were removed because they did not have appropriate factor loadings. Although the dimensionality (i.e. one-dimension or two-dimension) of The New Ecological Paradigm Scale seems to be controversial, it is accepted, based on a high internal consistency coefficient and a strong item total correlation, that all items express a particular attitude system (Dunlap et al. 2000). However, the results of the present study and Erdogan (2009) make it difficult to consider the scale a one-dimensional scale because it does not yield high internal consistency coefficient in the case of samples from the Turkish society and some items are problematic. Therefore, it is thought that the scale should have a two-dimensional structure (dimensions named New Ecological Paradigm and Dominant Social Paradigm). In this way, two sub-scales having much stronger internal consistency coefficients may provide a more accurate measurement of the perspective (i.e. new ecological paradigm or dominant social paradigm) to which environmental attitudes are closer.

# The development of an activity-based learning model using educational mobile application to enhance discipline of elementary school students

Sasitorn Lijanporn<sup>a</sup>, Jintavee Khlaisang<sup>b\*</sup>

<sup>ab</sup> Department of Educational Technology and Communications, Faculty of Education,  
Chulalongkorn University, Bangkok 10330, Thailand

## Abstract

The purpose of this research is to develop the activity-based learning model using educational mobile application to enhance discipline of elementary school students. The model was developed based on the review of literature and the experts' interview. Then, it was tested by 30 elementary school students, followed by the approval from the experts. Data analysis indicated that there was statistical difference between pre and post test scores at .05 level of significant. The results of this study showed that the model should consist of five components along with the four steps as detailed in the article.

## 1. Introduction

A study of the moral problems of children and youth need to be revised and developed rapidly. Research has found promoting moral effective. Case Study of Children and Youth Department of Religious Affairs Ministry of Culture Thailand. Search found that before and after the development of moral discipline, with an average minimum. The teaching and instilling moral past, especially in the elementary grades is unsuccessful, as the lectures that focus on rote learning make to the students was not interested in boring lessons. The moral teaching methods a successful, should be used activities was proposed by Jitradab (1987), so that the moral content easy to understand and the students participate in the learning process. Activity-Based Learning is a practical experience method to learners for students analyze and learn from the activity (Learning by doing). In addition, Activity-Based Learning can also be

integrated with the use of Mobile devices with an educational application in Mobile devices are learning that stimulates the students to analyze. In applications consist of Learning Object (LO) and Animation Cartoon. Learning Object (LO) helps learners understand and have the opportunity to choose and decide the sequence of presentation of content and promotes the learning (IPST, 2010). Animation Cartoon can explain complex and difficult to understand so much easier, stimulate the interest of the learners to become more moral lesson, and can be used as an explanation or teaching activities (Laowansiri, 1989).

A study of the problems and related research found, using an educational application consist of Learning Object (LO) and Animation Cartoon are suitable to be used with Activity-Based Learning, using Mobile devices are the tools used in the activities promote to students to practice real action. The researchers are interested in development of an activity-based learning model using educational mobile application to enhance discipline of elementary school students

## 2. Methodology

This research is divided into 3 phases which are (1) Develop an activity-based learning model using educational mobile application to enhance discipline of elementary school students, (2) Try out an activity-based learning model using educational mobile application to enhance discipline of elementary school students, and (3) Propose activity-based learning model using educational mobile application to enhance discipline of elementary school students.

*2.1 Phase 1: Develop an activity-based learning model using educational mobile application to enhance discipline of elementary school students.*

The study in this phase includes the study of theories and research on the Activity-Based Learning (ABL), Educational Mobile Application, Discipline, to be used as guidelines in determining learning processes and components of the model. The model will be designed after the reviewing of document, then an interview will be conducted to get an opinion towards the model from eight experts.

## 2.2 Phase 2: Try out an activity-based learning model using educational mobile application to enhance discipline of elementary school students.

The subjects in model experiment were 30 students from the elementary school students. The research instruments consisted of educational application, and a lesson plan. The data gathering instruments consisted of disciplinary situation test, behavioral self-assessment forms, an observation form, and student's satisfaction towards the model test questionnaire. The data were analyzed using mean, standard deviation, and t-test dependent.

## 2.3 Phase 3: Propose activity-based learning model using educational mobile application to enhance discipline of elementary school students

In this phase is the result of a study of the use of the model, then improve and proposed will be conducted to get the certification of the model from five experts.

## 3. Results

### 3.1 Phase 1: Results of the develop an activity-based learning model using educational mobile application to enhance discipline of elementary school students.

From the study on the related document, it was found that the Activity-Based Learning (ABL) has four main activities (Warotamawit, 1987; Kammanee, 2002; Maneengam, 2004; NCSALL, 2006; Lakshmi, 2007; Lualamai, 2009) and the experts were asked to criticize Activity-Based Learning (ABL) learning process to use for the model. The results indicated that the learning process of the model consisted of four steps as follows:

- 1) *Motivation and experience*: Stimulate the interest of the learners before the lesson by watching Animation Cartoon
- 2) *Knowledge and practice*: The students study from Learning Objects (LO) and work together as organized activities.
- 3) *Feedback*: The students analyze situations and things incurred while attending the activities and present their work from a mobile device.
- 4) *Evaluation*: The students do behavioral self-assessment forms after the learning activities.

From the study on the related document and opinion of the expert, found that the component of the model consisted of five components as follow:

- 1) *Instructional media for educational mobile application*: Teaching materials are presented in the form of Animation Cartoon and Learning Objects (LO) to educate and stimulate the interest of the learners.
- 2) *Learning activities*: The learning activities provide students the practical using of mobile devices as a tool for the activity and presentation of group work.
- 3) *Communications*: The discussion between learners and the group activities together. The communication between the learners has two forms: (1) Synchronous Discussions and (2) Asynchronous Discussions using mobile devices as a tool for the activity.
- 4) *Mobile devices*: Used to support the teaching learning activities, communications, and evaluation.
- 5) *Evaluation*: An evaluation by the students after the learning activities using behavioral self-assessment forms and evaluation by the instructor during the learning activities using observation form.

### 3.2 Phase 2: Results to try out an activity-based learning model using educational mobile application to enhance discipline of elementary school students.

The discipline of elementary school students scores of the data were analyzed using mean, standard deviation, and t-test dependent, were summarized in Table 1.

**Table 1:** The discipline of elementary school students scores of the data were analyzed using mean, standard deviation, and t-test dependent.

The discipline of elementary	scores	Mean ( $\bar{X}$ )	standard deviation (S.D.)	t	Sig.
------------------------------	--------	--------------------	---------------------------	---	------

school students scores					
Pre-test	20	15.80	1.648	11.799	000.*
Post-test	20	18.63	1.217		

\*\* p < .05

From Table 1, the experimental result indicated that the subjects had disciplinary post-test mean scores higher than pre-test mean scores at .05 level of significance.

### 3.3 Phase 3: Results to Propose activity-based learning model using educational mobile application to enhance discipline of elementary school students

The evaluation scores of the proposed and certified model from five experts, were summarized in table 2.

**Table 2:** Experts' evaluation scores of the proposed and certified model

	Mean ( $\bar{X}$ )	Interpretation
<b>Introduction</b>		
1. Principle and Reason	4.60	Most Suitable
2. Objectives of the model of learning	4.80	Most Suitable
<b>Model and Description</b>		
3. The diagram shows the model of learning	4.40	Very Suitable

5.2 Knowledge and practice	4.80	Most Suitable
5.3 Feedback	4.60	Most Suitable
5.4 Evaluation	4.60	Most Suitable
6. The model of learning are suitable for adoption to enhance discipline of elementary school students.	4.40	Very Suitable
7. Overview the model of learning are suitable for adoption to practice in real life situations.	4.60	Most Suitable
<b>Total</b>	<b>4.57</b>	<b>Most Suitable</b>

Note: 4.5 - 5.0 = Most Suitable, 3.5 - 4.49 = Very Suitable, 2.5 - 3.49 = Suitable, 1.5 - 2.49 = Less Suitable, 1.0 - 1.49 = Not Suitable

From Table 2, the proposed and certified model from five experts score was at a "Most Suitable" level, which indicated that most of the experts strongly agreed with using educational mobile application and Activity-Based Learning to enhance discipline of elementary school students, and the experts believed this proposed model can be used in a real context. The illustration of the proposed model is shown in Appendix A.

## Abstract

An increasing number of applications that use virtual reality technology have appeared in the classroom recently. Augmented reality (AR) uses humanized and interactive operations to allow students to learn from a total immersion experience. The market for keyboard- and mouse-based gaming is gradually being replaced by real-time interactive and sensory games. The application of AR technology can be seen in a variety of areas such as news, travel, sports, and commercials in which tangible and exciting experiences occur. Educators and technical developers are beginning to exploit the capabilities of AR technologies to enable new forms of learning in various fields. AR uses virtual objects that simulate a real environment and, if it can integrate image recognition and detection technology, its influence in gaming and education could be powerful. This study develops an AR system and tries to determine its advantage and drawbacks.

## Introduction

In recent years, digital learning has focused mainly on building teaching and learning platforms and on providing support for employing and integrating learning systems. Many learning environments have attempted to integrate content and technology, to build appropriate learning content, and to provide collaborative, interactive, and communicative learning activities to enhance learner creativity and learning effectiveness.

Augmented reality (AR) provides the opportunity for users to interact with computer-generated content from the real world. The application of AR technology can be seen in a variety of areas, such as news, travel, sports, and commercials, in which tangible and exciting experiences are created. Educators and technical developers also exploit the capabilities of AR technologies to enable new forms of learning in various subjects (Dunser & Hornecker, 2007; Kondo, 2006; Liu, et al, 2007).

Malone & Lepper (1987) demonstrated that games can increase motivation and are therefore an essential feature of the lives of children and teenagers. Many educators include games in learning settings and have transferred learner involvement and energy from games to educational activities. Through instructional games, learners develop higher-order cognitive skills (Sandford & Williamson, 2005).

This study constructed an AR game-based learning system for elementary science education. The learning content concerns the marine life food chain. The purpose of the study is to examine the effectiveness of the system to facilitate learning motivation, teamwork skills, and learning achievement.

## Learning System

This study used ARToolKit, Visual Studio C<sup>++</sup>, 3D Max, and Adobe Illustrator to develop the learning system and content. The interface of the learning system was presented as a book containing two game pages, specifically a fishing page and a food-chain page. Learners need to complete the tasks in the first page before proceeding to the next page. The setup of the system is displayed in Figure 1.

Fig. 1. The learning system

### Markers and Models

The game contains four types of interactive markers: status, bait, switch, and select. The “status” marker identifies the current action. The “bait” marker displays the ocean species. The “switch” marker works with the “bait” marker to display various kinds of baits in a certain area. Finally, the “select” maker is used to select a fish. Figure 2 shows five food chain markers which require learners to put the correct sequence, and four location markers that were used to calculate the position of each marker in the AR matrix. Table 1 displays system markers and their related models.

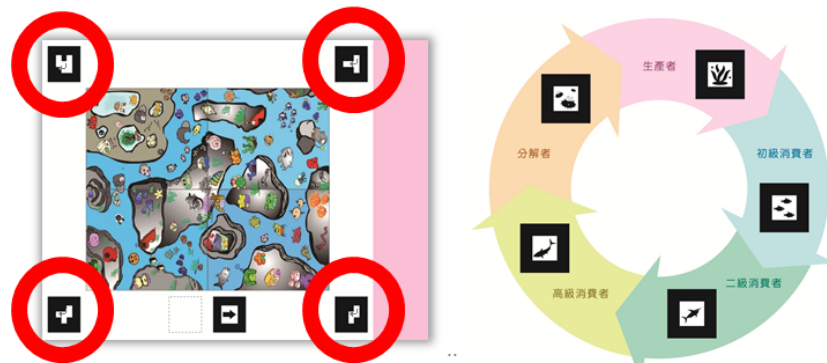

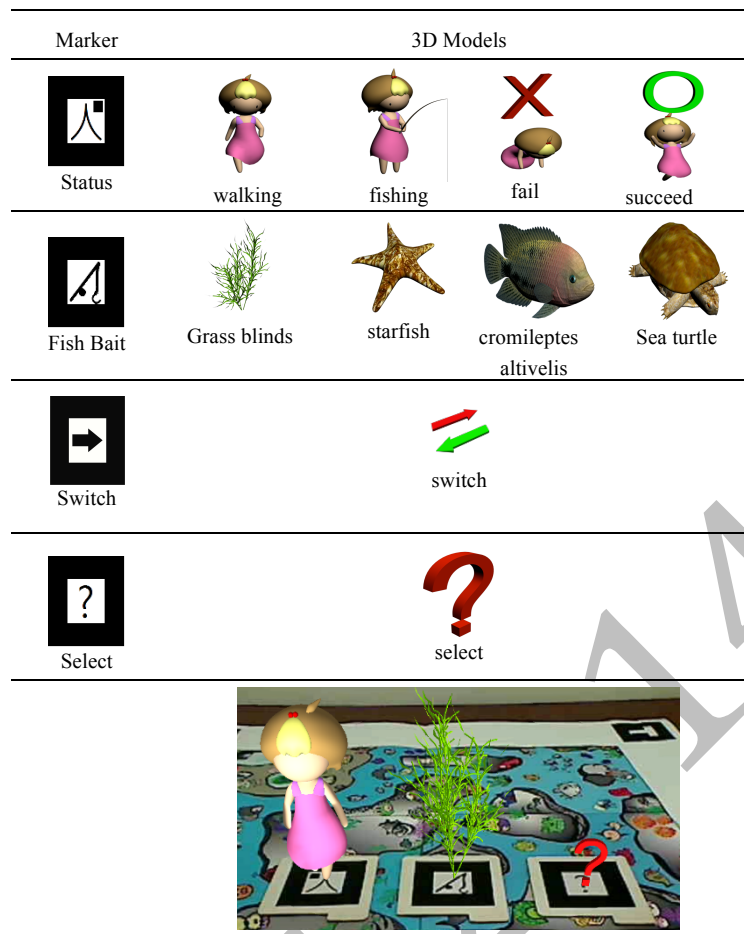

Fig. 2. Location and food chain makers

Table 1. Interactive markers and models

### Game procedures and system interface

The purpose of the game is for learners to explore fishing areas to find appropriate baits for certain fish, and to collect enough ocean species to form as many food chains as possible. The fishing page has six fishing areas; each one contains several ocean species from the food-chain categories including the manufacturer, primary consumer, secondary consumer, and tertiary consumer. The information of each ocean species will be presented when learners use the correct markers.

In the beginning of the game, the system provides four ocean species as the basic baits will appear in the upper left corner of the screen. When learners put the “bait” marker in the dotted area at the bottom of the fishing page, the information related to that bait will present at the bottom of the screen, and the “switch” marker serves as a menu button to swab among baits. Learners can place the “status” marker in any spot on the fishing page, if the marker is not on the fishing area, the system displays the “walking” model; if the marker is in the correct location, the system shows the “fishing” model and all the fish in that area. To find the facts of a fish, the learner need to place the “select” marker near that fish model; and information of that fish will then appear at the top of the screen.

Learners must place a “bait” marker near the “status” marker to capture a certain fish. If the bait is correct, the system will show the “succeed” model; otherwise it displays the “fail” model. If a fish belongs to the lower level of the food chain, the system will add it to the bait database. The process by which a food chain is formed is similar to catching a fish. Learners must place the correct bait marker in the right level of the food chain. The system interface can be seen in Figure 3.

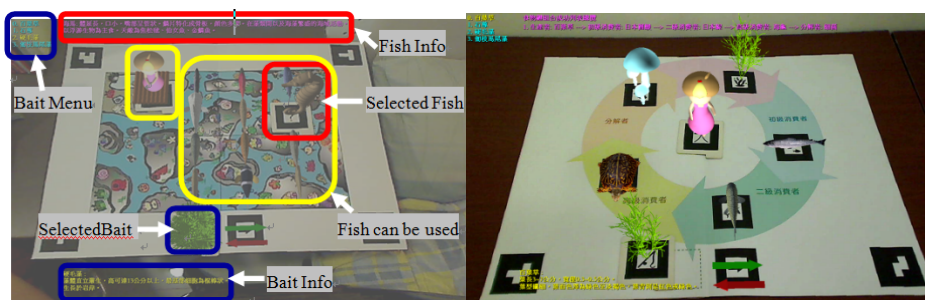

Fig. 3. Game interface

## System Evaluation

### *Evaluation of interface and functions*

Ten college students participated in five consecutive pilot tests, wherein pairs of students worked together to evaluate the interface and functions of the gaming system. For each pilot test, the researcher asked the pair to fill out a questionnaire, discussed with them regarding their responses, and revised the interface and functions of the system before the next pair of students was tested.

### *Evaluation of system usability and stability*

After the pilot study, the system was modified based on suggestions from the students. Ten students then participated in the second phase of the program evaluation, with two members forming each group. A short questionnaire and interview were conducted after the activity. The students provided positive feedback about the system and various suggestions to improve the game-play.

## Conclusion

This paper focused on the design and use of technology of an AR game-based learning system. The system is nearly finished. The results of the pilot system evaluation revealed that students are considerably interested in the system. However, despite the expressed satisfaction of participants, the system interface and learning activities need to be modified before a complete evaluation of the system is conducted.

# The development of college instructors' technological pedagogical and content knowledge

Nimer Baya'a<sup>a</sup>, Wajeeh Daher<sup>a,b</sup>

<sup>a</sup>Al-Qasemi Academic College of Education, P.O. Box 124, Baqa, 30100, Israel

<sup>b</sup>An-Najah National University, P.O. Box 7, Nablus, Palestine

## Abstract

The ministry of education is launching an overall project to implement the use of ICT in the Israeli higher education institutes, as well as in the elementary through high schools. In the 2011-2012 academic year. Al-Qasemi Academic College of Education was chosen to receive support from the ministry of education to participate in this project. The project goals are to facilitate the ICT integration into teaching on all its aspects; i.e. facilities and instructors. The goal of the research was to accompany the implementation of the college plan and intervention, especially the steps which the college carried out regarding the instructors' preparation and support, with a research that primarily examines the development of the instructors' TPACK (technological, pedagogical, and content knowledge) and its various components, in addition to the instructors' attitudes toward computers and instructors' ICT proficiency. For this purpose we translated to Arabic and modified existing questionnaires developed by the MOFET institute and by previous researches.

The findings of the research indicate that instructors and pedagogical supervisors in Al-Qasemi Academic College of Education had relatively high positive attitudes toward computers before the college intervention. These attitudes did not change significantly after the intervention. The instructors' ICT proficiency improved significantly after the college intervention especially as a result of three components of this intervention: ICT center support, participation in workshop and availability of assistants. The TPACK level of the instructors and the pedagogical supervisors, improved after the college intervention. Another major change occurred in the number of pedagogical initiatives that involve special use of ICT in teaching proposed by the pedagogical supervisors, going up from only one before the college plan to at least six initiatives this year. Moreover, the number of WBLE (web based learning environments) constructed by the pedagogical supervisors and presenting ICT based learning units that they developed by themselves or with their students in the practical training increased from only two at the beginning of the college intervention to over thirty toward the end.

Peer-review under responsibility of the Sakarya University.

**Keywords:** TPACK; teachers' knowledge; college instructors; ICT in teaching; ICT in learning; TAC; teachers' attitudes

## 1. Introduction

### 1.1 TPACK

Shulman (1986, 1987) suggested the PCK (pedagogical content knowledge) model to represent the interaction of two types of teachers' knowledge: content knowledge and pedagogical knowledge. He proposed considering this interaction in order to understand teachers' expertise in teaching a subject matter. Various researchers (for example Koehler and Mishra, 2009; Niess et al., 2009), built on Shulman's PCK to describe the interaction of teachers' understanding of educational technologies with their PCK to produce effective teaching with technology. Specifically they talked about the technological pedagogical and content knowledge of teachers (TPACK), where the TPACK model is presented in the three and knowledge, the TPK

In this paper, we will describe the development of the Al-Qasemi Academic College of Education, as a result of the initiative to influence the educational processes in the college more ICT elements.

"The TPACK framework articulates the role of technology process of teaching and learning in a truly integrated manner"

TPACK of college's to include

in the (Abbitt,

2011, p. 283). Generally speaking, TPACK is the knowledge of how to integrate technology in teaching the subject matter. This knowledge also includes the appropriation between a specific technological tool and the teaching of a specific topic in the subject matter and being aware of the difference between using various technological tools in teaching a specific topic in the subject matter. Further, this knowledge means being aware of students' problems of the subject matter that could be overcome by using specific technological tools. On the other side, it means the awareness of students' problems of the subject matter that could result from using specific technological tools, in addition to how to overcome these problems (Koehler & Mishra, 2008).

Niess (2005) mentions the following themes, adapted from Grossman's four components of PCK, as components of TPACK, when talking about mathematics as a subject matter: (1) An overarching conception about the purposes for incorporating technology in teaching mathematics; (2) Knowledge of students' understandings, thinking, and learning of mathematics with technology; (3) Knowledge of curriculum and curricular materials that integrate technology in learning and teaching mathematics; and (4) Knowledge of instructional strategies and representations for teaching and learning mathematics with technologies. These themes could be incorporated easily as themes of TPACK related to any other subject matter.

### *1.2 Instructors' attitudes toward computers*

Al-Zaidiyeen, Mei and Fook (2010) surveyed the various definitions of 'attitudes' as used by previous researchers, for example, Allport (1935) defined the attitude construct as "a mental and neural state of readiness, organized through experience, exerting a directive or dynamic influence upon the individual's response to all objects and situations with which it is related" (p.810). Fishbein (1967) defined attitude as "a learned predisposition to respond to an object or class of objects in a consistently favorable or unfavorable way" (p. 477). Other researchers (for example Zan & Di Martino, 2007) defined attitude in a simpler way: as a positive or negative emotional reaction toward a specific situation. These definitions show the possible influence of attitudes on behavior in general and instructors' behavior in particular. Thus researchers have been paying attention to this influence for decades, especially in the last two decades when the computer and ICT started to emerge as a possible tool for the improvement of teaching and learning.

Researchers' effort in verifying the relation between the instructors' attitudes toward computers and ICT and their use of these tools showed that instructors' attitudes toward the use of ICT in teaching and learning have major influence on the success and meaningful use of the computer and ICT in their teaching (Albirini, 2006; Al-Zaidiyeen, Mei & Fook, 2010; Baylor & Ritchie, 2002). Albirini (2006), for example, considers teachers' attitudes a major predictor of their use of new technologies in educational settings, while Al-Zaidiyeen, Mei and Fook (2010) say that teachers' attitudes toward ICT can play an important role in their acceptance and actual use of ICT tools.

In our research too, attention was given to instructors' attitude toward computers and ICT use, together with the development of their TPACK and ICT proficiency, as a consequence of participating in workshops and of the administrative emphasis on the use of ICT in teaching. Here we used teacher's attitude toward computers' questionnaire (TAC) because it implies teachers' attitudes toward the use of ICT in teaching and their intentions to do so (Baya'a & Daher, 2013). We were also interested in instructors' proficiency level in ICT as an indicator of their intention to use ICT in their teaching as the proficiency variable is reported to affect teachers' readiness to use the ICT in their teaching (Granger, Morbey, Owston & Wideman, 2002; *ibid*).

Regarding the instructor's type of work, it is expected that pedagogical supervisors would be more attendant to ICT use in schools than discipline lecturers. The goals for that are: (1) Pedagogic supervisors prepare the pre-service teachers as teachers in schools and not as regular students, (2) they are aware of the ministry of education intent and requirement to make ICT use a daily scene in the classrooms, so will probably work toward achieving this goal as teachers' educators.

## **2. Research rationale and goals**

The main research goal is to examine the consequences of implementing a college plan to advance the use of ICT in college instructors' teaching. So the research will concentrate on examining the development of college instructors' attitudes toward computers, the instructors' ICT proficiency and the instructors' TPACK, as a result of implementing the college plan. This study will enrich the research on college instructors' attitudes toward the ICT and on college instructors' TPACK. What distinguishes this study is its examination of the relationship of the implementation of a college plan, which includes: college policy, college infrastructure, ICT technical and pedagogical support, participation in workshops and the availability of assistants, with college instructors' TPACK development, their ICT proficiency and attitudes toward ICT.

The results of the study are expected to guide college instructors, researchers, college administrators, and professional development consultants regarding college instructors' professional development in ICT use, and regarding how to motivate college instructors to actually use ICT in their teaching.

### 3. The research questions

The main research question is: How the college intervention (college policy, college infrastructure, ICT center support, participation in workshop, and availability of assistants) will affect the instructors' attitudes toward computers, the instructors' ICT proficiency and the instructors' TPACK level? Three sub-questions are derived, as follows:

1. Will the college intervention improve the instructors' attitudes toward computers?
2. Will the college intervention improve the instructors' ICT proficiency?
3. Will the college intervention improve the instructors' TPACK level?

### 4. Research context, participants and procedure

Al-Qasemi Academic College of Education has set a three years plan to get college instructors ready to grasp and apply 21st century skills into their teaching processes. These instructors are expected to be ready, in three years, to lead the college into the 21st century education where ICT use becomes an integral part of the teaching and learning environment. This plan was approved and partially budgeted by the department of education.

Since the early years of the third millennium the college has been trying to implement modern technologies in the learning/teaching processes. Successful experiences and projects were reached and implemented, but did not extend to become a standard and a norm in the college teaching environment. Recently, about 10% of the college instructors constructed and used courses sites and integrated ICT in their teaching processes. This rate did not change since three years, in which there was a feeling of status quo regarding integrating ICT in education. The approved plan for preparing the college for the 21st century education opens an opportunity to boost up the expected change.

The college technological infrastructure was developed and improved continuously in the last decade; computers, projectors, internet access in most of the classrooms, college web sites, and LMS (Learning Management System) were acquired and installed in the college campus. In addition, an ICT center was established to provide technical and pedagogical support to assure proper use of the available technologies.

In order to implement the new plan, the college deployed intervention steps which included:

1. College policy: since the first year of implementing the plan, the college's administration required all instructors to enhance the use of ICT in their teaching, and college administrators stated this policy in all official meetings and occasions.
2. College infrastructure: special budget was directed toward improving the college technological infrastructure; all classes were equipped with appropriate and updated hardware and software (at least, a computer connected to over-head projector) and put up a wireless internet platform to provide fast and efficient communication from any point in the college campus.
3. ICT center support: to develop the instructors professionally in the field of using ICT in teaching, the college expanded the ICT center support staff in order to provide wider group and individual support in technical and pedagogical issues.
4. Participation in workshop: the ICT center arranged several workshops for the instructors and the pedagogical supervisors in the college. All the instructors and pedagogical supervisors who worked more than one third position (approximately 115 all together) were invited to participate in one of these workshops through the three academic years of implementing the college plan. 17 pedagogical supervisors and 13 instructors participated in two separate workshops in the college in the first year, while 6 pedagogical supervisors and 7 instructors participated together in the same workshop in the following year. 11 pedagogical supervisors of the 17 who participated in the first year introductory workshop participated also in an advanced workshop in the second year. In the introductory workshop the focus was on introducing the instructors to the various possibilities of using ICT in education and presenting examples of such uses, while in the advanced workshop the focus was on assisting the pedagogical supervisors in developing learning materials from various technological pedagogical models. In this workshop they developed ICT based lessons, constructed web-based learning environments (WBLE) (see the description of WBLE for example in Baya'a, Mia'ari & Baya'a, 2009), presenting in these environments ICT based learning units that they developed by themselves or with their students in the practical training. In total we had approximately 40 participants in the introductory workshops and 11 in the advanced one. These participants were the sample of our research. It is important to note that the college continues to offer these workshops for the instructors and pedagogical supervisors.
5. The availability of assistants: in addition to acting as role model for their students in using ICT in teaching, as any other instructor in the college, pedagogical supervisors are also required to train their students in implementing the use of ICT through the practical training in schools. They also are expected to help their students develop teaching materials that involve various ICT pedagogical models that suit their content field; that is developing their TPACK level. Therefore, special intervention was directed to the pedagogical supervisors, where each one of them, who participates in a workshop, gets from the ICT center an escort of a professional assistant in the field of web-based learning environments.

The current research followed the implementation of the plan and the college intervention through the first two years, including the administration of questionnaires to measure the advancement of the TPACK levels and attitudes toward computers of the instructors who participate in the workshops, as well as their ICT proficiency. Only 19 of the 40 participants in the

introductory workshops completed the questionnaires twice (at the beginning and the end of the workshop) and 4 out of the 11 participants in the advanced one. Therefore, we concentrated our data analysis on the paired sample of the 19 participants of the introductory workshop.

## 5. Research instruments

The research instruments include three questionnaires as follows:

1. Technological, Pedagogical, and Content Knowledge (TPACK) – revised questionnaire: Different questionnaire were used in previous researches to assess teachers' TPACK. Abbitt (2011) provides an overview of instruments and methods for TPACK-based evaluation of pre-service teacher preparation experiences. The current research's questionnaire was constructed on the basis of the TPACK assessment instrument for pre-service teachers developed by Schmidt & others (2009). The first administration was before participation in the workshop and the second administration was at the end of the workshop.
2. Teachers' Attitudes toward Computer (TAC, v. 6.1) questionnaire: This questionnaire was tested by Christen and Knezek (2009) who concluded that the TAC (v. 6.1) is a well-validated and reliable instrument for teachers' self-appraisal of their attitudes toward computers. The TAC questionnaire was administered twice for the same participants and at the same time of administering the TPACK questionnaire.
3. The Use of ICT in Colleges of Education – Questionnaire for Teachers of Teachers (UICT): This questionnaire was developed by The MOFET Institute to follow the professional development of instructors in colleges of education including ICT proficiency. The appropriate part of the questionnaire, regarding the ICT proficiency, was administered twice for the same participants and at the same time of administering the TPACK questionnaire.

### 5.1 Statistical exams

The questionnaires were translated for the first time to Arabic language before administering them to the instructors. The questionnaires underwent validity and reliability exam.

Face validity: The Arabic translations of the questionnaires were given to a group of instructors who were required to examine if the questionnaires' statements are understandable to the reader. Some items of the questionnaires were restated to clarify their ambiguity.

Content validity: The questionnaires were given to a group of experts (three college instructors) who were required to examine whether the questionnaires' items cover the full domain of the different educational constructs and whether they cover constructs other than the appropriate ones. As a result of the experts' remarks, the TPACK questionnaire was modified.

The questionnaires' reliability: The scores of the instructors in both questionnaires: TAC and TPACK, as well as their various components (categories), before the workshop and after it, were examined for internal reliability using Cronbach alphas. The results show high Cronbach alphas (all above 0.85) indicating adequate internal reliability for the questionnaires and their various components. These results were expected due to the extensive use of these questionnaires in the literature.

Data processing: Research questions 1-3 were analyzed using paired-samples t-Tests to determine if there were significant differences between scores of instructors in the various questionnaires before and after the workshop. Cohen's d was also used to compute effect sizes to assess the practical significance of results.

## 6. Results

The analysis of the data was conducted according to the research questions taking in consideration the independent and dependent variables of each question. We should note that the independent variable of questions 1-3 is the college intervention which includes five components (college policy, college infrastructure, ICT center support, participation in workshop and the availability of assistants) was presented in the tables as having two values: before the workshop and after the workshop, to indicate the period that these factors were active and could have influenced the dependent variables values regarding the instructors. A ranking of the effect of these components as affecting factors as perceived by the instructors themselves was also carried out showing the participation in workshop as the leading factor. This ranking is also presented in this section. The sample size was 19 counting the instructors who completed and submitted all the questionnaires before and after the workshop. In some cases the size was smaller if some instructors did not complete one of the questionnaires. The following tables present the results of the research analysis.

Research question 1: will the college intervention improve the instructors' attitudes toward computers?

Table 1

*Descriptive Data and Results of Paired-Samples t-Test for Instructors' TAC Level by Participation in Workshop (n=19)*

Outcome	Before Workshop		After Workshop		<i>t</i>	<i>d</i>
	M	SD	M	SD		
TAC	4.08	0.23	4.09	0.33	0.15	0.04
Interest	4.78	0.41	4.48	0.51	2.32*	0.65
Comfort	4.50	0.46	4.58	0.48	1.00	0.17
Accommodation	4.83	0.34	4.89	0.32	0.76	0.19
Interaction	3.99	0.53	3.96	0.70	0.30	0.06
Concern	2.79	0.48	2.80	0.63	0.05	0.02
Utility	4.38	0.50	4.36	0.49	0.26	0.06
Absorption	3.52	0.49	3.77	0.57	2.44*	0.46
Significance	4.43	0.46	4.48	0.52	0.35	0.09
Perception	5.49	0.78	5.61	0.95	0.47	0.14

As displayed in Table 1, the results show that the paired-samples t-Test for the instructors' TAC level differs before the workshop and after the workshop for interest and absorption. T-Test found significant setback in the instructors' interest category in the TAC questionnaire after participation in workshop. On the other hand, significant gain was found in the instructors' absorption category in the TAC questionnaire after participation in workshop). Moderately large negative effect size of 0.65 (Cohen, 1969) was derived for interest and average positive effect size of 0.46 was derived for absorption.

Research question 2: will the college intervention improve the instructors' ICT proficiency?

Table 2

*Descriptive Data and Results of Paired-Samples t-Test for Instructors' ICT proficiency level by Participation in Workshop (n=19)*

Outcome	Before Workshop		After Workshop		<i>t</i>	<i>d</i>
	M	SD	M	SD		
Score of table 1 in UICT	2.85	0.51	3.39	0.40	3.76***	1.19

As displayed in Table 2, the results show that the paired-samples t-Test for the instructors' ICT proficiency level differs before the workshop and after the workshop. T-Test found significant gain in the instructors' ICT proficiency level after participation in workshop. Very large positive effect size of 1.19 was derived for the instructors' ICT proficiency level.

Research question 3: Will the college intervention improve the instructors' TPACK level?

Table 3

*Descriptive Data and Results of Paired-Samples t-Test for Instructors' TPACK Level by Participation in Workshop (n=17)*

Outcome	Before Workshop		After Workshop		<i>t</i>	<i>d</i>
	M	SD	M	SD		
TPACK	3.88	0.45	4.21	0.28	3.82**	0.90
TK	3.52	0.70	3.79	0.46	1.73	0.46
PK	4.18	0.41	4.46	0.44	2.34*	0.65
PCK	4.39	0.56	4.63	0.56	1.48	0.42
TCK	3.82	0.82	4.16	0.62	1.87	0.46
TPK	3.94	0.51	4.37	0.50	3.05**	0.85

TPCK	3.91	0.65	4.39	0.54	3.85**	0.81
------	------	------	------	------	--------	------

As displayed in Table 3, the results show that the paired-samples t-Test for the instructors' TPACK level differs before and after the workshop. T-Tests found significant gains in the instructors' TPACK level after participation in workshop. Moderately large positive effect size of 0.65 was derived for PK and larger positive effect sizes of 0.9, 0.85 and 0.81 were derived for TPACK, TPK and TPCCK respectively.

### 6.1 Ranking of the college intervention components

The college intervention included five components: college policy, college infrastructure, ICT center support, participation in workshop and the availability of assistants. At the end of each workshop, the instructors were asked about the change in their perceptions, attitudes, abilities and behavior regarding the integration of ICT in teaching. Those who indicated positive change were asked to rank the components of the college intervention, as affecting factors of the change, from the most effective factor to the least effective one. The results concluded the following ranking of the factors, where the first one is the most effective: (1) Participating in the workshop, (2) the ICT center support, (3) college policy, (4) advancement in college technological infrastructure, and (5) the availability of assistants.

### 6.2 Outcomes of the college intervention

Before the beginning of the implementation of the college plan, only a hand full of instructors and pedagogical supervisors (less than 10% of the college staff) constructed and used courses sites and integrated ICT in their teaching processes. Only two WBLE (using Google sites platform) were constructed before the college intervention, while at the end of the second year of the college plan implementation, over thirty WBLE were constructed including ICT based lessons, units and learning materials that were designed and developed collaboratively by pedagogical supervisors and their students in the frame of the practical training. In addition a notable increase was apparent in the number of courses sites based on the Moodle platform that were developed and used by most of the instructors and pedagogical supervisors. These sites were used by the instructors to manage their courses including the use of ICT based teaching materials that would improve their teaching in the courses.

Another noticeable outcome of the college intervention was the number of pedagogical initiatives that involve special use of ICT in teaching in the college proposed by the pedagogical supervisors to the educational research center in the college. At least six initiatives were proposed this year as opposite to only one in the last year. These initiatives are directed to enriching the WBLE with special use of ICT in advancing the teaching methods in the training schools and/or encouraging higher order cognitive skills using ICT based learning/teaching materials among the pupils in these schools. All these initiatives intent to involve the college students and the training teachers in the development process, therefore the implementation of these initiatives would also advance the integration of ICT in the training schools. It is important to note that these initiatives come from various departments, such as: English language, Arabic language, Islam Studies, Science and Mathematics.

## 7. Discussion

The main research question was: How will the college intervention (college policy, college infrastructure, ICT center support, participation in workshop, and availability of assistants) affect the instructors' attitudes toward computers, the instructors' ICT proficiency and the instructors' TPACK level? The results of the research indicate several significant effects of the college intervention, which mainly pointed out improvement in the instructors' perceptions, abilities and behavior regarding the integration of ICT in teaching.

### 7.1 Instructors' attitudes toward computers

One of the main results of this research shows that no significant improvement was detected in the instructors' attitudes toward computers as an outcome of the college intervention. The main score of the TAC before the workshop ( $M=4.08$ ) almost did not change after the workshop ( $M=4.09$ ). But, in both cases the attitudes were very favourable toward computers. Even though, when looking at the subscales of the TAC we identify two significant changes: one negative change in interest and one positive change in absorption. Also in the case of the negative change in interest, both averages ( $M=4.78$ ,  $M=4.48$ ) were very high indicating great interest in computers. This interest could have dropped down after experiencing the work with computers during the period of the workshops, probably because the instructors did not have much experience working with computers before the workshop and were interested to experience it. After experiencing the work with computers, their willingness to work with computer dropped down a little bit because they were exposed to this instrument and experienced actual work with it, so their interest to do this experience lessened (like learning about the computer or how to use it). As for the positive change in absorption, the instructors expressed positive feeling toward the involvement in the computer world before the workshop. During the workshop they had the chance to be actually involved and improve their knowledge in computers. This might have improved their

absorption of computers, for example improved their ability to solve problems related to the use of the computer in general or in the classroom; which encouraged them to insist to solve these problems, even if they were hard ones. This influence of teachers' experience in technology on their ability to solve technological problems is mentioned in DeLuca (1991) who says that prior technological knowledge and knowledge seeking (in our case improved as a result of participating in the workshop) help overcome technological problems in the classroom. Moreover, Baya'a and Daher (2013) found that the participating teachers have generally positive perceptions of their competence in technology. Further, they have positive attitudes toward their self-esteem in the presence of technology.

### 7.2 *Instructors' ICT proficiency*

An important result of this research is the high significant improvement in the instructors' ICT proficiency ( $M=2.85$ ,  $M=3.39$ ) as a consequent of the college intervention. Three major intervention components: ICT center support, participation in workshop, and availability of assistants, were responsible for this objective. In more detail, the assistants accompanied the instructors in the workshops and had regular weekly meetings with them to direct them in using technology in preparing their lessons. This made the instructors feel confident to construct ICT based teaching and learning materials, which improved significantly their ICT proficiency. This means that the college instructors need specific training, accompanied by assistants, to improve their ICT proficiency. This need of training for teachers to improve their ICT skills and readiness to integrate ICT in their teachers was suggested by past researches, for example by Muir-Herzig (2004).

### 7.3 *Instructors' TPACK level*

As a result of the college intervention, the TPACK level of the instructors was significantly improved (from  $M=3.88$  to  $M=4.21$ ). This indicates that the intervention was successful in making the participating instructors improve their use of ICT in teaching their pre-service teachers who are the future teachers. This improvement would result probably in the pre-service teachers implementing ICT use in their practical training. This means that the college is stepping forward in applying 21st century skills into the teaching and learning processes, and as a result, in preparing its pre-service teachers for the 21st century education.

Looking at the average scores of each type of knowledge resulting from the intersection of two or three of the domains: technology, pedagogy and content, we see significant improvement in PK, TPK and TPCK. This could have happened because in the workshops, the instructors were not only exposed to ways of enriching existing pedagogies with exciting multimedia and required to implement them in their disciplines, but they were also introduced to new pedagogies that evolved recently in the era of modern technology.

The non-significant change in the TK score might seem contradicting the significant improvement of the instructors' computer proficiency mentioned earlier. In fact there is no contradiction because the computer proficiency, as measured in table 1 in UICT, refers to the instructors' actual use of technological tools, while, TK is involved with technology knowledge in general.

Regarding the pedagogical content knowledge, the instructors expressed high level of agreement with the PCK statements before the intervention, because they considered themselves experts in the pedagogy of their disciplines. This agreement increased after the intervention, but not enough to be significant. As for the technology content knowledge, the instructors started with above average agreement with TCK statements, where this agreement also improved after the intervention, but not significantly. This could have happened because the instructors were prepared for integrating technology in their teaching and not as a method to solve problems in the content.

It could be said that teachers' different experiences in the workshop improved their knowledge in types of knowledge related to their preparation in the workshop; i.e. pedagogic types of knowledge. Here too, experience through workshop preparation, including supporting instructors with assistants, helped teachers improve their knowledge in related domains, in our case PK, PCK and TPACK. It seems that teaming instructors with assistants led to teaching improvement, the same way as teachers' teaming leads to such improvement (Fulton & Britton, 2011).

It is important to mention that the advanced workshop which included 11 pedagogical supervisors out of the 17 who participated in the introductory workshop, had in it also department chairs. These chairs constructed in the advanced workshop WBLE rich with ICT based lessons and used these sites as a model for other instructors in the department encouraging them to construct their own WBLE. This act inspired several instructors and pedagogical supervisors to do so and resulted in the construction of over thirty WBLE as opposed to only two before the workshops. Another major change occurred in the number of pedagogical initiatives that involve special use of ICT in teaching proposed by the pedagogical supervisors, going up from only one before the college plan to at least six initiatives this year.

## 8. **Conclusions and recommendations**

The instructors and pedagogical supervisors in this study had relatively high positive attitudes toward computers before the college intervention. These attitudes did not change significantly after the intervention. The instructors' ICT proficiency improved

significantly after the college intervention especially as a result of three components of this intervention: ICT center support, participation in workshop and availability of assistants.

The TPACK level of the instructors, especially the pedagogical supervisors, was improved after the college intervention. The introduction of new pedagogies that evolved in the era of modern technology in the workshops affected positively the instructors' pedagogical knowledge in general, their technology based pedagogy and the adaptation of these technologies and pedagogies to the disciplines. This improvement and the previously mentioned ones would get the college instructors ready to apply 21st century skills into their teaching processes, and consequently would move the college further toward the 21st century education.

Our experience of this research leads us to recommend the following intervention components for colleges desiring to improve the ICT use in teaching among their instructors: (1) Providing appropriate workshops for their instructors: introductory and advanced ones, which expose them to modern pedagogies based on modern technologies. In addition, giving the instructors the chance to develop by themselves teaching materials for their disciplines using these pedagogies and technologies; (2) Enhancing the activity of the ICT center in the college, especially providing expert support for the instructors in the field of ICT tools and their use in teaching; (3) Establishing a clear support policy for ICT integration in teaching, where this policy includes involving the administrators, especially the department chairs, in this process; (4) Upgrading the college technological infrastructure and keeping it up-to-date; and (5) Providing escort of professional assistant in the field of web-based learning environments for each pedagogical supervisor. Of course it would be better if this assistant comes from the same discipline as the pedagogical supervisor.

# The discourse in Mrs. Dalloway by Virginia Woolf and foreign language teaching: the decline of language learner anxiety by the usage of hedges, particular modals and adverbs as in the usage of these structures in Mrs. Dalloway for a specific purpose

## Abstract

An already established way, of which frame is limited by the consensus particular to a specific society or rules activated by the way of thinking of that society, is preferably conducted to achieve a demanded goal instead of applying to possible other ways. Fluidity of languages enables novelists, playwrights, poets, politicians as well as ordinary men to apply to some distinct ways to inject appropriate notions or to explain a tenet to a great mass rather than incline to the ways, which have been known to others. This study draws a parallel between the language Virginia Woolf utilizes in her work Mrs. Dalloway for the purpose of clarifying feminist opinion system and the language used in foreign language classrooms to reduce learner anxiety. Woolf prefers implying her interpretation of the place of women in society with the help of hedges, modals and adverbs rather than explaining it directly. Thanks to the infinite statements in and the flexibility of English Language, Woolf characterizes feminist concept by unresolved and continuous alternations contrary to certain statements used by men. It is known that in the Suggestopedia Method, role-play as a technique of teaching is benefitted to reduce learner anxiety. As Woolf employs hedges, specific models and adverbs in Mrs. Dalloway to explain certain thoughts indirectly, the same structures may be applied to foreign language teaching. For the learners of foreign language in secondary schools, usage of hedges, modals and adverbs indicating that the speaker is not concise in his accounts might lessen the anxiety of learners. In this paper, Woolf's Mrs. Dalloway has been analyzed from the aspect of its discourse, through which Woolf tries to teach women thought system to the audience, under the spectacle of the probability of reducing language learning anxiety by the usage of specific structures which signify possibility such as 'could', 'might', 'as far as I know', 'perhaps', 'nearly', 'about' and etc. as in Mrs. Dalloway. The main purpose of this study is to clarify that the usage of these structures mentioned above help reduce foreign language learner anxiety.

## Introduction

An already established way, of which frame is limited by the consensus particular to a specific society or rules activated by the way of thinking of that society, is preferably conducted to achieve a demanded goal instead of applying to possible other ways. Actually, this preference must have been eliminated with the help of questioning reality at least in the 19th century. For instance, one of the great thinkers of 19th century, Nietzsche claims that there is not reality; on the other hand, there are interpretations of reality itself. Allowing for the vulnerability of reality, we as speakers of languages do not need to stick to the structured forms of language in communication. Studies today indicate that men have the ability to produce infinite utterances using finite language forms. George Yule points out: "Humans are continually creating new expressions and novel utterances by manipulating their linguistic resources to describe new objects and situations." Fluidity of languages enables novelists, playwrights, poets, politicians as well as ordinary men to apply to some distinct ways to inject appropriate notions or to explain a tenet to a great mass rather than incline to the ways, which have been known to others. Especially, writers emphasize on the meaning beyond language, as they want a text convey a hidden meaning inside.

Writers present a great talent on creating ties stretching from the text they create to the subconscious of the audience. Modernist and/ or postmodernist writers do not interfere with the ethos of their readers and leave the judgmental issues open to be evaluated by the reader himself/ herself. For instance; Orhan Pamuk in his novel named after "Snow" does not directly says what is right or what is wrong about common view of strong conservative people on women who are against wearing scarf, but he explains the situation from his perspective similar to a camera recording the events around, by which he arouses hatred in the hearts of his readers. That is, Pamuk creates a dark atmosphere explaining the situation with the help of the power of words chosen. Not just the word choice affects the overall meaning a text covers. On the other hand, punctuation, emphasis and writing

---

<sup>a</sup> E-mail address sakalin@atauni.edu.tr

style reveal the actual intention of the writers. Not all the time, it is about the context, but it might also be about the message of the writer to his/ her reader. According to Paula Bennett, the small but precious objects in Emily Dickinson's writing signal feminist propagation. Bennett identifies some objects in Dickinson's writings such as pebbles, pellets, nuts, pearls, gems, berries, beads, drops, jewels and bees as a part of clitoral imagery.

In this study, Mrs. Dalloway written by Virginia Woolf has been analyzed focusing on the emphasis on hedges, specific functional morphemes and parts of speech, which display possibility of occurrences. These usages shed light on how Woolf supports feminism since speaking of possibilities is one of the features of feminine speech characteristics as accepted by a great deal of research. Woolf prefers implying her interpretation of the place of women in society with the help of hedges, modals and adverbs rather than explaining it directly. Thanks to the infinite statements in and the flexibility of English Language, Woolf characterizes feminist concept by unresolved and continuous alternations contrary to certain statements used by men. This study draws a parallel between the language Virginia Woolf utilizes in her work Mrs. Dalloway for the purpose of clarifying feminist opinion system and the language used in foreign language classrooms to reduce learner anxiety.

In language classrooms in particular, learners come across some challenges such as speaking in a foreign language with a good knowledge of grammar and pronunciation. Anxiety might prevent some people from performing successfully in science or mathematics, many people find foreign language learning stressful likewise, especially in classroom situations. According to Gardner and McIntyre, language-learning anxiety can be described as "a subjective feeling of tension, apprehension, nervousness, and worry associated with an arousal of the automatic nervous system". Horwitz on the other hand, detailed the specific parts that learners are affected most when it comes to language learning anxiety. A different solution to reduce language-learning anxiety based on the discourse of Mrs. Dalloway may open a new horizon into language learning. It is known that in the Desuggestopedia Method, role-play as a technique of teaching is benefitted to reduce learner anxiety. As Woolf employs hedges, models and adverbs in Mrs. Dalloway to explain certain thoughts indirectly, the same structures may be applied to foreign language teaching. For the learners of foreign language in secondary schools, usage of hedges, modals and adverbs indicating that the speaker is not concise in his accounts might lessen the anxiety of learners. The main purpose of this study is to clarify that the usage of these structures mentioned help reduce foreign language learner anxiety.

#### Literature Review

A part of speech or writing does not solely stand for a sequence of related words; on the other hand, it is related to the speaker, the place and time. The intention of the speaker may be visible through an intelligent use of discourse. That is why some people utilize discourse to inject particular notions to the audience. Discourse has the capability of conveying notions in an indirect way. Seinfeld exemplify the inner meaning of a speaker based on his/her pauses during the speech as follows:

There are two types of favors, the big favor and the small favor. You can measure the size of the favor by the pause that a person takes after they ask you to "Do me a favor." Small favor -small pause. "Can you do me a favor, hand me that pencil." No pause at all. Big favors are, "Could you do me a favor..." Eight seconds go by. "Yeah? What?" "... well." The longer it takes them to get to it, the bigger the pain is going to be. Humans are the only species that do favors. Animals don't do favors. A lizard does not go up to a cockroach and say, "Could you do me a favor and hold still, I'd like to eat you alive." That's a big favor even with no pause. Seinfeld (1993)

In addition, discourse has an ability to manipulate ideas of people, which is accepted by the majority of us. Analysts examining speeches of politicians in particular might come across the power of discourse. Paul Foss fortifies the power of discourse with his saying: "Discourse has become the arena for the generation and propagation of historically specified norms and socially adequate forms of power."

Some writers who would like to convey some messages including the ones that cannot be accepted positively by the public apply to power of discourse. For example, for feminist writers, there are countless options to create a text to deliver intended messages such as punctuation, fragmentation, speaking of possibilities, detailing the events which seem ridiculous to men or giving importance on male properties in order to draw attention towards the torture on women in societies. As a matter of identity and difference, otherness of women might be visible with a closer look. Disposing the existence of worlds of male and female languages separately, Madeleine Gagnon claims that women use language of men so as to influence and transform it. Barbara Godard in her essay titled as '*Theorizing Feminist Discourse/ Translation*' puts forward polarity, which symbolizes the echo of the individual's self and the other, as a feature of women discourse. Additionally, Godard advocates displacement of women voice by themselves is characteristics of women discourse.

On the properties of the speech of women, Plato is in the view that the speech of women, the private speech of house hold, may be in lack of the form of philosophic argumentation or the form of poetry and thus, he describe the speech of women as unformed, chaotic, and consisting of only opinion not truth. Absolutely, Plato's discrimination of women speech takes one to think about mainstream of consciousness that was invented as a writing mood via experimentation in the late 19<sup>th</sup> and early in 20<sup>th</sup> centuries. However, in studies examining thought systems of men and women, the fragmentation and detailed speech are asserted to be properties of women speech not that of men. Similarly, Woolf explains that Dorothy Richardson has invented the 'sentence of the feminine gender', a psychological sentence that disregards the story and privileges the description of frames of mind: 'It is of a more elastic fiber than the old, capable of stretching to the extreme, of suspending the frailest particles, of

enveloping the frailest shapes' (Woolf 1919:191). Women's speech is considered a challenge to male logocentrism and binary logic (Guild 1992:75). According to Guild's study, men thought system works similar to a computer as it is based on pure truth.

Rachel May asserts that, in Modernist fiction, punctuation is utilized in experimental ways for visual effects or to emphasize the interplay of textual voices (1997:2-4). Semicolons, for instance, compose paratactic structures that erase syntactical and conceptual hierarchies and therefore this results in numerous viewpoints. The creation of multiple viewpoints might be considered to be one of the main functions attributed to semicolons in writings of Virginia Woolf. David Lodge (1993:26) proposes that Virginia Woolf is prone to use semicolons rather than full stops so as to delay the moment when the sentence commits itself to an ending. Breaking the sentence and breaking the sequence (Woolf, 1929) are proposed two critical acts for modern women writers.

As can be seen from the information given above based on the research conducted in the field of discourse and feminist discourse, writers take advantage of discourse and they assert some specific ideas especially when they are reluctant to make their claim clearly. Virginia Woolf is one of these writers and she not only tries to define the properties of the speech of women but also she explains how the speech of women should be. For instance, Woolf opposes presentation of lesbianism in Radclyffe Hall in her works and wishes she did not support lesbianism in her writing. Indirect messages are not fruitful just in texts; on the other hand, indirect messages might be conducted in education as suggested in this study. In Mrs. Dalloway, Woolf resorts to hedges, specific functional morphemes and parts of speech, which display possibility of occurrences for indirect messages throughout her writing.

"If you hedge against something unpleasant or unwanted that might affect you, you do something which will protect you from it. If you hedge or hedge a problem or question, you avoid answering question or committing yourself to a particular action or decision." (Collins: 1987) Uses of hedges or other parts of speech as Collins asserts, take the responsibility out of persons, which might be applied to language learning and that's why using hedges, specific functional morphemes and parts of speech, which display possibility of occurrences might reduce anxiety of learners. It has been found that the feelings of tension or nervousness center on the two basic task requirements of foreign language learning: listening and speaking (Horwitz et al., 1986) because, in interaction, both the skills cannot be separated. Guiora advocates that language learning itself is "a profoundly un-settling psychological proposition" as it directly menaces an individual's self-concept and worldview.

Language anxiety has been argued to have an importance on learning to speak a foreign language. Many researchers of language anxiety have suggested a variety of strategies to cope with this multifaceted dilemma (Hashemi, 2013). The most frequent solution proposal by language learners is to filter teacher domination from the atmosphere of classroom. These learners suggest a classroom in which mistakes might be made without looking or sounding unskillful (Constructivist Theory of Learning). Some teachers suggest instructors to create environments in which students can feel successful in using English and avoid setting up the activities which increase the chances for the students to fail". Others put forward a communicative approach where students are given chances to succeed even with imperfect language competence. Some other teachers emphasize on the use of drama-like and role-play activities through which learners could feel safe in a pretended situation with a pretended identity (Suggestopedia).

### Analysis of Mrs. Dalloway

The analysis of Mrs. Dalloway's discourse by which Woolf tries to teach women thought system to the audience sheds light on the probability of reducing language learning anxiety by the usage of specific structures which signify possibility and uncertainty such as 'could', 'might', 'as far as I know', 'perhaps', 'nearly', 'about' and etc. Woolf avoids asserting 100 percent true statements and she softens the exactness, which some research claim to be a feature of feminist discourse. That is why Woolf frequently utilizes hedges, particular adverbs, modals and phrases in Mrs. Dalloway. She not only finds mainstream of consciousness fruitful but also she manages to show fluidity of women thought by using these speech parts. Starting with the effect of role play technique on reducing the anxiety of language learners, it may be claimed that if language learners are taught to start with a statement clarifying possibility, their anxiety will decrease as the learners accept the probability of their mistakes to come. In the analysis part, excerpts from the text of Mrs. Dalloway are going to be examined in order to understand the function of hedges and similar structures gaining possibility.

### Example 1

"There was *a sort of* - ... - *a sort of* ease in her manner to him." (Used 16 more times with the same function)

In this excerpt, the speaker obviously have difficulty in finding proper adjective to explain the situation in which the part standing for the semantic role, goal is. Similarly, if language learners are provided with the knowledge and the function of 'sort of' structure, the learners do not feel obliged to use fixed derivational morphemes. For example, a learner who has been taught to use lexical relations such as synonym and antonym or to use hedges as indicated in the excerpt, may not know specific

words for specific situations, but they could handle explaining these specific situations by trying to use related words for the situation. Imagine a situation in which a learner has the native language equivalence of a word such as 'parsley' in his/ her mind, but he/ she cannot utter it. Then, a learner qualified with the knowledge of hedges, specific functional morphemes and parts of speech, which display possibility of occurrences as in this study, can try to explain 'parsley' using related words such as sort of a green plant added to meals especially soups or a kind of pickled herb supplying a good taste for meals. Capable of explaining what he/ she wants to explain, anxiety of learner lessens automatically. The same situation is valid for the similar structure '*kind of*' as:

"...and doing her hair in *a kind of* ecstasy, ... She said they had a *kind of* courage which the older she grew the more she respected"(Used 2 more times with the same function). In the following excerpt from the novel, a derivational morpheme 'like' is used for similar function. If students are taught the function of this derivational morpheme, then they may not lock in to find proper words while speaking or writing in a foreign language.

"She was *like* a poplar, she was *like* a river, she was *like* a hyacinth, Willie Titcomb was thinking. Oh how much nicer to be in the country and do what she liked! (Used 29 more times with the same function)

#### Example 2

"*It might be* an exaggeration-but still so it did seem now." (Used 12 more times with the same function)

Another part of speech to be examined in the novel is '*it might be*'. Woolf utilizes this structure so as to avoid taking responsibility of her utterances, which is categorized as a women speech feature. When the speaker uses this structure, it indicates that the speaker is not concise in what he/ she says and makes the utterance earn possibility. In language learning classrooms, learners hesitate in making mistakes both in grammar and in exactness of the situation they utter. If they are taught such a structure, learners may get to know that it is not a learner who takes the responsibility of his/ her utterances. It means that language learners may think that they could do mistakes before stating something as the hedge that they use take the responsibility out of the speaker. When language learners take it into consideration that they do not take the responsibility of their utterances, their anxiety might decrease as in role playing; students may have positive feelings, desires and attitudes towards language learning (Scarcella and Crookall: 1990).

#### Example 3

... but that might be her heart, affected, *they said*, by influenza. (Used 5 more times with the same function)

#### Example 4

She said *somehow* very like to him, ... (Used 11 more times with the same function)

#### Example 5

...,she looked almost beautiful, very stately, very serene. (Used 5 more times with the same function)

#### Example 6

*Probably* she does not get on with Clarissa. (Used 7 more times with the same function)

#### Example 7

... and *possibly* (this was a theory he used to make up to account for her, so transparent in some ways, so inscrutable in others), *possibly* she said to herself, (Used 6 more times with the same function)

#### Example 8

*I suppose* they are praying. (Used 9 more times with the same function throughout the novel)

#### Conclusion

One might easily confer from the analysis of Mrs. Dalloway based on uses of hedges, specific functional morphemes and parts of speech that display possibility of occurrences that Woolf benefit from these structures in order to diminish firmness of utterances. Tendency on being not exact might be considered as a feature of women speech on the ground that the speech of women has a character of being non-linear. The essential traits of female discourse that Woolf describes in her critical writings are: non-linearity, openness, suspension, and dissolution of subjectivity. The analysis of Mrs. Dalloway's discourse may be capable of creating a new horizon into language teaching and learning about the chance of lessening language learning anxiety by the usage of specific structures which suggest doubtfulness and possibility such as 'almost', 'probably', 'possibly', 'it might be', 'they said', 'sort of' and etc.

When the effect of role play technique on reducing the anxiety of language learners is taken into consideration; it might be supported that if language learners are taught to start with a statement clarifying possibility, their anxiety may decrease as the learners accept the probability of their probable mistakes. In role-playing, language learners choose different identities for themselves since it is found fruitful for students to see these foreign names responsible for their own mistakes. It is claimed in this paper that supposed that language learners are provided with words or phrases of possibility, the learners might welcome the possibility of their mistakes, which may happen during language classes, at first and that might reduce language learning anxiety.

# The education and the human capital to get rid of the middle-income trap and to provide the economic development

Refika Atalay<sup>a\*</sup>\*\*\*\*\*

<sup>a</sup> *Akören Vocational School, Selcuk University, Konya, Turkey*

## Abstract

The developing countries rising their national income to \$ 10.000 per capita face to two major problems: the economic development and the middle income trap. The economic development and the economic growth have been considered as equivalent terms until 1970. The economic growth is a numerical value to be able to measure the reel GDP(Gross Domestic Product) increasing rate while the economic development is a social criterion measuring the social levels of the human being such as the health , the education and the human living standard.

The other problem of the developing countries achieving to the middle income level is the middle income trap. The developing countries facing to the middle income trap and aiming to the economic development can improve their human capital in order to remove it. The human capital means the aptitudes such as the knowledge and the skill to be obtained by the manpower. All these enable to increase the individual and social development and the economical prosperity.

The basic condition of developing the human capital is the education and the lifelong learning. However, the more the education duration in the developing countries increases, the more the individual and social costs increase. Therefore, these countries must improve the employment during the education in order to both develop the human capital and decrease the alternative costs that would cause the education.

2014 The Authors. Published by Elsevier Ltd. Peer-review under responsibility of the Sakarya University.

Keywords: human capital, economic development, middle income trap, economy education.

## 1. Introduction

Nowadays, the biggest problem of the countries which reached to the level of middle-income countries is to be trapped in a middle income trap because they can't reach to the upper segment which is the level of high-income countries. The most important reason that the developing countries can't reach to the level of developed countries is that their level of production and development is lower than developed countries. In order to increase the production and development levels of countries, they must increase primarily the human capital education. For this reason, the countries should give importance to their human capital education. Because it is seen today that the countries advanced in the human capital education improved productivity levels in their production.

As the primacy of human capital requires both the education and the activities of R & D, it imposes heavy costs both to individuals and to the public. As long as the education levels scale up, it is observed that the difference between individual costs and public costs rises up. The reason of this case is that the education especially, higher education in developing countries is funded by the public. In order to ensure the social state conception and the equality of opportunity, the sponsoring of education by the public increases the demand for higher education and the necessity of allocating more resources to education in developing countries.

The purpose of this study is to offer the proposition solutions and to provide the human capital education by minimizing public and individual costs in order that developing countries can get ride of middle income trap. This study consists of six subtitles including the introduction and the conclusion. In the second subtitle, the human capital concept and human development level will be studied. The third subtitle aims to focus on the private and social returns of the education. The fourth subtitle targets to make comparison between Japan and South Korea and Turkey in the matter of the accumulation of human capital and R & D activities. In the last subtitle the training costs will be examined. In the conclusion subtitle, propositions will be offered in order to reduce the impact of education expenses on public and individuals

## 2. Concept of Human Capital and Human Development Index

### 2.1. Concept of Human Capital

\* Corresponding author: Phone number: 0905544887611  
e-mail address: refika\_atalay@hotmail.com

The concept of human capital, "as a social concept, has not a common definition. In most general terms, the human capital is a term expressing, on the one hand, the information, skills, abilities, experiences, that the individuals have in terms of the production process, their level of behaviour, sentimental dependence on their work, on the other hand, their physical and mental fitness or strength"(Keskin 2011:128). In other words," it explains the education expenditures to be realised in order that people obtain the knowledge, skill, and aptitude" (Seyidoğlu, 2002:59). The importance of the human capital for the economies has been expressed since Adam Smith to today. However, the physical capital has been insufficient by the globalization and the competitive environment after Second World War. As a result of that, the human capital concept has been proposed again for the agenda by economists.

Nowadays, the education expenditures made for the development of individuals is considered as investment expense in a sense. Because "the cultivated and skilful individuals who can use advanced machines and propose new ideas and methods in the production process" would increase the yield by minimizing the wastage (Bekmez et al 2009:67).

## 2.2. Education and Turkey in the Human Development Index

Since 1990, UNDP (United Nations Development Program) publishes every year the Human Development Index" making possible the wealth and social development degree of countries, in contemporary expression, the measurement realization by converting the human development into numerical values" (Keskin, 2011:129). "The Human Development Index is calculated by being based on three indicators. The first indicator is "the average life" showing the duration of the expected "average life" of a newborn person. The second indicator is the education status measured by schooling rate containing the adult literacy rate having the 2/3 weight and of and primary school, high school and university rate having the 1/3 weight. The third indicator is "the living standard " measured with real national income per capita calculated according to Purchasing Power Parity (PPP)(Keskin 2011:129).

According to the 2013 Human Development Index, Turkey having the value of 0.722 in the high human development category takes place in the 90<sup>th</sup> rank among 187 countries and regions. When we appreciate only Turkey in terms of education according to the Human Development Index, a significant difference is seen between the expectation of education duration and the average education duration. An increase has been seen every year in both periods.

**Table 1:** The data concerning the Human Development Index of Turkey.

Year	Expectation of education duration	Average education duration
1980	7.4	2.9
1985	8.3	4
1990	8.8	4.5
1995	9.5	4.8
2000	10.6	5.5
2005	11.7	6.1
2010	12.9	6.5
2011	12.9	6.5
2012	12.9	6.5

**Reference :** The report concerning the Human Development Index of Turkey " published by UNDP

According to "The United Nations Development Programme Report 2005", Turkey with 99.1% literacy rate takes place in the 83<sup>th</sup> rank among 184 countries (www.makaleler.com). Schooling rate in terms of educational levels in Turkey is figured in Table 2. According to the data, the schooling rate is higher in the level of primary school having the compulsory education. In higher education, the schooling rate has increased from year to year. However, if compared with other countries Turkey is seen to remain behind them.

	1980	1985	1990	1995	2000
Pre-School Education					
Turkey	0,5	5,0	4,7	7,3	6,1
Other Countries	27,4	30,5	33,8	37,2	43,2
Primary School					
Turkey	96,4	113,3	99,1	106,7	91,9
Other Countries	102,1	109,1	110,9	109,2	108,2
High School and Equivalent					
Turkey	34,6	41,6	47,3	57,0	73,3
Other Countries	55,0	56,1	60,6	71,2	75,0
Higher Education					

Turkey	5,4	8,9	13,1	19,5	23,8
Other Countries	14,3	16,0	17,9	20,9	25,9

\* Other countries group contains the data of 47 countries in kindergarten group in the 47, those of 48 countries in other education levels.

### 3.Profits of Education

Depending on the trend in the world, the increase in schooling rate, especially in higher education in Turkey arises from the expectation that the education, especially in higher education in Turkey will bring higher income stems from expectations. Moreover, we can make mention of many profits of the education such as the individual, social and non-monetary profits.

"Special profits are benefits which are obtained by individuals taking education, but aren't reflecting on the society. These profits appear in manner that the education enables individuals to obtain further incomes by increasing the possibility, productivity and capacity of earning of the employment in the future, indirectly to benefit from more goods and services ( Gölpek , 2012:46 ) . " Social returns are benefits that individual can't appropriate, but reflected to other members of the community These benefits will reflect to the national income by increasing the tax revenues and the productivity educated individuals to the society"( Gölpek 2012:48 ). " As for non-monetary returns, they can be enumerated as the employment of the educated individuals , particularly the employment of the higher education graduates in better conditions, their awareness in consumption and investment decisions, their more healthy and longer life, their increase of the literacy rate, their development of citizenship and democracy consciousness, the formation of an environment more suitable to the economic growth, the lower crime rates, the increase in publications and cultural activities, the better functioning of the economy and the markets and the development of freedoms ( Gölpek 2011:85 ).

### 4.The Education of Human Capital to get rid of the middle income trap and to provide the Economic Development

#### 4.1. The Concept of Middle Income Trap and Human Capital Relationship

The concept of middle-income trap has been placed for the first time in the literature by Homi Kharas and Intermit Gill who were employees in the World Bank (SDE 2012:64).

The middle-income trap describes that " economies reached to the level of middle-income have been in this level for so many years and don't spring up to the the higher income level. This concept measuring the per capita income in countries by dollar according to data field and mainly Purchasing Power Parity (PPP) indicates that a country enters into the vicious circle in a certain income level. Accordingly, the countries trapped in middle-income remain at this level for a long time and can not upgrade "(2012:96 MÜSIAD). In other words, economies pressed between 20 and 58% of national income per capita of USA are considered as countries trapped in middle-income.The income level per capita according to current prices in 2011 in USA is 48,147 \$. According to this data, the countries having the average income 10,000 \$ per capita are regarded as countries having middle-income level.

According to the theory of Gill and Kharas, these countries must be around 27,000 in 10 years otherwise it is inevitable to mention the middle income trap (Göçer 2013:216, <http://www.mahfiegilmez.com>, <http://tr.wikipedia.org> ). According to the theory proposed by Gill and Kharas, the process operates in the following way: the labor force surplus in the agriculture in the early stages of the development in under-developed countries is transferred to industry and services sectors.

Thus, the marginal productivity of labor is increased by preventing the hidden unemployment in rural regions and the profit starts to increase because the production will increase in the city. However, in the later phases the labor force to be transferred from agriculture to industry and service sectors will decrease and this will cause the decrease in production level. In other words, the country using the initial advantage of labor force surplus, is able to maintain its economic growth in modest rates, but a country which isn't able to maintain sustainable growth rates in this ongoing process has entered into a vicious cycle.

The main economic problems of countries trapped in middle-income can be listed as: the lack of investment resulting from the savings gap, the slow development in the manufacturing industry, the disappearance in the industry diversification and weakness in the labor market"(www.mahfiegilmez.com), the lowliness of R & D level and the human capital.Thanks to the export-based economic growth model that they started to apply since 1980s, the developing countries accelerated their economic growth and closed largely the difference between them " (Göçer 2013:220). The most of countries having the export-based economy has managed to achieve the middle-income country status in a short period. " While making initially the export based on the labor intensive and the natural resources, these countries managed to create their own brand and to export more capital and technology-intensive products and services by passing over time the contract-Producing process and by increasing the human capital and R & D expenditures (2013:220 Göçer).

When studied countries around the world, we see countries trapped in middle-income such as Thailand, Philippines and Malaysia etc. (MÜSIAD 2012:98). According to the theory of Gill and Kharas, it is observed that no country excepting Japan and South Korea can not escape from this trap until now (SDA 2012:64).

South Korea reaching to the middle-income country status with 10,310 dollars per capita income in 1993 has a 30,970

dollars national income per capita in 2012. Thanks to the "technology and the intensive export South Korea having the high-income country status after reached quickly to middle income level, takes place among countries accelerating significantly the economic growth (Göcer 2013:220). In 1982 by its 10,510 dollars per capita national income, Japan rose to the high income country status at the end of the 1990s.

Turkey which entered into monitoring Liberal policies in the 1950s in the economy, leaved the import substitution foreign trade policy closed to the outside in 1980. (Eroglu, 2008:296). By the 24 January 1980 Stability Decisions, Turkish economy entered into the squirm process, but internal and external efforts necessary for a departure could not be moved and global adjustment mechanism could not be established. Despite some economical improvements" the economic growth could not be seen until the 1990s. "In 1990s, the economic instability increased due to political and economic instability created by the coalition governments. This case ended in 2001 crisis (MÜSIAD 2012:99). "On 14 April 2001 the "Strong Economy Transition Program" was put into effect (Erdem 2013:209). With the impact of single-party government and the "Strong Economy Transition Program" the national income per capital and an economic growth began to increase.

When the national income per capita in dollar of Turkey is examined according to years, we see that Turkey takes place in the category of middle-income countries. Although a decline was seen in Turkish economy by the effect of the global crisis in 2009 we see that Turkey continues to be a middle-income country in subsequent years.

**Table 3:** Turkey's Gross Domestic Product (GDP) per capita (U.S.A \$)

Year	GDP per capita (USA \$)	Years	GDP per capita (USA \$)
1998	4.338	2006	7.586
1999	3.907	2007	9.240
2000	4.130	2008	10.438
2001	3.021	2009	8.559
2002	3.492	2010	10.079
2003	4.559	2011	10.444
2004	5.764	2012	10.504
2005	7.022	2013	10.782

**Reference:** <http://www.tuik.gov.tr>

In 2008, Turkey reaching to 10,438 dollars per capita national income has achieved the status of middle-income countries. During five years later Turkey gives signals fall into the middle income trap for its national per capita income around 10.000 dollars. In order that Turkey can be passed to a group of high-income countries such as Japan and South Korea without falling into the middle income trap, the basic requirement of this is to complete the human capital education and the R & D development.

"The education is an element allowing to labor to be more qualified, in other words, to increase knowledge and skills". The investments in education for the development of the human capital prepare ground both for the technological development and the human "capital accumulation. This case is reflected positively in the economic development. The human capital accumulation has a great importance in R & D activities and the process of technology production. Because the information is the source of R & D activities and technological innovations, it emerges thanks to the human capital accumulation"(Tiryakioğlu 2008:323). Trained and experienced individuals lead to progress more quickly the technology.

If we compared the development of education and R & D of Japan and South Korea with that of Turkey from high-income to middle-income trap now able to jam and, according to data of the World Bank, the part of public expenditures on education in GDP is 5.8% for Japan in 1980, and 3.7% for South Korea in 1998. 1980 was a year of transition to the medium income level for Japan while 1998 was the year when South Korea reached to medium income level in the World Bank data base. The 2008 year when Turkey reached to the middle-income level was the most recent date to 2006 for which there were databases. The share for this year is 2.9% (SDA 2012:64)

According to OECD data in 2004, the ratio of the education expenditures in GDP was 2.9 % in the primary and middle school, %1, 3 in higher education and % 4,8 in all education programs. These rates in South Korea were 4.4 % in the primary and middle school, % 2, 3 in higher education and % 7,2 in all education programs. According to data in 2004 in OECD countries, the ratio of the education expenditures in GDP was % 5,7 on average. According to these data, the ratio of the education expenditures in GDP in Turkey was % 3,1 in the primary and middle school, % 1 in higher education and % 4,1 in all education programs (Altundemir 2008:57). These ratios indicate that Turkey must give a great importance to the education in order to not fall into middle-income trap.

"Various studies show us that there is a strong correlation between the rise in R & D activities of the countries and their productivity growth. R & D activities are defined as transformations of the investments realised for increasing knowledge accumulation into new technologies or those of physical and human resources into more effective use "(Erkiletlioğlu the 2013:2). "If R & D is general for the country's economy it aims to use more effectively the national resources, to increase continually the knowledge accumulation and to produce the national technologies"(Unal and Seçil 2013:13). Thus, increasing the level of national income is realised. In Table 4, "Turkey's R & D" data are compared with those of "Japan's R & D".

**Table 4:** Japan-Turkey R & D data

Year	Rate of R & D Activities in GDP (%)		Number of Patent Applications in the context of PCT		Part of High Technology Export in the Total Export (%)		Performance of Scientific Publications	
	Japan	Turkey	Japan	Turkey	Japan	Turkey	Japan	Turkey
2000	3,04	0,48	384.201	227	27,00	3,97	72.062	5.321
2001	3,12	0,54	382.815	337	24,73	3,25	74.536	6.484
2002	3,17	0,53	365.204	414	23,09	1,63	73.452	8.511
2003	3,20	0,48	358.184	489	22,75	1,80	80.581	19.781
2004	3,17	0,52	368.416	682	22,37	1,88	73.524	12.463
2005	3,32	0,59	367.060	928	21,15	1,35	80.601	15.106
2006	3,40	0,60	347.060	1.072	20,04	1,65	76.647	14.971
2007	3,44	0,72	333.498	1.810	18,00	1,70	73.756	15.987

When R & D data are examined about Japan and Turkey

according to the years Turkey is seen to be still behind Japan although Turkey makes progress.

Turkey accomplishing to take place among the middle-income countries category must transform the advantage of young population into the human capital and create the qualified labour power to work to reach in R & D activities in order to increase national income level

#### 4.2. Concept of Economic Development and Human Capital Relationship

The economic growth refers to the increase in national income. The economic development also is a concept including the economic growth. The economic development is rather a concept in which the developing countries are mostly interested. It is a science studying the income justice, the human capital and the people-oriented social dimension of society and economy such as the average life expectancy. According to Romer (1990) having many studies in the matter of the economic development, the development rate of a country is not affected much by the increase in physical capital. It is indicated that the predominant effect in the increasing in the rate of development arises from opening to the world market and from the increase of the number of qualified engineers and scientists. The human capital in economic growth models plays a special role. The key of the research and development sector is the human capital stimulating the production of new products and forming the technological developments (Baş, 2004:25). Fredeerick Harbison and Charles A.Mayers indicate that the number of a highly skilled workforce of a country such as managers, scientists, engineers, doctors, teachers and qualified assistants is the most important criterion showing the development level of that country (Taban and Kar 2008:327). Schultz making many studies in 1950, accentuate that many people under developed countries neglected the primary school education and gave a great importance on the physical structures (factories) and the equipments. He considered that the education is a instrument of increasing the human capital and he stated that the education gives the resistance as well as the energy to people (Doğan and Şanlı 2003:187).

"The realization of the economic development of developing countries such as Turkey depends primarily on improving the quality of human capital that they have. The education must be the area for which the resources will be allocated firstly. The education quality should be well improved and generalized to a vast majority of public. The education policy should be redesigned in such a way that the staff will be trained in number and qualification to respond to the needs of sectors, particularly the industrial and service sectors.

However, in order to generalize the university education, the capacity of universities should be increase; the new universities should be established; the characteristics of the unemployed persons of a country should be coincided with the labour force qualification needed by that country; the employees working in continuous training programs should be trained with the vocational courses and women should be encouraged to participate to the labour force by vocational courses (Keskin 2011:147).

#### 6. Costs of the Human Capital Education to Developing Countries

All expenses incurred by the firms to make production are called "the cost" (Çoban 2012:157). "Education shows the investment property because it has the properties of increasing the future productivity and earning capacity and benefiting from more income, more goods and more services" (Gölpek 2012: 45). Both government and individuals should put up with some training costs for the education regarded as investment in long-term.

When the expenditures realised for the human capital are considered as investment expenditure, it is important to compare

them with their private and social costs. The social costs of education in developing countries rises quickly accordingly with the progress of individuals in education levels individual whereas individuals costs are increasing at a slower rate. The gap between social and individual costs has led to higher demand for education (Taban ve Kar 2008:328). Especially the demand in higher education encourages the private sector to invest in the field of higher education. As the public support to the education will be much in a poor country to ensure the equality of opportunity, the assessment rates in the evaluation can be negligible". (Gölpek 2011:88). According to 2010 OECD data, the distribution of higher education expenses in Turkey shows that the portion of 98.6% is sponsored by the public.

## 7. Conclusions and Propositions

Until 2000s, Turkey was exposed to many economic crises both due to political and economic instability within the country and external conjuncture. Turkey which succeeded to ensure economic stability since 2000 's years has achieved the middle-income country status by reaching to 10,438 dollars per capita national income in 2008's. However, Turkey is in the danger of the middle-income trap which is the problem of many developing countries. In order to be the third country which can't be exposed to this trap, Turkey should give importance to the human capital education, achieve scientific publications and obtain patents by increasing their R & D activities.

As Schultz suggested, "the human capital has been created by investing in the human being" (Dogan and Şanlı 2003:181) The main cause of human capital considered as investment is to increase the productivity in the long term. For the creation of human capital, both government and individuals are obliged to endure many educational costs. The fact that the private sectors are not investing enough in developed and developing countries particularly in the higher education sector and the government acts with the social state concept act impose heavy costs to the public. Another reflection of the current financing system on higher education is that the students have graduated after many years from the program they enrolled and it is question of lack of revenue losses because they can't work in the educational process. Such a system causes both a waste of public resources and public resources. The developing countries want to increase the level of national income and to ensure economic development by acquiring the human capital through the education but the education causes the waste of scarce public resources.

In order to escape from this dilemma, the developing countries can include the inactive labor force in the production and reduce the individual costs by employing the individuals taking the education in the part-time jobs to provide the benefits to their futur occupation and to participate in the production. In addition, the workforce wasting can be minimized by expanding hourly rate application in the private sector and by creating more flexible working hours for the studying individuals. In order to make the vocational education more qualified and minimize individual costs during the education, it can be obligated that the private sector can make payment to students at a minimum rate to be determined by the goverment in the periods of internship.

## Abstract

Since its foundation EU aims to increase the number of members, to make the collaboration among its members. EU having the economic characteristics at this point has focuses its politic in some areas such as agriculture, social politics and economics. In order to arrive to its economical targets the education has been considered as instrument. In the field of education EU education cooperation initiatives carried out in accordance with economic objectives of the community. After the Second War, the knowledge, the developments in the communication technologies and the globalisation fact have played great role in the education approach of EU. According to respond the growing expectation of individuals, EU has been forced to develop education policy with quality and efficient.

Education is one of the fundamental rights of individuals. Therefore All member states perceive a need to increase the quality of their education, develop accessed to learning at all stages of life. Its clear that Life-long learning has become the basic point in EU's educational strategy. This concept includes in itself all the stages and forms of education and besides combines them.

The aim of this study was to focus on the educational policy of European Union which has the goal of maintaining collaboration and integration among the members of the union within the framework of common cultural values. And also with this study was stressed historical perspective of EU education programmes.

*Key Words:* EU, Life-Long Learning, Education Policy, EU Educational Programmes

---

## 1. The Formation of Educational Policy and the Historical Development Process of European Union

European Union was established by the six leader European countries (Germany, France, Italy, Belgium, Netherlands, and Luxembourg) after WWII firstly in order to set an economic union among them (Fontaine, 2007). EU educational policy emerges essentially by the aim of carrying out internal market obligations, depending on economic justifications (Besgul, 2013). EU started to attach importance to educational policies by noticing that it had to provide a cultural and social integration for achieving the aim of politic and cultural integration (Besgul, 2013). In this point, EU educational policy emerged from social and economic factors, and it was considered as an instrument to fulfill the demands of equality and justice in society to realize social

justice and contribute to economic growth (Fontaine, 2007). EU sees its educational policy as both a national area of activity and goal to facilitate the applications of other community activities thanks to its educational policies at the same time. On the one hand while it consolidates the harmony among the citizens of union by supporting foreign education and exchange of students and teachers and empowering EU's integration, it successfully contributes to apply the policies like community, unemployment, research, technological development, environment etc. on the other hand (Horvath, 2007).

Different cultural, historical, and political identities which the twenty-eight members have in EU bring some differences in its education systems (Kihitir, 2004). In spite of these differences among EU's member countries, while education is seen as an advantage for countries to put their own experiences forwards, knowledge appears as an advantage in terms of the development of new viewpoints by experiences and innovations are exchanged (Kihitir, 2004). That is to say, it is accepted their own

differences of every member country to bring new ideas in the Union to boost the education system into a better level. EU in this way does not try to standardize its education system ignoring these differences in its education system and insist a unique educational policy; it sets the member countries free in applying a system suitable for their own national structures on the contrary. The harmonization of education systems more than the integration is deemed significantly with regards to the future of the Union. In this point, the basic approach of the Union in the field of education is to regulate the education systems of the member countries without contradicting each other (Tuzcu, 2006). The way of minimizing the negative states that can be emerged from the present differences is to develop policies inclined towards cooperating with EU's member countries in the field of education (Charlier and Croshe, 2005).

Despite EU supports the members countries to be applied their own national systems in the general education, the policies like broadening of vocational education, forming a common policy in vocational education, passing from vertical models of education to horizontal models of education, and teaching of two foreign languages at least before completing the compulsory education are accepted as *sine qua non* conditions (Aslan, 2010).

The historical course of EU educational policies has been assessed in different intervals by different authors. We are going to evaluate it in three phases as it was discussed by Charlier and Crosh (Charlier and Croshe, 2005).

### ***1.1. Towards a Common Policy (1957-1985)***

The first official assessment about EU educational policies was made in the Article 128 of the Roma Treaty in 1957. In the Roma Treaty, emphasizing on the importance of professional education for the free movements of services and persons, it was offered to provide the nostrification of diplomas abroad to raise free movements and encourage foreign language education (Besgul, 2013). However, these assessments could not have gone beyond the idea about emphasizing on the importance of education can develop the partnership (Duman, 2002).

The politic and economic factors leading European Economic Community (EEC) to be established since 1960's necessitated to cooperate in the other areas, too. However the Community foresaw the harmonization of educational area and its discussion in the eye of the Community, several members of the Community, France in the first, kept on defending that the education systems were to be treated also in the national platforms. As a result of this dichotomy experienced, it was accepted the educational policy to be continued under the intergovernmental cooperation out of the Community (Palayret, 1994).

Because EU had no an adequate experience and technique elements on developing an educational project special and specific to the Union in 1970's, the educational policy was not interested by the members as a field (Cakir, 2010). In that period, it was usually made some suggestions by recommendations on education.

Some problems, such feeling the effects of the oil shock in 1973 closely, the stagnation in the Community, and the unemployment of young generation, consolidated a belief in the field of education could be a solution way, and it was set about the studies on the way of realizing a closer cooperation also in the area of education (Ertl, 2003; Kilic, 2009). For these reasons, as the Community had not a leading educational policy containing all its members until 1980, the studies done showed to be attached importance to education by the perception on education would be an exit way for carrying out economic goals.

The decision taken by the Commission in 1974 for the vocational education is the foundation of vocational education system. By this decision, it was highlighted the education was a national system firstly and then reached a

consensus on establishing a committee consisting of the representatives of the member states to harmonize the national systems of the member countries in the integration process rather than standardizing and coordinate the educational programmes (Karaman, 2013). With the effect of these developments, it was made the first “Education Action Plan” by the decisions of EU Commission in 1976. Under this Action Plan, it was determined as the basic aims to facilitate the transition of young people from education to business life, improve the educational possibilities of migrant employees, develop the language education, and boost the cooperation in the higher education (Karluk, 2005). On the way of carrying out these aims, the importance attached to education started to increase because both some politicians saw education as a tool for forming a European Citizenship and the Union met with an economic mistrust during this period (Ertl, 2003).

In 1980, it was established Eurydice as a network of education and information to collect and spread reliable information in Europe about education systems and policies, put it into the service of those making educational policies, and contribute to constitute common policies based on the cooperation in the Community in this way (Kilic, 2009).

Consequently, the efforts of this period were limited only with statements of opinion because both the founding treaties had not any open authority on educational policies, the member countries considered education system as their own national issue, and they wanted to keep it in their own fields. The statements of opinion about the education were seen as an instrument on the way of carrying the economic goals out as parallel to the conjuncture of that period. The problems of unemployment and economic crisis at that time led to be focused mostly on vocational education. Regarding the educational policies of higher education, there was not any statement or information because the founding treaties did not mention any authorization in these fields.

### ***1.2. The Weakening of Legal and Political Limitations (1985-2000)***

In the period 1985-2000, it was started to mention about the higher education as a part of educational policies. These educational policies in the higher education went into the field of intervention of EU Commission because vocational education is considered as a phase of preparation for professional life. The political initiatives in the area of higher education were brought in a legal status in this manner, (Kilic, 1998, cited from Lonbay).

A prominent milestone about education in the history of the Community was realized by Single European Act (1986), which stipulated the completion of a single European internal market. It was accepted the completion of Single Market, which means free movements of goods, persons, capital, and services, to be dependent on human resources of the Community and development of these people’s skills. In this way, education became a new priority to the Community members. After this development, the member states started to develop educational opportunities to establish a single market, and it was started the exchange of students and lecturers in 1987 by the EU programmes like Erasmus Programme (European Commission, 1985).

The end of the Cold War refers to a period when EU experienced a transformation into the educational policies. By the members of the Eastern Bloc contributed to the Union, it was made some regulations on the educational policies. In this manner, it was started a reform process to provide the harmonization of new members, which were attended to the Union by 1990, in the Union (Cakir, 2010).

By the Maastricht Treaty that was signed in 1992, the education officially became one of the fields of EU educational policies and achieved a legal dimension (Coorparete and Public Strategy Advisory Group, 2009). In the Treaty, it was decided to constitute an EU formation to integration for every field among the member countries of EU. By this Treaty, Education, Vocational Education, and Youth Policies were firstly brought to agenda, and the aims of EU were fixed again in this way (Horvath, 2007). With the effect of acceleration brought with the Maastricht Treaty, EU accepted “*White Paper*” in the Brussels Summit in 1993 (Cakir, 2010).

EU published “*Green Paper*” in 1993 to provide young people improve their own skills for technological and social changes and contribute to the process of production more actively, and it accepted European Youth Programme III, too. In this Paper, it was brought in agenda to suit the labor force in parallel to technological developments and systematically develop the vocational-technical education emphasizing on its importance (Tuzcu, 2006).

In 1994, the Union prepared “*White Paper*” to form a social model in Europe as a continuation of “*Green Paper*.” In this Paper, there are some subjects like freedom of employees and equality of labor force (male or female). Because considered that it has not any effect apart from reducing quality of education, it does not give a place to any kinds of

discrimination like race, religion, language, and sex; sexual apartheid in the first. In this point, it is aimed at constituting a systemic educational policy setting a direct link between removal of unemployment and formation of educational policy (Tuzcu, 2006).

EU has some problems needed to overcome while constituting its vocational and technical policy of education. One of the most important of them is the problem of unemployment ruling across EU. This state, which leads young people completing their education live problems to find a job, causes that EU needs to solve this problem firstly because of the importance attached to vocational and technical education by EU. Another matter is the sustainability of lifelong education (European Commission, 1993). EU, with its vocational and technical policy of education, which it tries to constitute, tries to form a multinational structure against problems it will possibly meet in the future. Namely, generally it is not considered the period when the vocational and technical education system is provided, but assessed as a system for students to renew their knowledge continuously when they start in business life (Tuzcu, 2006).

In this point, when the national educational structures of each member country are considered from a general perspective, diversity appears as an advantage, but it is aimed at providing an increasing cooperation and harmonization in the vocational and technical education.

Some changes foreseen by EU for the higher education systems came in on the Sorbonne Declaration, which was accepted in 1998. Under the Declaration, it was aimed at providing international exchanges of students, teachers, and academicians, keeping national and international cooperation increasingly, achieving the nostrification of diplomas, and improving the language skills. In the Declaration, it was additionally offered that the higher education programmes were regulated as *graduate* and *postgraduate* (master's degree and doctorate) at the same time (Eurydice, 2010).

The EU's studies on the educational policy gained speed by the Bologna Process started in 1999 and the Lisbon Summit made in 2000 (TEPAV, 2006). The Bologna Declaration was prepared under the framework of the Sorbonne Declaration. The process following the Declaration was assessed as "*Bologna Process*." Despite the Bologna Process is a process designed separately from EU, EU has more effects on the process because most of its members are the member of EU and it was given a special status to EU Commission in the decision-making process. By the Bologna Process, the countries began to share their experiences in comparing their higher education systems with ones in the other countries and form regional cooperation to develop solutions against similar problems in which they live collectively. The objective is to form an Area for European Higher Education with different higher education systems of Europe and provide a harmony towards establishing a competitive system for European Higher Education System (European Commission, 2006).

As a result, this time became a period of time when the educational policies got a legal dimension more separately and the founding treaties were mentioned more than the previous period. The education in this period started to be used more on the way of realizing the aims of the Union. For the scope and content of the vocational education, which was considerable emphasized on education, some steps that are more concrete were taken. "Europeanness dimension" and "Europeanness conscious" among the basic philosophies of the Community began to come into prominence besides.

### **1.3. The Period of Consolidation After 2000**

The developments under the field of education by the end of 1990's were observed to increase. In the Lisbon Strategy, which became a milestone for EU education, it was aimed at bringing EU economy in a competitive, knowledge-based, and living state in a sustainable capacity of growth. Additionally, it was highlighted that common culture to be empowered in EU enlargement process and the diversity in language necessitated cooperating in education (Tuzcu, 2006). By this Strategy, it was fixed as a basic aim to bring Europe in a dynamic, competitive, and knowledge-based economy by 2010. In order to reach this foundational objective, EU tried to put some educational possibilities forwards in the fields of education, vocational education, and lifelong education for all citizens to benefit, after EU revealed the perspective on "*Education 2010*" for arriving at this goal (TEPAV, 2006).

It can be expressed that several EU principles on educational policies as a basis such as formation of multiculturalism, movement, education for all, profession information, and openness to the world (Topsakal and Hesapcioglu, 2001, cited from Freund, 1994). These principles offered the member countries to need to work on five basic areas in the following as the Commission emphasized in the Lisbon Summit:

*Quality:* All member countries should work for increasing quality in every phase of education and vocational education systems. It includes quality in general, quality of learning process, quality of teaching process for both the young and old the adult, quality of materials for helping people's learning, and quality of present teaching materials.

*Accessed:* All member countries should work for developing the accessed to learn and improving the lifelong learning for every phase of life. Here, it was emphasized on the role played by the member countries to develop the social harmony of education systems and on being sensitive to the conditions of learners for carrying out a more responsible and attractive learning at the same time.

*Contents:* All member countries should work for reviewing the basic skills of young people who left from primary school or education, and completely integrating them into information and communication technologies. Most of the member countries underline the role of education on transferring some social values of the Community like democracy and citizenship. This is at the same time the reason under all the interpretations made by the member countries about the role of education as a whole.

*Openness:* Most countries highlight to need schools, educational centers, and universities, which are opened to the world, for guarantying the spirit of openness (transparency) for member countries, other foreign countries, Europe, and a wider space, and in this manner the activities in this matter should be increased.

*Efficiency:* Despite the member countries mention about the increments in the expenditures of human resource, they emphasize on the need of making the quality assurance in the education systems more useful and convenient and on the efficiency of things introduced. Therefore, it should be worked for the suited resources to be used at best, and investments should be rightly directed to humane and financial conditions and processes (Commission of the European Communities, 2001).

As seen in these five basic elements, it is planned to be an important phase that the member countries adapt a common system (bachelor, master's degree, and doctorate) in their own national systems to reach the determined aims in the education system by aiming at constituting a more transparent education system in Europe. In this point, in order to establish European Higher Area via the Bologna Process, it has been achieved a consensus since 2010.

In 3 March of 2010, the report on "*Europe 2020: A European Strategy for Smart, Sustainable, and Inclusive Growth*" was published. Under the report, it is emphasized the initiatives in the field of *education, vocational education, and lifelong learning* under the smart growth need to be increased and aimed at boosting the quality of education and vocational education in every level and the employment opportunities of young population. In order to decrease the unemployment of young people, it is envisioned to benefit from young people's experiences, include them in the labor market, and increase the labor possibilities (Akas and Apar, 2010).

## **2. Educational Programmes of European Union**

EU tries to carry out its educational policies by its educational programmes. Thanks to these programmes, it is planned to develop both corporate and personal cooperation among the member countries of EU. When we express it in a general perspective, we see that the educational programmes operate for providing the donation support towards activities and projects to be performed in education and youth personally and corporately for the European people. By these programmes, while individuals increase their self-confidence within responsibilities that they take, they consolidate their conscious as citizens on the other hand. It is enabled to share different experiences with people in different culture who join to the programmes in an environment of understanding and cooperation. In this way, the aims of development and integration of EU, which it tries to reach by its educational policies, will be performed by people who have a European conscious and attend to the programme activities. The efficiency and sustainability of educational programmes are tried to provide by the education is carried out in every phase of life and in the strategy called "*Lifelong Learning*."

EU states that the educational system will generally provide three basic aims to be performed in this context. Firstly, it will be provided for a person to notice his own potentiality within education and contributed to his development for achieving a happy and productive life; secondly, differences and inequalities between individuals and groups will be reduced, and the development of community will be provided; finally, the (life satisfaction) level of employees will be pushed up to a level for fulfilling the needs of business life and entrepreneurs, and the improvement of economy will be gotten in this manner (Commission of the European Communities, 2001).

EU has various educational programmes that it has put into practice since 1987. These programmes have changed and showed sustainability on the way of reaching the expectations from the educational programme and achieving more applicable examples as to periods of time.

The first educational programme of EU is the programme called “COMETT”, which was accepted in 1987. This programme was designed for encouraging consultancies and contacts between the industry and the university in EU. As for Erasmus Programme, which follows this policy, both promotes the cooperative contacts among universities and aims at student mobility (Corporate and Public Strategy Advisory Group, 2009).

The other programmes applied since 1995 are *SOCRATES I-II* (1995-2006), *LIFELONG LEARNING* (2007-2013), and *ERASMUS+* (2014-2020).

### **2.1. Socrates I-II (1995-2006)**

EU conducted its educational activities for long years under “Socrates” Programme as EU General Programme of Education with the idea that education would be a very important factor in the future of Europe (Kihir, 2004). The first period of Socrates Programme was performed in between 1995 and 1999 for five years. The total budget for the first period of Socrates Programme in 1995-1999 was fixed as 933 million Euros (European Commission, 2001).

Socrates Programme was conducted in the fifteen countries and the other countries including in *European Economic Area* (Iceland, Liechtenstein, and Norway) in between 1995 and 1999. Since 1997, the programme was opened to Hungary, Romania, Czech Republic, and Greek Cypriot State. In the beginnings of 1998, Poland and Slovakia included in the programme. In the ends of 1998, while the three Baltic countries –Lithuania, Latvia, and Estonia– attended to the programme, and in the April of 1999, firstly Bulgaria and then Slovenia joined to the programme, too. Turkey included in Socrates Programme by the decision of European Parliament and Council, which was issued in Official Journal of the European Communities (24.01.2000), and its full participation occurred in the first April of 2004 (Rencber, 2005).

The Programme contains education of all age and tries to rise up the quality of education across Europe, encouraging cooperation among countries contributing to the programme. In this point, it is managed with some reasons like improving the information about European languages, being opened to innovation in education, and supporting mobility and cooperation during education. Additionally, it is tried to do studies, benefitting from experiences of different educational systems and respecting for linguistic variety of all countries contributing to the Programme. This Programme aims at all the actors in the educational life (Karluk, 2005).

Socrates II Programme was established, assessing the experiences obtained from the first period of the Programme to be conducted in between 2000 and 2006. It was tried to increase the efficiency of Socrates Programme in this manner (European Commission, 2006). The Programme encourages studying abroad, exchanging programmes for students and teachers, learning language, exchanging information, and the best practices in all grades of education (Horvath, 2007). The total budget left for the second period of the Program for 2000-2006 is 1,850 million Euros.

Socrates II Programme consists of several sub-action programmes and activities that enable teachers and students to have an experience about more different scientific, educational, and social situations than what they have in their own country and regions (European Commission, 2004). These fields of studies under the scope of the Programme are Erasmus (Higher Education), Comenius (School Training), Grundtving (Adult Education), Minevra (Open and Distance Education), Lingua (Encouraging Learning Language), Leonardo Da Vinci (Vocational Education) Youth Programme, Tempus Programme, and Erasmus-Mundus Programmes.

When looked at the general framework of these programmes, we see that it is opened to the benefits of young and adult people almost in all grades of education. The budget of mobility and the number of people benefitting may be indicated as a success of the programme. As a matter of fact, experiencing different cultures and educational systems mutually thanks to the mobility is a significant opportunity to contribute to both individual and social development

### **2.2. Lifelong Learning Programme (2007-2013)**

In this Programme started since 2007, it is aimed at the Union to have sustainable economic development, more and better works, and develop itself as an information society for lifelong learning. It includes doing studies for

exchange and cooperation to provide quality in consolidating as an important reference point. The Programme supports the activities of the member countries and respects for their differences in the educational systems.

This Programme, which covers the years between 2007 and 2013 and has about 3 billion Euros in budget, includes 27 EU members with Liechtenstein, Iceland, and Norway. By the Lifelong Learning Programme, it is aimed at realizing a social integration, providing better opportunities of business, and forming an information society under the roof of European Union (Toygur, 2012).

The sub-actions under the Programme are the programmes of Erasmus (Higher Education), Comenius (School Training), Leonardo Da Vinci (Vocational Education), and Grundtvig (Adult Education) (Turkish National Agency Website, 2006). These programmes are established on Socrates Programme. As it has the same scope and objectives, it is aimed at developing the Programme in being benefitted from experiences and reaching a wider mass. When we look at the Programme in a general perspective, we see that thousands of people benefit from the programme and contribute to both individual and social developments. Nevertheless, it can be criticized because there are many activities in the name of lifelong learning, each of them has separate procedures, and people have difficulty in accessing. Moreover, because it has changeable grants from country to country, the contributors see the Programme as inadequate. In this point, EU should contribute to minimize the problems in the practice of programmes at least and make the programmes more simple and flexible.

### **2.3. Erasmus Plus (+) Programme (2014-2020)**

Erasmus+ Programme is an educational programme of EU that is going to be conducted between 2014 and 2020 and to take the place of Lifelong Learning and Youth Programmes. Erasmus, Leonardo da Vinci, Comenius, Grundtvig, and Youth Programmes, which were performed in 2007-2013 under the framework of *Lifelong Learning Programmes* before, are united under an umbrella programme called “*ERASMUS PLUS*.” This Programme aims at bringing people in new skills without paying attention to their ages and educational experiences, consolidating personal development, and increasing employment possibilities (Turkish National Agency Website, 2013).

EU, with Erasmus+ Programme, plans to offer solutions for the unemployment problem, which increases among young people day by day and is one of the most urgent works of European countries especially. Because the number of people dropout from primary school raises, the risk of unemployment rises up for the adults having lower skills, too. In this manner, it is considered to offer solutions against these problems by the systems of education, business and youth that show a strong and good performance, the capabilities needed to a competitive economy, and a labor market are introduced to citizens. With another word, it is aimed at developing social capital among young people, motivating young people, and encouraging them for contribution to the democratic life in Europe (European Commission, 2013).

Androulla Vassiliou, who is a member of EU Commission and responsible for education, culture, multilingualism, and youth, informs about Erasmus+ Programme, expressing, “Erasmus+ Programme enables young people to increase their knowledge and skills abroad. Despite the large part of the budget is going to be spent for individual mobility, Erasmus+ is going to establish partnerships to people’s transition from educational life to business life, modernize the education in the member countries, and support the reforms to improve quality of education” (Euroaktiv, 2013). As we see from this expression, the basic activity field of the Programme is determined as providing exchange of individuals in mutual and increasing quality of education systems.

By this Programme, it is firstly given an opportunity of low interest loan (12.000-18.000 Euros) for students who want to study in Europe for their master’s degree education. Especially, importance attached by employers to master’s degrees has become a significant factor for EU to go into action in this matter (Euroaktiv, 2013).

The Programme is opened to the benefits of 28 member countries of EU, the programme countries, which are not a member of EU (Norway, Iceland, Liechtenstein, Switzerland, Macedonia, and Turkey), the third countries (Albania, Bosnia-Herzegovina, Kosovo, Montenegro, Serbia, Armenia, Azerbaijan, Belarus, Georgia, Moldova, Ukraine, Russian Federation, Algeria, Egypt, Israel, Jordan, Lebanon, Libya, Morocco, Palestine, Syria, and Tunis).

It is important for us to understand the changes in the educational policy of EU why EU needs a new educational programme. EU, via its educational programmes, keeps on its educational policies. One of reasons for a new attempt of programme is the end of operating period of the Lifelong Learning Programme, which was planned to apply between 2007 and 2013. EU has put a new umbrella programme forwards for this programme of which expiration date was

definite in the beginning. Another or the most important factor is interested in the strategy of growth and employment, which EU determined in its 2020 Strategy due to economic conditions. The exit point of EU in the 2020 Strategy is concerned with some structural problems and developments like globalization and climate changes in the world and the population aging in Europe. A structural transformation is aimed by the effects of these problems on EU are discussed (Akas and Apar, 2010).

One of the important concepts in the strategy is education. It was considered that the consolidation of education system would be one of the most effective ways to struggle with inequality and poverty. The most significant educational aims in the strategy were determined as realizing the lifelong learning and mobility, increasing the quality and efficiency of educational and training system, encouraging equality, social harmony, and active citizenship, and urging the efforts toward ingenuity and innovativeness in every grade of education, including entrepreneurship (Official Web Site of TR Ministry of EU, 2013). In this point, it is planned to raise the accessed of higher education up to 40% from 32% in according with the determined aims and reduce the dropout rate (before graduation) down 10% from 18%. This rate is 40% in USA, and 50% in Japan. It is among EU's indispensable aims to increase the number of student who study in the university (IKV Bulletin, 2013). Consequently, Erasmus+ Programme aims at helping people to have more and better skills with its opportunities of studying and working abroad in conformity with the 2020 Strategy of EU (Commission of European Community, 2009).

It is expressed that Erasmus+ Programme will differ from the programmes that were applied in the previous periods because it is more flexible and more accessible to programmes. It can be seen only in the future years to what extent the flexibility and accessibility will occur in practice. Nevertheless, overcoming the problems in the previous periods will increase the fertility and the efficiency of this programme that will be applied yet.

### **3.Conclusion And Suggestions**

Social and economic changes coming with globalization, and economic and politic aims that EU has since its foundation necessitate EU to cooperate with the member countries also in the field of education and to develop policies in this area. Here, the studies of EU in the field of education occur at the heart of economy, and this approach is criticized because there is not any change in practice despite a different interpretation is put in the developing process. In the same way, the idea about vocational education policies are usually expressed when EU educational policies are in question, education is introduced to the problem of unemployment as a solution, and well-learned people are more resistant on struggling with economic crisis does support this critique.

Different styles of culture, language, belief, and life, which EU has, bring the variety of educational systems with it. However, EU tries to develop its educational policies in respect for these differences. In this point, this variety is perceived as an advantage especially when looked at the general education, and EU sees as an opportunity to benefit from different kinds of culture, language, belief, and life instead of trying to make a monotype educational policy. Nevertheless, the main target in the vocational education becomes cooperation and harmonization increasingly.

It will not be a mistake to express that the reason of importance attached to the educational policies by EU is related to its problems of economic crisis and unemployment. In this context, EU tries to increase the number of individual who starts to study in higher education because EU thinks graduates from higher education are more resistant to struggle with economic crisis and more advantageous to find a job.

When we look at the EU educational programmes in general, we can say there are some deficiencies in practice despite the number of people benefitting from the programme shows that people are successful in the programme. In addition, because there are programmes more than one under the roof of a single programme and each of them has a different complex application process, the accessed of individuals to the programme becomes difficult. The inadequacy of budget, left for the beneficiaries of programme, appears as another problem. That's why, the budget left for the programmes should be increased and provided an adequate support. While the economic conditions in which EU is today do not allow to the grant increment, EU may not possibly want to make these arrangements to reach more beneficiaries. However, it can be reached the wanted targets by solving these problems and increasing the fertility and efficiency of the educational programmes in special and the educational policies in general.

## Abstract

The aim of this research is to study the relations between Critical Thinking Dispositions and entrepreneurship levels of future teachers and to evaluate them in terms of some demographic variables. Relational scanning model were used in this study. The California Critical Thinking Disposition Inventory (CCTDI) developed by Facione, Facione & Giancarlo (1998) and adapted to Turkish by Kökdemir (2003), Entrepreneurship Scale (ES) developed by Yılmaz & Sünbül (2009) were used as the data collection tool. The sample of this study is formed by 548 pre-services from Science, elementary school, mathematics, social studies Education, Department of Faculty of Education. In order to analyze the data, ANOVA, independent group t-test, Pearson correlation coefficient analysis, regression analysis were used. Between scales has been found a positive correlation. It has been seen that critical thinking dispositions have a significant effect on entrepreneurship levels. There are statistically significant differences on gender, high school and department variables in terms of CCTDI. Also, statistically significant differences were determined on grades in terms of ES.

## 1. Introduction

Entrepreneurship is a comprehensive concept which is an substantial element of all economies in the world. Entrepreneurs are crucial to make contributions to the nations through creating new economic activity. It strengthens competition between developed economies and has potential economic benefits for society as a whole (Soriano, 2011). Entrepreneurs procure job opportunities for the unemployed, endorse innovation and creativity. Although the origin of the term “entrepreneur” has been traced to famous economist and author Richard Cantillon in 1755, entrepreneurship is still broadly discussed by many scholars. The definition has gone beyond merely creating new businesses (Gartner, 2010) and transformed into a process of seeking opportunities which includes creative, innovative and risk taking individuals, intentions and environmental factors (Stevenson & Jarillo, 1990; McKenzie, Ugbah & Smothers, 2007). Entrepreneurism is to create a value by engendering a novelty, using creative skills or by finding a new production, service, source, technology or markets in other ways (Bird, 1989). In this context it can be seen that in entrepreneurship concept factors like: novelty, alteration, flexibility, dynamism, taking risks, creativity and focusing on improvement are affective (Korkmaz, 2000). Successful entrepreneurs possess characteristics such as desire for success, creativity, enthusiasm, risk taking, self confidence, locus of control, vision, persuasiveness, adaptability, determination, assertiveness, optimism, imagination, other motivational factors and personal values (Khan, 1986; Raposo, Do Paço & Ferreira, 2008). As it is seen, entrepreneurship requires a unique personality and a mind-set.

Decision making has gained a major significance in the age of information. The way of thinking has been debated over the years and critical thinking abilities came forward in the literature. The term critical thinking refers to the use of cognitive skills or strategies that increase the probability of a desirable outcome, evaluating the outcomes of thought

processes, how good a decision is or how well a problem is solved (Halpern, 1998). Critical Thinking can be defined as an effective, organized and operative cognitive period enabling us to improve understanding our own thoughts and others ideas and our skill to explain the opinions (Chaffe, 1994). According to various researches, evidence show that individuals are able to gain critical thinking abilities through proper guidance. Therefore, future teachers' thinking abilities can be enhanced if it is possible to consider notions such as looking for novel approaches and reject myths (Pithers & Soden, 2010).

Considering the fact that entrepreneurship has evolved from mere business meaning into creating innovative ideas and processes, teachers might also benefit from the concept. Considering all these changes, it is necessary that countries should rearrange their educational programs. In this context, in Turkey as well, the updated teaching programs encourage critical thinking, creative thinking, communication, research- questioning, problem solving, information technologies, entrepreneurship and using Turkish language correctly and effectively with an approach that puts the students in focus point (MEB, 2005). One of the basic skills in primary school programs, entrepreneurship is one of the key factors for individuals to reach information, use and apply information in new situations (Aytaç, 2006). Along with this, the entrepreneurship skills of students are related to the personal and occupational qualifications and entrepreneurship skills of their teachers (Bacanak, Ülküdür & Öner, 2012).

## **2.The Aim of the Research**

The aim of this research is to study the relations between critical thinking dispositions and entrepreneurship levels of future teachers and to evaluate them in terms of some demographic variables.

## **3.Hypotheses**

Hypothesis 1: Critical thinking dispositions levels of teacher candidates differentiate according to the varieties of gender, department, class, and graduated secondary school.

Hypothesis 2: Entrepreneurship levels of teacher candidates differentiate according to the varieties of gender, department, class, and graduated secondary school.

Hypothesis 3: Critical thinking dispositions have a significant effect on entrepreneurship Levels of teacher candidates.

## **4.Methods of the Research**

In this study, quantitative research method and relational screening model has been used.

### **4.1.Sample of the Research**

The sample of this study is formed by 548 teacher candidates from departments of science, social studies, elementary school, mathematics at Education Faculty. 167 of participants (30.5%) were from the department of science, 129 of them (23.5%) were from the department of elementary school, 143 of them (26.1%) were from the department of mathematics, 109 of them (19.9%) were from the department of social studies, 397 of the participants (72.4%) were female and 151 of them (27.6%) were male.

### **4.2.Data Collection Instruments**

Data collection tool consists of three parts. In the first part personal data such as the gender, department and graduated secondary school have been collected. Second part includes The California Critical Thinking Disposition Inventory (CCTDI-R) which is developed by Facione, Facione & Giancarlo (1998) and adapted to Turkish by Kökdemir (2003). Third part includes Entrepreneurship Scale (ES) which is developed by Yılmaz & Sünbül (2009)

The California Critical Thinking Disposition Inventory (CCTDI-R): As a data collection tool, The California Critical Thinking Disposition Inventory (CCTDI) was developed by Facione, Facione & Giancarlo (1998) and was translated

and validated in Turkish by Kökdemir (2003) has been used. Cronbach's alpha coefficient, which shows internal consistency for the dimensions of the CCTDI-R were calculated as .75 in analyticity dimension, .75 in open-mindedness dimension, .78 in inquisitiveness dimension, .77 in self-confidence dimension, .61 in truth-seeking dimension, and .63 in systematicity dimension. Cronbach's alpha coefficient of the latest scale which was translated in Turkish by Kökdemir (2003) and has six dimensions and 51 items was calculated as .88. The scale was prepared as six – point Likert scale. Six-point Likert type scale shows “totally agree” option 6, “disagree” option 1 point. Six-point Likert type scale responses were collected. Raw scores were calculated for total scale and each factor. The raw scores were divided by the number of questions. In this way, the lowest value 1, and the highest value 6 standard scores are obtained. (Kökdemir, 2003).

Entrepreneurship Scale (ES): In the study; “Entrepreneurship Scale (ES)” which is developed by Yılmaz & Sünbül (2009) to determine students' entrepreneurship levels was used as the data collection tool. The scale was prepared as five–point Likert type scale. The factor analysis of the questionnaire responses using Principal Component Analysis resulted in 36 items which loaded on one factor. Cronbach Alpha coefficient was of found to be  $\alpha=0.90$ . The minimum and the maximum score that can be taken from the scale are between 36-180. Entrepreneurship points based on the following criteria were included in the evaluation.

Points	ES Evaluation
36-64	Very low entrepreneurship
65-92	low entrepreneurship
93-123	Mid-level entrepreneurship
124-151	High entrepreneurship
152-180	Very high entrepreneurship

### 3.3. Analyzing Data

SPSS 16.00 is used to analyze the data. ANOVA, independent group t-test, Kruskal-Wallis test have been conducted to monitor the scores taken from the scales in terms of demographic varieties. PEARSON correlation coefficient analysis technique and Regression Analysis are applied in order to observe the relations between scales. In all statistical processes significance at a level of .05 has been sought.

## 5. Findings

The sample of this study is formed by 548 students from Education Faculty. In this study, the taken total The California Critical Thinking Disposition Inventory (CCTDI-R) scale score was calculated as 4.1926 . The minimum and the maximum score that can be taken from the Entrepreneurship Scale (ES) are between 36-180. In this study, the taken total Entrepreneurship Scale (ES) score was calculated as 155.4394 (Table 1).

Table 1. Distribution of scores of teacher candidates taken from CCTDI-R scale according to the factors and Entrepreneurship Scale.

Scale	X	SD	SE
CCTDI-R Scale	Analyticity	4.3595	.55778
	Open-Mindedness	3.9256	.49588
	Inquisitiveness	4.3112	.55864
	Self-Confidence	4.2242	.58454
	Truth-Seeking	4.2500	.66410
	Systemacity	4.1670	.63790
	CCTDI-R Scale Total	4.1926	.43277
ES Total Score		131.3412	20.25600

As in table 2, as a result of independent group T-test applied to define whether the scores taken from the CCTDI-R scale and factors differentiate according to the gender variable; for the CCTDI-R scale total score and all factor scores the difference between the arithmetic average of the groups have been found statistically significant. Female students' score average is significantly higher than the Male students ( $p<.05$ ). The result of independent group t-test applied to

define whether the scores taken from the Entrepreneurship Scale differentiate according to the gender variable; for the Entrepreneurship Scale total score the difference between the arithmetic average of the groups have not been found statistically significant ( $p>.05$ ).

In this study, independent groups t-test and ANOVA have been used to test the hypothesis 1 and hypothesis 2.

Table 2. The results of Independent group t-test of the scores taken from CCTDI-R scale and factors and Entrepreneurship Scale according to the gender variable of teacher candidates.

Scale	Group	N	X	SD	SE	t-test		
						t	df	p
CCTDI-R Scale	Analyticity	Female	397	4.4552	.53135	6.773	546	.000
		Male	151	4.1079	.54888			
	Open-Mindedness	Female	397	3.9652	.48780	3.048	546	.002
		Male	151	3.8217	.50351			
	Inquisitiveness	Female	397	4.3602	.54510	3.358	546	.001
		Male	151	4.1825	.57497			
	Self-Confidence	Female	397	4.2814	.56761	3.759	546	.000
		Male	151	4.0738	.60336			
	Truth-Seeking	Female	397	4.3235	.66151	4.266	546	.000
		Male	151	4.0568	.63333			
	Systemacity	Female	397	4.2338	.63007	4.034	546	.000
		Male	151	3.9912	.62680			
	CCTDI-R Scale Total	Female	397	4.2551	.41877	5.634	546	.000
		Male	151	4.0283	.42721			
	ES Total Score	Female	397	131.7582	20.10822	.781	546	.435
		Male	151	130.2450	20.66687			

As seen in Table 3 as a result of ANOVA which is done in order to determine whether the scores taken from the Profound Approach and Superficial Approach factors show a significant difference according to the department variable; for the superficial approach factor scores the difference between the arithmetic average of the group has been found statistically significant but the difference has been found to be insignificant for the profound approach factor. Following this process Post-Hoc analysis techniques are started to be applied.

After ANOVA; to determine the changes in CCTDI-R scale and factors among sub-groups, considering the department variable, LSD test has been chosen from among the post-hoc analysis techniques; because of Analyticity, Open-Mindedness, Inquisitiveness, Self-Confidence, Systemacity factors and CCTDI-R Scale group variance are homogen according to the Levene's test ( $L=1.522$ ,  $L=.735$ ,  $L=.725$ ,  $L=.565$ ,  $L=.565$ ,  $L=.859$ ,  $p>.05$ ), Tamhane test has been chosen from among the post-hoc analysis techniques; because of Truth-Seeking factor group variance are not homogen according to the Levene's test ( $L=2.856$ ,  $p<.05$ ). As a result of this test it has been stated that, Science Education students' score are significantly higher than all other department students' score for Analyticity, Inquisitiveness, Self-Confidence, Truth-Seeking Factors and CCTDI-R Scale total score, Science Education students' score are significantly higher than Elementary School and Mathematics Education department students' score for the Open-Mindedness Factor scores, Science Education students' score are significantly higher than Elementary School and Social Studies Education department students' score for the Systemacity Factor scores.

As a result of non-parametric Kruskal-Wallis test which is done in order to determine whether the scores taken from the Entrepreneurship Scale show a significant difference according to the department variable; for scale scores the difference between the arithmetic average of the group has been found to be insignificant statistically ( $\chi^2=6.525$ ,  $Sd=3$ ,  $p>.05$ ).

Table 3. The results of ANOVA applied to define whether the scores taken from CCTDI-R scale and factors differentiate according to the department variable of teacher candidates.

As a result of ANOVA which is done in order to determine whether the scores taken from the CCTDI-R scale and factors show a significant difference according to the class variable; the difference between the arithmetic averages of the group has been found to be insignificant statistically.

As seen in table 4 as a result of ANOVA which is done in order to determine whether the Entrepreneurship Scale show a significant difference according to the class variable; the difference between the arithmetic averages of the group has been found statistically significant.

Following this process Post-Hoc analysis techniques were applied. After ANOVA; to determine the changes in Entrepreneurship Scale among sub-groups, considering the class variable, LSD test has been chosen from among the post-hoc analysis techniques; because of group variance are homogeny according to the Levene's test ( $L=1.759$ ,  $p>.05$ ).

As a result of this test it has been stated that senior students' score are significantly higher than all other class students' score for Entrepreneurship Scale total score.

Table 4. The results of ANOVA applied to define whether the scores taken from Entrepreneurship Scale differentiate according to the class variable of teacher candidates.

Group	N,X and SS Values			ANOVA Results					
	N	X	SS	Var. K.	SS	df	MS	F	p
1.Grade	161	130.0497	20.89402	Between	8955.104	3	2985.035		
2.Grade	133	128.0000	20.74009	Within	215482.083	544	396.107	7.536	.000
3.Grade	129	129.3178	18.16848	Total	224437.188	547			

As seen in table 5 as a result of ANOVA which is done in order to determine whether the CCTDI-R scale and factors show a significant difference according to the graduated secondary school variable; for scale total score and Analyticity, Inquisitiveness, Truth-Seeking factors scores the difference between the arithmetic average of the group has been found statistically significant. Following this process Post-Hoc analysis techniques are started to be applied.

After ANOVA; to determine how changed in CCTDI-R scale and factors among sub-groups, considering the graduated secondary school variable, LSD test has been chosen from among the post-hoc analysis techniques; because of Analyticity, Inquisitiveness, Truth-Seeking factors and CCTDI-R Scale group variance are homogeny according to the Levene's test ( $L=.415$ ,  $L=.537$ ,  $L=.009$ ,  $L=.208$ ,  $p>.05$ ).

As a result of this test it has been stated that, graduated public high school and anatolian high school students' score are significantly higher than graduated teacher high school students' score for Analyticity, Inquisitiveness, Truth-Seeking Factors and CCTDI-R Scale total score.

As a result, for scale scores the difference between the arithmetic averages of the group has been found to be insignificant statistically.

As a result of Pearson Multiplication Momentum Correlation Analysis, conducted to define the relations between the CCTDI-R scale and factors and Entrepreneurship Scale score have a significant positive relation (Table 6).

In order to determine whether there is a significant effect of CCTDI-R scores on entrepreneurship scale, linear regression analysis has been conducted. It has been seen that critical thinking dispositions have a significant effect on entrepreneurship levels ( $R=0.507$ ,  $R^2=0.257$ ,  $F=188.766$ ,  $p<.01$ ). According to the results, 25.7% of the variation in entrepreneurship levels is explained by the variation in critical thinking dispositions (Table 7) Therefore, hypothesis 3 is accepted.

Table 5. The results of Independent group t-test of the scores taken from SRLS scale and factors according to the gender variable of students.

F <sub>(1,546)</sub> =188.766		P=0.000				

## 6.Results

It has been seen that the teacher candidates included to the research have very high entrepreneurship levels with the score of 155.4394. One of the sub-problems of the research is whether there is a differentiation on entrepreneurship levels and critical thinking dispositions according to the varieties of gender, department, class, and graduated secondary school. The statistical evidence shows that on the CCTDI-R scale total score and all factor scores the difference between the arithmetic averages of the groups have been found statistically significant. Female teacher candidates' score average is significantly higher than the male teacher candidates.

On the other hand, for the Entrepreneurship Scale total score the difference between the arithmetic averages of the groups have not been found statistically significant in terms of gender. Furthermore, for critical thinking dispositions scale total score and all factors scores, the difference between the arithmetic averages of the group has been found statistically significant. Science Education students' score are significantly higher than all other department students' score for Analyticity, Inquisitiveness, Self-Confidence, Truth-Seeking Factors and CCTDI-R Scale total score, Science Education students' score are significantly higher than Elementary School and Mathematics Education department students' score for the Open-Mindedness Factor scores, Science Education students' score are significantly higher than Elementary School and Social Studies Education department students' score for the Systemacity Factor scores. This might show the differences between methods and perspectives of those disciplines.

Another important result is that senior students' score are significantly higher than all other class students' score for Entrepreneurship Scale total score. It might be interpreted into the awareness of employment opportunities as students approach to graduation.

It has been stated that, graduated public high school and Anatolian high school students' score are significantly higher than graduated teacher high school students' score for Analyticity, Inquisitiveness, Truth-Seeking Factors and CCTDI-R Scale total score.

As we argued before, the results show that there is a correlation between critical thinking dispositions and entrepreneurship levels of teacher candidates. Also, there is evidence that critical thinking dispositions have a significant effect on entrepreneurship levels.

For further research, other variables related to entrepreneurship levels might be examined. Additionally, teacher candidates in various disciplines might be included to further investigations.

**Article Title : The Effect of Educational Context on Affective Characteristics at Korean Students based on TIMSS Mathematics Results**

**Presentation Type: Video Presentation**

**Sangwook Park**(Research Fellow, Korea Institute for Curriculum and Evaluation)

**Jaok Ku** (Research Fellow, Korea Institute for Curriculum and Evaluation)

Korean students have shown high achievement on mathematics through international achievement tests such as Programme for International Student Assessment (PISA) and Trends in International Mathematics and Science Study (TIMSS). However, their affective domains, such as interest, self-efficacy, and value recognition, in the mathematics subject were ranked last among countries. It has been required to make a plan to progress students' affective characteristics in the mathematics subject.

In this paper, the effects of educational contexts on students' affective domains (interest, self-efficacy, and value recognition) in mathematics subject were statistically analyzed and reported. Grade 8 Korean students in TIMSS 2011 were selected and Hierarchical Linear Model (HLM) was used for statistical data analysis. The results showed that the number of books at home, home resources, parents' interest on study, attitude toward to school, class participation, years of teacher career, frequency of homework, and application of homework affected on students' affective domains, positively. On the other hand, teacher satisfaction and no experience of bullying affected on students' affective domains, negatively. The affective characteristics of male students are higher than those of female students in mathematics.

# The effect of gender and socio-economic status of students on their physics conceptual knowledge, scientific reasoning, and nature of science understanding

## Abstract

We examined the effect of gender and socio-economic status of Turkish 8<sup>th</sup> graders on their conceptual knowledge, scientific reasoning, and nature of science (NOS) understanding. Results showed females performed better than males on physics conceptual knowledge test. However no difference between males and females was found for scientific reasoning and NOS understanding. Besides high SES students performed better than low SES students on scientific reasoning and NOS test. No physics conceptual knowledge difference was found between low and high SES students. Implications for science education were discussed according to these findings.

## Introduction

Factors affecting students' science achievement have been a concern in science education. Self efficacy (Lawson et al., 2007), prior knowledge (Acar, 2014a; Coletta & Phillips, 2005; O'Reilly & McNamara, 2007; Yenilmez, Sungur, & Tekkaya, 2006), and scientific reasoning (Johnson & Lawson, 1998) have been found to affect science achievement. Besides these factors, students' SES explained more of the science achievement variance in an international assessment (The Organisation for Economic Co-operation and Development, 2013). In addition it was found that females perform better than males on topics related to biology (Alparslan, Tekkaya, & Geban, 2003; Yenilmez et al., 2006) however this case turns to reverse on topics related to physics (Cavallo, Potter, & Rozman, 2004).

In Turkey, females perform better than males in science (Bursal, 2013; Milli Eğitim Bakanlığı, 2013). Moreover high SES students perform better than low SES students (Milli Eğitim Bakanlığı, 2013). Although gender and different SES groups' science achievement differences have been studied in Turkey, paucity of study exists in the literature which examined the effect of these factors on student nature of science understanding and scientific reasoning. Furthermore although gender conceptual knowledge differences were examined in biology related topics (Alparslan et al., 2003; Yenilmez et al., 2006), few study exists which examined this issue in physics related topics. To close these gaps in the literature, this study examined the effect of student gender and SES on their physics conceptual knowledge, nature of science, and scientific reasoning. Following research questions were sought for this aim:

R.Q.1. Are there any gender differences in physics conceptual knowledge, nature of science, and scientific reasoning?

R.Q.2. Does student SES has an effect on their physics conceptual knowledge, nature of science, and scientific reasoning?

## **Method**

### *Research Context and Participants*

This study was conducted in an industrial city in Turkey. Two school regions were selected for the aim to categorize students under different SES groups. One of these regions was in a suburban area. Families residing in this region were mostly emigrants from other cities and had low SES. The other region was in an urban area. Families in this region, on the other hand, mostly had high SES. Two 8<sup>th</sup> grade classes from each region were selected. Although 96 students participated in this study, only students who completed all the instruments used in this study remained in the final sample. As a consequence a total 26 8<sup>th</sup> grade students in low SES region and 20 students in high SES region constituted the final sample. 20 students were female and 26 students were male.

### *Instruments*

#### *Conceptual knowledge test*

This test was used to assess 8<sup>th</sup> graders conceptual knowledge about sound, heat and temperature, matter states and heat, electricity in our life, and natural processes. Since this test was administered before students were instructed about these concepts, it assessed students' prior knowledge about these concepts. There were 17 multiple choice items in the test. Several items were selected from different student study books. Other items were constructed by the researchers. Science teachers participated in this study examined the test for content validity before the study took place. Student responses were coded as 1 if they answered an item correct otherwise they were coded as 0.

#### *Scientific reasoning test*

This test was originally developed by Lawson (1978). In its original form, there were questions about conservation of mass, control of variables, proportional reasoning, correlational reasoning, and probabilistic reasoning. Questions related to hypothetical reasoning were included in a modified version (Lawson, 2000). There were 24 items in the test. This version of the test was translated to Turkish by the first author and an expert from Teaching English as a Second Language department edited any vague statement in this translation. Students' responses were coded as 1 if they answered a question correct otherwise they were coded as 0.

#### *Nature of science test*

Bora (2005) used selected items from nature of science (NOS) test developed by Aikenhead and Ryan (1992) to examine NOS understandings of high school teachers and students. This modified version was used in this study to assess 8<sup>th</sup> graders' NOS understanding. There were 25 multiple choice items in the modified version. Each item's multiple choices were rated by scientists for their relation to contemporary understanding of NOS as realistic, acceptable, and insufficient in Bora's (2005) study. We adopted this coding in the present study. Accordingly, multiple choices that were defined as realistic were coded as 3, acceptable were coded as 2, and insufficient were coded as 1.

## Results

### *R.Q.1. Is there any gender differences in conceptual knowledge, nature of science, and scientific reasoning?*

To test the first research question, analyses of variances (ANOVA) was performed for physics conceptual knowledge, scientific reasoning, and nature of science understanding separately. In these analyses, gender was the independent variable. According to the result of the first ANOVA, conceptual knowledge scores between females and males differed significantly ( $F_{(1, 44)} = 12.65, p = .00$ ). This result means that females performed better than males on physics conceptual knowledge according to the mean scores seen in Table 1. According to the result of the second ANOVA, scientific reasoning performances of females and males were similar ( $F_{(1, 44)} = 1.69, p = .20$ ). Finally the result of the last ANOVA showed that females and males did not differ significantly on NOS scores but the difference got closer to .05 significance level ( $F_{(1, 44)} = 3.15, p = .08$ ).

Table 1. Descriptive statistics of female and male students on study measures

	Conceptual Knowledge		Scientific Reasoning		Nature of Science	
	<i>M</i>	<i>SD</i>	<i>M</i>	<i>SD</i>	<i>M</i>	<i>SD</i>
Females*	8.20	2.04	8.95	3.09	50.30	3.34
Males**	6.35	1.50	7.73	3.21	48.42	3.71

\*n=20, \*\*n=26

### *R.Q.2. Does student SES has an effect on their conceptual knowledge, nature of science, and scientific reasoning?*

An ANOVA was performed separately for each study measure to examine the second research question. In these analyses, SES type was the independent variable. Result of the first ANOVA showed that low and high SES students did not differ on conceptual knowledge scores ( $F_{(1, 44)} = 1.46, p = .23$ ). On the other hand, second ANOVA's result showed there was a statistical difference between these groups on scientific reasoning scores ( $F_{(1, 44)} = 7.13, p = .01$ ). If we examine the mean scores in Table 2, this result means that high SES group students scored higher than low SES group students. A final ANOVA was performed on NOS scores. The result showed low and high SES group students' NOS scores were different from each other ( $F_{(1, 44)} = 5.89, p = .02$ ). This result suggests that high SES group students scored higher than low SES students on NOS test according to the mean scores at Table 2.

Table 2. Descriptive statistics of low and high SES students on study measures

	Conceptual Knowledge		Scientific Reasoning		Nature of Science	
	<i>M</i>	<i>SD</i>	<i>M</i>	<i>SD</i>	<i>M</i>	<i>SD</i>
Low SES*	6.85	1.95	7.23	2.70	48.15	3.44
High SES**	7.55	1.96	9.6	3.32	50.65	3.48

\* n=26, \*\*n=20

## Discussion

According to the results females performed better than males on physics conceptual knowledge test but both genders scientific reasoning and NOS scores did not differ. In addition, high SES students outperformed low SES students on scientific reasoning and NOS tests but not on physics conceptual knowledge test. Result regarding females' conceptual knowledge advantage over males is consistent with the results of previous research conducted in Turkey (Alparslan et al., 2003; Yenilmez et al., 2006). Since scientific reasoning is a good predictor of science achievement (Johnson & Lawson, 1998) and no gender difference was found on this measure, we can be hopeful to expect similar science achievement between males and females in the future. In fact, fostering argumentation in science classrooms can reduce the conceptual knowledge gap between males and females (Acar, 2014b). Our result regarding NOS understanding relation to students' SES is alignment with the finding of Bora (2005). We recommend including more instructional activities regarding scientific reasoning and NOS understanding in science classrooms

for low SES students to enhance their science achievement. On the other hand, low and high SES students' physics prior conceptual knowledge seems to be similar because they may be exposed to similar information about these concepts before the formal science instruction.

---

## Abstract

The oldest social work education institution of Turkey is Hacettepe University Department of Social Work. One of the most important goals of the Theory of Social Work 2 course given in this department is to improve the application skills of students. Thus, a group work is conducted with voluntary students throughout this course where the instructor functions as a facilitator. In this group work, students are expected to develop an insight and self-awareness of themselves. The present study aimed at determining the effect of group work on the self-efficacy of the 2<sup>nd</sup> grade students receiving social work education. The group work was constructed on the basis of creating awareness for them to know themselves. Therefore, the pretest-posttest comparison group design was employed. The general self-efficacy scale was used as the pretest tool and the posttest tool. Based on the said design, 46 students (12 people constituting the in-group and 34 people constituting the out-group) were included in the study. A group work lasting 6 weeks was conducted with the in-group. The out-group, on the other hand, only observed the group work, and took notes. Then the differences between the scores obtained by the in-group members before the group work and the scores obtained by them after the group work were examined, and the differences between the in-group and the out-group score averages before and after the group work were analyzed.

## 1. Introduction

Group work is one of the important intervention methods in the application of social work. It involves such skills as helping one another, strengthening people, and understanding people despite differences (Gougeon, 2002), and provides various advantages including but not limited to empathy, feedback, hope-instilling, mutual assistance, normalization, socialization, social support, and approval (Toseland and Rivas, 2009). Besides such advantages, the inclusion of social work students in self-knowledge oriented group work is of big importance for the development of their insight and self-awareness.

Insight and self-awareness intended to be developed via group work may affect the self-efficacy of students. Self-efficacy is described as people's beliefs in their capabilities to produce given attainments in specific contexts (Bandura, 1977, 1986). According to Bandura (1997), self-efficacy, which is cognitive in nature, is open to effects and change to be introduced by knowledge. Efficacy expectations provide a gap for the prediction of formation, development, generalization, and permanence of the coping behavior. General self-efficacy, on the other hand, refers to a person's belief in his/her capability to cope with stressful and difficult life events in general (Scholz and Schwarzer, 2005). They

---

E-mail address: meliketunc@yahoo.com.tr

are also defined as an individual's general confidence in view of new situations which s/he encounters in various fields and are unusual or difficult to cope with (Scholz, Gutierrez-Dona, Sud and Schwarzer, 2002).

Raising awareness and acquiring insight may be dynamics of the group work and affect one another due to in-group and out-group effects. Thus, the performance of the group work with students in a protected and safe environment may enable students to express themselves more comfortably. For that reason, awareness-raising efforts on the basis of self-knowledge may encourage students to develop more effective coping strategies. This is because; according to the research findings provided by Luszczynska et al., while high general self-efficacy beliefs were mostly associated with the selection of effective coping strategies (planning, seeking for knowledge, having a positive attitude towards the problem, etc.), low general self-efficacy beliefs were mostly related to passive coping behaviors (self-condemnation, interrupting and doing nothing behavioral, etc.) (Luszczynska et al., 2005). As can be understood from the definition of self-efficacy, individuals may cope with the different life events they encounter and produce solutions for them only by knowing themselves.

In consideration of the foregoing, the present study aimed at determining the effect of the group work constructed on the basis of self-knowledge on the self-efficacy of the 2<sup>nd</sup> grade students receiving social work education.

## **2. Method**

The pretest-posttest comparison group design was employed in the current study. The general self-efficacy scale was used as the pretest tool and the posttest tool. Based on the said design, 46 students (12 people constituting the in-group and 34 people constituting the out-group) were included in the study. A group work lasting 6 weeks was conducted with the in-group. The out-group, on the other hand, only observed the group work, and took notes. The group sessions took averagely 90 minutes each week.

The group process was constructed as follows;

1<sup>st</sup> Session: The group members introduced themselves, and group rules were determined. In this session, the group members were asked to add a concept to their names, and the reasons for the selection of such concepts were discussed. The aims of participation in the group and the expectations from the group were touched upon.

2<sup>nd</sup> Session: The previous session was evaluated, and the sculpture & animal activity was conducted in order to reveal the perspectives of the group members on themselves. Each group member performed the animal or sculpture s/he desired. Then discussions were made on why the group members selected such animals or sculptures, what they felt when performing such animals or sculptures, and how related such animals or sculptures were with them.

3<sup>rd</sup> Session: The previous session and its effects on the group members were evaluated. The paper pieces prepared by the group facilitator that were in different colors and forms and were not fit for any specific pattern were chosen by the group members. Then discussions were made on why the group members selected such pieces. In addition, whether they were able to choose immediately or they had difficulty in choosing was addressed. The name "group turtle" was given to the group.

4<sup>th</sup> Session: The previous session was evaluated. In this session, the group became integrated. The integrity of the group manifested itself especially when the members not participating in the group felt themselves incomplete. Thus, the "sailing" activity was conducted. Everyone performed whomever they wanted on board. Then the ship sank. This scenario questioned what the group members did and why they did so. The activity was aimed at seeing group belonging and integrity in particular.

5<sup>th</sup> session: The previous session was evaluated, and the thoughts of the group members on the group until the 5<sup>th</sup> session were discussed. This session aimed to concentrate on the importance of building confidence with the group members. Thus, the "confidence walk" activity was conducted with the group members. In this activity, two people walked in group. One of them closed his/her eyes, and the other one guided. Then they changed sides. By this means, the students were enabled to notice what guiding and walking with closed eyes made them feel.

6<sup>th</sup> session: Firstly, the group members were asked to create a sculpture with the participation of all members. Then

discussions were made on why the related sculpture was created. Later the final evaluations of the group members were requested. Finally, the group members were asked to explain what they felt in the group work process, what kind of characters they noticed in themselves, and what they thought about the group as a whole.

### 2.1. Data collection tool

The “General Self-efficacy Scale” (GSE), which was developed by Schwarzer and Jerusalem (1995) and whose Turkish validity and reliability study was carried out by Aypay (2010), was used in the present study in order to measure general self-efficacy. This scale has been adapted to more than 25 languages. Based on the examination of the psychometric characteristics included in its versions in more than 25 languages, it is highlighted that general self-efficacy is a universal structure (Scholz et al., 2002). In the scale, low score refers to low self-efficacy, and high score refers to high self-efficacy.

### 2.2. Data analysis

The differences between the scores obtained by the in-group members before the group work and the scores obtained by them after the group work were examined, and the differences between the in-group and the out-group score averages before and after the group work were analyzed.

The statistical software SPSS version 17 (Statistical Package for Social Sciences, Version 17, Chicago IL, USA) was used for calculations. All values presented as mean  $\pm$  standard deviation and mean (Maximum- Minimum) percent and frequencies. Repeated measures of analysis of variance was analysed by Mauchy's sphericity test and Box's Test of Equality of Covariance Matrices. For comparisons of means of repeated measures Repeated Measures Analysis of Variance was used. If parametric tests (factorial design for repeated measures analysis) does not provide the preconditions, Greenhouse-Geisser (1959) correction or Huynh-Feldt (1976) correction was used for corrections to the Degrees of Freedom. The Corrected Bonferroni test was used for multiple comparisons.  $p$  values  $< 0.05$  were considered statistically significant.

## 3. Findings and Results

This section presents the findings and the results of the current study. Table 1 presents the self-efficacy score analysis of the in-group and the out-group.

**Table 1. The analysis of the in-group and out-group self-efficacy scores**

	Mean $\pm$ SD Median (Min-Max)	Mean $\pm$ SD Median (Min-Max)	Interaction p Self-efficacy score*group	Difference between measurements p
	Measurement 1	Measurement 2		
In-group	30.33 $\pm$ 6.26 29.5 (21-39)	38.08 $\pm$ 4.3 32 (24-38)	0.540	0.025*
Out-group	29.38 $\pm$ 4.6 30 (18-40)	30.58 $\pm$ 4.1 31 (22-40)		0.024*
Inter-group Difference p	0.603	0.312		
Total	29.68 $\pm$ 5.1 30 (18-40)	31.05 $\pm$ 4.2 31 (22-40)		

\* $p < 0.05$

When the in-group and the out-group are considered, it can be said that the variation in self-efficacy scores through the group work was not statistically (interaction effect) significant ( $p = 0.540$ ). However, when the groups are not

considered, it can be said that a statistical increase occurred in the self-efficacy scores through the group work ( $p < 0.05$ ).

The variation in the score can be seen better in the figure below.

**Fig. 1. Self-efficacy measurements belonging to the in-group and the out-group**

According to the Fig. 1, there was a significant difference (increase) between the pretest (Measurement 1) and posttest (Measurement 2) scores. While the self-efficacy score average of the in-group increased from 30.33 to 38.08, the self-efficacy score average of the out-group rose from 29.38 to 30.58. In addition, since the score difference between the in-group and the out-group was casual, the highness of the score average of the in-group was not significant in comparison to the out-group.

To sum up, the group work constructed on the basis of raising awareness for self-knowledge affected the self-efficacy of both the in-group and the out-group, and increased the self-efficacy score average of the entire class.

Among the main objectives of the Theory of Social Work 2 course are improving the application skills of students and making them develop insight and self-awareness through group works. In this sense, the course achieved its objective through the group work, and enabled not only the in-group members but also the entire class to make progress in terms of self-efficacy.

In the light of the research results, it is safe to say that group works on the basis of self-knowledge may have a positive effect on the self-efficacy levels of the students receiving social work education. Therefore, self-knowledge groups should be designed in social work education in particular, and it should be made sure that each student takes part in the self-knowledge group until graduation. In this way, professionals and scientists with an insight of themselves and a developed self-efficacy may be cultivated.

## Abstract

In the accounting education process, theoretical - practical information is taught as a whole. In this period in which several teaching methods such as cooperative learning, discussion, case studies and so on, are used, the methods are being shaped as educational factor and just one or several of these methods can be used together. The learning style concept is defined in literature as an individual way chosen in analyzing and comprehending. The learning styles are innate and it affects the people's learning process. It is how a person learns than what a person learns. In this context, the students' success is related directly with the right learning style. So the aim of the study is measuring the influence of learning styles over the students taken accounting courses. Therefore a questionnaire will be applied to the students of ASU FEAS and the data collected will be analyzed with SPSS package program. With the results, we aim bringing out the inventory of students' learning styles and the performance relations.

## Introduction

The data needed for implementing the activities efficiently in the businesses is produced by the information system. One of the most important information system is the accounting information system. The financial information produced by accounting information system is used by the inner or outer users and it has a significant role for the deciding process. So the quality of personnel work in accounting department has a great importance for taking advantage of the information. In this aspect, the accounting education is hived off the educations of other disciplines (Carland, Carland, & Dye, 1994).

The accounting education is comprised of theoretical accounting education and applications. With the globalization and rapidly evolving technology, the accounting applications become very important. Theoretical structure of accounting and the education quality of accounting applications are related to the learning style adopted by the student as well as instructive, course material etc. (Adler, Whiting, & Wynn-Williams, 2004).

The learning is a process that includes continuous and permanent changes which occur in the attitudes of people by repetition or experience (Seven, Bağcivan, Kılıç, & Açikel, 2012). The people gains knowledge, skills, attitudes and values via learning. In normal conditions, everyone who is mentally health has the learning ability, but this process is fast and easy for some while it is slow and difficult for some others (Topuz & Karamustafaoğlu, 2013). In this context, it can be said that the method and process of each individual is different. At this point, it is known that the learning style determines how a student fulfill his learning action (speaking, listening, writing, symbolizing, memorizing etc.). The learning style is a consistent and characteristic approach about a person's perception, processing, editing and interpretation of the stimulants surrounded him (Özbaş, 2013).

The concept of learning style was emerged for the first time in 1960 by Dunn and after this there have been so many works about it (Durukan, 2013). The learning style is a continuous and constant style that shows how a student react to

the stimulants and how a student use the stimulants in the learning process (Claxton & Ralston, 1978) and it is an obtaining and processing information style which starts with the learner's focusing on a new and difficult data (Dunn, 2001), and a method preferred by individually while comprehending and processing data (Kolb, 1984), and a learning situation formed by people according to perception capability (Gregorc, 1984). Considering the descriptions, it can be seen that there are different variables in the learning styles. By adhering the variables, different learning styles has been developed. The most familiar and popular ones are Kolb's "Learning Styles Inventory", Gregorc's "Information Systems Model", "Learning Styles Inventory" developed by Dunn and Dunn, "Learning Styles Model" developed by Honey and Mumford and which is used in this study.

Mumford declined that people cannot learn new knowledges if there are no aims for them and different people pursue different objectives for learning (Duff & Duffy, 2002). Considering this definition, we can say that there are four learning styles according to the inventory of learning style developed by Honey and Mumford (1992) who inspired from Kolb's "Learning Style Theory":

1. **Activist:** They decide intuitively and enjoy acquiring new experinces. They dislike restricted works. Their learning capability is limited in the passive activities such as listening or reading and they relatively fulfill learning via fleeting activities.
2. **Theorists:** They don't rely on intuitions or emotions, they consider importance to the rationality and systematic functionality. The learning becomes more difficult without a pattern or plan. The efficiency of learning will increase if they place whatever they has learnt into a theory, draft, plan, or pattern framework. They enjoy associating the observations with a conceptual model.
3. **Pragmatists:** They enjoy taking risk, discussing with a group, acting practically, approaching realistically. They cannot show patience for working with a group or discussing endlessly. They believe the principles such as "everytime there is a better way to do" or "it is good if it works".
4. **Reflectors:** They are used to observing the processes, comprehending the results and inferring a meaning. Listening at the background and participating in the activities that they can observe are according to them. Their learning level is low if there is no opportunity for planning.

The learning styles are as in the figure below according to Kolb and Honey and Mumford:

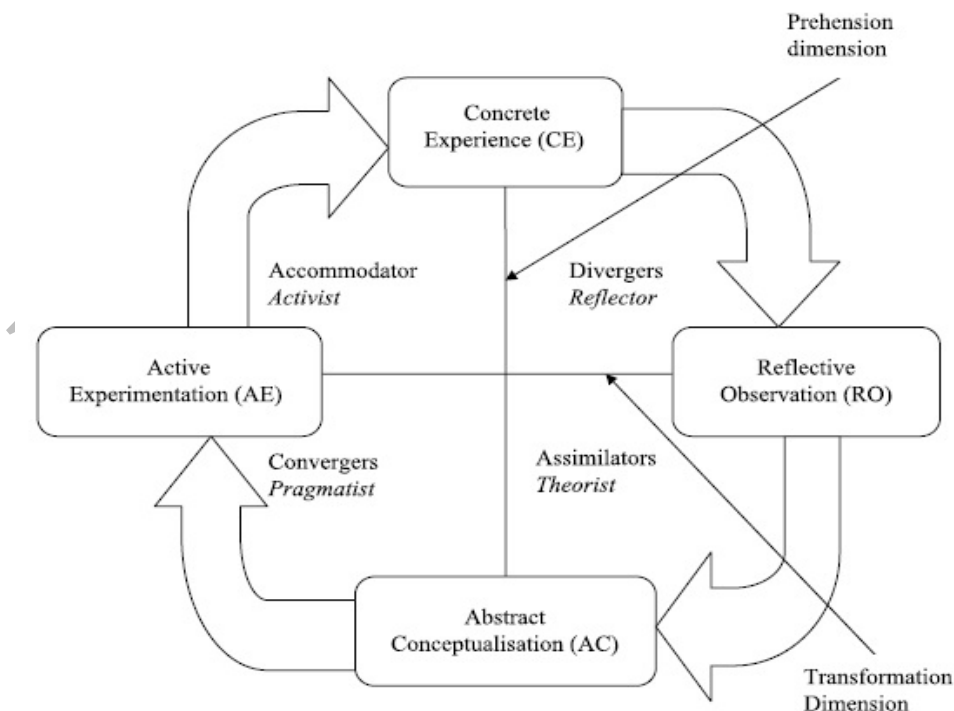

Figure 1: The Learning Style Model of Kolb and Honey and Mumford

Source: McChlerya & Visserb, 2009.

According to Honey and Mumford, in case of learning activities, it is excepted that an individual prefer one of four learning styles above. Being known of these preferences can be used in matching the style to which an individual tends with the education activities. Learning accounting can be convert from boring and difficult way to entertaining and easy way.

### 1.Literature Review

In this chapter, we refer the knowledge from the academic works over accounting education and learning styles of accounting.

In McChlerya and Visserb (2009)'s study, there is a research over comparing the learning styles of the English students with South African students. Fedler's learning styles are used as data collection tool. The findings show that the students have different learning styles and the teacher who own strength or weakness of the learning styles must design the learning activities according to the styles.

Guyen and Kurum (2004) were implemented a theoretical study over the relationship between the learning styles and the critical thinking. They clarified that the features of learning styles and critical thinking are directed increasing the individual and communal development of the individuals and both concepts are similar in that aspect.

Bilgin and Durmus (2003) examined the relationship between the learning style and students' success. Grasha's learning style scala was used as data collection scala. In the study implemented in two different schools, they found no significant relationship between the learning styles of the students, but they appointed that the students who adopted the learning styles were more successful than others.

In the study by Seven et al. (2012), it was aimed examining the learning styles and success in the courses bu using Kolb's learning style inventory. They found that the learning styles of the students didn't affect the academical success.

In the study of Novin, Arjomand and Jourdan (2003), they examined in the learning styles of the students studied at the accounting, marketting, management and other departments of the business administration. In the study Kolb's learning styles was used and as a result they pointed out that the case of noticing the students' learning styles by educator can increase the efficiency and productivity.

Duff (2004) analyzed the role of the cognitive learning styles in accounting education. The work which is a kind of literature review at the studies about the learning styles underlines that the learning ability of the students will develop if the educators comprehend cognitive learning styles.

In her study, Senyuva (2009) aimed to examine the learning styles in terms of class, school, department and so on. Senyuva used Kolb's "Learning Styles Inventory" and she ascertained that all learning styles must be regarded when arranging the teaching-learning process.

Swanson, Heath and Edmiston (2005) investigated the effect of the learning styles over students' performance in accounting courses. The results shows that knowing the learning styles has a positive effect on the learning.

### 2.Research

#### 2.1.Scope and Methodology

The research includes the students of Aksaray University (ASU) Faculty of Economics and Administrative Science. The students of the public administration, economics, and management information systems departments exclude from the research in that they don't study the accounting sufficiently.

Survey questions as tool of data collection adapt from "The Learning Styles Inventory" developed in 1992 by Honey and Mumford. The research data was collected from the students of Aksaray University Business Administration via the questionnaire method. The collected data was analyzed by SPSS 20 package program.

Table 1. Reliability Coefficient	
Number of Polls	243
Number of Questions	80
Alpha	0.755

The reliability coefficient which is applied to all surveys is determined as 0.755. This figure means the reliability of the survey is pretty good.

## 2.2.Purpose

The aim of the study is determining the learning styles which adopted by the students of ASU at accounting education and examining the relationship between these styles and the performance of the students.

## 2.3.Findings and Analysis

The frequency values of demographic data concerning the research universe are shown at Table 2:

Table 2. Demographic Research Findings of the Universe

	Frequency	Percent(%)		Frequency	Percent(%)
<b>Gender</b>			<b>Age</b>		
Male	90	37,0	17-21	184	51,3
Female	153	63,0	22-26	171	47,6
			27 and over	4	1,1
<b>District Inhabited By Family</b>			<b>Planned Career Field</b>		
Marmara	24	9,9	Banking and Finance	66	27,2
Ic Anadolu	109	44,9	Self-Employed	13	5,3
Akdeniz	62	25,5	Public-Employed	90	37,0
Dogu Anadolu	6	2,5	Marketing	14	5,8
Guney Dogu Anadolu	12	4,9	Entrepreneur	23	9,5
Karadeniz	6	2,5	Financial Advisors	25	10,3
Ege	22	9,1	Others	11	4,5
<b>Description By Students About Cultivation</b>			<b>State of Having Anxiety</b>		
Village or Borough	37	15,2	Have	140	57,6
County Town	62	25,5	Don't Have	27	11,1
City Centre (Medium Size)	56	23,0	Partly Have	76	31,3
Metropolitan	88	36,2			
<b>Class</b>					
1st Grade	103	42,4			
2nd Grade	44	18,1			
3rd Grade	70	28,8			
4th Grade	26	10,7			

Table 1 provides the data of % 63 of the participants are female and %37 of the participants are male and %44,9 of the participants are from Ic Anadolu District. The %57,6 of the students have career concerns about future and %31,3 of it has partly career concerns. It can be read from the table that the career planning of the students intensify over the public sector with a rate of %37 and %27,2 of the students make career plan about banking and finance.

Figure 2. The Learning Styles Adopted by the Participants

The learning styles adopted by the students considering the collected data are constituted as Figure 2. As we look at the Figure 2, it is obvious that %42 of the participants internalize Pragmatist learning style, % 30 are Reflector learning style, %17 are Theorists learning style and %11 are Activist learning style. So it affects the choices of students towards public sector as a professional career depending upon the career anxiety over their learning styles. Because there is less

risk at the public sector, and the conditions are better than the private sector. Whereas the private sector has a theoretical structure which provides practical solutions to the problems. It demonstrates that there is a relationship between their personal and professional development and the education taken by the students, the learning styles adopted by the students, the future plans about their career.

Table-3 Frequency, Percentage and Standard Deviation Values Concerning Learning Techniques Applied by Students for Accounting

Learning Techniques Applied By Students	Absolutely Important-Important		Not Sure		Absolutely Not Important - Not Important		n:243
	f	%	f	%	f	%	$\bar{x}$
I learn the lesson when instructor lecture it.	185	76.1	29	11.9	29	11.9	1.14030
I learn the lesson when I study myself.	204	84	32	13.2	7	2.8	0.79945
I learn the lesson when my friend lecture it.	169	69.5	47	19.3	27	10.8	1.03490
I learn the lesson when we study with a group of friends.	127	52.3	61	25.1	55	22.6	1.17538

Table 3 provides that the students learn better when they work themselves or the instructor lectures it. It is observed the students consider it is least useful when they work with a group of friends. The students' judgment of adopting pragmatist learning style (%42) who don't join to the group works supports this finding.

Table-4 Frequency, Percentage and Standard Deviation Values Concerning Factors That Make Accounting Courses Productive

Factors That Make Accounting Lessons Productive	Absolutely Important-Important		Not Sure		Absolutely Not Important - Not Important		n:243
	f	%	f	%	f	%	
	$\bar{X}$						
Personal knowledge, interest and talent	206	84.8	24	9.9	13	5.4	0.94088
The overall success of a high level of class	115	47.3	50	20.6	78	32.1	1.24759
Lecturing the course efficiently and effectively by the instructor	210	86.4	20	8.2	13	5.3	0.97955
Physical facilities in schools; library, internet and so on.	148	60.9	44	18.1	51	21	1.24918
Being educational theory supported by the practice	197	81.1	23	9.5	23	9.5	1.12799

As we look at Table 4, it is shown that the students attribute the productivity of accounting courses firstly to lecturing effective and efficient by instructor and then to the personal information, interests and abilities and at the same time to supporting the theory with practice. Also it can be seen that there is a majority of considering that the success of the class has no influence on the efficiency of accounting courses.

The relation between the gender and the learning styles adopted by the students are compared by the data collected from the participants. In this context, the hypotheses are following:

**H<sub>0</sub>:** Learning styles and gender are independent.

**H<sub>1</sub>:** Learning styles and gender are not independent from each other.

Table – 5 Test Results of Gender Chi - Square of Independence and Learning Styles

Chi-Square Tests			
	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	11,365a	3	,010

Analyzing Table 5, it is observed that the value of Pearson Chi – Square is lower than 0.05 and so H<sub>0</sub> is refused. Therefore it can be said that there is a relationship between the gender and the learning styles. In that context, several factors such culture, family, values of society lived in, environmental factors, education etc. have influence on adopting the learning styles. So, it can be considered as reasonable that the male students adopt the activist learning style in the male dominated society; and female students adopt a logical and systematic learning style which she can share the risk and acts as a group.

Table – 6 Learning Styles / Gender crosstabulations

		Male	Female	Total
Learning Styles	Count	17	9	26
	% within Learning Styles	65,4%	34,6%	100,0%
	% within Gender	18,9%	5,9%	10,7%
	% of Total	7,0%	3,7%	10,7%
	Count	17	24	41

	% within Learning Styles	41,5%	58,5%	100,0%
	% within Gender	18,9%	15,7%	16,9%
	% of Total	7,0%	9,9%	16,9%
	Count	33	70	103
Pragmatists	% within Learning Styles	32,0%	68,0%	100,0%
	% within Gender	36,7%	45,8%	42,4%
	% of Total	13,6%	28,8%	42,4%
	Count	23	50	73
Reflector	% within Learning Styles	31,5%	68,5%	100,0%
	% within Gender	25,6%	32,7%	30,0%
	% of Total	9,5%	20,6%	30,0%

Table 6 provides the data of female students adopt pragmatist, theorist and reflector learning styles. And it can be said that male students adopt activist learning style more than female students.

The relation between the success level and the learning styles adopted by the students are compared by the data collected from the participants. In this context, the hypotheses are following:

**H<sub>0</sub>:** Learning styles and success level are independent from each other.

**H<sub>1</sub>:** Learning styles and success level are not independent from each other.

Table 7. Test Results of Chi - Square of Independence Between Learning Styles and Success Level			
Chi-Square Tests			
	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	35,492a	3	,000

Analyzing Table 5, it is observed that the value of Pearson Chi – Square is lower than 0.05 and so H<sub>0</sub> is refused. Therefore it can be said that there is a relationship between the success level and the learning styles.

Table – 8 Learning Styles / Success Level crosstabulations					
		Successful*	Unsuccessful	Total	
Learning Styles	Activist	Count	12	14	26
		% within Learning Styles	46,2%	53,8%	100,0%
		% within Success	8,4%	14,0%	10,7%
		% of Total	4,9%	5,8%	10,7%
	Theorists	Count	19	22	41
		% within Learning Styles	46,3%	53,7%	100,0%
		% within Success	13,3%	22,0%	16,9%
		% of Total	7,8%	9,1%	16,9%
	Pragmatists	Count	83	20	103
		% within Learning Styles	80,6%	19,4%	100,0%
		% within Success	58,0%	20,0%	42,4%
		% of Total	34,2%	8,2%	42,4%
	Reflector	Count	29	44	73
		% within Learning Styles	39,7%	60,3%	100,0%
		% within Success	20,3%	44,0%	30,0%
		% of Total	11,9%	18,1%	30,0%

\* The students are agreed as successful who has the CC and over points according to Aksaray University, Associate Degree, Bachelor of Education and Article 21 of Examination Regulations.

As we look through the Table 8, it is obvious that the success level in the pragmatist learning style which is most adopted by the students is %80,6 which is a high rate. Examining other learning styles, it is noticeable that the students who adopt activist, theorist or reflector learning styles and who are unsuccessful at the same time are more than the successful students as amount. It can be seen that the highest level of unsuccessfulness in the learning styles is belong to reflector learning style with a %60,3.

### 3.Conclusions and Recommendations

Totally 243 questionnaires has been done on the business administration students of ASU FEAS so that ascertaining the reasons for anxiety of learning accounting and the results are following:

- It is set that there is a relationship between learning styles and academic achievement. But it is seen from the data that students adopted pragmatist learning style are just successful.
- The learning styles and gender factors are not unconnected from each other. It can be seen that female students prefer mostly pragmatist learning styles.
- It is obvious that the students don't prefer studying with a group of friends and they don't consider that the success of the class aren't dependent the mean of class success. The results support the idea that the students adopted pragmatist learning style don't prefer joining in the group works.
- It can be inferred from the results that most of the students adopt pragmatist learning style. But results show also that in the education process there are the students who adopt different learning styles not the students who adopt just one learning style.

Every individual in a society learn in different ways and they adopt a suitable learning style considering their abilities. Knowing the best learning style for him supports the learning power (Duff, 2004). In this context, the changes in the attitudes of the students studied by the learning style are following (Veznedaroğlu & Özgür, 2005):

- A positive significant increase in attitudes about teaching,
- An increase in adopting attitude to what is different from themselves,
- An increase in academical success,
- A positive development in behavior in the classroom and discipline
- More internal discipline in completing their homework,

In light of these results, it is necessary that informing the instructors and students about the learning styles and arranging the education environment by the instructors considering four different styles not just most adopted one and determining the teaching methods, approaches and educational materials by the instructors considering all learning styles and using them efficiently.

## Abstract

The purpose of this study was to determine the effect of pedagogical formation courses upon the professional self-efficacy perception of pre-service teachers. The study was carried out through the participation of 29 pre-service teachers having pedagogical formation training in Adiyaman University Educational Faculty in 2013-2014 academic year. This study was carried out in single-group pre-test and post-test model as one of the pre-experimental designs. In the study, profession of teaching professional self-efficacy scale was used as the pre-test. Cronbach Alpha Reliability Coefficient calculated for overall scale was found as .92. The scale included totally 27 items including the sub-dimensions of instructional design, teaching enhancement, teaching evaluation and professional development. At the end of six-week pedagogical formation training, the same measurement instrument was performed to the pre-service teachers as the post-test. In analysis of the data, arithmetic average and dependent-groups t-test were performed. As result of the research, it was determined that pedagogical formation courses had a significant effect upon developing the professional self-efficacy perception of pre-service teachers.

Peer-review under responsibility of the Sakarya University.

*Keywords:* Teaching profession, professional self-efficacy, pre-service teachers

---

## Introduction

Through the emergence and development of education as a science, professional teaching knowledge started to gain importance; and the necessity for the individuals to have special knowledge and skills for teaching appeared (Erden, 1998). When teaching process is considered, the responsibility is mostly taken over by the teachers. The reason for this is the necessity of reflecting new educational applications under changing conditions and the strong effect created by teachers upon shaping the learning process of their students through the academic activities they carry out (Wang & Walberg, 1994). For that reason, pre-service teachers and teachers that will raise next generation should be educated in a qualified way and they should be guided well in accordance with specific purposes during their education. In order to actualize this, professional development of teachers is needed in subjects such as instructional planning, practice, and evaluation through planned studies. Pedagogical formation courses are provided in order to have these features. In order to be a successful teacher, pedagogic formation, self-confidence, and adequate knowledge related to how teaching will be created are necessary (Lin & Tsai, 2000).

It has been mentioned that the teachers responsible for teaching are required to have some competences upon fulfilling their responsibilities (Gordon, 2010). The leading of these is self-efficacy. When the conditions of teaching profession are considered, the teachers should struggle with different conditions and cope with different problems. The belief of professional self-efficacy is essential upon coping with these situations (Bandura, 1997).

Self-efficacy is one of the fundamental concepts revealed by Bandura (1997) as the social learning theoretician and

---

E-mail address: hakkikontas@hotmail.com

suggested to be efficient upon behavior. According to Bandura, the belief of self-efficacy is the belief of an individual towards practicing the capacity into a given behavior or behaviors (Bandura, 1997; Zimmerman, 1995). Self-efficacy is a product, a result of individuals' judgments related to what they can do using their own skills, a perception of their own self related to their capacity and ability of achieving a specific activity, and their own belief, judgment (Senemoğlu, 2013). This judgment creates a great effect upon teacher's intra-class behaviors, instructional planning, practicing, evaluation, and motivation (Adu & Olantundun, 2007; Akiri & Ugborugbo, 2009; Allinder, 1995; Hoy & Spero, 2005; Woolfolk, Rosoff & Hoy, 1990). Because self-efficacy perception of teachers proves their own capacity or the ability of actualizing their own courses successfully (Ashton, 1984).

Council of Higher Education (YÖK) restructured Educational Faculties in 1998 in order to provide teachers to reveal their own capacities and actualize their courses successfully. As result of this restructuring, total credit of professional teaching knowledge courses was increased up to 36, and total course hours were increased up to 48. Through this regulation, it was aimed to develop more professional practicum of pre-service teachers. In this perception, it was also proposed for the ones that have been graduated from arts and science faculty but assigned as teachers after having pedagogical formation training to obtain 36-credit professional teaching knowledge courses. Pedagogical Formation refers the curriculum including courses related to teaching profession provided within the framework of Ministry, and cooperation of Ministry and Council of Higher Education. Within the framework of this curriculum, pre-service teachers are trained with the courses of introduction to teaching profession, development psychology, teaching-learning theories and approaches, assessment and evaluation, program development and teaching, classroom management in the first term, and with instructional technologies and material design, special teaching methods, guidance and counselling and teaching practice in the second term (YÖK, 1998).

When the literature was analysed, there have been several studies related to self-efficacy beliefs (Gömleksiz & Serhatlıoğlu, 2013; Taşkın & Hacıömeroğlu, 2010; Demirtaş, Cömert & Özer, 2011) and perceptions of teachers (Kurt & Ekici, 2013; Coşkun, Özer & Tiryaki, 2010; Ülper & Bağcı, 2012). However, there has been no study revealing the effect of pedagogical formation courses upon the pre-service teachers' perception of professional self-efficacy. For that reason, this experimental study that was carried out upon pre-service teachers trained with pedagogical formation has been considered to provide contribution for the literature.

### **1. The purpose of the study**

The purpose of the study was to analyze the effect of pedagogical formation courses upon pre-service teachers' perception of professional self-efficacy. In accordance with this purpose, answers to the questions below were sought:

1. Is there a significant difference between pre-test and post-test total scores and professional self-efficacy perceptions of pre-service teachers?
2. Is there a significant difference between pre-test and post-test total scores and professional self-efficacy perceptions of pre-service teachers related to the instructional design sub-dimension of pedagogical formation courses?
3. Is there a significant difference between pre-test and post-test total scores and professional self-efficacy perceptions of pre-service teachers related to the teaching enhancement sub-dimension of pedagogical formation courses?
4. Is there a significant difference between pre-test and post-test total scores and professional self-efficacy perceptions of pre-service teachers related to the teaching evaluation sub-dimension of pedagogical formation courses?
5. Is there a significant difference between pre-test and post-test total scores and professional self-efficacy perceptions of pre-service teachers related to the professional development sub-dimension of pedagogical formation courses?

### **2. Methodology**

In this research, single-group pre-test post-test design as one of the semi-experimental designs was used. In single group, pre-test post-test design, the independent variable is performed to a randomly selected group. Both pre-test and post-test measurements were performed. The symbolic appearance of the model was as below:

G1 is O1.1 X O1.2.

G1: Research group, O1.1: First measurement (pre-test), X: independent variable (educational activity), O1.2: second measurement (post-test)

If  $O1.2 > O1.1$  in the model, this is accepted as to be arisen from the implementation of X, and the evaluation is administered considering this (Karasar, 2005). In order to analyze the change in self-efficacy perceptions of the pre-service teachers, "Profession of Teaching Professional Self-Efficacy Scale" (PTPSES) was performed as pre-test to 29 students at the beginning of the term. Totally 144-hour pedagogical formation courses including 24 hours per week were provided to pre-service teachers for six weeks. The content of these courses were determined in accordance with the curriculum specified by YÖK for Educational Faculties. "Profession of Teaching professional self-efficacy scale" was performed as pre-test at the beginning of the term and as the post-test at the end of the term to the pre-service teachers. After this measurement, it was searched whether the courses pre-service teachers received created a change upon their perception level of self-efficacy.

### 2.1. Participants

The study group of the research included 29 (16 females, 13 males) pre-service teachers graduated from arts and science faculty history department having pedagogical formation training at Adiyaman University Educational Faculty in 2013-2014 academic year. Purposive sampling method was used for selecting the study group. In such kind of sampling, the researcher uses his/her own judgment about who will be selected, and the ones deemed as appropriate by the researcher are included into sampling (Balci, 2004). For that purpose, the appropriateness of study group is decided considering their absenteeism and their carrying on teaching profession or not.

### 2.2. Instruments

The research data were obtained through "Profession of Teaching Professional Self-Efficacy Scale" (PTPSES) developed by Konaş & Demir (2014). The scale included 27 items and four sub-dimensions on five-point likert type. The first sub-dimension was "instructional design" (13 items), the second sub-dimension was "teaching enhancement" (6 items), the third sub-dimension was "teaching evaluation" (4 items), and the first sub-dimension was determined as "professional development" (4 items). The highest score that could be obtained from the scale was 135, and the lowest was 27. Whereas Cronbach Alpha Reliability Coefficient calculated for the whole scale was found as .92, it was .90 for instructional design dimension, .83 for teaching enhancement dimension, .70 for teaching evaluation dimension and .73 for professional development dimension.

### 2.3. Data Analysis

For this study, arithmetic mean was used for the analysis of data; dependent group t-test, Cronbach Alpha reliability, and eta-squared effect size were used for testing the significance of difference between the averages.

### 2.4. Experimental Process

The research was carried out in a six-week (each week 24 hours) time period. After the pre-test implementation, the pre-service teachers in the study group were trained with the courses of introduction to teach, development psychology, teaching-learning theories and approaches, assessment and evaluation, program development and teaching, classroom management, instructional technologies and material design, special teaching methods, guidance and counselling and teaching practice courses within the scope of pedagogical formation. At the end of this instructional process, the same measurement scale was performed to pre-service teachers as post-test.

## 3. Results

In this section, the findings obtained in accordance with the purposes of the research were included. T-test results performed for the significance of the difference between pre-test and post-test total score averages of professional self-efficacy scale were presented in Table 1.

**Table 1.** T-test results of pre-service teachers' professional self-efficacy pre-test and post-test average scores

Measurement	N	$\bar{X}$	S	Sd	t	p	$\eta^2$
Pre-test	29	102.52	9.34	28	3.63	.001	.19
Post-test	29	113.17	10.63				

When Table 1 was analyzed, pre-test score averages of pre-service teachers related to their professional self-efficacy perceptions were calculated as  $\bar{X}=102.52$ , and post-test score averages were calculated as  $\bar{X}=113.17$ . In post-test, total score averaged were noticed to be increased. It was found according to the t-test result that the difference between score averages was significantly higher in favor of post-test ( $t=3.63$ ,  $p<.05$ ).

Effect size ( $\eta^2$ ) was analyzed in order to determine to what extent pedagogical formation courses affected the self-efficacy perception of the pre-service teachers. The effect size value related to the pedagogical formation courses was determined to be .19 in overall scale. According to the criteria specified by Karasar (2005), this value was interpreted as a broad effect size. It was understood that 19% of the positive change in professional self-efficacy perception levels of pre-service teachers was arisen from the pedagogical formation courses.

T-test results performed for the significance of the difference between pre-test and post-test total score averages of professional self-efficacy scale instructional design sub-dimension were presented in Table 2.

**Table 2.** T-test results of instructional design sub-dimension pre-test and pos-test average scores

Measurement	N	$\bar{X}$	S	Sd	t	p
Pre-test	29	51.55	5.07	28	2.16	.039
Post-test	29	54.76	5.75			

When Table 2 was analyzed, whereas pre-test score averages of pre-service teachers related to the "instructional design" sub-dimension was  $\bar{X}=51.55$ , post-test score averages were found as  $\bar{X}=54.76$ ; and score averages were noticed to be increased in post-test. It was found according to the t-test result that the difference between score averages was significantly higher in favor of post-test ( $t=2.16$ ,  $p<.05$ ). It could be mentioned related to instructional design sub-dimension that pedagogical formation courses received by the pre-service teachers caused this difference. This finding proved that pedagogical formation courses had a significant effect upon increasing the instructional design perceptions of pre-service teachers. In other words, pedagogical formation courses can be mentioned to provide contribution upon development of pre-service teachers in instructional design dimension.

T-test results performed for the significance of the difference between pre-test and post-test total score averages of professional self-efficacy scale teaching enhancement sub-dimension were presented in Table 3.

**Table 3.** T-test results of teaching enhancement sub-dimension pre-test and post-test average scores

Measurement	N	$\bar{X}$	S	Sd	t	p
Pre-test	29	23.28	3.25	28	1.82	.080
Post-test	29	24.86	2.80			

When Table 3 was analyzed, whereas pre-test score averages of pre-service teachers related to the "instructional design" sub-dimension was  $\bar{X}=23.28$ , post-test score averages were found as  $\bar{X}=24.86$ ; and score averages were noticed to be increased in post-test. It was found according to the t-test result performed whether the difference was significant or not that the difference was not significant ( $t=1.82$ ,  $p>.05$ ). Teaching enhancement is closely related with

the process of gaining professional experience. Among the pedagogical formation courses, instructional technologies and material design, special teaching methods and teaching practice courses were determined to have a significant affect upon pre-service teachers' gaining professional experience. The aforementioned courses were provided in the second-term after the post-test implementation.

T-test results performed for the significance of the difference between pre-test and post-test total score averages of professional self-efficacy scale professional development sub-dimension were presented in Table 4.

**Table 4.** T-test results of professional development sub-dimension pre-test and post-test average scores

Measurement	N	$\bar{X}$	S	Sd	t	p
Pre-test	29	14.69	1.02	28	7.17	.000
Post-test	29	17.83	2.02			

When Table 4 was analyzed, whereas pre-test score averages of pre-service teachers related to the “instructional design” sub-dimension was  $\bar{X}=14.69$ , post-test score averages were found as  $\bar{X}=17.83$ ; and score averages were noticed to be increased in post-test. It was found according to the t-test result performed to determine whether the difference was significant or not that the difference between score averages were significantly higher in favor of post-test ( $t=7.17$ ,  $p<.05$ ). It could be mentioned related to teaching evaluation sub-dimension that pedagogical formation courses received by the pre-service teachers caused this difference. This finding proved that pedagogical formation courses had a significant effect upon increasing the teaching evaluation perceptions of pre-service teachers. In other words, pedagogical formation courses can be mentioned to provide contribution upon development of pre-service teachers in teaching evaluation dimension.

T-test results performed for the significance of the difference between pre-test and post-test total score averages of professional self-efficacy scale teaching evaluation sub-dimension were presented in Table 5.

**Table 5.** T-test scores of teaching evaluation sub-dimension pre-test and post-test scores

Measurement	N	$\bar{X}$	S	Sd	t	p
Pre-test	29	11.00	1.81	28	3.07	.005
Post-test	29	12.14	1.55			

When Table 5 was analyzed, whereas pre-test score averages of pre-service teachers related to the “professional development” sub-dimension was  $\bar{X}=11.00$ , post-test score averages were found as  $\bar{X}=12.14$ ; and score averages were noticed to be increased in post-test. It was found according to the t-test result performed to determine whether the difference was significant or not that the difference between score averages were significantly higher in favor of post-test ( $t=3.07$ ,  $p<.05$ ). It could be mentioned related to professional development sub-dimension that pedagogical formation courses received by the pre-service teachers caused this difference. This finding proved that pedagogical formation courses had a significant effect upon increasing the instructional design perceptions of pre-service teachers. In other words, pedagogical formation courses can be mentioned to provide contribution upon development of pre-service teachers in teaching evaluation dimension.

#### 4. Conclusion and Discussion

Important results were concluded at the end of this study. It was concluded that there was significant difference between pre-test and post-test total score averages in all scale with which self-efficacy perceptions of pre-service

teachers were determined. This obtained result has a quality supporting the results of some research results. In this perception, Kurt & Ekici (2013) mentioned that there was a statistically significant difference between the pre-test and post-test scores of the overall scale in which instructional process self-efficacy perception levels of the pre-service teachers were determined. It could be noticed in this research that teaching profession courses had a significant effect upon the professional development of teachers. Because it was concluded that the difference between pre-test and post-test average scores of professional self-efficacy scale professional development sub-dimension was significant. Kutluca, Birgin & Çatlıoğlu (2007) concluded in their study that the course of planning and evaluation in teaching as one of the pedagogical formation courses provided contribution upon individual, professional and social development of pre-service teachers, and helped their learning; moreover, this finding proved the finding in our study.

It was also concluded that there was a significant difference between the pre-test and post-test average scores of teaching profession, professional self-efficacy scale instructional design and teaching evaluation sub-dimensions. It was noticed that there was no significant difference between the pre-test and post-test score averages in profession of teaching professional self-efficacy scale teaching enhancement sub-dimension.

When the results obtained from the study were analyzed, it was understood that pedagogical formations courses were efficient upon increasing the professional self-efficacy perceptions of the pre-service teachers. Furthermore, effect size ( $\eta^2$ ) was analyzed in order to determine to what extent pedagogical formation courses had effect upon the professional self-efficacy perception of the pre-service teachers. The effect size value related to pedagogical formation results was determined to be .19. It was understood that 19% of the positive change in professional self-efficacy perception levels of pre-service teachers was arisen from the pedagogical formation courses. When the literature was reviewed, the study carried out by Wagler (2007) supported this finding. Wagler mentioned that teaching competence belief of pre-service teachers had significant difference between pre-test and post-test at the end of the practical pedagogical formation courses and their self-efficacy levels developed positively. In this perception, when the effect of pedagogical formation courses upon the self-efficacy perception levels of pre-service teachers was analyzed, the effect size values related to the practiced pedagogical formation courses were determined to be ( $\eta^2=.172$ ) in overall scale. These values expressed a high effect. Because the effect size of 0.01 was defined as small, 0.06 as medium, and 0.14 as large.

Consequently, pedagogical formation courses created a positive effect upon raising pre-service teachers and developing their professional self-efficacy perceptions. In this perception, the effect created by the pedagogical formation courses should be analyzed separately for developing the self-efficacy perceptions of teachers. The experimental studies that will be carried out in that perception should be supported through qualitative studies.

*School of Physical Education and Sports, Akdeniz University, Dumlupınar Avenue 07058 Campus Antalya, Turkey*

---

## Abstract

The purpose of the study is to examine the acute effect of physical fatigue on short-term memory. 25 university students in total, as being 6 females (with an average age of  $21,57 \pm 1,59$ ) and 10 males (with an average age of  $21,72 \pm 1,48$ ), had participated voluntarily in the study. Following collection of rested heart rates (HR) of all the participants, Numerical String Learning Test (NSLT) and then an exercise with 90% load on treadmill had been applied 5 minutes later. Right after the applied exercise, NSLT had been applied for the second time, and the results of both test scores had been compared. As per the results of statistical analysis performed, a statistically significant difference had been determined in between the NSLT scores of all the group ( $p < 0,05$ ) prior to ( $17,48 \pm 3,79$ ) and after ( $14,88 \pm 5,5$ ) fatigue. According to these results, it can be said that physical fatigue generating as the result of running exercise performed at maximal intensity has negative effect on short-term memory.

## 1. Introduction

The term memory is a very comprehensive term, and it covers many different skills and abilities (Leana, 2009). The memory is the function of assessment, processing, coding, storage in mind and recalling –when required- of learned information and experiences (Öktem, 1992, Yıldız, 2008). Short-term memory is the memory which can only be measured with seconds or at most minutes unless converted to long-term memory. It is described as being able to keep in mind the 7-10 figures of a phone number (or 7-10 specific articles) for a few seconds and minutes only by continuously thinking or verbally repeating them (İşgüzar, 2010). Memory and learning are cognitive functions. In some of the previous studies while it had been specified that exercise had facilitated cognitive functions or that it was beneficial, in some other studies it had been specified that exercise had harmful effects on cognitive functions or had no effect at all. It is very difficult to compare these studies. Because, the period and intensity (high or medium intensity etc) of the exercise and the applied cognitive tests had differentiated considerably. The researchers had specified that the low or high intensity of exercises had different effects on cognitive functions. They had also specified that the level of fitness was also significant in determining the effect of intense physical exercise (Antunes, 2006).

Generally fatigue is being defined as decrease in performance level depending on the decrease of force and power generated by a muscle (Pekünlü, 2012). It had been indicated that the performance loss -obtained in studies relevant to fatigue- could arise from changes occurring at any phase of neural pathway which is being assessed as factor of central nervous system or at neuromuscles, or that it could arise from negative changes affecting the contractile process of skeleton's muscle cells. Under the light of this information, in order to better understand the definition, the fatigue arising by the changes in neural pathway had been named as central, and the performance loss arising as the result of changes in muscle cell had been named as peripheral fatigue (Korkmaz, 2010).

The purpose of this study is to examine the acute effect of maximal running exercise performed on treadmill on short-term memory -among cognitive functions- through NSLT test for the effect of fatigue in young people.

## 2. Material and Methods

### 2.1. Participants

Twenty five university students -as being 6 females and 19 males- who were  $21,68 \pm 1,47$  years old, whose heights were  $177,56 \pm 9,083$  cm and who perform regular sports activities had voluntarily participated in the study.

### 2.2. Test procedure

In the study, the rested Heart Rate (HR), Perceived Difficulty Degrees (PDD) during maximal exercise and 90% HR had been recorded. Prior to test, polar watches had been provided to all the participants after providing information regarding test protocol and borg scale, and their rested heart rates had been determined. 90% HR values of the participants had been calculated by using the karvoven formula. NSLT had been applied to all the participants prior to exercise, and their points had been recorded. And then they had performed heat-up run on the treadmill for 5 min with a speed of 6km/h. After the heat-up run, the test had been started with 8km/h and 2% inclination. The km/h speed had been increased by 2 with two minutes intervals, and the inclination had been increased by 1% with one and a half minute intervals. The % of inclination had been determined as at most 6%. The PDD values had been asked to participants at times when HR reached 90%, and they had been recorded. It had been continued with the exercise until the HR values had reached and got fixed at 90%. NSLT had been applied for a second time on the participants right after the completion of exercise on treadmill, and the obtained results had been recorded.

**Numerical String Learning Test 9:** The Numerical String Test had been developed in 1943. NSLT measures the memory and learning ability. The test is sensitive against temporal area, hippocampus and other limbic system structures. There are 3 units of numerical strings in NSLT 9. The strings consist of figures from 1 to 9, and a figure is being referred only once in a specific string. The place of figure in the string had been determined randomly. The test is realized individually in a silent room. NSLT 9 form is applied to subjects who are under the age of 65 and who had been educated after high school. Any of the strings in the form in subject is selected. The serial number of the determined string (1, 2 or 3), and the figures in the string are written at relevant places in the entry form. The numerical string written on the entry form is told as to provide one figure in a second. 1 second after the completion of string, it is commanded for the subject to start. The figures told by the subject are written at the relevant place on entry form. If the subject corrects any of the figures s/he had told, the newly provided figure is entered on the entry form. The accuracy of the provided figures is immediately determined. The trials continue until the subject repeats the string correctly for 2 consecutive times. At most 12 trials are performed in this manner.

**Scoring of Test:** 2 points is provided to the subject for trials in which all figures of the string is correctly repeated. 1 point is provided for trials in which only one figure is incorrectly repeated. 0 point is provided for all the other conditions. When two adjacent figures are replaced, it is deemed as two faults, and 0 point is provided for such conditions. The obtained points are written at the relevant place on entry form. The type of fault (skipping the figure, replacing it with another figure, replacing adjacent figures etc) is specified. In the implementation of NSLT, the test is concluded when the subject correctly repeats the string for 2 consecutive times. In such a case, 2 points are provided for each trial including 12<sup>th</sup> trial following the trial in which the string is correctly repeated for the 2<sup>nd</sup> time and which is not applied to the subject. The points obtained from 12 trials are summed up, and the total point is calculated. The value is written at the relevant place on entry form. The highest point possible to be obtained is: 24. Approximate application period is: 15 minutes (Demir, 2012).

**Perceived Difficulty Degree (Borg Scale):** The participants of the study had been briefly informed regarding Borg Scale prior to the start of test. It had been required for the volunteers to provide a figure in between 0-10 during exercise in order to measure their fatigue degree, and the data had been entered on the computer environment.

**Heart Rate:** The % values of heart rates had been calculated with the following formula.

Maximal Heart Rate=  $220 - \text{age}$

Karvoven HR% =  $x\% (\text{Maximal Heart Rate} - \text{Rested Heart Rate}) + \text{Rested Heart Rate}$ .

### 2.3. Statistical method:

The descriptive statistical analyses of the whole group and their distribution had been considered. Kolmogorov Smirnow analysis had been used in order to determine the homogeneity of data. Wilcoxon test had been used in the pretest-posttest comparisons, and Mann Whitney U test had been used in the comparison of two groups.

### 3. Results

The purpose of the study is to examine the effect of physical fatigue on short-term memory.

**HR:** Heart Rate, **PDD:** Perceived Difficulty Degree, **NSLT:** Numerical String Learning Test

As seen on Table 2, the performance of short-term memory had been negatively affected following maximal loaded exercise applied with similar intensity on female and male individuals. Significant difference had occurred ( $p < 0,05$ ) in between the NSLT points of the whole group prior to and after the maximal exercise. No significant difference had occurred ( $p > 0,05$ ) in between the NSLT points of females pre to and after the exercise. Significant difference had occurred ( $p < 0,05$ ) in between the NSLT points of males pre to and after the exercise.

### Discussion

The purpose of the study is to examine the acute effect of maximal running exercise on short-term memory which is among cognitive functions.

In the previous studies, it had been specified that the effect of acute exercise on memory may differ according to time, type of memory (i.e. acquisition, consolidation, recall) (Roiga et al., 2013). In this study, it had determined that NSLT points measuring the short-term memory performance following 90% loaded running exercise had decreased. While the decrease in short-term memory points of males was statistically significant, it had been determined that it was not significant in females. It is being considered that this result arises from the low number of female subjects.

In literature, it is being specified that intense exercises may cause decrease in cognitive functions as similar to our study. In a study performed on 102 male and female recreative sports people, maximal treadmill exercise test had been applied for the effect of physical fatigue and a test (IMPACT) measuring the cognitive functions prior to and after the exercise had been applied to all the participants. As the result of research performed by 15 minutes running exercise on treadmill (it had been started with an inclination of 0% and had been increased by 2,5 mph, and had been increased by 0,5 mph until reaching to 6 mph. And then 3% increase of inclination had been performed until occurrence of fatigue), impairment of verbal memory had been found regarding the performance of short-term memory (Covassin et al., 2007).

In the reviews of Rooks, Thorn, McCully, and Dishman (2010), the effect of acute exercises on cerebral oxygenation had been searched by using near-infrared spectroscopy. As the result of that research, it had been found that moderate exercises increase the oxygen level of prefrontal cortex, but that intense exercises decrease the same. Consequently, they had specified that exercise period and difficulty level may cause differences in the performance of memory (Martin A.Q et al., 2013).

Fleury and Bard (1987) reported that a strenuous anaerobic treadmill run to exhaustion produced a significant impairment in exercisers' recall memory but that recall memory was not influenced by a 30-minute sub-maximal treadmill run (Tomprowski and Ganio, 2006).

Briefly, in this study the effect of 90% loaded maximal treadmill exercise on short-term memory among cognitive functions- had been researched. NSLT had been applied to all the participants prior to and after the exercise in order measure the effect of exercise on short-term memory. After an exercise in which the participants reached a pulse of 90%, impairment had been determined in the scores of NSLT test. Based on the result of this research performed on healthy young people, it can be told that the trainers shall consider their strategies of developing the cognitive functions of sports people while forming their exercises for a good sportive performance. In the researches to be performed in the future, the effect of intensity of exercise on cognitive functions shall be determined by using more direct protocols in activities peculiar to sports.

## Abstract

Usage and development of new learning tools increased along with the developing technology in health education. The changing expectations in the health services drew attention to clinical skill trainings. Patient safety, which is among the rising values, the struggle to increase the patient rights and student competency, enabled the simulation usage getting more and more widespread in the health education. These developments rising from the technology and education paved the way for the applications and tools of simulation, which is used widespread in enhancing the technical and non-technical skills in health education and which is among the trust worthy education methods, by bringing these two fields together along with them. Using simulation helps students have increased self-esteem and develop their ability to make clinical decisions by providing learning based on experience. Because it contributes to the experiences and occupational skills of the students positively at the same time, the goal of increasing the clinical competence of the students in a virtual or laboratory environment prior to the patient care environment is accomplished. Before going out to the clinic, students can develop their occupational skills in a laboratory that reflects a real clinical environment that is integrated with the life like scenario.

## 1. Introduction

Usage and development of new learning tools increased along with the developing technology in health education (Bradley, P., Bligh, J., 2005). The health education needs to provide students of associate degree level with knowledge, skills( Karaoğlu et al., 2011), and attitudes they can use in daily practice and usage (General Medical Council. Tomorrow's Doctors. Report of the Education Committee, 1993). Clinical skill is a skill that all the students must learn and something that can be used by the individual in all aspects of his life (Çifçili et al., 2006). While some writers define clinical skill as procedures and attempts to be used for the occupation, some writers include to this definition of the clinical skills, communication, professional ethics, physical examination, resuscitation skills, problem solving, team work and information technologies (Das et al., 1998 , Ledingham et al., 2006). Today, which we define as an age of information technology and change, the importance of the easy way of observing very fast developments in science and technology and the medical cognitive applications such as simulator and virtual reality in terms of internalizing during the process of education cannot be denied (Kapıcıoğlu et al. ,2014 ).

Simulation is defined as the imitation of duties, relationships, phenomena, equipments, behaviors or some cognitive activities that exist in reality (Patrik 2002). Developments in technology and education have brought along the association of these two areas and enabled the simulation applications and instruments to become widespread and be used in education. Both the patient safety that is among the rising values and the efforts of increasing the patient rights and student's competence have enabled the simulation to be commonly used in medical education (Mıdık et al., 2010). Patient simulators provide a number of opportunities in medical education. In the system involving a robot patient

(model) operating based on a computer program, as well as a required computer software and various accessories, the model enables us to obtain information about the heartbeat, respiration, pulses, pupil reflex, urination, all kinds of normal and abnormal heart and respiratory sounds (Kneebone 1999). Models being used provide the students a chance to apply many of the skills before encountering the real patients. Model applications that will be used in the skill laboratory will gain the students the basic medical skills that are necessary without damaging the patient (Yazar 2003). Both in the world countries and in our country, the population of the elderly increase day by day. Along with the scientific differences, the prevention of the diseases by scientific and technological developments, providing early stage diagnosis and treatment, the decrease of the fertility rate and infant death are reflected to the average life positively and this helped the increase of the age of death. Thus the rate of population above the age of 65 increased. In this age group, where both physical and cognitive ability losses are experienced, dependency constitutes a very important problem (Onat 2004., Öztöpe et al., 2008, Bahar et al., 2007, Akgün et al., 2004).

### 1.1. Purpose

In this study we conducted with the 45 student of the elderly care program on the efficiency of the simulator usage, it is determined that the simulator usage affects the learning.

Elderly Care Associate Degree Program raises students that can take part in academic and service areas related with the elderly health which is needed in our country; and raises individuals that can provide service and studies in the fields of aging process, protection of the health of the elderly, encouraging aging healthily, and meeting the needs of our society.

## 2. Method

The research was planned and carried out as descriptive in order to find out about the thoughts of the students that are studying in the elderly care department of the Selçuk University Health Services Occupational High School, concerning their education with the simulator. The scope of the study is comprised of the students that are studying in the care services department during the academic year of 2013- 2014. In order to carry out the research, a written permission is taken from the Directorate of Selçuk University Health Services Occupational High School. The survey form, which is prepared by the researcher through the analysis of related literature, consists of 2 sections. In the first section, there are questions about the sociodemographic features related with the student; the age, sex, income and education period of the students in the university. In the second section, there are questions that include the impacts of the simulator usage on the learning. There are many applications performed on the alternating student groups by different instructors annually. In the assessment of the study, each student that provide feedback is asked survey questions with the answers: I agree, I am unsure, I do not agree and his views on the educations with the simulator are collected. In the statistical assessment of the data acquired as a result of the research, number percentage distributions are used.

## 3. Findings

Table 1. Sociodemographic features of the students

Sociodemographic features of the students		Frequency	Percentage
Sex	Female	28	62.2
	Male	17	37.8
Age groups (years)	18-21	25	55.6
	21-23	15	33.3
	24 and above	5	11.1
Economic Status	Bad	15	33.3
	Medium	12	26.7
	Good	18	40.0
Education year in university	1.Sınıf	26	57.8
	2.Sınıf	19	42.2
Total		45	100

The distribution of the students taken to the research context in terms of their sociodemographic features are given in Table 1. 62.2% of the students are women and 37.8% of the students are men. When it is analyzed in terms of age groups, 55.6% is 18-21 years old, 33.3% is 21-23 years old and 11.1% is 24 years old and above. When their economic situation is analyzed, it is determined that 33.3% is bad, 26.75% is medium and 40% is good. When it is analyzed in terms of their education year in the university, 1<sup>st</sup> graders are 57.8%, 2<sup>nd</sup> graders are 42.2%.

Table 2: Thoughts of Students about the Simulator Use

Thoughts of students about the simulator use	Agree n %	Disagree n %	Undecided n %
Simulator use has helped me in learning a lot.	42 93.4	1 2.2	2 4.4
Simulator use has increased my communicational skills.	36 80.0	3 6.7	6 13.3
Simulator use has developed my autonomy.	37 82.2	3 6.7	5 11.1
Simulator use has increased my self-confidence.	37 82.2	- -	8 17.8
I can easily apply the skill that I have acquired following the simulator-education in my professional life.	34 75.6	1 2.2	10 22.2
Simulator-education has decreased my anxiety about the clinic.	30 66.7	1 2.2	14 31.1
The course hour should be higher in the simulator-education.	33 73.3	5 11.1	7 15.6
Both the physical space and the duration were convenient for me in terms of the simulator-education.	18 40.0	11 24.4	16 35.6
The attitude of the instructor considerably affects my motivation in the simulator-education.	35 77.8	3 6.7	7 15.6
Total		n=45 100 %	

The views of the students taken to the scope of research concerning the simulator usage are provided in table 2. 93.4% of the students stated that the simulator is helpful for learning, 80.05 stated that it increased their communication skills, 82.2% stated that it enhanced their autonomy, 75.6% stated that they can apply the skills gained from the simulator in their professional lives, 77.8% stated that the instructor's attitude is important, 73.3% stated that the hours of the applicable lessons must be increased, 66.7% stated that the anxiety towards clinic decreases with the simulator usage. In addition to that, 24.4% of the students stated that the physical environment and time provided to them is not sufficient (Table 2).

#### 4. Discussion

With the simulation education, students gain a full care application ability, technical skill, making decision, assessment, team work and management skill in a safe environment without having the fear of misunderstanding the current situation of the patient and being unsuccessful (Alinier G, 2003). Students can experience fear and anxiety related with the lack of experience in clinical applications (Rhodes M, Curran C, 2005). (Altıok HÖ, Üstün B, 2013).

The anxiety levels of the students can affect their skills of making decisions directly for the clinic and it also affects their learning (Altıok HÖ, Üstün B, 2013). Continuous repetitions provided by the education based on simulation increases the performance and self-esteem of the student (Moule et al., 2008), (Burgess 2007).

Schoening et al. (2006); stated that the simulation for the students are not merely an effective learning tool but also a learning tool that increases their self-esteem for unexpected situations occurring in the clinic. Besides, they stated that this self-esteem after the simulation education is related with the development of hand skill, team work, communication and decision making skills.

In another study related with the topic, it is indicated that students must take a major role in order to control the situation during the simulation. With this way, the students learn to see their mistakes by making appropriate decisions in patient care and treatment and they learn how to move upon their decisions (Alinier et al., 2006), (Göriş et al., 2014)

## 5. Result

There should be studies towards enabling the society to develop positive attitudes and preventing the nursing home and care center to be seen as the last resort of life. The first of them is the need for qualified care personnel. The presentation of elderly care given within the scope of corporate care is performed by the helping attendants. In this context, the need for educated personnel to be employed for elderly care services is inevitable.

Physical, emotional and cognitive incompetence are very important problems for the old age. Diseases and loss of abilities cause both decrease in quality life and health expenses at great dimensions. However, it is possible to decrease them with protective measures. Elderly Care Associate Degree Program raises students that can take part in academic and service areas related with the elderly health which is needed in our country; and raises individuals that can provide service and studies in the fields of aging process, protection of the health of the elderly, encouraging aging healthily, and meeting the needs of our society. As a result with the usage of skill laboratories and simulators in health education, the potential medical errors can be decreased to a large extent, and a better and effective health service can be provided.

Simulator use will enable the student to prepare for the professional life better by smoothing the way especially for some complicated basic applications and the perception of both biochemical and physiological incidents occurring in body.

## Abstract

This study aims to find out the effect of computer based teaching activities on the academic achievement and retention of technical programme Students of Computer Programming on Vocational Foreign Language in Computer Technologies Department. The study was conducted in Vocational School of Technical Science in Suleyman Demirel University with 30 students of computer programming. The experimental group (15 students) was taught with computer assisted instructional software and the control group (15 students) was taught with traditional methods. Achievement test was developed to measure the success of second class students of Vocational Foreign Language lesson was used as pretest, posttest and retention test. As a consequence, it is seemed that the application of computer assisted instructional methods used Vocational Foreign Language lesson is more effective than traditional instructional methods in terms of students' academic achievement and retention.

## 1.Introduction

Today, the technology is going ahead rapidly. Computers have an important place from social to educational life of us. This situation which is the result of computer and human interaction, positively affects both the professional and personal success (Teo, 2008; Hammond, etc, 2009). The increase in the usage of computers in every field of the science and technology especially in education enables to have new development in education and increase the usage of computer in this system (Bottino, 2004; Altun& Bektaş, 2010).

Technology is defined as people's developing new production that eases the life of them by using available equipment. The needs of people's living more modern life cause the technologies rapid development (Tor & Erden, 2004).

Information and communication technologies are mostly affected by the rapid changes and the developments of science and technology in recent years and developing innovations are felt in every aspects of the life. This development

accelerates the producing and using information and information became the main factor both in social and similar fields (Tor & Erden, 2004).

This, in the educational institutions, is affected by the changes and developments in technology. These developments show fundamental changes in the process of education and develop a point of view. While person- information-society triad's changes in quality and developments coming together with their mutual interaction shows changes in person's qualities, it also enables the developments in modern social structures (Keser, 1991).

Some of the technologies used in educations are films, Cyclopes and computers (Akdağ, 2006). Especially its increasing the motivation of the student and its alternatives in programming and increasing flexibility shows the reason of using computer in education (Alkan, 1997; Gürol, 1990; Arseven, 1986).

Computer assisted instruction; is backing up the education with the technologic materials like films, Cyclopes and computers. It is seen as a teaching method and also it also has the role of enriching the education.

As the main item of the education, multimedia equipments can be shown. Multimedia consists of the audio, video, and visual and written material all together. It is the most important technologic material enables students to learn audial and visual learning and gets the information actively by trial and error. It also enables the presentation of the natural application's simulations of complicated terms and enables people to learn with their capacity and capability. Technology is presenting the educational materials appropriate to each level of the education to the usage of the students one to one or as a group (Alakoç, 2003).

### *Problem*

This study aims to find out the effect of computer based teaching activities on the academic achievement and retention of technical programme Students of Computer Programming on Vocational Foreign Language in Computer Technologies Department. So, the answers are seeking for those subs problems.

### *Subs-Problem*

1. Is there a significant difference in the pre-test academic success scores between experimental group and control group?
2. Is there a significant difference in the pre-test and post-test academic success scores in experimental group?
3. Is there a significant difference in the pre-test and post-test academic success scores in control group?
4. Is there a significant difference in the post-test academic success scores between experimental group and control group?
5. Is there a significant difference in the post-test and retention-test scores in control group?
6. Is there a significant difference in the post-test and retention-test scores in experimental group?

## **2.Method**

In this study, it is used 30 students sample, 15 students for experimental group and 15 students for control group who are the students of vocational foreign language students of computer programming in Vocational School of Technical Science in Suleyman Demirel University in the spring term of 2013-2014 educational year.

It is used experimental design with control and experimental group in this study. The effectiveness of computer assisted instruction to traditional methods is compared.

### *Consisting of The Groups*

Literature review has been done related to the topic and the obtained data consists the theoretical background of the study. Before instructing the topic of " The Terms using in Programming Language" It has been applied a pretest consisting of 15 questions prepared by the experts instructing the same lesson in the other departments of the university and the obtained data has been evaluated by the same experts with the answer key prepared by them. Then the topic "The Terms using in Programming Language" is instructed to the experimental group with instructional software and

visual materials and to control group with traditional methods. After this application, a post test with the same questions in the pretest was applied. The tests were again evaluated with the same answer key. After three weeks from this evaluation a retention test was applied.

#### *Application of The Experiment*

A pretest was applied in order to measure the pre knowledge of the groups about the topic before the instruction. Then, the topic was instructed to the control group with traditional method using just board and board marker and to experimental group by using instructional software as Microsoft Office PowerPoint, Microsoft Visual Studio and visual materials in computer lab by the instructor 3 hours in 2 weeks. And also for experimental group interactive lecturing prepared by the instructor, animations, tests related to the topic and instructional videos were used.

#### *Data Analysis*

It has been used statistical tests, T-test in order to observe the significant differences between the pretest and post test scores of the students attended this study. it has been defined  $p < .05$  the level of significance in the statistical analysis.

The pretest and the posttest have been evaluated with 15 points by giving each question 1 point by the experts. After evaluating, the data has been evaluated in SPSS 15, programme.

### **3.Findings**

1) Is there a significant difference in the pre-test academic success scores between experimental group and control group?

Table 1. The comparison of the scores of pretests of control-experimental group

Group	N	$\bar{X}$	S	Sd	T	p
Control	15	3.93	0.96	28	0.34	0.73
Experimental	15	3.80	1.14			

It is seen that the scores of the pretests of the control and experimental group are very close to each other. While the arithmetic mean of the pretest scores of control group is 3.93 and standard deviation is 0.96, the arithmetic mean of the pretest scores of experimental 1 group is 3.80 and standard deviation is 1.14. It has been used the Independent samples T-test if there is a significant differences between the means of their pretest scores. Because the founded "p" value is not  $“.73” < .01$ , there isn't a significant differences between the pretest scores of the groups. So the group equality between the groups is enabled.

2) Is there a significant difference in the pre-test and post-test academic success scores in experimental group?

Table 2. The comparison of the scores of pretest and the posttest of the experimental group

Test	N	$\bar{X}$	S	Sd	t	p
pretest	15	3.80	1.14	14	14.22	0.000
posttest	15	12.60	1.84			

When Table 2. is examined, it is seen that the arithmetic mean of the pretest scores of experimental group is 3.80 and standard deviation is 1.14 and the arithmetic mean of the posttest scores of experimental group is 12.60 and standard deviation is 1.84. It is used paired samples T-test to define the significance of the sub problem. Because the obtained p value is smaller than .01, the proposal has been accepted and it is seen that there is a significant differences between the pretest and posttest scores of the experimental group. While the pretest main of the experimental group is 3.80, the posttest main is 12.60 after instructing the lesson with computer assisted methods. So there is a 8.80 points of increase has been observed. According to the obtained data it is seen that there is an increase in the academic success of the students used computer assisted instruction methods compared to the beginning.

3) Is there a significant difference in the pre-test and post-test academic success scores in control group?

Table 3. The comparison of the scores of pretest and the posttest of the control group

Test	N	$\bar{X}$	S	Sd	t	p
Pretest	15	3.93	0.96	14	11.66	0.000
Posttest	15	8.46	1.50			

When Table 3 is examined, it is seen that the arithmetic mean of the pretest scores of control group is 3.93 and standard deviation is 0.96 and the arithmetic mean of the posttest scores of experimental group is 8.46 and standard deviation is 1.50. It is used paired samples T-test to define the significance of the sub problem. Because the obtained p value is smaller than .01, the proposal has been accepted and it is seen that there is a significant differences between the pretest and posttest scores of the control group. While the pretest main of the control group is 3.93, the posttest main increased to 8.46 after instructing the lesson with traditional methods. So there is a 4.53 points of increase has been observed. According to the obtained data it is also seen that there is an increase in the academic success of the students used computer assisted instruction methods compared to the beginning and traditional methods also contributes the academic success of the students.

4) Is there a significant difference in the post-test academic success scores between experimental group and control group?

Table 4. The comparison of the scores of posttest of control-experimental group

Group	N	$\bar{X}$	S	Sd	T	p
Control	15	8.46	1.50	28	6.72	0.000
Experimental	15	12.60	1.84			

When Table 4. is examined, it is seen that the arithmetic mean of the posttest scores of control and experimental group is 12.60 and standard deviation is 1.84, the arithmetic mean of the posttest scores of control group is 8.46 and standard deviation is 1.50. It has been used the Independent samples T-test if there is a significant differences between the means of their posttest scores. Because the obtained "p" value is smaller than .01, the proposal has been accepted and it is seen that there is a significant differences between the scores of the posttest of control and experimental group.

5) Is there a significant difference in the post-test and retention-test scores in control group?

Table 5. The comparison of the posttest and retention test scores of control group

Test	N	$\bar{X}$	S	Sd	T	p
Posttest	15	8.46	1.50	14	12.85	0,000

Retention	15	5.53	1.45
-----------	----	------	------

6) Is there a significant difference in the post-test and retention-test scores in experimental group?

Table 3.6. The comparison of the posttest and retention test scores of control group

Test	N	$\bar{X}$	S	Sd	T	p
Posttest	15	12.60	1.84	14	7.13	0,000
Retention	15	11.26	2.15			

When Table 5 and 6 are examined, there is a significant difference between the scores of posttests and retention tests of both experimental and control group. ( $p < 0.01$ ). Retention test scores of the both group is lower than the posttest scores. But the differences are lower in experimental group. While the decrease between the posttest and retention test scores of experimental group is 1.34, the decrease between the posttest and retention test scores of control group 2.93.

#### 4. Conclusion And Discussion

1) In this study, firstly in order to define the equality of the groups and see their evaluation steps, a pretest was applied and then to show the effectiveness of the methods a posttest was applied. When looked at the pretest scores of the control and experimental group, they are very close to each other. After it is determined that the groups are homogenous and medium level, In the Vocational Foreign lesson, the control group was instructed with traditional methods and the experimental group was instructed with computer assisted instruction methods to the students by the instructor 3 hours 2 weeks.

2) There is 4.53 points difference between the pretest and posttest scores of the control group to whom traditional methods were used in Vocational Foreign Language lesson. So according to this traditional method positively affects the academic success of the students.

3) There is 8.80 points difference between the pretest and posttest scores of the experimental group to whom computer assisted instruction methods were used in Vocational Foreign Language lesson. So according to this, computer an assisted instruction method also positively affects the academic success of the students.

4) When compared the posttest scores of the control and the experimental group, the scores of experimental group is 4.14 higher than the scores of control group. So according to this differences, It is seen that in Vocational Foreign Lesson, the experimental group to whom computer assisted instruction methods are used are more successful than the control group to whom traditional methods are used.

5) When looked the differences between the posttest and retention test scores of the experimental and control group, While there is a 1.34 decrease in the posttest and retention test scores of the experimental group, the decrease in the control group is 2.93. When looked at this difference in view of the retention of the instruction, it is seen that computer assisted instruction is more successful than the traditional instruction in enabling the retention.

According to this conclusion, we can say that in Vocational Foreign Language lesson, an application of computer assisted instruction positively affects the academic success of the students.

In the study of Kulik and Kulik(1991), it has been examined the results of 254 different studies. According to the results of the studies, the computer assisted instruction positively affects the students' attitude and behaviors to computer and education and it shortens the time needed for instruction.

The instruction diversity is increasing with the developing technology. According to the most researchers, the educational technologies used affectively have the potential to enhance the education (Jonassen & Reeves, 1996; Means, 1994). One of these educational technologies is computers. It is shown in the literature that the usage of computers in education increases the success of students and their motivation and similarly decreases the anxiety level of them (Köse, Ayas & Taş, 2003; Sanger & Greenbowe, 2000; Tezcan & Yılmaz, 2003; Zacharia, 2003). It is also seen that computer

assisted instruction not only affects the academic success but also it positively affects the retention of the instruction (Hacker & Sova, 1998, Chang, 2002). Also, besides the academic success and the retention, it enables the learning by understanding more than memorizing (Renshaw & Taylor, 2000).

# The Effect of Using Multimedia in Teaching Geography on the Achievement

## and Critical Thinking Skills of Second Secondary School Students

### in KSA

أثر استخدام برمجيات الوسائط المتعددة في تدريس الجغرافيا على تنمية التحصيل ومهارات التفكير الناقد لطلاب الصف الثاني الثانوي في المملكة العربية السعودية

Theyab Moqbel Hareb Asharari, Aljouf University, AlQuarayyat, 1300, Saudi Arabia

#### Abstract

##### ملخص الدراسة.

هدفت الدراسة إلى التعرف على أثر استخدام برمجيات الوسائط المتعددة في تدريس الجغرافيا على التحصيل ومهارات التفكير الناقد لدى عينة الدراسة التي تشمل طلاب الصف الثاني الثانوي فرع العلوم الشرعية في محافظة القريات. ولتحقيق هذا الهدف، تم إعداد وحدة إلكترونية تجريبية (السكان والموارد الطبيعية) بمقرر الجغرافيا للصف الثاني الثانوي بالفصل الدراسي الثاني من العام الدراسي 2012/2013م، باستخدام برمجيات الوسائط المتعددة، وإعداد اختبار تحصيلي لقياس المستوى المعرفي لمحتويات الوحدة التجريبية لدى عينة الدراسة، وتطبيق اختبار التفكير الناقد على عينة الدراسة لقياس مدى تنمية مهارات التفكير الناقد. وتم تطبيق الاختبار التحصيلي واختبار التفكير الناقد تطبيقاً قيبلياً وبعدياً على عينة الدراسة، حيث تم تقسيمها إلى مجموعتين (تجريبية وضابطة).

وننتج عن الدراسة وجود فروق ذات دلالة إحصائية عند مستوى (0.05) لصالح المجموعة التجريبية، في التحصيل ومهارات التفكير الناقد قبل التجريب وبعده. وقد أشارت نتائج تطبيق الاختبارين على المجموعتين (التجريبية والضابطة) أن الوحدة الإلكترونية المعدة باستخدام برمجيات الوسائط المتعددة يتضمن: قيام الطلاب بأنشطة مختلفة تنمي التحصيل لديهم، وتنمي قدراتهم على التفكير الناقد. (الكلمات المفتاحية: الوسائط المتعددة، مهارات التفكير الناقد، الجغرافيا).

This study aims at identifying the effect of using multimedia in teaching geography on the achievement and critical thinking skills of second secondary school students. To achieve this goal, an experimental electronic unit (Human and Natural Resources) are assigned in the geography text book of second secondary students in the province of AlQurrayat, in Second semester of the academic year 2012/2013, in the form of PowerPoint.

An achievement test is also designed for assessing the cognitive level of the content of the experimental unit. Moreover, a critical thinking test is applied for evaluating the critical thinking skills. Both tests were applied to a sample of students who were classified into two groups: experimental and controlling.

The study results in finding out some statistical differences (0.05) in favour of the experimental group in the achievement and critical thinking skills before and after the treatment. The results of applying the two tests to both groups (controlling and experimental) indicate that the electronic unit supported by multimedia programs has assisted students practice various activities that develop their cognitive skills as well as their critical thinking abilities.

#### • المقدمة:

يشهد القرن الحادي والعشرين ثورة معلوماتية مذهلة في شتى مجالات الحياة متمثلة في الانفجار المعرفي والتقدم التقني، والتطور التكنولوجي، الذي ألقى بظلاله على الأنظمة التربوية، لتأخذ دورها في نقل تلك المعارف والتكنولوجيا إلى المتعلمين، فكان دور التربية أكثر أهمية ليس فقط في نقل المعارف إلى المتعلمين، بل في إكسابهم مهارات عمليات التعلم ومهارات التفكير العلمي ومهارات التفكير الناقد والابتكاري، فكان لاستخدام الحاسب الآلي النصيب الأوفر في مجال التربية منها: استخدامه كمساعد تعليمي Computer Assisted Instruction، والتعليم المدار بالحاسب الآلي Managed Computer Instruction، واستخدامه كمعلم Computer as a TUTOR،

واستخدامه كمتعلم Computer as a TUTEE، واستخدامه كأداة تعليمية Computer as a TOOL (صقر، 2007، ص 45).  
ومما ساعد على ذلك، ظهور العديد من البرامج الحاسوبية المختلفة منها : برنامج البروينت (برنامج العروض التقديمية) وبرنامج الفوتوشوب (برنامج لمعالجة الصور) وبرنامج الوسائط المتعددة وغيرها ، مما يسر عرض المادة التعليمية بالصوت والصورة مصحوبة بالحركة واللون ، وعرض لقطات الفيديو والرسوم والتحكم في سرعة وزمن العرض. فأصبح من الممكن الاعتماد على أكثر من مؤثر تعليمي، بالإضافة إلى جذب المتعلم وجعله نشطا أثناء فترة العرض، خاصة بما يتخلل العرض من تقديم أسئلة ومناقشات تتطلب استدعاء معلومات من جانب المتعلم.

وتؤيد الأبحاث لعلامة الحاسوب في تكنولوجيا التعليم، فمنها تكويد في التوثيق، القتل كما أشارت نتائج إحصائيات الدراسات السابقة إلى أهمية استخدام الوسائل التكنولوجية الحديثة في التعلم ، حيث أنها تعمل على توفير من (30% إلى 40%) من وقت التعليم ، كذلك مساعدة المتعلم على الاحتفاظ بالمهارات والمعارف لفترة زمنية أطول ، وبتكلفة أقل من التعليم بدون استخدام التقنيات الحديثة ( السيد ، 2002 ، 34 ).  
وتؤيد الأبحاث لعلامة الحاسوب في تكنولوجيا التعليم، فمنها تكويد في التوثيق، القتل كما أشارت نتائج إحصائيات الدراسات السابقة إلى أهمية استخدام الوسائل التكنولوجية الحديثة في التعلم ، حيث أنها تعمل على توفير من (30% إلى 40%) من وقت التعليم ، كذلك مساعدة المتعلم على الاحتفاظ بالمهارات والمعارف لفترة زمنية أطول ، وبتكلفة أقل من التعليم بدون استخدام التقنيات الحديثة ( السيد ، 2002 ، 34 ).  
فهي تتميز بتحقيق التفاعل مع المتعلم ، وبذلك يصبح المتعلم محور العملية التعليمية وليس المعلم ، وبذلك يتوفر عنصر جذب المتعلم وتشويقه للمحتوى وزيادة مدة احتفاظ التلاميذ بالمعلومات والقدرة على استرجاعها ( صقر ، 2007 ، 223 ) ، وكذلك سهولة إدخال النصوص والصور والفيديو والأصوات في برامج التعليم ، والتحكم في سرعة العرض ، ورخص ثمن أجهزة التخزين المستخدمة CD-ROM .

وهناك العديد من الدراسات التي بينت ذلك، حيث هدفت دراسة رادا وآخرون (Rada et al., 1994)، ودراسة الفار (1998)، ودراسة أوغتون وريد (Oughton and Reed, 1998) ، ودراسة ألن (Allen, 1998) ودراسة أبا الخيل والسيد (2000) ، ودراسة عباس (2001) ، ودراسة بوليك وميجلين (Bolic & McGlinn, 2004) ، ودراسة لال (2004) ودراسة خضر والمهديب (2006) ودراسة السيد (2007) ، ودراسة حسين وخير الدين (2007) ، ودراسة سليمان (2010)، ودراسة أبي الحمال (2013)، ودراسة تشينك وفوك (Ching and Fook, 2013).

هذا وقد اهتمت المملكة العربية السعودية بإدخال الحاسب الآلي في العملية التعليمية التعليمية بما توفره في جميع المدارس من معامل للحاسب الآلي، ومصادر التعلم وربط المدارس بشبكات الانترنت، وقد تمثل ذلك في مشروع الملك عبد الله بن عبد العزيز الوطني لاستخدام الحاسب الآلي في التعليم عام 2000م .  
من جميع ما تقدم يتضح لنا ضرورة توظيف الوسائط المتعددة في تصميم برمجيات تعليمية (وحدة الكترونية) لوحدة تدريسية في الجغرافيا والكشف عن فعاليتها في تنمية التحصيل ومهارات التفكير الناقد.

#### • مشكلة وأسئلة الدراسة :

يحدد الباحث المشكلة الرئيسة للدراسة الحالية في الإجابة عن السؤال الرئيس الآتي :

- ما أثر استخدام برمجيات الوسائط المتعددة في تدريس الجغرافيا على تنمية التحصيل ومهارات التفكير الناقد لدى طلاب الصف الثاني الثانوي؟

وبتفرع منه الأسئلة الآتية:

1. ما أثر استخدام برمجيات الوسائط المتعددة في تدريس الجغرافيا على تنمية التحصيل لوحدة " السكان والموارد الطبيعية " لدى طلاب الصف الثاني الثانوي ؟
2. ما أثر استخدام برمجيات الوسائط المتعددة في تدريس وحدة "السكان والموارد الطبيعية" بمقرر الجغرافيا على تنمية مهارات التفكير الناقد ككل لدى طلاب الصف الثاني الثانوي ؟

#### • أهداف الدراسة :

تهدف الدراسة الحالية إلى:

1. التعرف إلى أثر استخدام برمجيات الوسائط المتعددة في تنمية التحصيل لدى طلاب الصف الثاني الثانوي في مقرر الجغرافيا.
2. التعرف إلى أثر استخدام برمجيات الوسائط المتعددة في تنمية بعض مهارات التفكير الناقد ككل لدى طلاب الصف الثاني الثانوي في مقرر الجغرافيا.

#### • محددات الدراسة :

تقتصر الدراسة الحالية على:

- حدود خاصة بالعينة : تم اختيار الصف الثاني الثانوي من مدرسة ثانوية عبد الرحمن بن عوف بمحافظة القريات كمجموعة تجريبية، و الصف الثاني الثانوي من مدرسة ثانوية الحديثة كمجموعة ضابطة .
- حدود خاصة بالمحتوى: حيث اقتصر المحتوى على اختيار وحدة " السكان والموارد الطبيعية" بمقرر الجغرافيا لدى طلاب الصف الثاني ثانوي بالفصل الدراسي الثاني، عام 2013م.
- تكونت الوحدة من عشر حصص تدريسية

#### • التعريفات بالمصطلحات:

الوسائط المتعددة (Multimedia): تعددت تعاريف مصطلح الوسائط المتعددة ومنها:

فقد عرفها بأنه "مجموعة من أدواتها التي يمكن استخدامها لتقديم محتوى تعليمي".

وتعرف إجرائيا: بأنها استخدام إمكانات الحاسب الآلي في بناء برنامج تعليمي لربط النص والصوت والرسوم والصور الثابتة ولقطات الفيديو والرسوم المتحركة، وتقديمها في صورة الكترونية متكاملة.

**التفكير الناقد: في اللغة:** ورد الفعل " نقد " في لسان العرب بمعنى ميز الدراهم وأخرج الزيف منها فنقد الدراهم أي ميز الذهبية منها ، بمعنى اكتشاف الزائفة .  
**ووظيفته:** بله الأسلوب الذي يستخدمه الطالب في تفسير واستنتاج، واستنباط المعلومات، **وهدفه:** وتقويم الحجج لحل المشكلات التي تواجهه، ويقاس بالدرجة التي يحصل عليها الطالب في اختبار مهارات التفكير الناقد الذي تبناه الباحث.  
 التجريب الأساسي:

تم تطبيق التجربة الأساسية للبحث بالفصل الدراسي الثاني عام 2013م ، بعد التأكد من صدق وثبات الأداة.

#### • النتائج:

##### أولا : نتائج تطبيق الاختبار التحصيلي:

1. **لإجابة أسئلة في اللغة:** (ما أثر استخدام برمجيات الوسائط المتعددة في تدريس الجغرافيا على تنمية التحصيل لوحدة " السكان والموارد الطبيعية " لدى طلاب الصف الثاني الثانوي؟).  
 قام الباحث باستخراج المتوسطات الحسابية والانحرافات المعيارية وقيم (ت) لنتائج التطبيق البعدي لاختبار التحصيل؛ فكانت النتائج كما يوضحها الجدول رقم (1) الآتي:

**جدول ( 1 )**

المتوسطات والانحرافات المعيارية وقيم (ت) لنتائج التطبيق البعدي لاختبار التحصيل الكلي على كل من المجموعتين التجريبية والضابطة

الاختبار	المجموعة التجريبية		المجموعة الضابطة		قيمة ت	حجم التأثير
	ن=5		ن=7			
	م1	ع1	م2	ع2		
الاختبار التحصيلي	60	3,162	52,6	3,361	0,05	كبير

- ويتبين من الجدول رقم (1) وجود فروق دالة إحصائية عند مستوى (0.05) بين متوسطات درجات عینتي الدراسة في الاختبار التحصيلي لصالح المجموعة التجريبية ، كما تشير النتائج إلى أن حجم تأثير الوحدة الالكترونية المعدة ببرامج الوسائط المتعددة كبير.  
**لإجابة أسئلة في اللغة:** (ما أثر استخدام برمجيات الوسائط المتعددة في تدريس الجغرافيا على تنمية مهارات التفكير الناقد لدى طلاب الصف الثاني الثانوي؟).  
 قام الباحث باستخراج المتوسطات الحسابية، والانحرافات المعيارية، وقيم (ت)، لنتائج التطبيق البعدي لاختبار التفكير الناقد الكلي ؛ فكانت النتائج كما يوضحها الجدول رقم (2) الآتي:

**جدول ( 2 )**

المتوسطات والانحرافات المعيارية وقيم (ت) لنتائج التطبيق البعدي لاختبار التفكير الناقد ككل على كل من المجموعتين التجريبية والضابطة

الاختبار	المجموعة التجريبية		المجموعة الضابطة		قيمة ت	حجم التأثير
	ن=5		ن=7			
	م1	ع1	م2	ع2		
التفكير الناقد	80,2	2,864	60,8	1,304	0,05	كبير

- ويتضح من الجدول رقم (2) وجود فروق دالة إحصائية عند مستوى (0.05) بين متوسطات درجات عینتي الدراسة في التفكير الناقد ككل لصالح المجموعة التجريبية، كما تشير النتائج إلى أن حجم تأثير الوحدة الالكترونية المعدة ببرامج الوسائط المتعددة كبير.

#### • الاستنتاجات والتوصيات:

- في ضوء ما توصلت إليه نتائج الدراسة ، يمكن تقديم الاستنتاجات والتوصيات التالية :
- 1 التأكيد على ضرورة استخدام برامج الوسائط المتعددة لطلاب الأقسام الأدبية في تدريس مقرر الجغرافيا.
  - 2 تدريب المعلمين على إعداد الوحدات الدراسية ببرمجيات الوسائط المتعددة.
  - 3 إجراء دراسات تتناول فعالية الوسائط المتعددة في تنمية مهارات التفكير الإبداعي لدى الطلاب والطالبات من خلال محتوى المقرر الدراسي .
  - 4 بحث مخططي مناهج المواد الاجتماعية والمسؤولين المختصين في وزارة التربية والتعليم (وكالة الوزارة للتطوير التربوي) على ضرورة تضمين النشاطات التعليمية، التي تساعد في تنمية مهارات التفكير الناقد لدى طلاب المرحلة الثانوية.

## Abstract

Turkey, the educational simulation has an important place in terms of this changing sense in medical education. The universities, which review the training they provide, involve the simulation in their curriculum in order to enable the students-to-graduate to acquire the need of convenient knowledge and some skills during the faculty education. The team that is employed in 112 emergency health services primarily aims to perform interventions for saving the human life in cases of any danger, try to prevent the possible secondary damages while performing these interventions and thus, enable the sustainment of life without any sequela. Simulation presents a learning environment that provides the possibility of a learner-centered experience rather than an experience where the patient is objective, and gives both confidence and support to the student.

## 1. Introduction

The history of simulation dates back to 5000 years ago. The first simulations, known as WEICH, come from Chinese war games. These games were also used to develop army and navy strategies. Since 1800s, military plans were made with the help of simulations (Shah et al., 2007). The second important milestone in the history of simulation was the first flight simulator developed by Edward Link in 1929. Although it was designed for paid recreational flights, Link's simulator was later extensively used in military and commercial aviation training and evaluation beginning from 1949 (Patrick 2002). The third milestone in the history of simulation was its use in the training and evaluation of medicine students with the medicine training reform in the 1990s, which has made it recognized world-wide. At first, simulators were only used in clinical skill laboratories because of their high costs. Today, they are an indispensable part of both pre- and post-graduation training programs and simulation-based training has been extensively used as an innovative approach in medicine training (Bradley 2006).

The concept of simulated patient was first suggested by Barrows and Abrahamson in 1964 in order to make it easier to teach clinical skills (Collins et al., 1998). The first studies on simulated patients were conducted by Harden, Stevenson, Wilson and Downie in 1975. The use of simulated patients has become widespread in both training and assessment-evaluation after 1980 (Lane et al., 2001).

### • The definition of simulation

Simulation is defined as the imitation of tasks, relations, phenomena, equipments, behaviours and certain cognitive activities, which are present in reality. Developments in technology and education resulted in a collaboration between these fields, thus allowing simulation applications and tools to become widespread and used in training. Rising values such as patient safety, patient rights and efforts for improving student competency made it possible for simulations to be extensively used in medicine training (Mıdık et al., 2010).

Every simulation must possess the property of "fidelity", which can be defined as "consistency with real life", or in other words, "authenticity". This property reflects the reality of experiences (Maran et al., 2003). A simulation must be able to imitate all existing possibilities and provide a rich environment, where participants can respond realistically. A

simulation must contain different paths that the participant can follow in case of a change in the problem or situation or unclear situations, it should be able to act in accordance with the actions of the participant. The more of these features contains the system, the better the participants can transfer what they learned during the simulation to the real life (Patrick 2002).

- *The Benefits of Using Simulation in Training*

Using certain occupational applications on the patient for the first time puts the student under stress for many reasons. The primary reasons are worrying about making a mistake or fear of harming the patient. The other reasons include not being able to experiment on the patient continuously, not being able to learn because of lack of supervision and worrying about being insufficient (Weller 2004). The trainings on real patients are brief, opportunistic and they depend on the experience level and interests of the trainer. This results in a training environment which is difficult, incomplete, insecure and lacks feedback. The use of simulations helps reverse all these negativities (Ziv 2005). The use of simulations will provide an innovative spirit for the training program, it will take basic and advanced trainings to a higher level by increasing cognitive knowledge level. The transfer of skill from training environment to real situations will be encouraged and proficiency of the students will improve with right applications and high recall ratios. Thus, it will be possible to claim an increase in the quality of training programs and graduates. With the use of simulations in training programs, trainers will have the opportunity to actively participate in student's trainings and evaluations, learn about the developments in the field and practice (Ziv 2003).

## **2. Discussion**

Simulation is defined as the imitation of tasks, relations, phenomena, equipments, behaviours and certain cognitive activities, which are present in reality (Midik et al., 2010). Issenberg et al. (2001) defined simulation as an application in which students have to act as if they were in a real life situation. Bradley (2006) approached the use of simulation in medicine training as in a broad perspective and defined it not only as a wide range of technological possibilities, but also as a training method which contains an considerable amount of human interaction. According to Gaba (2007), simulation is a technique which makes it possible to experience a real situation beforehand with the help of a guide. It's important to give feedback to students on a regular basis during the application in order to expand their knowledge about the practice (Alinier 2003). Giving feedbacks to students during trainings in which simulation is used makes it possible for them to learn from their mistakes and gain experience without harming patients (Burgess 2007). Students may experience fear and anxiety during clinic practices due to lack of experience (Rhodes et al., 2005). Anxiety levels of students directly affects their ability to make clinic-related decisions and learn (Rhodes et al., 2005). Continuous repetitions made possible with simulation-based trainings improve students' performances and boost their self-confidence (Reilly 2007). Having more practice allows students to have lower levels of anxiety and improve their self-confidence, thus improve the quality of their performance (Karaköz 2003).

In a study conducted by Terzioğlu et al. (2002), it has been stated that using advanced application-responsive models in skill development applications was more effective in terms of making them feel proficient. Schoening et al (2006) has stated that simulation was not only an effective training tool, but also a training tool which boosts students' confidence in emergency situations which may occur in clinics. In addition, students have expressed that this self-confidence was associated with improvements in post-training dexterity, team work, communication and decision-making skills. (Göriş et al 2014)

## **3. Conclusion**

Considering the mortality rates, the first few hours after the onset of the event that is called "golden hours" on the margin of life and death are very important in terms of intervention. Once the event occurs, it is required to perform the right intervention on the patient/injured at the right time, provide the stabilization (balance of vital functions) of the patient/injured on the scene and carry her/him with convenient teams and equipments and with convenient carrying methods. Today, it is required to have sufficient knowledge and skills in many respects in 112 emergency health services. Simulation-based health education is one of the best examples of the application areas of the experience-based learning. It enables the patient to gain experience by repeating, making mistakes and learning from mistakes without

any harm. It prepares an educational environment for the student to think about her/his performance. It is possible to prepare scenarios as required and test all probable conditions. Such an educational environment will increase the transfer of what is learned with the help of convenient skill educational methods to learnings in the clinical environment.

# The effectiveness of using toys in developing Palestinian students' communication skills and vocabulary retention

Dr. Ibrahim Mahmud Sabatin

Hebron University -Hebron, Palestine

---

## Abstract

This study aimed to investigate the effectiveness of using toys in developing Palestinians students communication skills. . It also examined the long-term effect of the toys on the retention of the vocabulary. The researcher chose 60 third grade students from Quziba School for girls and boys in Hebron area. He chose two classes from the third grade classes randomly . The sample of the study was 60 students, 30 students in each one. Toys were used in teaching the experimental group, while the traditional way was used with the control one in the first semester of the academic year (2013-2014).

The experiment lasted for six weeks. After two weeks, a delayed test was administrated to the experimental group to measure retention. The results of the study revealed that there were statistically significant differences in the total mean score in communication skills achievement between the pupils who learned through toys (experimental group) and those who learned through the traditional method (control group ) in the post test. It also showed that there were statistically significant differences at ( $\alpha \leq 0.05$ ) in the total mean score in vocabulary achievement between the pupils who learned through toys (experimental group) and those who learned through the traditional method (control group ). And this was due to the method of using toys in teaching vocabulary. In the light of those findings the study recommended the necessity of using toys in teaching English language to make better outcomes in students' achievement and to shed light on techniques that emphasize organizing information for long learning (retention).

## Introduction

Language plays an essential role in making people communicate with each other. And as for English, it is considered one of the most important languages all over the world. It helps communicating with foreigners at home and abroad. Accordingly, The English language is widely used in science, technology, computer services, politics, commerce and internet. Hence, many countries emphasize the importance of teaching English to their citizens. Richards (2001: 1) believes that "Second and foreign language teaching is one of the world's largest educational enterprises and millions of children and adults worldwide devote large amounts of time and efforts to the task of mastering a new language". The English language has a special place in the world today. It has become an international language, both in the sense that it is now the native language of people from several continent sand in the sense that many others have learnt to speak it as a second language (Graddol, Cheshire& Swann,1987:3). Ardeo (2003:110) states that during the last few decades there has been an increasing need to use the English language for the expression of knowledge within specific professional fields. In order to achieve a successful process of learning English, one must acquire its vocabulary, grammar, pronunciation and the Four skills: listening, reading, speaking, and writing. Accurate and adequate vocabulary

influences language comprehension more than grammatical correctness in effective communication. In this concern, Wilkins (1972:111) emphasizes that “Without grammar very little can be conveyed, without vocabulary nothing can be conveyed”. This clarifies the importance and the essential role of vocabulary in learning a foreign language. Vocabulary is a vital part of language that students need to master in order to communicate effectively. Moreover, it is considered the base for the other skills.

### **Statement of the Problem**

The researchers has observed that students face big difficulties in English communication skills and vocabulary retention. This difficulty might be a result of ineffective communication skills and vocabulary teaching methods which affect their vocabulary achievement and retention. Thus, the students' low achievement level in communication skills and vocabulary requires a serious research for alternative and effective techniques that may increase students' achievement and motivation. and adults worldwide devote large amounts of time and efforts to the task of mastering a new language”. The English language has a special place in the world today. It has become an international language, both in the sense that it is now the native language of people from several continents and in the sense that many others have learnt to speak it as a second language.

### **Purpose of the Study**

The purpose of the present study is to investigate the effectiveness of using toys on the learners' achievement in communication skills and vocabulary retention.

In short we can say that this study will try to help teachers of English in Palestine to improve their students' level in communication skills and to achieve good communication in foreign language.

### **Research Questions:**

- Are there statistically significant differences at ( $\alpha \leq 0.05$ ) in the total mean score in communication skills achievement between the pupils who learned through toys (experimental group) and those who learned through the traditional method (control group) in the post test.
- Are there statistically significant differences at ( $\alpha \leq 0.05$ ) in the mean score in communication skills achievement between the pupils who learned through toys (experimental group) and those who learned through the traditional method (control group) due to sex.
- Are there statistically significant differences at ( $\alpha \leq 0.05$ ) in the total mean score in vocabulary achievement between the pupils who learned through toys (experimental group) and those who learned through the traditional method (control group)

### **Limits of the Study**

The researcher acknowledges the following limitations to the study. This study will be limited to the third grade students who study English at Hebron area for the academic year 2013/202014. The results of this study could not be generalized out the boarders of these limits. All of the subjects are non-native speakers of English. The results of this study could be generalized only to other similar conditions.

### **Methodology**

This study aimed to investigate the effectiveness of using toys in developing the third grade students communication skills achievement. It also examined the long-term effect of toys on the retention of the vocabulary.

### **Research Design**

The researchers followed the experimental approach. Two groups were assigned as the participants of the study; the experimental group, and the control group. The research includes four variables; the first variable is toys, the second variable is vocabulary achievement, the third variable is communication skills, the fourth variable is vocabulary retention. The experimental group was taught communication skills and vocabulary via toys, while the control group was taught via the traditional method. The experiment lasted for six weeks. Both groups were taught by the same teacher, the researchers.

### **Population of the Study**

The population of the study consists of all third grade students at the governmental schools in Hebron area in the first semester of the academic year (2013-2014).

### Sample of the Study

The sample of the study consisted of (60) students distributed into two groups; one experimental group consists of (30) students and one control group consists of (30) students. The sample of the study was chosen purposively from Quaziba girls school. The sample of the study was randomly chosen from the third grade classes and equally divided into two groups, experimental and control.

### Instrumentation

The researcher used an achievement tests to gather data. The tests were held on two days. In the first day, the researcher divided the subjects into two groups (experimental and control ). Each group consists of 30 male and female students. The a post test was given to them.

### The homogeneity of the sample

This section of the study presents the homogeneity between the two experimental and the two controlled groups in order to form homogenous groups.

Before administering the test, the research assured the homogeneity of all students to form homogeneous groups, depending on their GAE.

**Table :( 1). Means and Standard Deviation for the Homogeneity between the Two Groups (A/B) for the First Sample**

Section	Number	Mean	Std Dev	DF	T-VALUE	Sig
A	30	74.4286	1.77484	58	-.762	0.449
B	30	76.3714	1.83023			

A: Controlled group

B: Experimental group

As can be seen from the mean scores in Table (3.5 )group A assigned (M=74.43, Sd=1.77) while group B assigned (M=76.37, Sd=1.83).Both groups assigned almost the same mean scores. No significant difference was found between the two groups.(P > 0.05)

### Results :Data Analysis

This section will discuss the results of the effectiveness of using toys on the learners' achievement in communication skills and vocabulary retention.

The study revealed the following results:

#### Hypothesis 1

There is no statistically significant difference in the total mean score in communication skills achievement between the pupils who learned through toys (experimental group) and those who learned through the traditional method (control group ) in the post test

**Table (2) Means and Standard Deviation of Students' Performance in communication skills due to the group**

Group	No	Mean	Std. Deviation	DF	T-value	Sig.
Controlled	30	0.538	0.156	58	5.027	0.000
Experimental	30	0.717	0.116			

Comparing the mean scores of both texts we notice that the experimental group which was taught by using toys assigned higher mean scores ( M= 0.717, Sd=0.116) than the controlled group which was taught by the traditional way (M=0.538,Sd=0.156 ). We notice from Table (1) that the hypothesis is rejected .

#### Hypothesis 2

There is no statistically significant difference in the total mean score in communication skills achievement between the pupils who learned through toys (experimental group) and those who learned through the traditional method (control group) due to sex.

**Table(3) Means and Standard Deviation of Students' Performance in communication skills due to sex**

Variable	N	Mean	Std. Deviation	DF	T-value	Sig.
Male	31	0.656	0.136	58	0.556	0.580
Female	29	0.623	0.168			

This result supports the second hypothesis which says There is no significant difference in the total mean score in communication skills achievement between the pupils who learned through toys (experimental group) and those who learned through the traditional method (control group) due to sex.

### Hypothesis 3

There is no statistically significant differences at ( $\alpha \leq 0.05$ ) in the total mean score in vocabulary achievement between the pupils who learned through toys (experimental group) and those who learned through the traditional method (control group).

**Table(4) Means and Standard Deviation of Students' Performance in vocabulary due to the group**

Group	No	Mean	Std. Deviation	DF	T-value	Sig.
Controlled	30	0.538	0.156	58	5.027	0.010
Experimental	30	0.717	0.116			

Comparing the mean scores of both texts we notice that the experimental group which was taught by using toys assigned higher mean scores ( $M = 0.717$ ,  $Sd = 0.116$ ) than the controlled group which was taught by the traditional way ( $M = 0.538$ ,  $Sd = 0.156$ ). We notice from Table (1) that the hypothesis is rejected. This means that there is statistically significant differences at ( $\alpha \leq 0.05$ ) in the total mean score in vocabulary achievement between the pupils who learned through toys (experimental group) and those who learned through the traditional method (control group).

### Conclusion

Based on the findings, derived from the results of this study, the following conclusions were reached:

1. Toys stimulate students towards an independent practice of English language instead of direct instruction.
2. Educational toys provide a context in which language is used in a meaningful way and they helped students develop communicative competence in the English language. This also adds an interesting aspect to toys, the competition. Adding competition to educational toys is a good technique to try to push its players to learn.
3. Toys provide students with enjoyment, pleasure, enthusiasm and variation which are significant enough to affect the students' achievement positively.
4. Toys can afford a valuable technique in language classroom for students at intermediate level and hence can be used to facilitate the process of vocabulary learning.

### Pedagogical Implications

In the light of the study results, the researchers suggest the following:

1. Teachers should be aware of the needs of their students as well as their abilities and can accordingly choose suitable techniques for activating English vocabulary.
2. Teachers should avoid teacher-centered classes and encourage student-centered classes. And should use strategies which can promote learners' motivation.

## Recommendations

In the light of the results, the researchers recommend that:

Curriculum designers and decision makers are recommended to enrich the Palestinian curriculum with different educational toys that tackle the different skills of English language .And Develop and enrich the Teacher's Guide with activities and techniques with different types of toys. Supervisors are recommended to Provide teachers with instructional materials which improve their awareness about toys and their importance and the necessity of using them in teaching English. And Conduct workshops that aim at familiarizing teachers with different toys. English language teachers are recommended to Change the methods and approaches of teaching from traditional to communicative which based on the students' real involvement in the teaching-learning process. And Change their role from instructors who dominate the class into educators whose role is to facilitate, guide, organize, help, coordinate and support the students to communicate and acquire the language.

## Recommendations for Further Studies

The researchers suggested the following recommendations for further studies:

1. The effect of computerized competitions on developing students reading comprehension skills.
2. The effectiveness of using toys on developing listening comprehension skills.
3. The effect of educational toys on developing students' critical thinking.
4. The effectiveness of a suggested program based on toys on developing reading comprehension skills.
5. The effect of toys based learning on the development of self-learning .

## Abstract

Education is an important tool for development of individuals and societies. Children as a part of education system and the adults of future are a vital importance. The education system should be covered, especially children, including every human being in order to develop. In Turkey the process of education raised to twelve year, is known 4+4+4 system, and this decision got so much reaction because of its possible results. One of this results is the child labour problem. The aim of this study is to discuss the effects of education system on the child labour and bring into question social work intervention in order to eliminate this problem.

## 1. Introduction

Among other members of a community, a child is an individual who needs looking after and private caring because of having a nature sensitive, sentimental and cognitive characteristic open to learning. Progression of a society is merely possible with the development of children in that community, who are strong psychosocially and physically. While child abuse dates back early humans, any child abuse in whatsoever form it is requires medical and psychosocial treatment, in addition the person who are involved in child abuse is subjected to legal act. Child abuse is mainly grouped as physical, emotional, sexual, and economical and negligence, and child labour is one of the prime issues of the economical abuse.

Economical abuse can best be defined as hiring a child for a work in which his rights are infringed, low payment is made, and his personal development is hindered (Bahar et. al, 2009). It is an insurmountable issue in our country as well as in many other developed and developing countries as a clear result of the distribution of unbalanced economic and technological growth. The need for human workers in the industries has gained an utmost importance because of the competition in the global markets in a correlation with globalisation; it has resulted in a crowded mass of labour class first in Europe and all around the world respectively (Alp et.al, 2009; Sunal et.al, 2008; Yıldız, 2007; Kavi, 2006; Özdemir, 2005; Sapancalı, 2002; exp.: Güler, 2001). As expected, first male workers and then in time female workers and in a short span of time child workers have been employed in industries, which has led a disturbance in the physical, sensorial, kinaesthetic, social, medical and moral development and his right for education has been disregarded. That has brought about children being prone to every threat, for they have adopted all the negative experiences and way of behaving in the work life.

## 2. The Issue Of Child Labour

To make a definition of child labour necessitates the definition of child. It can best be done by taking the age criteria and the children rights into consideration. The United Nations Convention on the Rights of the Child (commonly abbreviated as the CRC, CROC, or UNCRC) defines a child as any human being under the age of eighteen.

E-mail address: bugrayildirim58@gmail.com

Child labour refers to the employment of children in any work that deprives children of their childhood, interferes with their ability to attend regular school, and that is mentally, physically, socially or morally dangerous and harmful. According to ILO (International Labour Organisation), the definition of working child and that of child labour do not overlap (FAO, 2013).

Child labour has always been considered as the series of acts that deprive the children of their childhood, main potentials, and the most importantly their honours, and that give a serious harm to their physical and mental development. All these prevent them from attending school and even if they do so, they lead them to work in heavy jobs that last for hours. To decide if a job is child labour or not is solely depends on the kind of job, the age of the child, the content the hours of the job, the working conditions, and the goals of the country; therefore, it varies from country to country and from sector to sector (ILO, 2004).

In Turkey, in accordance with the labour law of 2003, it is forbidden for employers to employ children under the age of 15; however, those who are in their 15 legally and have completed secondary school education or those who continue their education could be hired for the jobs as long as these jobs do not harm their physical, mental, and moral developments. For employment, it is a requirement for the workplaces to consider children's safety measures, their physical, mental, and psychological developments, personal tendencies, and abilities. It is necessary for works not to hinder them from going to school, and vocational training. Working hours of the children who have completed the compulsory education and do not attend to school is not allowed to be more than 7 hours per day and 35 hours per week, but for those who have completed the age of 15, the time could be extended to 8 hours per day and 40 hours per week (Labour Law No: 4857, Article 71).

It is clear that education system has considerably important to shape the working conditions of children. It would be useful to have a look at the prospects of child labour both in our country and in the World before giving the details of education.

### **3. A General Overview Of Child Labour Both In Turkey And In The World.**

Almost 1/3 of the World population is comprised of children under the age of 18. Children and youngsters constitute almost half of the whole population in most countries (Unicef, 2006). Although according to the statistics of ILO there are a plethora of children who are employed under the age of 5, almost all of the children employed are those under at the age range of 5-17. In accordance with the records of ILO, 306 million out of 1.586 billion children in the World (19.3%) are in the employment sector, and 250 million (around 70%) of these children are child worker, which shows that one out of every seven child in the World is child worker. 115 million of these children are performing very dangerous tasks (ILO, 2010).

The same statistics 176 million children at the age range of 5-14 are in industry and it is clear that the number of child workers is 153 million, of whom 53 million are employed in dangerous tasks. 129 million children at the age range of 15-17 in the industry of whom 53 million are employed in dangerous tasks are child workers and all of the workers in that range have been working in dangerous tasks (ILO, 2010).

As of considering the rates from gender point of view, the records reveal that 15.6 % of male children and 11.4% of female children at the age range of 5-17 are child workers. In other words, the number of female workers is 88 million, while the same number applies to 128 million for male children. 9.4% of the male children and 5.4% of the female children at the same age range has been working for dangerous jobs (ILO, 2010).

60% of the children at the age range of 5-17 in the World has been employed in the agriculture sector and are subjected to work accident or occupational disease (FAO; 2013) most of the male children are employed in the industrial and agricultural sector, while female children operate in service sectors. 67.5 of the children employed work without payment, and 21.4% are paid, and 5% work freelance. The rate of female children who work without payment is 72% and the same rate is 64% for males (ILO, 2010).

According to 2012 records of Turkey Institute of Statistics, the population of children at the age range of 0-17 constitutes of 30% of the total population (22 691 179). It is a reality that the issue of child labour which is relevant to a huge segment of the society should not be ignored. The exploitation of the labour of the children has still been an issue that has been deeply affecting the country which has promised to strive for the exploitation of child labour and has started to implement some laws to regulate the issue. The issue of child labour has been observed in two ways as both employing the children under the legal age illegally and forcing them to work under heavy work conditions.

According to the records of the questionnaire of child labour in Turkey in 2012, children at the age range of 6 -17 have mostly been employed in agricultural sector. The second sector in which they are employed abundantly is service sector and the third one industrial sector. Considering the gender, the records show that female children are mostly employed in the agricultural sector, but male children are hired for service sector. When the records between 2006 and 2012 are compared, it comes out that the number of child workers has increased, while the number of male and female children working in service and industrial sectors has decreased, but the number of those working in agricultural sector has risen.

Considering the questionnaires about child labour in 2006 – 2012 , the results have shown that in 2012 , 413.000 children out of 893.000 in Turkey have worked as family workers , and 470.000 are paid workers and that 10.000 run their own businesses. It is a striking point that the number of children who work as family workers without payment is huge. It is interesting to note that the number of children has dramatically fallen in comparison with those of 2006 and that the number of family child workers unpaid (<http://www.tuik.gov.tr>).

#### **4. Reformation Of The Education System As 4+4+4 Causing Children To Work In Turkey**

The response to be given to the question of why children work or have them work could best be explained by the economic conditions of the family, the increasing tendency for the illegal employment, the gender roles, social security working against women and children, and the effects of immigration on children, in addition the instability on the education policies takes the priority.

The education system in Turkey is classified as public and vocational education. Public education is comprised of primary, secondary, high school education and tertiary education. Vocational education is defined as the education system that aims to teach reading and writing to the elderly, and the vocational schools in which students are able to put what they have learnt all throughout their education life into practice (Senar and Garip, 2013). It is indisputable to go for some changes in education system as a requirement of modern era. However, the point that should be considered well is to what extent all these changes will affect students, parents, and teachers and more importantly the future of the country.

A new formulation has been required in the education system on the grounds that the compulsory education for 8 years, which was legislated at the 28 February process in Turkey, is not satisfactory enough to meet demands for teaching all the contemporary topics to the new generation; therefore, the compulsory education has been enlarged to 12 years, and the logic behind that policy has been stated as Turkey being far behind the other nations in terms of the number of schools and graduate students. Another important point highlighted by the new policy is the need for democratization of education system and making the education system more flexible (<http://www.meb.gov.tr>).

With the new system that started in 2012- 2013 education year, education has been divided into levels in which first 4 years is primary school, and the next 4 years is secondary school and the last 4 years is planned to be the high school. The age to start to school has been decreased with that new system that has been objected much by public. Children 66 months old have been decided to start the school. However, the point to be discussed is that a child at the age of 5.5 is lack of physical, cognitive and psychological capabilities; namely, psycho-social situation of the child is unable to meet the demands of such an education. The new system has stated that a student at the second level of the education (secondary school) or parents have got the right to choose the suitable eclectic course in accordance with the wishes and the talents of the child. A critic to be given to that matter is that children can be directed to the religion classes without getting the wishes of the children (<http://www.egitimsen.org.tr>).

Also, the implementation of 4+4+4 system has been objected by many unions and protest walks have been held (<http://www.radikal.com.tr>). According to a study carried out by Karadeniz Bahtiyar (2012) in which 468 teachers are involved, it has been concluded that 82.3% of the teachers feel that the new law has not been discussed properly before implementation, 79.1% feel that teachers have not been advocated beforehand, 62.8% of the teachers do not support the law, 64.3% of the teachers feel that the new law will enable students to graduate from the high school without attending the school.

According to a study having been carried out by Memişoğlu and İsmetoğlu (2013), the interviews with the school managers have shown that 8 of them feel the new law is missing in many points and that, although the new law might be considered appropriate, there are many deficiencies in planning and implementation and that it has to be in the form 5+3+4; there is a rush and enforcement in implementation and the weekly hours are more than required. Moreover, it is another matter of dispute that the implementation is limited to only Religious Vocational Schools.

On condition that students are unable to pass the proficiency test after 8th grade (SBS), they might have a chance to sign up Religious Vocational Schools or other Vocational School with the coordination of governors. The issue that arises at that point is that it is uncertain whether students could be followed well since the system will run e-school (<http://www.meb.gov.tr>). That issue should also be considered from the social gender roles. It is necessary to take into consideration that the children who will graduate at an early period have the risk to start to work as child workers and that female children have the risk to get married at an early age and that necessary measure should be taken immediately.

It is evident that the new system of 4+4+4 has been objected much indeed. It is necessary to carry out enough studies to accommodate the needs to arise and to prevent the issues from happening about the children who started to the first grade at the implementation of the system and study at the 5th grade for the time being and also for the current students of 8th grade who will start to high school. For the sake of the country and education system, it is highly important that the law should be re-evaluated to the extent that the missing points are filled.

## **5. Child Labour And Social Work**

The fight with the issue of child labour which is a kind of economical exploitation requires a holistic approach; therefore, the social work to be applied should cover micro, mezzo and macro levels. The implementation of social work at micro and mezzo levels should be started with the definition of the characteristics of the families who force their children to work and the main reasons of that issue. The awareness that depriving children of the right to study is a violation of human rights should be raised on the families' side. The child and his family have got the right to get the social benefits provided by the government; therefore, social worker should direct the child and his family to the use of these economical resources. It is necessary to follow a way to maximize the benefits of these resources in order to prevent child labour.

According to Karataş (2007), one of the major things that should be taken into consideration, while deciding on child care system in Turkey, is whether an inclusive and straightforward approach has been implemented. Even though there are a lot of judicial, managerial applications about the matter, it could be said that all these do not reflect the necessities required by a contemporary world. The prime feature of the existing policies is that they have developed themselves separately from each other in the span of time. As stated above, the interference to be developed at macro level could best be provided by using constructive child caring policies and social policies. The interference to be applied at macro level by social workers could be summarized as follows.

- To be able to enforce some dissuasive sanctions to families who consider children as child workers unpaid by depriving them of the right of education and to employers and families who force the children under a certain age set out by laws.
- To promote some social events which are educational, advocacy, and empowering the right based in parallel with the needs and characteristics of the populations which the implications and applications cover.
- To select the children of the families who are under the socioeconomic level and provide scholarship to them.
- With the accompany of the social workers employed in the ministries, to take the role of enforcement in order to prevent child labour and to engage in lobby facilities.

Furthermore, social work and social workers should take an active role in shaping social policies and regulations that are required for the fight with the issue child labour.

## **6. Conclusion And Proposals**

Child labour which is a kind of economical exploitation is a growing issue in both our country and all around the World. The most important measure to be taken to prevent child labour is education. One of the main responsibilities of a nation aiming to increase social welfare is to shape the education to an extent to cover the whole nation. While the changes the educational policy is parallel with the needs of contemporary World, the issue of how to shape is a matter of concern, for the changes implemented might result in children to be away from school or to be ousted from school.

The compulsory education has been increased to 12 years after 2012-2013 school years and designed as 4+4+4. The new education system has been discussed since the age to start to school has gone down, Religious Vocational Schools have opened as a result of conservative social structure, these students have been desired to be sent to these schools,

female children have been forced to get married at an early age as a requirement of compulsory religion classes and patriarchal social structure.

Social workers are mainly responsible for providing the individuals who have lost their social functions as a result of their interactions to their environments with these positive qualities again. Social workers who evaluate the life of every child and his family should take major role against every policy that will make the child away from education and help them get their shares equally from education. Also, people who are knowledgeable enough should engage in law making policies in order to strengthen the education system.

## Abstract

The purpose of the study was to investigate the relationship between throwing accuracy and shoulder strength. Two groups of young healthy, male participants took part in the experiments as a elite and non- elite athletes. The ball velocity at ball release was derived from the change in distance between wrist and the ball. The elite athletes performed many accurate throwing with lower ball velocity. The isokinetic strength performances were determinate as 60°/s and 240°/s, by using the Cybex Norm Dynamometer. The elite athletes presented a bigger shoulder extension value (for dominant and non-dominant arms). As the angular velocity increased, peak torque values displayed lesser value on extension and flexion in the elite athletes and the non-elite athletes. The peak torque values of the elite athletes were found higher during extension and flexion at each angular velocity. However, correlation was not found between shoulder extension/flexion and ball velocity. Elite handball players shoot with lower shooting velocity but more accurately.

## Introduction

In many sports branches, the over arm throwing is considered to be the most important skill. The throwing performance depends on the player's optimal coordination of his/her body to create the maximum velocity. The player, when she/he is ready for throwing, has to use all body segments from ankle to wrist. Toyoshima et al. have indicated that the 53,1% of the throwing velocity springs from arm movement and the 49,9% of it is dependent on stepping and body rotation (Toyoshima et al., 1974). In the acceleration stage of the throw, the arm performs the whip motion while passing from the external rotation (ER) position to the internal rotation (IR) position. Tullos and King (1973) suggested that, as the shoulder rotational range of motion increases, the efficiency of the athlete's internal rotator muscles will increase and the velocity of the ball will be higher (Tullos & King, 1973). Jobe et al. (1984), Braatz & Gogia (1987), and Pappas et al. (1985) examined internal and external range of motion and strength in throwing motion in baseball (Jobe et al., 1987; Braatz & Gogia, 1985; Pappas et al., 1985). In these studies, they have found that the thrower should produce a considerable amount of torque during the IR in order to throw the ball accurately and with a high speed.

Handball necessitates several skills and physical traits special to the game. The goal, which is the essential to win in handball, depends on a quality throwing (Joris et al., 1985). Thus, throwing is a crucial skill in handball as it is the case in several other sports branches (Joris et al., 1985; Elias 1999). The goal is achieved expeditiously before defenders and the goalkeeper block. When the kinematic chain during the throwing is observed to give the ball maximum velocity; firstly the shoulder, then the elbow, and finally the wrist reaches the maximum velocity (Joris et al., 1985).

In handball, the goals coring ability substantially depends on ball velocity and throwing accuracy. Throwing velocity and accuracy are the main performance parameters during the game in handball (Bayious & Boudoulos, 1998). This study aimed to investigate the contribution of shoulder strength and throwing accurate in overarm throwing in team handball.

## Material and Methods

### Participant

Eighteen participant in total participated in the study; nine of which are elite male handball players (Elite athletes: playing for the Turkish National Handball Team) (age: 25.44±3.28 years, height: 188.88±6.75 cm, weight: 89.55±10.33 kg, training experience: 15.4±3.3 year) and nine of which are male non-elite athletes in Physical Education Sports College and playing handball (Non-elite athletes) (age: 22.66±1.58 years, height: 183.66±5.17 cm, weight: 89.00±11.82 kg, training experience: 6.4±1.8 year). Determination of subject's characteristics (Table 1) and clinical examination of the shoulder were performed prior to isokinetic testing. Individuals with present shoulder pain were excluded from the study. All participants prior to examination signed a consent form which explained the testing procedure in detail.

Table 1. Subjects characteristics

Groups (n=18)	Age (year)	Height (cm)	Weight (kg)	Experience (year)
Group 1	25.4±3.3	188.9±6.7	89.6±10.3	15.4±3.3
Group 2	22.7±1.6	184.4±5.3	85.1±13.2	6.4±1.8

### Kinematic

Motion data were collected using two 100-Hz fast cameras (BASLER- A602 fc color, 100 Hz) in gym after ten minutes warm-up. The performance values of the participants were recorded through recording two throwing performances of each of them after ten minutes warm up session. In this study, the participants were requested to present throwing performances, after taking three steps, directed towards the target placed on the upper right corner of the goal which is at six meters distance from the throwing line. The subjects were asked to perform fast and accurate shooting. The target was placed on 25 cm below of the upper right corner of the goal, and the dimensions of the target were 60x60 cm. Participants were given two minutes breaks between each throwing performance. Passive markers were placed at the heel, ankle, knee, hip, shoulder, wrist, hand, head, chin and ball.

Three dimensional location of markers were calculated with and manual digitizing system HUBAG (Hacettepe University Biomechanics Research Group, <http://www.biomech.hacettepe.edu.tr>)(Aritan, Çilli &Amca, 2010) utilizing the direct linear transformation method (Abdel-Aziz, 1971).

The root mean square error in the calculation of the 3D passive markers location, with a calibration cube approximately 3.0 m x2.0 m x 1.0 m in size, was found to be less than 10 mm. Coordinate data were filtered with a Butterworth digital low-pass filter.

Ball velocity was calculated using a five-point differential filter. The velocity at ball release was derived from the change in distance between wrist and the ball ( Tillaar & Ettema, 2007). The velocity location  $x$  at the time frame  $i$  is determined based on two data points before ( $i-1$ ,  $i-2$ ) and two data points after ( $i+1$ ,  $i+2$ ) the position data

$$\vec{v}_x[i] = \frac{1}{12} (-\vec{p}_x[i+2] + 8\vec{p}_x[i+1] - 8\vec{p}_x[i-1] + \vec{p}_x[i-2])f$$

Where  $f$  stands for the sampling frequency (Tillaar and Ettema, 2003; Zheng et al., 2004).

### Isokinetic Assessment

The isokinetic strength performance was defined in a different day through a different test. Each participant had been given the instructions about the test procedure and the equipment before the test. Each of them was tested by Cybex Norm isokinetic dynamometer (Lumex, Ronkonkoma, NY). Isokinetic dynamometer was calibrated by the

Cybex calibration procedure and the isokinetic force was determined as Nm.

Arm ergometer was used in the warm up. Extension exercises were done for five minutes before and after the test in order to prevent possible injuries. Peak torques, work and power variables were determinate as 60°/s and 240°/s, by using the Cybex Norm Dynamometer. Participants took 30 seconds break between repetitions.

### Statistics

All data are presented as means (SD). Data were analyzed using SPSS software (version 10.0). Student-t test for independent samples was used to compare baseline values between groups. The Pearson product moment correlation coefficient was used to examine the relationship between isokinetic strength and ball velocity. The level of significance was set at 0, 05.

### Results

The shoulder flexion and extension peak torque values for each group are presented in the Table 1. There was not a statistically significant difference between two groups in terms of shoulder flexion values.

Table 2. Comparison of dominant and non-dominant shoulder extension and flexion at 60 and 240 °s<sup>-1</sup> in Group 1 and Group 2

	Group 1				Group 2			
	Extension 60°s <sup>-1</sup>	Flexion 60 °s <sup>-1</sup>	Extension 240 °s <sup>-1</sup>	Flexion 240 °s <sup>-1</sup>	Extension 60°s <sup>-1</sup>	Flexion 60 °s <sup>-1</sup>	Extension 240 °s <sup>-1</sup>	Flexion 240 °s <sup>-1</sup>
Dominant	111.6±25.2	77.5±14.9	79.3±18.2*	54.3±13.7	98.2±15	73.3±12.3	55.2±23.1	41.7±19.5
Non-dominant	100.1±16.7*	79.8±12.2	69±14*	56±12.3	84.3±10.7	75.7±11.8	48.6±19.1	46.7±18.9

\* p<.05

The shoulder IR and ER average and standard deviation values for each group are presented in the Table 2.

The differences between groups in terms of shoulder IR and ER values for dominant and non-dominant arms are statistically significant(p<.05). Shoulder IR and ER values of the elite athletes at 60 and 240 °/s were bigger compared to the other group. Only the shoulder ER values for non-dominant arms were not statistically significant (p>.05).

Table 3. Comparison of dominant and non-dominant shoulder IR and ER in Group 1 and Group 2

	Group 1				Group 2			
	IR 60 °s <sup>-1</sup>	ER 60 °s <sup>-1</sup>	IR 240 °s <sup>-1</sup>	ER 240 °s <sup>-1</sup>	IR 60 °s <sup>-1</sup>	ER 60 °s <sup>-1</sup>	IR 240 °s <sup>-1</sup>	ER 240 °s <sup>-1</sup>
Dominant	71.1±20.2*	50.6±14.3*	58.5±16.4*	38.6±11.5*	49.1±9.9	35.6±7.6	37.5±10.7	27.7±6.4
Non-dominant	69.6±18.3*	53±14.6	54±14.6*	40.1±13.4	48.6±9.7	39.7±12.1	40.5±8.2	32.8±10.3

\* p<.05

IR: shoulder internal rotation

ER:shoulder external rotation

Differences were found between the groups in terms of ball velocity for accurate throwing (Table 3). The students threw faster compared to the elite athletes. However, the number of accurate throws was eleven for the elite athletes, and six for the non-elite athletes. There is not a significant difference between the elite athletes and the non-elite athletes in terms of inaccurate throws.

Table 4. Ball velocities in accuracy and non-accuracy throwing

	Ball velocity (m/sec)	
	Group 1	Group 2
Accuracy throwing	16.5±5.8(n=11)*	23.5±6.7(n=6)
Non-accuracy throwing	22.8±6.6(n=7)	22.7±7.8(n=12)

\* p&lt;.05

n= accuracy and non-accuracy throwing number

The shoulder IR/ER values of the elite athletes and non-elite athletes did not present significant correlation with the ball velocity in accurate and inaccurate throws.

## Dicussion

In handball, throwing velocity and accuracy are considered to be the main performance parameters during the game. Various researchers have examined the correlation between the movement velocity of the upper limb and accurate throwing to the target. The results of these studies have generally suggested that there exists a significant negative correlation between velocity and accuracy (Elias, 1999).

The aim of this study is to define the relation between throwing velocity and shoulder strength in accurate and inaccurate throws in handball.

We found a significant difference between two groups in accurate throws in terms of ball velocity. The ball velocity was determined as 16.50(5.80) m/s for the elite athletes and as 23.50(6.70) m/s for the non-elite athletes. Despite the fact that the elite athletes consists of highly training experienced athletes having 15 years of experience in average, the ball velocity in this group was lower than that in the other group. However, the number of accurate throws was higher in the non-elite athletes (The number of accurate throws elite athletes: 11, non-elite athletes: 6). Elite athletes preferred to throw accurately rather than throwing fast, thanks to their technical skills which they had obtained through experience.

They presented a more careful throwing performance compared to the other group. The ball velocity for accurate shots was determined 26.10(2.90) m/s for cricket (Sachlikidis & Salter, 2007), and 17.20(1.40) m/s for handball (Joris et al., 1985). Akpınar et al.'s study has found that the ball velocity for throwing after taking three steps was determined 20.80(1.02) m/s for the Super League Team, and 19.35(1.47) m/s for the 1st League Team and the study also suggested that the velocity of the ball when it is released from the hand is correlated with maximal power and force (Akpınar & Mirzeoğlu, 2006). Various researchers who analyzed the over arm throwing have indicated that the muscle force is a crucial factor in throwing velocity (Elasz, 1999; Best et al., 1993). According to Bayious et al., the maximal arm speed is one of the important factors in the determination of ball velocity during set shot (Bayious et al., 2001).

Shoulder IR/ER force in 90° abduction were tested at 60 and 240 °/s. A significant difference was found between the elite athletes and the non-elite athletes in terms of shoulder IR/ER force values. Elite athletes have presented a bigger shoulder IR (for dominant and non-dominant arms) and ER (for the dominant arm) values at 60 and 240 °/s (p<.05).

Many studies on handball have examined the correlation between the shoulder IR/ER force and the ball velocity for different shot types. In these studies, significant correlation between ball velocity and shoulder IR/ER force has only been found in jump shot performance (Elasz, 1999; Fleck et al., 1992).

The shoulder IR and the elbow extension are related to the total ball velocity, after the release of the ball. Tillaar and Ettema have indicated that the shoulder IR and the elbow extension are crucial factors for high speed shots (Tillaar & Ettema, 2007). However, only the shoulder IR and the elbow extension are not enough for high speed shot. These parameters are dependent on body and lower extremity.

In this study, a correlation between shoulder IR/ER force and ball velocity was not found. Bayious et al., did not find any significant difference between shoulder IR and ER force among groups for three different shot types in handball (set shot, cross-over step and jump shot) (Bayious & Boudoulos, 1998). In addition, a significant correlation between the shoulder IR/ER and the ball velocity was not found, except the jump-shot performance. Here, the role of the lower extremities has been effective in jump shot performance. According to Bayious, the shoulder internal/external peak

torque values are not good indicators of throwing velocity, except jump-shot (Bayious & Boudoulos, 1998). The conclusions that we reached in this study show similarity to those of these studies.

The shoulder extension/flexion was tested at 60 and 240 °/s for dominant and non-dominant arms. Significant difference for dominant and non-dominant arms was found in the shoulder extension value; at 240 °/s for the elite athletes, and at 60 and 240 °/s for the non-elite athletes ( $p < .05$ ). The elite athletes presented a bigger shoulder extension value (for dominant and non-dominant arms).

As the angular velocity increased, peak torque values displayed lesser value on extension and flexion in the elite athletes and the non-elite athletes. The peak torque values of the elite athletes were found higher during extension and flexion at each angular velocity. However, correlation was not found between shoulder extension/flexion and ball velocity.

The throwing success in handball depends on throwing velocity. However, the most important factor affecting ball velocity is the technique of the movement (Wit & Eliazsz, 1990). On the other hand, accuracy is among the important factors too. As the attention devoted to accuracy increases, the velocity will go down. When the aim is to throw accurately, the throwing velocity is 85% of the maximal velocity (Tillaar & Ettema, 2003). This study shows that elite handball players shoot with lower shooting velocity but more accurately.

## Conclusion

In the present study we analyzed accuracy performance and kinematics of 9 elite and 9 non-elite team-handball players in the standing throw with three steps and not found significant influence of shoulder IR/ER to the ball velocity in accuracy or non-accuracy throwing. For team handball coaches and athletes, the results of this study suggest that trainers, while coaching their players, should put as much emphasis on throwing accuracy as they do on increasing ball velocity.

# The effects of self-regulation skills on TEOG exam

Nazife Süer<sup>a</sup>, Sertel Altun<sup>b</sup>

<sup>a</sup>75. Yıl (75<sup>th</sup> Year) Secondary School, Güngören, Istanbul 34220, Turkey  
<sup>b</sup>Yıldız Teknik University, Faculty of Education, Istanbul 34220, Turkey

---

## Abstract

In this study, the effects of secondary school students' self-regulation skills on TEOG examination were examined. *Motivational Strategy Scale*, developed by Pintrich and De Groot (1990) and adapted to Turkish by Üredi (2005), was used as the data collection instrument. TEOG exam scores of the students were obtained from their school administrations. The study group of the research consisted of 412 students attending the 8<sup>th</sup> Year Classes of 75<sup>th</sup> Year Secondary School of Güngören District in the province of Istanbul. To analyse the data of the research, multi regression analysis was used. The research showed that the variables of self-efficacy and anxiety were effective in predicting the TEOG exam, and that use of cognitive strategy came after self-efficacy and anxiety with respect to impacting the TEOG exam achievement, and also that self-regulation and intrinsic value dimensions were not effective in predicting the TEOG exam scores.

## 1. Introduction

Due to the fact that educational levels of societies are considered as the main criteria in determining their development levels, societies make effort to narrow the gaps between them, in terms of development, through education. (Erdoğan, 2010). The central exams play a key role in educational lives of students in Turkey as their admissions into and placements in high schools and universities depend on the exam scores achieved, which means that they may become students of education bodies either with high education standards or poor education standards. Once the student has achieved a good score in the central exam, s/he will have the privilege to have an education in a school where the quality of education is better. Starting from this point, families display a tendency to make the greatest effort within their own means in order to provide their children with a qualified education as part of their short term goals, and therefore with a bright future as part of their long term goals.

While the exam oriented education system gives rise to the mentioned effect upon the parties concerned, it confronts us as a reality affecting the system negatively as one of the factors that inhibit achieving the desired student profile. However, success in education should not be perceived as the performance displayed in exams only. (MEB, 2013a). Taking this into consideration, the Ministry of National Education abolished the Placement Test called SBS, the student selection exam for admission to secondary education as from 2013-2014 Academic Year with the aim of relieving students of the exam stress. A new transitional system, abbreviated to TEOG and standing for transition to secondary education from primary education in Turkish, to replace the exam abolished has been introduced. The new system aims to present a pluralistic approach eliminating the conventional approach of raising monotype individuals through secondary education, observing respect to differences as well as securing students. The new system allows 6<sup>th</sup>, 7<sup>th</sup> and 8<sup>th</sup> year students' school test scores to be included in calculating their final scores to be used in their admissions to secondary education bodies besides their scores achieved in centrally designed and applied Turkish, Mathematics, Science and Technology, History of The Turkish Revolution, Religion and Morals and Foreign Language tests each

term (MEB,2013b). While exam achievement is quite important in our country, the TEOG exam which is a new system in this research has been considered worth scrutinizing in order to put forward the variables that affect the student exam achievement and understand them.

A lot of factors that could have an effect on the course achievement or exam achievement of the student can be mentioned. The concept *self-regulation*, which plays an affective role in students' own learning process, lies on the focal point of the researches done on academic success in recent years (Üredi, 2005). Self-regulation, which is defined by a great number of theoretical points of view, has been defined by Pintrich (2000) as "an effective and constructive process in which the students determine their own learning purposes, try to arrange their cognitions, motivations and behaviours, and are directed and limited by their targets and the contextual features in their environment". It is defined by Risemberg and Zimmerman (1992) as "determining targets, developing strategies in order to realize these targets and, managing whatever gained thanks to these strategies". Self-regulation skill is considered as a mechanism that assists in explaining the differences of achievement among the students, and this means an increase of the achievement (Schunk, 2005). In spite of the fact that the concept self-regulation is interpreted through various theoretical points of view, researchers have focused on two elements in the organization of the learning process of individuals which are self-regulation strategies and motivational beliefs which are the sources of motivation enabling the usage of these strategies.

Self-regulation strategies, according to Zimmerman (1990), are the processes implemented by students which they believe will be of help to them and serve as a tool in gaining the knowledge and skills required to meet their objectives. These processes are the cognitive strategies such as self-regulation, which contains the metacognitive strategies for the planning, monitoring and changing the cognition, and students' managing their efforts to do an academic assignment in the classroom and repeating, making sense and organizing for use in order to learn, remember and understand (Pintrich ve De Groot, 1990). However, in addition to the usage of the cognitive and metacognitive strategy in order to achieve success, the individual should not only use the cognitive strategies, but also the belief, will-power and affective factors so that the self-regulation processes will be effective (Pintrich, 2000). Motivational beliefs are the beliefs of learners about the event and the object, or the topic (Boekarts, 2002). Individuals opinions on their abilities to learn are beliefs linked to one another, which are being certain about their knowledge and skills, judgment of proficiency, output expectation and appreciation of academic duties (Pintrich and De Groot, 1990). The beliefs of students related to their own management and proficiency levels may provide an important clue in predicting their future applications and participations. In the field literature, Alan has put forward the fact that self-regulating learning strategies and motivational beliefs influence achievement in researches that examine the relationship between self-regulation and achievement (Malpass, O'neil, Herold and Hocevar, 1999; Pintrich, 1999; Zimmerman and Martinez-Pons, 1990; Azevedo, Cromley, Winters, Moos and Greene, 2005; Cleary and Zimmerman, 2004; Chen, 2002; Canca, 2005; Üredi, 2005). According to the data of the Program of International Student Assessment, PISA 2012, arranged by Organization for Economic Cooperation and Development (OECD), and which is one of the most comprehensive educational researches of the world, when the self-regulation and motivational beliefs in Mathematics lesson are examined, in spite of the fact that the intrinsic motivation or the approach towards the lesson is above the OECD average in Turkey, this positive attitude did not reflect on the results as an academic success, and our country took a place in the last rows in Mathematics Achievement. According to the PISA reports, self-efficacy in Mathematics displays a tendency of rising among the countries whose Mathematics Anxiety levels are low (OECD,2013).

In this study, the level of motivational strategies' predicting the TEOG exam scores related to learning has been examined in terms of self-regulation. In this context, an answer to the question "To what extent do the self-regulation skills on predict the scores achieved in the TEOG exam?" was sought for.

## **2. Method**

### **The Model of the Research**

Of the screening models, the relational screening model was applied in the study. The relational screening models are research models aiming to determine the existence or degree of the covariance among two or more variables (Karasar, 2006).

### **Study Group**

Of the 412 students attending the 8<sup>th</sup> Grades of 75 Yıl (75<sup>th</sup> Year) Secondary School in Güngören District in the province of Istanbul, 213 (51,7 %) of them were girls, and 199 (48,3 %) were boys.

### Data Collection Tools

In the study, Self-regulation strategies and motivational beliefs of the students were examined using the “Motivational Strategies Scale Related to Learning” developed by Pintrich and De Groot (1990). It was adapted to Turkish and its validity and security checks were by Üredi (2005). The measuring scale consisted of two sections, which were self-regulation strategies and motivational beliefs. The measuring scale within the section of self-regulation strategies comprises of two scales as Cognitive strategy usage and Self-regulation; and within the section of motivational beliefs, there were three scales which were self efficacy, intrinsic value and exam anxiety. 2013-2014 school year, 1<sup>st</sup> Semester TEOG exam scores of the students were obtained from the school administration.

### Analysis of the Data

To what extent the motivational strategies related to learning predict the TEOG Achievement was tested by using SPSS 16.00 program via “Multi regression analysis”.

### 3. Findings

The subjects of Turkish, Mathematics, Science, Revolution History and Kemalism, Foreign Language, Religion and Morals included in the TEOG exam were handled separately in order to find an answer to the question “To what extent the self-regulation skills on effect the scores achieved in the TEOG exam?”, which was the problem of the study. In order to find an answer to this question, first of all, the arithmetic average of the related variables, their Standard Deviations and minimum-maximum scores were found. The data obtained are as follows, given in Table 1.

**Table1: Self-regulation skills and descriptive statistics related to the TEOG scores with respect to various subjects**

Variables	N	Min.	Max.	$\bar{x}$	SS
Cognitive strategy usage	412	21,00	85,00	64,58	12,04
Self-regulation	412	16,00	63,00	42,58	8,83
Self efficacy	412	17,00	63,00	44,27	11,45
Intrinsic Value	412	16,00	63,00	48,29	8,79
Anxiety	412	4,00	28,00	17,57	6,65
TEOG Turkish Test Achievement	412	5,00	100,00	64,77	19,63
TEOG Mathematics Test Achievement	412	5,50	100,00	42,46	21,03
TEOG Science Test Achievement	412	10,52	94,73	55,66	16,97
TEOG Revolution History and Kemalism Test Achievement	412	15,00	100,00	56,61	20,17
TEOG Foreign Language Test Achievement	412	5,00	100,00	37,98	17,20
TEOG Religious and Morals Test Achievement	412	20,00	100,00	64,05	16,13

N: Participation number,  $\bar{x}$ : Arithmetic Average, SS: Standard Deviation, Min: Minimum Value, Max: Maximum Value

In the study, regression analyses were made individually for each lesson in order to determine the predictability rate of the independent Variables (Self-regulation Skills) on the dependant variable (TEOG score according to different subjects) with the aim of finding an answer. The hypothesis required in order that the regression analysis can be made is that each of the independent variables at issue should display a linear relationship with the TEOG score, which is a dependant variable. For this reason, Pearson Correlation Analysis was made in order to determine the relationship between the independent variables (Self-regulation Skills) and dependant variables (TEOG score according to various subjects) before the regression analysis. The findings obtained as a result of the analysis are presented in Table 2.

**Table 2: The Relationship Between Self-regulation Skills and the TEOG scores belonging to all the subjects**

Variables	TEOG scores according to subject					
	Turkish	Mathematics	Science	Revolution History and Kemalism	Foreign Language	Religious Culture and Moral Knowledge
	r	r	r	r	r	r
<b>Cognitive strategy usage</b>	,305**	,286**	,208**	,272**	,281**	,314**
<b>Self-regulation</b>	,215**	,238**	,148**	,170**	,196**	,311**

Self-efficacy	,391**	,526**	,396**	,404**	,356**	,409**
Intrinsic Value	,237**	,236**	,218**	,212**	,151**	,253**
Anxiety	-,228**	-,349**	-,224**	-,252**	-,153**	-,200**

\*\* p<,01

When the Relationship Between self-regulation skills and the TEOG scores belonging to all the subjects in Table 2 is examined, it is seen that there is a meaningful correlation in the positive direction in a level of  $p<,01$  between the Cognitive strategy usage, Self-regulation, self – sufficiency and Intrinsic Value Variables and the TEOG exam scores belonging to each leasson; and a meaningful correlation in the negative direction in a level of  $p<,01$  between the Anxiety and TEOG exam scores belonging to each lesson. After the relationship at issue was seen, a regression analysis to find out the predictability of TEOG scores through motivational strategies related to learning was carried out.

#### The Level of Predicting the TEOG Score of the Self-regulation Skills:

The multi regression analysis results are given in the Table below in order to find an answer to the question “To what extent do self regulation skills on effect the scores achieved in the TEOG exam?”, which is the problem of the study

**Table 3: The results of multi regression analyses to determine the predictability of TEOG scores through self-regulation skills**

\*p<,05    \*\*p<,01

When all the subjects included in TEOG exam are taken individually in Table 3; the regression analysis results related to predicting the TEOG Turkish scores are meaningful predictors each in explaining the Turkish Achievement of the self-regulation skills (F:17,87, p<,01). The cognitive strategy usage, self-regulation, self efficacy, intrinsic value, which are the independent variables and the anxiety variables explain together the 18% of the variability on the TEOG Turkish score, which is a dependant variable. It has been found that self efficacy (t=4,29, p<,01), cognitive strategy usage (t=2,51, p<,05) and anxiety (t=-2,83, p<,01) variables are meaningful predictors in explaining the Turkish Achievement each.

Regression analysis results related to predicting the TEOG *Mathematics* scores show that the self-regulation skills are meaningful predictors of the Mathematics Achievement each (F:39,43, p<,01). The cognitive strategy usage, self-regulation, self efficacy, intrinsic value, which are the independent variables and the anxiety variables explain together the 32% of the variability on the Mathematics Achievement, which is a dependant variable. It has been found that self efficacy (t=8,80, p<,01) and anxiety (t=,19, p<,01) variables are important predictors of Mathematics Achievement.

The regression analysis results related to predicting the TEOG *Science* score are meaningful predictors each in explaining the self-regulation skills in Science Achievement (F:17,42, p<,01). The cognitive strategy usage, self-regulation, self efficacy, intrinsic value, which are independent variables and the anxiety variables explain together the 17% of the variability on the Science Achievement, which is a dependant variable. It has been found that self efficacy (t=5,88, p<,01) and anxiety (t=-2,44, p<,01) variables are meaningful predictors of Science Achievement each.

The regression analysis results related to predicting the TEOG *Revolution History and Kemalism* show that the self-regulation skills are meaningful predictors in explaining the Revolution History and Kemalism Achievement (F:17,42, p<,01). The cognitive strategy usage, self-regulation, self efficacy, intrinsic value and anxiety variables which are independent variables together explain 19% of the variability upon Revolution History and Kemalism Achievement, which is a dependant variable. It has been found that self efficacy (t=5,39, p<,01) , anxiety (t=-3,09, p<,01) and cognitive strategy usage (t=2,18, p<,05) variables are meaningful predictors of Revolution History and Kemalism Achievement.

The regression analysis results related to predicting the TEOG *Foreign Language* score show that self-regulation skills are meaningful predictors in explaining the Foreign Language Achievement (F:14,60, p<,01). The cognitive strategy usage, self-regulation, self efficacy, intrinsic value and anxiety variables, which are independent variables together explain 15% of the variability upon the Foreign Language Achievement, which is an independent variable. It has been found that self efficacy (t=5,20, p<,01) and the cognitive strategy usage (t=2,54, p<,01) variables are meaningful predictors of the Foreign Language Achievement each.

The regression analysis results related to predicting the TEOG *Religion and Morals* score show that the self-regulation skills are meaningful predictors in explaining the Religion and Morals Achievement (F:18,96, p<,01). The Cognitive strategy usage, self-regulation, self efficacy, intrinsic value and anxiety variables, which are independent

variables jointly explain 18% of the variability upon the Religion and Morals, which is a dependant variable. It was found out that the self efficacy ( $t=0,32$ ,  $p<,01$ ), cognitive strategy usage ( $t=0,18$ ,  $p<,01$ ) and anxiety ( $t=0,10$ ,  $p<,05$ ) variables are meaningful predictors of Religion and Morals.

#### 4. Conclusion, discussion and suggestions

In light of the findings obtained in the research, it is seen that the sub-dimensions of the self-regulation skills in different subjects predict the TEOG exam meaningfully. The results can be summarized as follows:

- “Self-efficacy”, which is a sub-dimension of the motivation scale, is the most important variable in predicting the TEOG score of all the subjects (Turkish, Mathematics, Science, Revolution History and Kemalism, Foreign Language, Religious Culture and Moral Knowledge).
- “Anxiety”, which is a sub-dimension of the motivation scale, is the second important variable in predicting the TEOG score except for the English lesson.
- “Cognitive strategy usage”, which is the sub-dimension of the self-regulating learning strategies scale, is the variable that predicts achievement and is the variable that predicts TEOG score and the achievement in the subjects of Turkish, Revolution History and Kemalism, Foreign Language, Religion and Morals after self-efficacy and anxiety.
- It was found out that the “Self-regulation and Intrinsic Value” dimensions are not effective in predicting the TEOG score.

In the study, was discovered that *self-efficacy*, which is a meaningful predictor in each subject, is the most important variable in predicting achievement. It was observed that the students that have a high self efficacy perception are more resistant to difficulties confronted throughout the learning activities (Zimmerman, 2001) and made more efforts (Williams, 2006). Otherwise, the students with lower self efficacy levels, who have lost their beliefs in themselves and who have given in will not struggle. In the research that was carried out by OECD on this topic, due to the fact that the students who have a low self efficacy level have problems in the fields such as class participation and self-direction, it is emphasized that the possibilities of their displaying a low academic performance increase. Furthermore, like low motivation, low self efficacy may give rise to the students’ not being able to make career plans matching their skills, as well (OECD, 2013). In parallel to the conclusion in this study, the studies made on self efficacy and academic success in the literature show that the higher the students’ levels of self-reliance increase, the higher their academic success increases (Zimmerman and Martinezpons 1990; Schunk 1996; Pintrich 1999; Malpass, O’neil, Herold and Hocevar 1999; Altun 2005; Him 2006; Alci 2007; Yamaç 2011; Mutlu 2012).

Another conclusion that has been reached in the study at hand is that the variable of *Anxiety* is effective in predicting the TEOG score except the English lesson. According to the findings at hand, it has been found that there is a meaningful relationship between exam achievement and anxiety in the negative way, in other words, as Anxiety increases, the score received from the TEOG exam decreases. The students’ exam anxieties increasing makes a negative impact on their achievement. The fact that there is too much anxiety in the exams may cause the students to have difficulties in the questions. According to Kurt (2006), Anxiety is a feeling that is experienced in the possibility arising from the individual’s inner and outer world, or in any situation perceived or interpreted as dangerous by the person. According to PISA 2012 report, while the student’s academic performance of the person whose anxiety is high decreases, the students most of whom are 15 years old stated that they felt desperate and stressful when they dealt with Mathematics. When the reason of anxiety was researched, however, 59% of the OECD countries worried about the fact that mathematics would be difficult, 31% were stressed when they were solving a Mathematics problem, 33% were stressed when they were doing homework, 30% felt hopeless when they were solving a problem, and 61% were worried about receiving a low mark (OECD, 2013). In the same study, there are two fields in which the students in Turkey feel more anxiety compared to the other countries. It appeared that the students felt helpless while they were solving a Mathematics problem, and that they were much stressed when they were doing Mathematics homework. In our country, the fact that the exams create a great pressure on the students because they feel that they have to be successful in an exam they take with a mentality that considers academic success and exam achievement the same is an unavoidable fact. The result obtained in this study is in a quality that supports the studies in the literature, and a meaningful relationship in the negative way has been determined between the exam anxiety and achievement (Malpass, O’neil, Herold and Hocevar 1999; Hofer and Yu 2003; Üredi and Üredi 2005; Him 2006; Yamaç 2011).

Another result that has been obtained in the research is that the cognitive strategy usage was effective in predicting the achievement in the TEOG score in the subjects of Turkish, Revolution History and Kemalism, Foreign

Language and Religious Culture and Moral Knowledge, and that the cognitive strategy usage was not effective in predicting the achievement according to the TEOG Mathematics and Science scores. In that case, if we start out with the subjects, it appeared that while the cognitive strategy usage was effective in predicting the achievement in the verbal lessons, it was not effective in the non-verbal lessons. As a reason of this situation, while the cognitive strategies used in the education of the verbal lessons and the cognitive strategy measured in the exam showed parallelism, there may not be such a parallelism in the non-verbal lessons. According to Heo (2000), the cognitive strategies used in the self-regulation process enable the learners to attain, store and express the knowledge in the learning process in a more effective way. The cognitive strategies include the interpretation strategies that enable the activation of knowledge in a working memory and the repeating strategies used for simple processes, and storing knowledge in a long term memory by establishing the inner connections among pieces of knowledge of the students and the organization strategies that enable them to select the appropriate knowledge (Hofer, Yu, & Pintrich, 1998). The conclusion reached in this study supports the related literature, and the self-regulating learning strategies affect the academic success in the positive way. (Zimmerman and Martinez-Pons 1990; Paterson 1996; Schunk 1996; Pintrich 1999; Altun 2005; Uredi and Uredi 2005; Alcı 2007; Kitsantas, Steen and Huie 2009; Puteh and Ibrahim 2010; Altun and Canca 2011; Cheng 2011; Tonguç 2013).

In the present study, the self-regulation and intrinsic value dimensions are not effective in predicting the achievement of any subject. The students who adopt the kind of learning which is based on self-regulation possess qualities such as being able to set a target that is unique to themselves, knowing what they are doing in learning, progressing with self-assured steps in their own achievements, being able to manage time effectively, being able to get productive and learning by discovering (Pintrich, 2000). At this point, the fact that the concept that we express as success within our educational context is used only for the good results to be achieved in the exams cause education to be dragged into an environment of competition. Instead of learning, adopting or discovering the subject, students give priority to be successful in the exam only by memorizing some patterns of knowledge in the way that will appear in the exams they are to take as from a very young age. As a result of the study, it was seen that rather than structuring knowledge, students to take the TEOG exam study in an exam oriented way, that is not permanent, that is based on rote learning, that brings about anxiety of achieving good scores. The effect of the variables at issue related to the PISA exam was examined, and according to the data obtained, it was seen that there was a decrease in both the inner motivation and the motivation directed to the target of the students in Turkey between 2003 and 2012 (ERG, 2014). Given these, it can be said that the belief that learning is necessary only for exams since students take exams almost every year in our country has been adopted. Instead of students who are curious, and who are open to learning and development, students who believe that whatever knowledge they have gained will lose significance once the exam is over exist our education system. The exams cause the student to ignore the piece of knowledge which they think will not be of help to them in exams but seek for whatever they think will contribute in this process. In spite of the fact that school achievement and the significance attributed to school are desired to be increased through TEOG, which is the new system introduced, it is an unavoidable fact that the learning level will not be able to get out of the framework of exam oriented context as long as there is an “exam” ahead.

## 5. Suggestions

- When the positive effect of the self efficacy belief on academic success and the negative effects of the exam anxiety on achievement are taken into consideration, activities boosting students’ self efficacy beliefs and decreasing the exam anxiety should be organized.
- Educative seminars aiming to provide students, parents, teachers and administrators with the content reached through this study, which is self efficacy, anxiety and cognitive strategy usage as boosters of success, should be given.
- Activities directed towards the development of the learning strategies based on self-regulation could be organized by the teachers for students with respect to cognitive strategy usage, which has an important effect on achievement.
- Studies similar to this research could be carried out with larger study groups, and the results could be opened to discussion.
- Exam achievements of the students who attend different types of schools and their self-regulation skills could be examined and a comparative study could be carried out.

## Abstract

In our contribution we focus on the problem of the quality increase of university education and its evaluation by students in the last year of university study. The quality increase is an actual challenge which is analysed and practically implemented through various concepts, like KSC (knowledge, skills, competences) Typology (Wintertog, Delamare-Le Deist, & Stringfellow, 2006), Tuning Methodology (González, & Wagenaar, 2008), Biggs' SOLO Taxonomy (Biggs, & Tang, 2007) or Bloom's taxonomy of cognitive education goals (Bloom et al., 1956; Krathwohl, 2002). Our attention is dominantly set onto these concepts, as well as on the practical outcomes which are the products of the projects solved at the University of Constantine the Philosopher in Nitra (Verešová, Žilová, & Vozár, 2012; Verešová, & Čerešník, 2013). The research problem was determined as the evaluation of the explicitness and the understandability of the changes in course descriptions of the study program subjects by the students of the Psychology teacher training program. The research sample consisted of students in the last year of the Psychology teacher training program (N=22). We assumed that innovated course descriptions will be evaluated positively from the point of view of better explicitness and understandability. The research method was the original questionnaire created by M. Verešová, & Ľ. Pilárik (2013). It was targeted on the evaluation of nine parameters of the course descriptions through a five point scale where the end points expressed clear agreement and disagreement respectively, with formulated items. Statistical analysis was realised by Mann-Whitney test in SPSS 20.0 software. We accepted the standard level of statistical significance  $\alpha \leq 0.05$ . The acquired results allow us to support the formulated hypotheses. The results show that the innovation of the course descriptions was a progressive change which can be considered as a positive alteration of the quality increase system in education. They also show that there exists a need for a higher application of the acquired knowledge and the particularity and diversification of the methods of education, self-education and evaluation.

## Introduction

The area of education results is a significant part of university quality evaluation. Nowadays their implementation in European university field and in field of qualifications and occupations therefore represents a demanded and supported activity (Verešová, & Čerešník, 2013). M. Blaško (2012) characterizes school quality via optimal operation of processes at school, especially the process with which are satisfied school partners and which is optimally measured and evaluated. The attention is therefore paid to the results which the school achieves as well as processes, which lead to them.

## Learning Outcomes as a Need of the Actual University Education

The process of creation/definition of specific education results is currently supported by a combination of multiple approaches. Accordingly, the formulation of education results particularly requires an orientation in theoretical bases of tuning methodology (González, & Wagenaar, 2008), KSC typology (Wintertog, Delamare-Le Deist, & Stringfellow, 2006), (knowledge, skills, competences), Biggs' theory in relation to education results (SOLO taxonomy) (Biggs, & Tang, 2007) or Bloom theory (Bloom et al., 1956; Krathwohl, 2002) and its revised version, which is in conditions of our university recommended as key approach (Verešová, & Čerešník, 2013).

Education results bring multiple benefits within optimization and harmonization of university studies in EU. According to D. Kennedy, A. Hyland and N. Ryan (2006), key advantages of education results are:

- Clear overview of what the student should achieve to be successful,
- precision,
- easier definition compared to education targets,
- transparency.

Above state advantages of education results are expanded by M. Verešová (2013) as follows:

- they help students in observation of education process and address teachers' expectations,
- they help students in decision making when selecting a study program as well as by enrolment of subject (mandatory or optional),
- they help teachers to aim the curriculum and direct students' expectations,
- they help to synchronize content with methods (education and learning) and with expected or achieved "performance" and its evaluation,
- together with the criterion of student's study load, they enable to correctly set the credit value of education item (subject, module, study part),
- they create space for fluency and consistency of education aims in the direction of progressing demands and the enable to verify how individual study program subjects or modules link up within the education process and increase of knowledge, skills and competences,
- they simplify the proposal of curriculum by visualizing the "overlapping" areas between study programs (primarily related) and subjects within one study program,
- clearly define the subject field of study, study program for the purpose of accreditation and evaluation,
- they have key role as reference points when creating evaluation standards, they help to improve evaluation methodology of study programs quality,
- they improve the effectiveness of student's mobility in the area of curriculum comprehension and performance standard of appropriate study program which is a subject of student's mobility on a different university and improve the transfer of study results at various universities,
- they offer information to prospective employers about gained competences of graduates in individual study fields,
- they simplify the comparison of study programs equivalency in the process of recognizing foreign university qualifications.

The biggest advantages of unified approach to education results description on the level of study programs and their disciplines are: clarity, precision and transparency when describing student's requisites for being successful; help when observing the education process and reflexion of educator's expectations; possibility to improve the evaluation methodology of study programs quality; offering information about competences for prospective employers and many others (Verešová, Čerešník, 2013).

Education results, as being perceived by ESG based quality system also valid on our university, are measurable and verifiable set of information, skills and/or competences, gained by individual and/or is able to present not only at the end of education process as whole but also at the end of every module, block of study program, even after the end of every subject within the study program.

## Method

22 second grade students of Psychology master's teaching program in academic year 2012/2013 participated in the

research. This means all the students who have had experience with appropriate subjects of their study program. Some evaluations were however omitted from the analysis because of incompleteness. Therefore we can see lower quantities in some of the charts and groups (Results section).

To measure the effectiveness of education results implementation, we used an originally compiled questionnaire named “Quality of subject course descriptions from the point of view of education results at UKF Nitra” (Verešová, & Pilárik, 2013). The questionnaire contained header area for information about grade, study level, form and study program. In the second part there was a space for identification of evaluated discipline (subject course description). The third part represented the instruction for evaluation of presented form of course description (not a vision or required perspective) within nine selected parameters and two of their qualities. The fourth part contained a representation of nine parameters (knowledge, abilities, topics, methods – knowledge, methods – abilities, preparation – knowledge, preparation – abilities, evaluation – knowledge, evaluation – abilities). These were evaluated by participants using two qualities – explicitness and understandability. Qualities of selected ILP parameters were evaluated on a scale of 1 to 4 (1 – definitely agree, 2 – partially agree, 3 – partially disagree, 4 – definitely disagree, N – not able to evaluate). The aim of the research was to verify the quality of course descriptions without introduced education results and with introduced education results defined based on revised Bloom taxonomy methodology. The output was then a comparison of explicitness and understandability statements of 9 observed course descriptions quality parameters:

1. description of expected knowledge,
2. description of expected abilities,
3. content standard (topics which create the content of education),
4. methods of knowledge acquisition of a student, related to educator’s didactic activity,
5. methods of ability acquisition of a student, related to educator’s didactic activity,
6. methods of knowledge acquisition of a student by independent studying,
7. methods of ability acquisition of a student by independent studying,
8. methods of teacher’s final evaluation of acquired student’s knowledge,
9. methods of teacher’s final evaluation of acquired student’s abilities.

In the charts in chapter Results are these parameters introduced under the acronym which represents the identification by “item”, number which represents the numeric order of a parameter (1-9) and letter “e” and “u”, representing the terms “explicitness” and “understandability”.

We hypothesized that:

- H1: innovated course descriptions will be evaluated by students as being more explicit.  
H2: innovated course descriptions will be evaluated by students as being more understandable.

## Results

To test the hypotheses we used Mann-Whitney test for two independent selections in SPSS 20.0 software. The reason for this was an abnormal data distribution of the observed variables. We accepted the standard level of significance  $\alpha \leq 0.05$ . Analysis results are presented in charts 1 to 6.

Legend: N = count; Min = minimal measured value; Max = maximal measured value; AM = average mean; SEM = standard error of mean; SD = standard deviation; U = value of Mann-Whitney test; p = significance

We discovered significant differences in explicitness and understandability of individual study subjects. We specifically discovered the following differences when judging explicitness:

- in the subject Psychodiagnostics in School (Table 1.) in item content standards (i3e) and methods of knowledge and abilities acquisition (i6e);
- in the subject Didactics of Psychology (Table 2.) in items description of expected abilities (i2e), methods of student's knowledge acquisition related to teacher's didactic activity (i4e), methods of student's knowledge acquisition related to teacher's didactic activity (i5e), methods of knowledge acquisition by student's self-study

- (i7e), methods of teacher's final evaluation of student's ability (i9e);
- in the subject School and Pedagogical Psychology in Praxis (Table 3.) in all items except the item content standard (i3e);
- in the subject The Basics of Psychological Methodology (Table 4.) in items description of expected knowledge (i1e), description of expected abilities (i2e), methods of student's knowledge acquisition related to teacher's didactic activity (i4e), methods of student's ability acquisition related to teacher's didactic activity (i5e), methods of teacher's final evaluation of student's acquired abilities (i9e);
- in the subject Statistics in Social Sciences (Table 5.) in items description of expected knowledge (i1e), description of expected abilities (i2e), methods of student's knowledge acquisition related to teacher's didactic activity (i4e), methods of student's ability acquisition related to teacher's didactic activity (i5e);
- in the subject Psychodiagnostics of Children (Table 6.) methods of student's knowledge acquisition related to teacher's didactic activity (i4e), methods of student's ability acquisition related to teacher's didactic activity (i5e), methods of knowledge acquisition by student's self-study (i6e), methods of ability acquisition by student's self-study (i7e), methods of teacher's final evaluation of student's ability (i9e).

When judging understandability, we discovered differences in identical items in almost all subjects. The exceptions are:

- the subject Psychodiagnostics in School, where we also observed differences in items methods of student's knowledge acquisition by self-study (i6u), methods of student's ability acquisition by self-study (i7u)
- the subject The Basics of Psychological Methodology, where we also observed the difference in the item methods of student's knowledge acquisition by self-study (i6u) and haven't observed the difference in item description of expected knowledge (i1u).

## Discussion

Based on the above stated findings we could establish that innovation of course descriptions of teacher's study program Psychology was positively perceived. Students valued increased explicitness and understandability. Every subject had its own particularity considering statistically significant differences, which shows heterogeneous quality of original course descriptions. Despite not having found significant differences in all observed items, we believe that the defined hypotheses could be supported. We point out that innovation of course descriptions from the point of view of defining expected knowledge and abilities, education standard, work methods and evaluation methods is a way of increasing university education quality specifically in Psychology teacher's field of study. We could also point out that the biggest challenge when working with expectations regarding students and their study results is (1) the area of abilities, or application level of acquired knowledge and (2) area of work methods, whether on educator's or student's side, and furthermore an explicitly phrased answer to the question: "What are the means of achieving the expected education results?".

# The examination of elementary mathematics pre-service teachers' spatial abilities

Ahmet Şükrü ÖZDEMİR<sup>a</sup>, Sevdâ GÖKTEPE YILDIZ<sup>b</sup>

<sup>a</sup>Marmara University, Atatürk Faculty of Education, Istanbul, 34722, Turkey

<sup>b</sup>Yıldız Technical University, Faculty of Education, Istanbul, 34220, Turkey

## Abstract

The purpose of this study is to analyze the spatial abilities of pre-service mathematics teachers according to SOLO taxonomy. For this purpose, three students with different spatial skills were selected and clinical interviews were carried out with these students. The data was evaluated qualitatively and analyzed descriptively. A section was created for each of the answers given by students. In addition to that direct quotations from the dialogues were also used. The data collected shows that as the spatial skills of pre-service teachers increase their reasoning skills also increase.

## 1.Introduction

According to Sutton and Williams' (2007) definition, spatial skills include rotating objects in the mind, understanding how objects look like from different perspectives, imagining the relationship of objects with others in space and understanding forms in three-dimension. Therefore, spatial skills and geometrical thinking is interrelated. In order to understand how geometrical thinking develops in individuals, it will be useful to analyze geometrical thinking levels created by a Dutch couple Pierre and Dina Van Hiele Geldof (1957). According to their research, each individual passes through from the given levels in the same order even if not in the same age. These levels are accepted as sequenced and hierarchical. That is, when individuals fulfil the necessities of lower levels, they pass on another Van Hiele level or higher levels (Clements and Battista, 1992).

Jurdak (1991) in his study made a comparison between Van Hiele geometrical thinking skills and SOLO model used in this study. SOLO levels created for determining the levels of responses provided by students not for determining the levels of students. Therefore in this comparison the aim was generally to determine at which Van Hiele level the students were according to their own responses. In the table below, a comparison was made between Van Hiele geometrical thinking levels and level of responses in each thinking phases of SOLO model.

Table 1. The Comparison between Van Hiele Geometrical Thinking Levels and SOLO Levels

Van Hiele Levels	SOLO Levels
	Pre-structural
Visualization	Uni-structural
Analysis	Multi-structural
Informal deduction	Relational
Formal deduction	Extended abstract
Rigor

Jurdak (1991) was stated in his study that when the SOLO Model which is valid for all disciplines is applied to geometry, the SOLO thinking levels and Van Hiele geometrical thinking levels which were created particularly for geometry are similar to each other. There are two situations which are not match to each other. First, pre-structural SOLO level is not matching with any of van Hiele levels. This is an understandable situation as the pre-structural SOLO level is either refusing or the insufficiency in focusing. Secondly, van Hiele level 'Rigor' is not matching with any of the SOLO levels. This is because there are individuals who are more specifically studying mathematics in the fourth level.

All the generalizations may not be suitable for all the students, thus SOLO model is created in accordance with this thought but it is important in terms of giving some ideas about how teachers on the average should behave. One of the important points is the reality that while passing on a higher level from a lower level, teachers are playing an important role. Providing education by preparing necessary learning environments makes transition between levels easier and provides us to achieve expected level.

According to Hallway (2010) SOLO Model consists of thinking levels. Each thinking level stated in SOLO model includes five sub-levels of response. These levels are also called as 'SOLO Taxonomy'. These are pre-structural, uni-structural, multi-structural, relational and extended abstract levels. As the complexity of the responses increases the level is getting increase. Besides, as the level increases the skills such as making consistent explanations, creating relations, and thinking by considering more than one situation also increase (Biggs and Collis, 1991; Çelik, 2007).

In accordance with this information, the purpose of this study was to analyze spatial abilities of elementary mathematics pre-service teachers. In the part of analyzing spatial skills, spatial visualization skill among the components of spatial skill was considered and the evaluation and the determination of the student responses were made by using SOLO model.

## **2.Methods**

The study is a qualitative study and the data was obtained through clinical interviews. In order to analyze students' thoughts deeply, interactive interviews with students are called as clinical interviews (Güven, 2006; Zazkis and Hazzan, 1999). Clinical interviews are one of the most important techniques in analyzing what students are thinking about on a particular subject and eliciting the scope of their knowledge thoroughly (Zazkis and Hazzan, 1999; Goldin, 1998). The most important features which distinguish clinical interviews from others are being semi-structured, clinical and subject field is in the centre. The meaning of the word clinical comes from the fact that interviews take place in environments where students can feel themselves more comfortable than other teaching and learning environments. The researcher decided on the questions but he/she can also ask different questions in order to analyze students' thoughts in details. For this reason it is semi-structured. It subject field centred as the main interest is especially some particular mathematics subjects and concepts (Zazkis and Hazzan, 1999).

Goldin (1998) indicates that one of the purpose of using clinical interviews is to have information about individual's mathematical behaviours through problem solving. Thus, recently clinical interviews started to be used in teaching mathematics researches (Güven, 2006; Dindyal, 2003; Çelik and Baki, 2007; Bishop, 1997; Money, 2002). In accordance with this information, it was chosen to use clinical interviews during this research.

### *2.1. Study group*

First of all in order to determine pre-service teachers' spatial ability levels, Purdue Spatial Visualization Test (PSVT) was carried out. According to the results of this test, from each student group that were classified in three levels (bad, average, good), clinical interviews were carried out with three pre-service teachers by selecting one student from each group. Three classrooms were determined by dividing the total score into three according to maximum and minimum scores obtained from the general of the test. While selecting three pre-service teachers among 81 students, it was paid attention to have pre-service teachers who were representing their own classrooms. The selection was made on the basis of willingness. Students were selected from A1 low, A2 average, A3 high levels. R shows researchers' answers in the dialogues.

### *2.2. Data collection tools*

The Purdue Spatial Visualization Test which was used in the research for determining the spatial skill levels of pre-service teachers was created by Guay in 1997. The test has 3 sections and 36 questions. In each section, there are 12 multiple choice questions (Bodner and Guay, 1997). The sections are as Developments, Rotations, and Views. These parts were adopted to Turkish by Uygan (2011) and used within the permission of the writer. Besides a permission was taken from George Bodner who worked with Guay to develop the original version of the test. In this study, Purdue Spatial Visualization Test was carried out with 81 pre-service primary mathematics teachers and alpha reliability coefficient was found as 0,834 according to KR-20 reliability analysis. Since the coefficient is higher than 0, 80, as stated by Kalaycı (2010) the scale is highly reliable.

‘Geometrical Achievement Test’ which tested spatial abilities of students at different dimensions was prepared by the researcher for using during clinical interviews. The test was finalized after the pilot study. Geometrical Achievement Test has 16 questions which is testing the spatial skills. The questions are open ended, multiple-choice and requiring to make drawings. Besides, the questions were designed in a form which requires switching in and between dimensions. There are questions which require thinking in two and three dimension and besides switching from two-dimension to three-dimension and from three-dimension to two-dimension. In this study, there is one question which require switching from two-dimension to three-dimension in Geometrical Achievement Test. The answers provided for this question by each student from three levels were considered in details and the solutions of the students were given. The responses of the students were placed in a suitable level by evaluating according to the SOLO taxonomy.

The question is as in the following:

A Cylinder was obtained by attaching the AB and CD sides of the below cartoon which is in the shape of rectangular and composed of unit squares.

When an ant in the P point of this cylinder advanced to the Q point by using the shortest way, how many units has this ant advanced?

### 2.3. Clinical Interviews

The clinical interviews were made by using a recorder in the seminar room of the school. Each interview lasted approximately 60 minutes. During the interviews, the students were asked to answer questions and explain how they found the solution loudly by giving the questions one by one. In addition to that, questions such as ‘What kind of a generalization do you make about this question?’ and ‘What is your conclusion as a result of the asked rotation action?’ were posed to students. According pre-service teachers’ responses, the spatial visualization skills of them was determined according to SOLO taxonomy by asking different questions.

### 2.4. Data Analysis

During the analysis of the data obtained through clinical interviews, interviews which were recorded with the permission of the pre-service teachers were transcribed. The personal notes taken by the researcher also added to this text.

The data obtained through clinical interviews were analyzed qualitatively and the place of spatial visualization skills of pre-service primary schools mathematics teachers in SOLO taxonomy was searched.

The data collected in descriptive analysis are interpreted and summarized according to the levels specified before. In descriptive analysis, direct quotations are stated frequently in order to reflect dramatically the opinions of the individuals interviewed or observed. The purpose of this analysis is to present the data to the reader after the data was organized and interpreted. First, the data collected in this purpose is described systematically and openly. Later, these

descriptions are explained, cause and effect relations are analyzed and finally some conclusions are inferred (Yıldırım and Şimşek, p.224).

In this study, how pre-service primary mathematics teachers think while solving questions which require thinking from two to three-dimension of spatial visualization components, ways of understanding, direct quotations from the dialogues between the researcher and the pre-service teacher for expressing solution strategies were included.

### 3.Findings

In this part, three students' problem solutions and the dialogues having direct quotations were mentioned.

#### The Problem Solution of A1

A1 got a cylinder by attaching the AB and CD sides of the rectangular. While drawing the figure of a cylinder, she pointed the places where P and Q points will coincide. But we do not think that she used this figure for solution. She formed the hypotenuse of a right triangle by combining P and Q points on a rectangular at two-dimension. She stated that the shortest length would be found by using Pythagorean relation and pointing side length of this triangle in horizontal and vertical. For this, she expressed that hypotenuse length therefore the shortest length would also be calculated immediately by using 3-4-5 triangle. She did not think that there could another way for the shortest way so the answer that he/she found was wrong. The dialogue between the pre-service teacher and the researcher while solving the problem is as follows:

*A1: P from below 1 unit to another is somewhere from here, Q from above 1 unit to another is somewhere from here. But I rotated therefore these distances stayed in the folded places. (This dialogue happens while drawing the closed version of the figure) So, I cannot show it on this. Besides, if it was given in this way, I would prefer to open it.*

*R: So, you are saying that, for the solution I would in any way find the solution by opening the figure, right?*

*A1: Yes, in the first figure, I wrote 5 units from Pythagorean by counting the square units.*

*R: The shortest way is being asked. Why do you think of this for the shortest way? Can there be another way from P to Q.*

*A1: This is the shortest way ... (1)*

Figure 1. The Solution of A1 regarding the Problem

While reaching from P point to Q, as it can be seen from sentence (1), as the pre-service teacher thought that there is only one way for the shortest without thinking any alternatives and without making any comparisons between the distances, he/she is on 'Uni-structural' level.

#### The Problem Solution of A2

Although it was stated in the problem that AB and CD sides should be attached, the pre-service teacher attached AD and BC sides. After attaching both sides in this way, he formed the cylinder and placed P and Q points. Then he drew

the ant's way. First moved from right to left on the drawing, then from left to right and decided that this was the shortest way. For the solution, the shortest way was calculated as  $\sqrt{13}$  by pointing on the rectangular and taking 3 units in vertical and 2 units in horizontal.

A part from the dialogue between the researcher and the pre-service teacher is as follows:

A2: When we rotate in this way, it will pass through from a point from the shortest way. Q point is here, isn't it?

R: Draw this cylinder, if you want. Can you also write which point coincides to other there?

A2: If we think in this way, when we attach like this, for instance A point is here and B point is there. This is C and D point is here. If P point is here, when we rotate in this way, it is the Q point. Then the problem is asking how many units the ant advanced. It should go from the shortest way. It can go from here. How many will be there? If we take a vertical length, then that point for instance is Q point. The distance between these two is 2 units, 3 units,  $\sqrt{13} \dots$  (2)

Figure 2. The Solution of A2 regarding the problem.

As it can be seen from the sentence (2), as the student specified more than one ways which the ant can follow and made calculations from different ways but since his/her explanations were superficial and started calculations without thinking deeply and preferred to attach in a wrong way, he /she is at the 'Multi-structural' level.

### The Problem Solution of A3

A3 formed the cylinder by attaching AB and CD sides, showed that A and D points and B and C points coincide and pointed P and Q points on the surface. He showed on the rectangular that which distance should be taken between the points for the shortest way. He specified why he took 2 units instead of 3 units and reached the correct solution.

The explanations of A3 during problem solving are as in the following:

A3: If I took P from here, Q would be on the other side, at the back. Then, the shortest way of this will be from the other side; this will not be in fact. It will turn around like this, in fact. (It will come back into the form given in the question. He stated that the shortest way is from the other side rather than first drawing by adding squares under the rectangular.) ... (3)

R: Is this the shortest way?

A3: Yes, at first the other one came into my mind, but this should be like this.

Figure 3. The Solution of A3 regarding the Problem

Since he considered more than one situation and he explained why he chose this way with reasons as it was stated in sentence (3), he is at the 'Relational' level.

According to the responses provided for the current problem, A1 is at the uni-structural level, A2 is multi-structural and A3 is at the relational level. The responses display features in the level of highest relational structure and one way relational structure.

INTE 2014

#### 4. Conclusion and discussion

Since the pre-service teacher who has low level spatial visualization skill is at the unistructural level, she focus on the problem, but she uses only relational single data for the solution. She cannot understand the value of data in whole and the relation of this data with the others. According to Hattie and Brown (2004), since the responses at the unistructural level are not profound, it can be said that pre-service teachers at the low level have a superficial learning. When pre-service teachers with middle level spatial visualization skills are analyzed, their responses can be seen at multi-structural level. As the spatial visualization skills increase, level of the pre-service teachers' responses has progressed into a higher level. This can be thought as normal situation because as the level of the students increases, the responses of the students are expected to be at a higher level. Similarly, it was found that pre-service teachers in high levels are at the relational level. In accordance with this information, pre-service teachers in middle or high levels generally use more than one information given in the problem but they cannot fully understand their values in the whole and their relation with the others and it is seen in each 3 situation, pre-service teachers are superficial. Experiences gained in classroom environment for geometrical concepts are developing their spatial skills (Hoover, 1996). From this point it can be concluded that in order to develop spatial skills, the necessity of carrying out various activities comes in to view. There are studies which show that dynamic geometry programs and using abstract materials can be effective at this level. Thus, Baki and Güven (2007), Kösa (2011), Uygan (2011) displayed in their studies that dynamic geometry and Arıcı (2009) in his study that origami can be effective in developing spatial skills. The fact that in Lian and Idris's (2006) studies the participants are mostly at Unistructural and multi-structural levels and the responses of the pre-service teachers in this part of the study display similarities. Çelik (2007) and Ardiç and others' (2012) studies shows parallelism with the results obtained in a part of this study in terms of the responses of the participants stayed under relational level.

When we look at the general, the responses coming from pre-service primary mathematics teacher for the questions testing spatial visualization skills from two to three-dimension are mostly at relational level and at the least at Unistructural level. Their explanations are through rote learning, they started their calculations without thinking deeply which means there is no in-depth thinking and the questions were analyzed mostly superficially. Therefore, it cannot be said that pre-service teachers are successful.

The previous studies give us the fact that spatial thinking is mostly related with geometry rather than mathematics (Battista, 1990; Grande, 1990; Karaman, 2000). Since space is a more suitable field for the development of students' spatial skill, the importance given for teaching this field should be increased.

The level of students' responses can be determined by moving from various components that are specified by the other researchers of spatial skills and other subjects included in spatial geometry. The data obtained in this study was analyzed according to thinking levels of SOLO model. After evaluating the same data by using a different taxonomy, a comparison between two models can be made so that the subject can be considered from different point of view. In this way, if there are missing or overlooked aspects, they can be added.

## Abstract

The purpose of this study was to determine the effects of gender, grade and type of school variables on the primary school students' attitudes toward science and technology course and science experiments. The study group is 247 students in 4th, 5th and 6th grades from three public schools and one private school in Istanbul in the semester of 2012-2013. Attitudes toward science and technology course and science experiments scale was used as a data collection instrument within the scope of this study. The scale was developed by Barmby et al (2005) and adapted to Turkish by Kaya and Büyük (2011). The data obtained were analyzed quantitatively using SPSS 16.00. T-test and One Way Anova test, and Kruskal -Wallis test for students' scores for attitudes toward science experiments were employed. In this study, it was found that students' attitudes toward science course didn't differ by gender and school type; however, there was a significant difference in terms of grade in favor of 6th grade. It was also found that students' attitudes toward science experiments didn't differ by gender and grade, however, there was a significant difference in terms of school type in favor of private school. As a result, the difference in favor of private school brings to mind the question "how and how often is science taught using experiments in state schools?" In this study, it is also recommended that pre-service science teachers should be taught the importance of making science experiments.

## 1. Introduction

Science course is one of the important courses that will help students cope with the problems they encounter in daily life and understand nature. By science literacy, which is one of the most important goals of science course, individuals understand the nature of science and scientific knowledge, learn to solve problems based on basic principles, concepts, laws and theories of science and technology and to use scientific methods (Kenar and Balci, 2012). Indeed, it was intended to raise all citizens as science and technology literates in science and technology course curriculum published in 2006 as well as in science course curriculum published in 2013. However, it is also expected in common and main purposes created that the students develop curiosity about, attitudes toward and interest in science [Ministry of National Education (MEB), 2006; MEB, 2013]. Focus in science course should be not only scientific knowledge but also improving students' current scientific knowledge, skills, perspectives and attitudes (Bilgin and Geban, 2004). In parallel with the rapid advancement in science and technology, importance given to science education have increased all over the world and studies conducted in the field of education revealed the role of concepts such as attitudes and motives in the learning process (Altınok, 2004). When the literature of science teaching is examined, it is clear that the importance of academic learning products as well as of affective learning products, and accordingly the ineffectiveness

---

\*Corresponding author. Tel.: +90-262-303-24-78; fax: +90-262-303-24-03

E-mail address: canandilek@kocaeli.edu.tr

of science teaching are frequently verbalized. The affective learning product which is emphasized the most is attitudes toward science and science courses (Altınok and Ün Açıkgöz, 2006).

Since the importance of developing positive attitudes toward science was realized, specific activities that can be performed to improve students' attitudes toward science were carried out by many educators and researchers in a wider framework (Papanastasio and Papanastasio, 2004). The importance of students' attitudes in learning science has attracted researchers for the last 30 years (Hong, Lin and Lawrenz, 2008).

Previous research reported that students' positive attitudes toward science and hence science courses improve their academic performance and meaningful learning levels, and it is an important factor influencing understanding of science (Azizoğlu and Çetin, 2009; Erdem, Yılmaz, Atav and Gücüm, 2004; Hong and Lin, 2011). Attitude influences students' decisions and behaviors so it plays an important role in the realization of learning (Altınok and Ün Açıkgöz, 2006; George, 2006).

In studies conducted about attitudes toward science conducted with different age groups, it was established that attitudes toward science courses vary by gender, performance status, father's education level and family's economic status (Akgün, Aydın and Öner Sünkür, 2007), that they are affected by students' education readiness, desire and school conditions (Papanastasio and Papanastasio, 2004), do not show significant difference by gender (Kaya and Büyük, 2011; Altınok, 2004), and show significant difference by grade level and age (Kaya and Büyük, 2011).

In studies related to teaching methods and techniques influencing attitude toward science, multiple intelligences theory (Özyılmaz Akamca and Hamurcu, 2005) and collaborative and individual concept mapping (Altınok and Ün Açıkgöz, 2006) were found to have no significant effect on students' attitudes toward science, whereas delivering performance-based activities during evaluation process (Önal Çalışkan and Kaptan, 2012), guided questioning approach (Köksal and Berberoğlu, 2014), an education setting in which science and social events are incorporated and discussed (Hong, Lin, Wang, Chen and Yang, 2013), science-technology-social approach (Lee and Erdoğan, 2007), drama technique (Sağırlı and Gürdal, 2002), experiments made using simple materials (Koç and Büyük, 2012) and cooperative learning (Bilgin and Karaduman, 2005) were found to have positive effects on students' attitudes toward science course.

One of the most important methods used in science course is experiment method. Through science experiments, students will be able to reflect on the events that occur in nature and develop activities that will enhance their cognitive skills. Students are also thought to exhibit positive or negative attitudes toward science experiments (Yeşilyurt, Kurt and Temur, 2005), which have a core importance in learning science (Hofstein, Kipnis and Kind, 2008; Hofstein and Lunetta, 2004; Demirbaş and Pektaş, 2010). Accordingly, it was aimed to investigate whether students' attitudes toward science course as well as science experiments vary by gender, grade level and type of school they attend. For this purpose, the sub-problems below were established:

- 1.1. Do primary school students' scores for attitudes toward science courses and science experiments vary by gender?
- 1.2. Do primary school students' scores for attitudes toward science courses and science experiments vary by grade level?
- 1.3. Do primary school students' scores for attitudes toward science courses and science experiments vary by whether the school they attend is a private school or a state school?

## **2. Method**

### *2.1. Research Model*

In this study, screening model was used to determine whether primary school students' attitudes toward science courses and science experiments vary by gender, grade level, and type of school they attend.

### *2.2. Sample of the Study*

The sample of the study was 247 students from 4th, 5th and 6th grades of three different primary schools selected randomly among primary schools in the province of Istanbul during the 2012-2013 academic year. Distribution of participants by gender and grade is shown in Table 1.

Table 1. Characteristics of sample group

Grade	Female	Male	Total
4	8	9	17
5	36	43	79
6	69	82	151
Total	113	134	247

### 2.3. Data Collection Instrument

In the study, “Attitudes Toward Science Courses and Science Experiments (ATSCSES) Scale”, which is a translation into Turkish created and developed by Kaya and Böyük (2011) of a 5-point Likert attitude scale with a reliability coefficient of Cronbach Alfa 0.76, originally developed by Barmby et al. (2005) to investigate students’ attitudes toward science and technology courses and science experiments, was employed to collect to data. This scale was chosen because it collects data related to attitudes toward science course and experiments, and it was developed in an updated manner. The statements in ASTSCSE used in the study were evaluated using a five-step Likert-type rating scale as follows: strongly agree (5), agree (4), neither agree nor disagree (3), disagree (2), strongly disagree (1). The scale consists of two parts. The scale consists of a total of 21 items and its first part includes 13 attitude items related to science and technology courses aiming to reveal students’ attitudes, and its second part includes 8 attitude items regarding science experiments.

### 2.4. Data Analysis

First, in order to determine which test methods to use in the study, distribution and homogeneity of data were analyzed. Fitness of the research data for normal distribution was determined using Single- Sample Kolmogorov-Smirnov test.

Factor 1: Attitude toward Science Courses

Factor 2: Attitude toward Science Experiments

Table 2. Results of Kolmogorov Smirnov Test

	Factor 1	Factor 2
N	247	247
Mean	53.93	36.10
Kolmogorov Smirnov Z	1.266	3.184
Assymp Sig	.081	.000

Factor 1 value on line Assymp.Sig. (Significance) from Table 2 is larger than 0.05, which is considered as a limit value in statistical significance calculations, indicating that factor 1 data were normally distributed, however, Factor 2 value on line Assymp.Sig. (Significance) in the same table is smaller than 0.05, indicating that factor 2 data were not normally distributed.

Moreover, for homogeneity of the data, One-way ANOVA test was performed.

Table 3. Homogeneity results of the values

	Levene Statistic	df1	df2	p
F1	.001	1	245	.976
F2	4.807	1	245	.029

In Table 3, p values of Factor 1 are larger than 0.05, which indicates that factor 1 distributions are homogenous, whereas, p values of Factor 2 in the same table are smaller than 0.05, which indicates that factor 2 distributions are not homogenous. Therefore, it was deemed appropriate to use parametric test methods in analysis of Factor 1 and non-parametric test methods in analysis of factor 2.

t-test and One Way ANOVA test were used for students' total scores for attitudes toward science courses. Kruskal-Wallis test, an alternative technique to one-way variance analysis, which does not require the assumptions of normal distribution and equality of variances, was used for the scores for attitudes toward science experiments.

### 3. Findings

In this section, distributions of 247 primary school students included in the study sample by gender, grade level and type of school they attend were determined, and the results regarding whether students' scores for attitudes toward science courses and science experiments vary by gender, grade level, and type of school they attend are given.

#### 3.1. Do students' scores for attitudes toward science courses and science experiments vary by gender?

a. t test was conducted to determine whether students' scores for attitudes toward science courses vary significantly by gender.

Table 4. t-test results of students' scores for attitudes toward science courses by gender

Gender	N	X	S	sd	t	p
Female	113	54.83	7.53	245	1.684	.094
Male	134	53.18	7.75			

As seen in Table 4, no significant difference was found between female and male students ( $t_{(245)}=1,684$ ,  $p>.05$ ).

b. Kruskal-Wallis test was conducted to determine whether students' scores for attitudes toward science experiments vary significantly by gender.

Table 5. Kruskal-Wallis test results of students' scores for attitudes toward science experiments by gender

Gender	N	Average of Rows	sd	$\chi^2$	p
Female	113	129.33	1	1.179	.277
Male	134	119.50			

As seen in Table 5, no significant difference was found between female and male students ( $\chi^2_{(1)}=1,179$ ,  $p>.05$ ).

#### 3.2. Do students' scores for attitudes toward science courses and science experiments vary by grade level?

a. One Way ANOVA test was conducted to determine whether students' scores for attitudes toward science courses vary significantly by grade level. As shown in Table 6, a significant difference was found between the grades ( $F_{(2-244)}=3,405$ ,  $p<.05$ ). According to the results of Scheffe test conducted to find between which grades a difference exists, 6th grade students' scores ( $X=54,93$ ) for attitudes toward science courses were demonstrated to be more positive than 5th grade students' scores ( $X=49,80$ ) for attitudes toward science courses.

Table 6. t-test results of students' scores for attitudes toward science courses by grade level

Variance Source	Sum of Squares	sd	Mean of Squares	F	p	Significant Difference
Between-group	393.911	2	196.956	3.405	0.035	5-6
Within-group	14114.178	244	57.845			
Total	14508.089	246				

b. Kruskal-Wallis test was conducted to determine whether students' scores for attitudes toward science experiments vary significantly by grade level.

Table 7. Kruskal-Wallis test results of students' scores for attitudes toward science experiments by grade level

Grade	N	Average of Rows	sd	$\chi^2$	p
4	17	119.91	2	.468	.791
5	79	128.42			
6	151	122.15			

It is evident from Table 7 that no significant difference was found between grade levels ( $\chi^2_{(2)}=.468$ ,  $p>.05$ ).

### 3.3. Do students' scores for attitudes toward science courses and science experiments vary by educational institutions they attend?

a. t test was conducted to determine whether students' total scores for attitudes toward science courses vary significantly by type of school.

Table 8. t-test results of students' scores for attitudes toward science courses by type of school

School Type	N	X	S	sd	t	p
State	173	53.8035	7.81	245	.424	.672
Private	74	54.2568	7.39			

As shown in Table 8, no significant difference was found between groups for attitudes toward science courses by school type ( $t_{(245)}=.424$ ,  $p>.05$ ).

b. Kruskal-Wallis test was conducted to determine whether students' scores for attitudes toward science experiments vary significantly by school type.

Table 9. Kruskal-Wallis test results of students' scores for attitudes toward science experiments by school type

School Type	N	Average of Rows	sd	$\chi^2$	p
State	173	117.32	1	5.126	.024
Private	74	139.61			

A significant difference in favor of private schools ( $X=139.61$ ) was found between state and private schools, as shown in Table 9 ( $\chi^2_{(1)}=5.126$ ,  $p<.05$ ).

## 4. Results and Discussion

This study was conducted to investigate whether primary school students' attitudes toward science course as well as science experiments vary by gender, grade level and type of school they attend. The results were presented in line with data obtained according to these variables.

In the study, when the effect of gender variable on students' attitudes toward science course is considered, attitude scores were found to show no significant difference by gender factor. Although this result is not comparable to the results of several previous studies (Çakır et al. 2000, Yenice 2003, Çakır K. et al. 2007, Kozcu Çakır and Şenler

2007, Avcı Erduran and Darçın Selcan 2008, Kaya and Büyük 2011), it is comparable to some other studies (Weinburgh 1995, Bilgin and Karaduman 2005, Tekbiyik and İpek 2007).

In the study, when the effect of gender variable on students' attitudes toward science experiments is considered, attitude scores were found to show no significant difference by gender factor. Although this result is not supported by the result found by Yıldız et al. (2006), it is supported by previous studies which investigated attitudes toward science experiments (Bernardez 1998, Kaya and Büyük 2011, Yeşilyurt et al. 2005), attitudes toward physics experiments (Taşlıdere and Korur 2012), attitudes toward chemistry experiments (Cheung 2009) and attitudes toward biology experiments (Erdoğan et al. 2009), which are disciplines covered by the science course. In a study by Greenfield (1997), which evaluated interest and participation in science laboratory, it was observed that female students actively participated in science laboratory, set up pendulum and balance mechanisms, prepared mixtures related to chemicals, just like male students, and that male students counted the number of swings of the pendulum, took readings of the weights of objects in balance, just like female students, which also support this study, suggesting that gender has no influence on attitudes toward science experiments.

Another result of this study was that primary school students' scores for attitudes toward science course did not vary in terms of school type variable. There are studies in the literature reporting that attitudes toward science course vary by school type (Novick and Duvdani 1976, Banu 1986, Mutlu 2006). There are also studies which concluded that private school students' attitudes toward science course are at the top (Kiraz and Omağ, 2013). However, the results of this study are also supported by previous studies suggesting that attitudes toward science course do not vary by school type (Craker, 2006). With the results obtained from this study, it may not be entirely accurate to say that school type has no significant effect on attitudes toward science course. Private school students only comprise 34% of the sample of this study, which may not be adequate to measure the difference between attitudes by school type.

As a result of the analysis conducted to determine whether participating primary school students' scores for attitudes toward science experiments vary by educational institution they attend to, it was concluded that their attitudes toward science experiments varied in favor of private schools by school type. In a study by Bozdoğan and Yalçın (2005) which investigated attitude scores of primary school students grouped according to different education-teaching and different number of teachers-students, and in a study by Temel et al. which investigated attitude scores of students from faculty of science & literature and faculty of education, in which physical conditions and tools-equipment were either arranged well or not, it was concluded that those who had limited laboratory facilities could not conduct most of the experiments, resulting in reduced student attitudes toward science experiments. Özdemir and Azar (2004), and Yıldız et al. (2006) compared attitudes toward the purposes of science experiments of teachers who have science laboratory in their school and of those who don't, and identified a significant difference in favor of teachers who have science laboratory in their school. Feyzioğlu et al. (2011) determined that physical conditions of a laboratory causes significant difference in perceptions of teachers toward the laboratory. The results obtained from these investigations conducted with students and science teachers from different levels of education are consistent with the conclusion of this study that the attitudes toward science experiments vary in favor of private schools, which have better equipped laboratories. Effective use of laboratories by science teachers depends on whether teachers exhibit a positive attitude toward laboratory use as well as on whether laboratory conditions in their schools are suitable for work. Teachers' positive attitudes toward laboratories may also encourage students to adopt positive attitudes toward science experiments.

In the study, it was concluded that attitudes toward science course varied significantly by grade level in favor of 6th grade, among 5th and 6th grades, however, attitudes toward science experiments did not vary by grade level. There are research studies which demonstrated that students' scores for attitudes toward science course decreased with increasing grade level (Greenfield 1997, Bozdoğan and Yalçın 2005, Murphy et al. 2006), and that such decline is significant for especially 8th grade, compared to other levels (Akpınar et al. 2009). Weinburgh and Englehard (1994) observed that students from lower grades participate in experiments in the laboratory more actively than those from higher grades. According to Rice et al. (2013), students who receive social support from their parents, friends and teachers for mathematics and science courses have more positive attitudes toward mathematics and science courses, and their qualifications in these courses are in a sense higher. The findings of this study that attitudes toward science experiments do not vary by grade level, whereas attitudes toward science course vary in favor of 6<sup>th</sup> grade, among 5<sup>th</sup> and 6<sup>th</sup> grades, may have arisen from perceptions regarding science teachers, motivations regarding the course, of

students constituting attitudes toward science course, their friends' and parents' attitudes and laboratory or classroom setting, as suggested by Osborne et al. (2003).

## 5. Suggestions

It is important for effective use of laboratories, which are indispensable for science and technology lessons, that laboratories are rearranged in accordance with the goals of the course in all schools.

Professional development with respect to laboratory practices of teachers, knowingly or unknowingly playing an important role in students' developing positive attitudes toward science experiments, should be supported.

Considering that positive attitudes toward science course can also affect the students' course selections in the next stage of their education and their career choices in the future, science classrooms should be arranged in such a way as to attract students' attention, increase their interest and curiosity so that they have positive attitudes toward science course.

In-service training should be provided to teachers so that science courses, as a course by which students can develop their manual skills as well as their creativity and thinking styles, and laboratory practices indispensable for the course are conducted with activities that will encourage participation of students.

# The examination of the required multicultural education characteristics in curriculum design

Nevcan Demir\*, Bünyamin Yurdakul

*Ege University, Faculty of Education, Department of Educational Sciences, Curriculum & Instruction, Bornova, İzmir 35040, Turkey*

---

## Abstract

This phenomenological study focused on what multicultural characteristics can be reflected to the elements of the curriculum objectives, content, learning situations and evaluation. Multicultural literature was examined via content analysis method. The findings were reported according to the themes based on the curriculum's elements. Some results of the research revealed that a curriculum design has multicultural characteristics if the objectives have the learner characteristics such as comprehending human rights and appreciation of different views, the content consists of some subjects such as human rights and citizenship, the learning situations offer different groups bias-free implementations and the evaluation process focused on thinking skills such as reflective thinking.

## 1. Introduction

Multiculturalism is dealt as a set of beliefs and applications which a group of people use to make sense of themselves and the world and to arrange their personal and collective lives (Parekh, 2000); multicultural education is dealt as an idea or an educational movement that gets students to achieve academic success and a reform movement that changes all elements of the educational enterprise, including its underlying values, procedural rules, curricula, instructional materials, organizational structure and governance policies to reflect cultural pluralism (Gay, 1994).

Studies revealed that different characteristics of individuals are not accepted in educational settings and they are even marginalized because of these; so, the objectives of curricula are not achieved (Bennet 1986; Banks, 2003; Macgillivray & Jennings 2008; Gay, 2010; Aguado, Ballesteros & Malik, 2010; Terra & Bromley, 2012). It is stated that monocultural education stunts the growth of the imagination and critical skills of students and causes them to judge other cultures and societies by the norms and standards of their own and to find them odd even worthless (Parekh, 2000). So, it is proposed that restructured education systems which have multicultural curricula are needed (Cole, 1998). It is proposed that school climate and hidden curriculum, teaching styles and strategies, language of communicate, elements of participation, formal education and training program, measurement and evaluation methods, instructional materials, attitudes, perceptions, beliefs and behaviors of school staff and school policies, also, should be

E-mail address: nevcandemir@gmail.com

changed by multicultural education which aims at ensuring equal opportunities for all students regardless of their gender, sexual opportunities, social classes, ethnic, racial and cultural features (Banks, 2003). But the primary concern is how to develop curricula, steering teaching implementations substantially, in terms of multicultural characteristics. In development of curricula, indispensable elements of education systems, multicultural characteristics can be reflected to teaching implementations taking learner differences into consideration (Banks, 2003; Grant & Sleeter, 2007). In this study, it is accepted that the hidden curriculum is inevitable and despite how perfectly was prepared, teachers can reshape formal curriculum plans with their own characteristics in implementation processes (Ertürk, 1994; Hewitt, 2006; Varış, 1988). Nevertheless, it is thought that teachers' curriculum implementations can be steered by curricula which have multicultural characteristics. In this context, the study focused on the question of what multicultural characteristics can be reflected to the elements of the curriculum objectives, content, learning situations and evaluation in designing curricula.

## 1. Method

In this study which was conducted on phenomenological method, a design of qualitative research methods, document analysis was chosen as the basic data collection method (Yıldırım & Şimşek, 2011). Multicultural literature was examined via content analysis method in the research. The findings were reported according to the themes based on the curriculum's elements.

## 2. Findings

### 2.1. The objectives of curriculum design

Multicultural curricula should have aims at imparting cognitive, affective and psychomotor features, providing a more equitable and fair society, to students (Banks, 2003).

It is suggested that curriculum plans have individual features which enable students to have knowledge about some key concepts such as democracy, human rights, prejudice, discrimination, sexism, sexual orientation, racism, social class, diversity, religious orientation, different languages, globalization which provide students with thinking multidimensionally and to examine the relations among these concepts (Banks, 2003; Bennett, 1986; Çavdar, 2014; Gay, 2010; Sears, 1991; Tiedt & Tiedt, 2010).

In terms of *affective domain*, it is suggested that a curriculum should have some features enabling; *i*) to develop empathy (Arikan, 2005; Baker, 1977; Banks, 2003; Gay, 2010; Grant & Grant, 1981; Portera, 2004); *ii*) to feel responsibility for world societies and esteem to the nature (Bennett, 1986); *iii*) to accept his/her responsibilities as a citizen of a multicultural society (Tiedt & Tiedt, 2010); *iv*) to appreciate different ideas and to be aware of how they develop decision making skill in different times (Tiedt & Tiedt, 2010); *v*) to accept different views (Tiedt & Tiedt, 2010); *f*) to develop a positive sense of self (Boyer & Babtiste, 1996), *vi*) to accept and appreciate different sexual orientations (Taxel, 1978; Sears, 1991; Macgillivray & Jennings, 2008; Mayo, 2014; Yağcıoğlu, 2014); *vii*) to reduce homophobia (Mayo, 2014; Alkan, 2014), *viii*) to develop an understanding which can remove social problems based on oppression and inequality (Boyer & Babtiste, 1996); *ix*) not to find one's and others' cultural heritage odd (Tiedt & Tiedt, 2010) and *x*) to develop friendship relations with marginalized groups (Banks, 2003).

It is, also, vital that a curriculum should include the skills enabling: *i*) to communicate with individuals who have different cultures (Boyer & Baptiste, 1996; Bennett, 1986); *ii*) to put the concept democracy into practice (Banks, 2003) *iii*) to be able to do teamwork (Banks, 2003; s. 122) and *iv*) to gain social movement (Bennett, 1986).

## *2.2. The content of curriculum design*

In the content of a multicultural curriculum design, it is highly recommended to include such concepts as notably human rights education, citizenship courses and how events, cases and notions are dealt from different views (Banks, 2003). The content should have historical and cultural events which enable to understand the experiences of different groups (Banks, 2003; Bennett, 1986). For example, the texts which deal with the roles, experiences, challenges and contributions of women to the society can take part in course books (Banks, 2003). Subjects which illuminate and break down prejudices against LGBTI individuals can be dealt (Macgillivray & Jennings, 2008; Mayo, 2014). To sum up, it is expected that content of the curriculum should identify the diversity in subject area and different views related to the content (Banks, 2003; Bennett, 1986; Gay, 2010).

## *2.3. The learning situations of curriculum design*

The findings oriented to curriculum objectives revealed that affective domain features should take part in multicultural curriculum design mostly. When it is taken into consideration that having affective features gained to individuals and measuring them are hard, it can be asserted that learning situations should be based on active experience. In this context, for Boyer & Babtiste (1996) methods such as simulation, role-play and case study/critical case can be used.

Tiedt & Tiedt (2010) suggest that teaching methods such as reading aloud, reading books with pictures, brainstorming, collaborative learning, drama, using graphic regulations and activities which let learners tell their own experiences and stories can be used. In addition, it is proposed that the materials which can make negative ideas, bias, hate speech and stereotypes against diversities shouldn't be used and the materials which are used should have the quality to test the bias against diversities (Arikan, 2005; Ayalon, 2008; Banks, 2003; Boyer & Babtiste, 1996; Collado & Atxurra, 2006; Grant & Grant, 1981; Kowalski, 2009; Ndura, 2010; Portera, 2004).

## *2.4. Measurement and evaluation process in curriculum design*

As empathy development and change in attitudes can take a long time, evaluation should be flexible to reflect diversity. In this context, it is thought that learners can prepare reflective thinking portfolios (Tiedt & Tiedt, 2010). It is also suggested that thought provoking questions can be asked after videos about discriminated groups are shown and historical and sociological information about different cultures can be used to test personal attitudes of learners (Banks, 2003). Aguado, Ballesteros & Malik (2010) propose that cultural differences should be taken into account in evaluation process.

## **3. Conclusion**

The importance of altering curricula into a multicultural structure for all ages and levels of learners is obvious so as to prevent learners who have different cultural features from being exposed to marginalization in educational settings and to affect their learning positively by turning their cultural differences into advantages. When viewed from this aspect, it can be said that a multicultural curriculum design should have the aims at raising democratic individuals who have reached the awareness and acceptance level of differences, can empathize, know human rights and respect them and communicate interculturally. A curriculum content which includes all marginalized groups and gets to gain multidimensional views should be organized. In learning situations, team works between heterogeneous groups, collaborative learning, discussing with differences and different views with due regard, and materials which include all differences as well as method and techniques such as drama enabling learners to develop the empathy skill. Evaluation process should be flexible and wide as the development of some attitudes can take a long time, and should reflect cultural diversity and should be convenient for learners' cultural backgrounds.

To sum up, this research revealed that curriculum designs can be said to have multicultural characteristics providing that curriculum includes the following; objectives having the learner characteristics such as comprehending human rights and appreciation of different views, the content consisting of subjects such as human rights and citizenship, the learning situations offering different groups bias-free implementations and lastly, the evaluation process focusing on thinking skills such as reflective thinking.

Consequently, it can be thought that program evaluation studies can be conducted to evaluate how substantial curriculum documents have multicultural characteristics accepting the characteristics determined in this study as criteria.

## Abstract

Analogy is the accordance with proportion. Metaphor is the form of analogy which contains semantic. Architect interprets metaphor which he chooses as the beginning of the design process, according to himself. The project develops and concludes with this interpretation. He transfers an image to the building with metaphor. The result reflects this metaphor. Metaphor causes the building to gain symbolism. This study Studio 7 shopping centre project that based on metaphors has been organized for third year students on Selcuk University Architecture Faculty in the academic year 2013-2014, spring semester. It is aimed to evaluate the progress in designing skills of students by using metaphor technique in architectural design. The secondary purpose is to indicate the capability of a design approach based on metaphors to meet the demand for architecture with identity and overcome the increasing monotony in the man-made environment. The relationship between architectural design practice and metaphor concept were evaluated with all positive and negative aspects within the context of students' projects.

## 1.Introduction

An analysis of the general framework of the recent architectural design practice reveals that criticizing, valuation or interpretation of designed projects are based on only the visual values or architectural images of these works. Architecture is using metaphor for a communication mediator. Human describes the thoughts in his mind by establishing relations with some objects while adding architectural accumulations to the environment he lives. While establishing relations with the objects sometimes he uses the method of formal metaphoric design in which he uses the object as metaphor directly; also sometimes he uses the method of conceptual metaphoric design in which he uses the object as metaphor indirectly. The increasing in the number of the metaphoric buildings is directly proportional with the developments in today's technology. The progress in material, computer and structural fields makes the applications of the projects possible which are impossible to be built in past. Original metaphoric buildings are considered important because of being constructed against impossibilities beside possibilities.

This study emphasizes the concept of metaphor. The speeches on the usage of metaphor in architecture are examined. In this paper, these conclusions can be sad; as it can be in the world, also in our country metaphor was used in architecture. The successful buildings can be made with the right sending's, right messages but if this concept is used unconsciously, unsuccessful buildings would be formed and the reactions were borned. Because of this, architect candidates have to be thought these concepts as consciously.

## 2. Metaphor in Philosophy and Architecture

Aristotle was the first philosopher known in history who pointed out the effective role played by metaphors in creative processes. He briefly defines a metaphor as, "...consists in giving the name that belongs to something else" (Poetics, 1457b). And he explains the importance of metaphors: "...ordinary words convey only what we know already: it is from metaphor that we best get hold of something fresh... It is a great thing by far to be master of metaphor" (Rhetoric, 1410b). One of the aspects of imagination is seeing something in terms of another thing as claimed by Lakoff and Johnson (2003) who clarify the reason for this importance. If this idea is true, it can be concluded that the effectiveness of imagination and thus, creativity, can be increased through metaphorical thinking. According to Lakoff and Johnson (2003), "The essence of metaphor is understanding and experiencing one kind of thing in terms of another" (p. 5), and "...principally a way of conceiving one thing in terms of another" (p. 36). Johnson (1987: 168) asserts that "Metaphorical projection is one fundamental means by which we project structure, make new connections, and remold our experience". "A metaphor can often create novel features in an object or a situation", writes Indurkha (1999: 621). From the perspective of Lakoff (1987), new metaphors create the entire conceptual system that human activities depend on. In a similar vein, Ricoeur (1991) underlines that metaphors increase our perception of reality by shattering our sense of reality, and that reality goes through phases of metamorphosis through metaphors.

Expressing via metaphors is the richest way of building a relationship between the signifier and signified. Metaphor is a deliberate preference by the artist. Expressing via metaphors generates the depth of the piece of art. Wandering in the world of object, the artist frequently employs metaphors in the relevant discipline or in the interdisciplinary context. In addition to enriching the language, expressing via metaphors is a profound route fortifying art. Thus, art finds an easier way to connect with the outer world. Metaphor is the connection between what we see when we observe the objects and what is left beyond of our observations. Metaphor in art is an attempt to read what the artist intended to express in his/her journey to the world of objects via the concept of metaphor, using the signifier objects.

Metaphors are not just a matter of language; they are also a matter of thought and action. They involve all natural dimensions of our sense experience such as color, shape, texture, sound (Lakoff and Johnson, 2003). The origins of verbal and visual metaphors are similar according to Rothenberg (2008). The concept of "visual metaphor" was first coined in scientific vocabulary by Aldrich (1968), but has been known and used by architects since ancient times. It is quite natural that visual metaphors prevail in architecture since it is a visual art. Designers' creative ideas are usually in the form of objects or images in their minds, and they cannot be easily verbalized. However, in relation to concrete samples, it is seen that architects not only use visual metaphors directly, they also apply verbal and conceptual metaphors into visual images and by using different interpretations transform them into visual images. As a matter of fact, it is a much more intelligent attitude than using visual metaphors straightaway and has potential to create more sophisticated architectural designs because a concrete graphic image of an abstract concept changes from one architect to another and varies even according to different perspectives of the same architect at different times. Every image appearing as a result of this process would be superposed on previous images. Thus imagination would be activated and new images would emerge (Ayran, 2012).

In the process of creating, the depth of the dialogue the subject builds with the object is about narrating "the other" in the context of style-content relationship. In this relationship, narrating the other is to make a metaphor. The metaphor is the transference of ideas into form. The Architectural form is the complement of idea. When metaphor, which is simply defined as "describing something by referring to something else", becomes a concept used by the architectural creator, turning the vessel, a carrier and protector by nature, into the "metaphoric design". With its formal relation to space, the metaphoric design gains a meaning for the trace it leaves in the space. It turns into an oral and ideological act conveying this trace.

## 3. Case Study

Architectural education differs from the other education branches, includes both theoretical courses involving such methods as transfer of information and evaluation; and also "creative studio" activities specific to design education. Educational sciences consist of sub discipline titles such as "education methods", "teaching techniques", "educational environment", "education tools" and "educational psychology". In creativity education, it is necessary to use some of these components. The case study was conducted in Selcuk University Department of Architecture, and studio 7 design

studio with a cluster of twenty students in the academic year 2013-2014, spring semester. In the phase of theoretical narrating lecture and collecting data about problem; teacher oriented, discussion-debate, sample case methods were applied in formal education (8 hours a week) and class environment. During the creativeness part of design education, “metaphor” technique has been tried. In the first days of the study, information about metaphors was given to the student. Firstly metaphor designs and photographs of previously made contemporary architectural samples were shown related with the semester’s subject of design. Students were requested to be inspired from these examples for their new designs. Firstly every student researched an architecture who design based on metaphors and made his/her poster.

Fig. 3. Student's poster 3

It is seen that contemporary prominent architects especially Libeskind, Calatrava, Zaha Hadid, Correa and Holl abstain from direct Analogy and use narratives, memories, historical events, characteristics related to project subjects or site or natural structures as metaphors. It is seen that these architects reach generally multi-layered, sophisticated, effective meanings by constantly making mental shifts between the verbal and the visual metaphors. The significance of this meaning in relation to this article's argument is that it has a very remarkable architectural identity (Ayıran, 2012). According to Fernandez (1974), metaphors play a major role in identity formation. Creative or generative metaphors

enrich a certain cultural environment by adding new meanings (Tucker, 1994). After that each student designed his or her own shopping center project that based on metaphor in Konya city. In the following Table 1 there are some shopping center projects that based on metaphors.

#### 4. Assessment and Conclusion

The main purpose of architecture is to design unique architectural environments and consequently generate effective architectural identities which broaden the feelings, thoughts and imagination of human beings; in short, their experiential realm. Metaphor is seen as a very valuable tool for the designers who needs both rational thought and imagination at the same time and seeks a unique situation, in this sense, a new reality which has never been experienced before. In this study we can say, metaphoric technique is idea generator in creating new designs. So this study was intended for students to gain a way of an architect's eye vision. Successful student works were created by using the

metaphor technique. In spite of success of this technique, it is seen that the “metaphor technique” should be used conceptual metaphoric design because it is more successful than formal metaphoric design.

Since Aristotle a large number of philosophers and researchers indicate the positive role played by metaphors on creativity, primarily in art; subsequently, in science and other disciplines. The significant role of metaphors in the formation of architectural identity has been realized and applied by architects since Vitruvius. When architects implemented this tool, they created architectural works which have indelible reflections on human mind. It is seen that many architects have generated new images by triggering their imagination by overlapping two or more discrete images in their minds through homospatial thinking, particularly related to properties of a project topic or site area. Prominent architects such as Wright, Taut, Le Corbusier, Tatlin, Fuller, Cansever, Correa, Calatrava, Holl and Libeskind have been able to generate multilayered, sophisticated and significant meanings through this approach (Ayıran, 2012). As a result we can use this approach for new architectural designs.

## Abstract

The purposes of research were to study and compare the factors affecting to selected study digital art program Humanities and Social Science Faculty Loei Rajabhat University's students Loei Province, Thailand to be sort out of sex, age, education level homeland and family salary. This is quantitative research and the target were group 59 digital art program students academic year 2013. The questionnaires have reliability situations .93. Collected data quantitative research were analyzed and statistic used percentages, mean scores and standard deviations. The statistics used in statistical hypothesis testing. The Wilcoxon Signed Ranks test and Kruskal-Wallis's test. There is significant difference ( $p < .05$ )

The research findings:

1. The factors affecting to selected study digital art program the Faculty of Humanities and Social Science Loei Rajabhat University's students were high rank follow: student and parent value, teacher, curriculum, environment, material and instruction media, bursary, organization image and financed student loans.

2. Compare the factors affecting to selected study digital art program the Faculty of Humanities and Social Science Loei Rajabhat University's students to be sort out of sex, age, education level, homeland and family salary.

2.1 None significant as a whole of the effective factors to selected study digital art program male and female, and family. Found significant level .05 of financed student loans.

2.2 None significant as a whole of the factors affecting to selected study digital art program difference age. Found significant level .05 of environment material and instruction media, teacher and bursary.

2.3 None significant as a whole of the factors affecting to selected study digital art program difference education level. Found significant level .05 of environment material and instruction media and teacher.

2.4 None significant as a whole of the factors affecting to select study digital art program difference homeland and family salary.

## INTRODUCTION

Today we all have high completion in every part of the world. Especially in the education such as in 2012 by Thailand Newspaper show downward of Thailand Education that we changed 3 ministers of Department of Education in past 1 year in 2012. [1] Pearson Company present their research for 52 papers in to main object 1 Balance the international education 2 Compare the international education. And Thailand is in the 37<sup>th</sup> [2]

Thailand government rule the education project in the government development project form support technology for higher education In 2000 the digital become technology a part of our lift, for example the mobile phone, notebook computer, tablet, GPRS and etc. And we are in the Globalization mean that everyone in the world can connect each other by using digital technology.[3]

Loei Rajabhat University is the only one University in the province that open Digital Art subject since 2008. For past 6 year Digital Art section increase more students every year. Because we improve and develop our course in efficiency by these following: 1) knowledge of Digital Art technology to create a new invention, 2) skill to improve and manage Digital Art technology, 3) positive Attitude in Digital Art technology design by used to develop in local society, 4) moral principle, honest and responsibility in Digital Art career and 5) consciousness and be apart to support and promote Thailand Art Culture.

The result that become Digital Art more popular in present day by the reason from the teenager' s behavior and technology. In the past the Art mostly doing by hand that cause a lot of problems but the Digital technology is the solution for many port in the new modern Art. Then fore, I am the teacher of Digital Art section have been study and research form vary institutes and research to make a research of The factors affecting to selected study digital art program.

Humanities and Social Science the Faculty of Loei Rajabhat University in 8 fields, image of institute, course, media and equipment, teacher, values, scholarship, financial aids and circumstances. Forget the new information to continue development the courses and students.

## MATERIALS AND METHODS

2.1 Scope of the study with respect to their 8 detail of factors affecting to selected study digital art program Humanities and Social Science Faculty Loei Rajabhat University's students. The data gathering through the use of a questionnaire. Data gathering are analysis through the use of the following statistical tools: frequency count and percentage, mean scores and standard deviations. The statistics used in statistical hypothesis testing The Wilcoxon Signed Ranks test and Kruskal-Wallis's test. The target group of this study 59 digital art program students in Department of Humanities Loei Rajabhat University.

2.2 The questionnaire try out for 30 students visual art program have reliability situations .93. Part 1 Personal factors of the respondents. Gathering information relative to the part 1 and part 2 the factors affecting to selected study digital art program Humanities and Social Science Faculty Loei Rajabhat University's students. Likewise, to measure the level of rating scale. The researcher set the scale arbitrarily. Boonchom Srisaard.[4]

2.3 Data Gathering Procedure. There data were gathering procedure; 1) The research went to participation of students digital art program activities. 2) Observation of in-depth interview. 3) Data gathering are doing personal by the researcher who utilize a questionnaire for the purpose and 4) After the questionnaires are collect, the researcher tally and tabulate the results. All data in the tables are primarily taking from the questionnaire.

## RESULTS AND DISCUSSION

Table 1 Summary mean rate of the factors affecting to selected study digital art program Humanities and Social Science Faculty Loei Rajabhat University's students.

## CONCLUSIONS

1) University should provide sufficient support in the creation of the modern library and the knowledge more suitable as a source of support and development budget personnel to go to study teacher training program of computer modern. To be used in the development of teaching and applied in educational service to the local community school.

2) The cost of borrowing the research results at the lowest level. The university should have more funding sources, both in the government and enterprises. Capital of education for students with the best or education in master to send for school related to the knowledge back development of the University.

3) Should encourage the education guidance and relations to allow access to parents of students by may have introduced educational institutions in higher education when meeting the rule.

4) Add advertisement in place, parents of students have seen frequently. Government agencies or village school far away city promotion of students and teachers in Digital Art. To participate in the local development and the promotion of social activities of the Institute of online students and parents

5) Administrators or those involved with the Loei should recognize the benefits and importance by training teachers and students to get the knowledge about the related programming techniques. In order to suit the instruction Should promote budget procurement of modern media and sufficiency requirements with appropriately.

#### ACKNOWLEDGEMENTS

The research support has been favorable by the following: Prof. Dr. Choetkiat Kunlabut Dean, The research support has been favorable by the following: Assistant Sarnid Lauobudnark President, Dr.Maturod Charamart Vice President Research, Assistant Dr.Pornsawan Suwannarsree. All specialized research; Asst. Prof. Dr. kalaya Yotcamlue and Dr.Jurairat Ardkaw for her direction in the conduct of the study, improvement of the manuscript and statistician. Digital art program Students of Loei Rajabhat University for being very supportive in try out the questionnaire and being very supportive in accomplishing the questionnaire. All manpower team researchers, digital art program students and my family moral supportive for my research success.

## Abstract

The major aim of this study is to identify the differences between the schools, one of which had implemented a Comenius Project and the other not, depending on the views of teachers. It also aims at determining the extent to which school administrators have collaborative leadership characteristics depending on stated school features. The study is a qualitative research. The data were collected through interviews and analysed with the descriptive statistical technique. The findings showed that each school has different school features and school administrators in the school involved in project have much more collaborative characteristics.

## 1.Introduction

The Comenius Program is a European Union educational project. It concerns school-level education, and is part of the EU's Lifelong Learning Program 2007–2013. Its major aim is to assist both students and educational staff in having a better understanding of the range of European cultures, languages and values. Turkey is part of the program and the projects carried out under the program in Turkey are being implemented through the EU loans allocated to the Ministry of EU. In addition, the Ministry of National Education reinforces and supports schools which are planning to engage in Comenius projects or which have implementing such projects.

It is needed to be in a different organization in order to have and implement a Comenius project. School administrators, teachers and students collaboratively work and spend extra time to achieve project's goals beyond the rutin school running. During the project process a lot of group studies are carried out for planning, decision-making, problem-solving and other activities related to project. Such project activities which are required extra and voluntary attempts make the school energetic and are realized through collaborative work by the participants. Therefore, implementing a Comenius project is mainly successful experience and it is worth examining what features lead to a school for success. In addition, this kind of project can also be considered as in connected to the leadership characteristics of school administrators. Collaborative leadership supports and facilitates collaborative work which requires the participation of different groups and/or people in different status in schools. However, not only leadership but also school culture should be expected to be “collaborative” for success of the activities.

### 1.1 Concept of School Culture and Collaborative School Culture

It can be argued that both culture and its elements are the products of human's life experience and of the interactions

---

\* Corresponding author : Berrin BURGAZ. Tel.: +90532 424 7408  
E-mail address: burgaz@hacettepe.edu.tr

among people. Then these cultural products become behavioral codes guiding people's thinking ways and actions (Çetin, 2004) or cognitive programming that differentiate a group of people from other groups (Hofstede, 1980). In other words, cultural products are the reasons for or determinants of intuitions, ideas, values, emotions, attitudes and acts guiding groups of people and shaping people's life. It is asserted that both content and quality of culture also change when interactions among people change.

This social fact is also observed in the organizations. Schools which are among social organizations have been studied in terms of their culture. The concept of school culture was first used by Waller (cited in Schoen & Teddlie, 2008). Waller argued that schools have their own unique identity resulting from folkways, mores, sanctions and moral codes and that it guides relationships within schools. The concept of school culture began to be studied again when the concept of organizational culture became popular in the 1980s. Although there was no commonly agreed definition of the concept during this period some definitions became known. For instance, Deal and Peterson describes school culture as

“Culture influences everything that goes on in schools: how staff dress, what they talk about, their willingness to change, the practice of instruction, and the emphasis given student and faculty learning” (1998, p.28)

As stated in the definition above non-written rules, norms, expectations and traditions influence the functioning of schools. More importantly, school culture fills the gaps in formal school rules and functioning and therefore, affects people in schools and the functioning of schools. In other words, school culture has significant effects on school organization. Each school has its own culture. Those schools with collaborative culture provides teachers with opportunities to realize their energy, creative thinking, efficiency and attempts (Kohm & Nance, 2009). It is further argued that such schools increase professional solidarity among teachers, leading to having effective outcomes (Rubin, 2009). Basic characteristics of schools with collaborative culture include solving complex problems, professional networks to exchange information, taking much more risks and making experiments, having a rich technical language shared by educators in school, higher levels of organizational commitment and job satisfaction and continuous and comprehensive attempts to improve school (Fullan & Hargreaves, 1991). Collaborative school culture is based on “collaborative” thinking which is a prerequisite of democracy (Rubin, 2009) and is not suitable for hierarchical leadership models (Bowman, 2003). Collaborative school culture necessitates “collaborative leadership” to survive its entity.

### *1.2 Collaborative Leadership*

Collaborative leadership refers to collaborative relationships between school administrators and school staff and others in school (Gruenert & Valentine, 1998). It is shared by the school administrator, teachers and others, and focuses on schoolwide activities to improve school. It requires the use and adoption of administrative processes that gives authority to both staff and students, encourages active participation in decision-making process, and supports shared accountability for student learning (Hallinger & Heck, 2010). Gruenert and Valentine (1998) list the common characteristics of collaborative leaders as follows:

- 1) Leaders value teachers' ideas
- 2) Leaders trust the professional judgments of teachers
- 3) Leaders take time to praise teachers that perform well
- 4) Leaders engage teachers in decision-making process
- 5) Leaders facilitate teachers working together
- 6) Leaders inform teachers on current issues in the school
- 7) Leaders believe that teachers' involvement in policy making is serious
- 8) Leaders reward teachers for their experimenting with new ideas and techniques
- 9) Leaders support risk-taking and innovation in teaching
- 10) Leaders protect instruction
- 11) Leaders encouraged teachers to share ideas

Characteristics of collaborative leadership are desired ones for people to lead to collaborative activities in schools. For instance, the Comeinus projects carried out by joint efforts by school administrators, teachers and students are examples of such activities. For any project to be successful effective and continuous activities by stakeholders are

needed (Hammick, Freeth, Copperman & Goodsmith, 2009). Therefore the study which finds out whether or not any Comenius project school's organisational features stem from the characteristics of collaborative leadership may contribute to explain the relation between them.

Based on this basic aim the present study tries to answer the following two major research questions:

- 1) What are the school features of the schools which involved and did not involve in a Comenius project in terms of a) administrative activities, b) teaching-learning activities, c) social and cultural activities and d) school-parents cooperation, and do such characteristics vary between two groups of schools?
- 2) Do the school features indicate that the school administrators have the characteristics of collaborative leadership?

## 2. Method

The study was designed and carried out as a qualitative case study.

### 2.1 Participants

The participants of the study are primary school teachers working at four different schools in Zonguldak province during the academic year of 2012-2013. Two schools implemented the Comenius projects, and the other two schools did not have any such project. Total number of the participants is eight, two from each school. Since mostly English language teachers are active in the Comenius Projects, one of two teachers from each school in the study was chosen from them. Therefore, the critical case sampling which part of the purposive sampling techniques was employed in the study.

The data of the study were collected through interviews with the teachers sampled. Then the interviews were transcribed and coded for data analysis. These codes also used in the tables used for the presentation of findings. The schools sampled were coded with the letters as A, B, C and D and teachers were coded with T. The characteristics of teachers are given in Table 1.

**Table 1.** Participants of the study

Schools	Type of schools	Code of participants	Teaching field	Experience	Gender	Educational background
Project schools	Primary school (A)	A.T1	English language	9	E	Undergraduate
		A.T2	Turkish language	14	K	Undergraduate
	Primary school (B)	B.T1	English language	6	E	Undergraduate
		B.T2	Mathematics	4	E	Undergraduate
Non project schools	Primary school (C)	C.T1	English language	5	K	Undergraduate
		C.T2	Classroom teaching	20	E	Undergraduate
	Primary school (D)	D.T1	English language	7	K	Undergraduate
		D.T2	Physical education	8	E	Undergraduate

### 2.2 Data collection

As stated earlier the data of the study were gathered through semi-structured interviews which are among qualitative research techniques. The interviewing technique provides the researcher with the opportunity to ask the participants both major questions and related secondary questions to express their views about a specific subject (Türnüklü, 2000). In order to develop the interview questions a literature review was done to identify the basic processes of school functioning. The questions developed were categorized based on the related process. They were also simplified to facilitate the understanding of teachers. The interview forms were reviewed by three faculty members and some secondary questions were added. In the final form there are four major questions in regard to four main processes and there are 18 secondary questions.

In order to test the understandability and content of questions a pilot study was carried out on a sample of four teachers from four schools (again, two project schools and two non project schools) in Zonguldak. The findings of the pilot study indicated that the interview form is convenient to use in the study. The interviews were carried out between 1-30 April 2013. The minimum and maximum duration of the interviews were 50 minutes and 95 minutes, respectively. All interviews were made in a quiet room in the schools where the participants were working.

### 2.3 Data analysis

The data obtained were analysed through descriptive statistical techniques and related information was recorded for each question. In the descriptive analysis two steps were followed (Yıldırım & Şimşek, 2013). The first step is to develop a framework for descriptive analysis. In this step the framework was developed including a) administrative activities, b) teaching-learning activities, c) social and cultural activities and d) school-parents cooperation. The second step is to process the data based on the framework developed. In this second step data were categorized based on the major themes given above.

### 3. Findings

This section presents the findings of the study obtained concerning school features, and the relationship between these features and the characteristics of collaborative leadership.

#### 3.1 Teachers' views about administrative activities

The views of the teachers about administrative activities working at project schools and non-project schools were collected through the questions given below:

- a) You or your colleagues have a new idea which you or the others believe that it will be useful to your school. How your administrators behave or react when you or others explain the idea at that time?
- b) Do school administrators support your participation in school-related decision-making processes?
- c) Except for formal meetings and your official duties can you talk to the school administrator?
- d) How do your administrators react when you ask permission for personal reasons or you tell about your private problem?
- e) Do school administrator participate in the meetings of commission or committee which are in the responsibility of teachers in school. Do they have any interest in such meetings?
- f) What are the reactions of school administrator when you express your ideas about the current functioning of school which can be useful for the school itself or students?

Table 2 presents the school features and the characteristics of collaborative leadership depending on teacher views related to the questions above. The responses of teachers were grouped under six sub-themes and it is found that there are some differences in their views.

**Table 2.** School features and collaborative leadership characteristics based on teacher views about administrative activities

Themes	Views of teachers in project schools	Views of teachers in non project schools	Evaluation in terms of collaborative leadership
Support for new ideas/Openness	<ul style="list-style-type: none"> <li>*Initiative</li> <li>*Practices out of regularities</li> <li>*Safe environment</li> <li>*Equipment support</li> <li>*Attempts to overcome barriers</li> <li>*Being open to new ideas</li> </ul>	<ul style="list-style-type: none"> <li>*Very limited support</li> <li>*Strict use of regularities</li> <li>*Less motivation</li> <li>*Not being able to finalize activities</li> <li>*No interest and avoidance</li> <li>*Getting anxious about potential problem</li> </ul>	<p><b>*Project schools</b></p> <p>In these schools administrators exhibit the following characteristics; valuing teacher views, trust in teacher judgements and making possible for teachers to take part in decision making process, facilitating the common work of teachers, and encouraging teachers to share their ideas.</p>
Participation in decision-making process	<ul style="list-style-type: none"> <li>*Continuous dialogue</li> <li>*Constructive and friendly setting</li> <li>*Take care of common decision making process</li> <li>*Variety in topics to be decided</li> <li>*Exchange of views in informal settings</li> <li>*Flexible exchange of ideas</li> </ul>	<ul style="list-style-type: none"> <li>*Rare exchange of ideas</li> <li>*Only notification of decisions</li> <li>*Limited participation in the decision making process about themselves</li> <li>*Strict use of regularities</li> </ul>	
Informal relations	<ul style="list-style-type: none"> <li>*Good relations with everybody</li> </ul>	<ul style="list-style-type: none"> <li>*Limited conversations about school</li> </ul>	

	*Openness to dialogue *Positive dialogue setting	*Short conversations	<b>*Non project schools</b>  In these schools administrators do not exhibit any characteristics of collaborative leadership concerning administrative activities.
Sensitivity to personal problems and ideas	*Continuous support and understanding *Sensitivity to permissions (related to professional development activities, graduate studies and health issues)	*Support under regulations *Asking for excuses for permissions	
Interest in teacher activities	*Participation with enthusiasm *Frequent participation *Conveying the ideas openly and positively and not intervention *Also participation of vice principals	*Participation to only some meetings *Mostly participation of vice principals *Mostly talk of principals	
Interest in teacher views about school activities	*Taking into consideration *Realization when possible *Easy expression of ideas	*Taking into consideration *Realization of ideas which require low levels of financial support	

### 3.2 Teacher views about teaching-learning activities

The views of the teachers about teaching-learning activities working at project schools and non-project schools were collected through the questions given below:

1. Do you assign your students collaborative research projects? Do you allow your students to share the findings of these projects in your classroom? What is the attitude or reaction of school administrators to these activities?

2. Do you use various sources for your courses other than textbooks and other supplementary sources recommended by the Ministry of National Education (MONE)? What is the reaction of school administrators to these activities?

3. Do you have professional cooperation with your colleagues who some of which are in your field and the others not? What is the attitude or reaction of school administrators to these activities?

4. Do you regularly observe and follow and evaluate your students? Do you inform them about their incomplete knowledge revealed by your evaluation? Do you take steps to overcome these? How? What is the attitude of school administrators to these activities?

5. Do you use new ways of teaching and try them in your teaching activities? What is the attitude or reaction of school administrators to these activities?

Table 3 presents the teacher responses to the questions above in relation to the features of schools and characteristics of collaborative leadership. The responses of teachers about teaching-learning activities were grouped under five sub themes and it is found that there are some differences in their views.

**Table 3.** School features and collaborative leadership characteristics based on teacher views about teaching learning activities

Themes	Views of teachers in project schools	Views of teachers in non project schools	Evaluation in terms of collaborative leadership
Making students do the projects in cooperation	*Frequently *Continuous attempts *Rewarding the best *Sharing with class *Administrators' support	*Rare (once a year) *Not project but assignment *Limited sharing with class *No administrators' support	<b>*Project schools</b> In these schools administrators exhibit the following characteristics; taking risks and supporting taking risks, and trusting in teachers' professional judgements, facilitating joint teacher work, informing teachers about new practices, supporting to share ideas and new activities.
Using various and different sources	*Using various sources (not advised by MONE) *Support by both administrators and parents	*Using various sources (not advised by MONE) *Support by both administrators and parents	
Professional cooperation among teachers and support for professional development	*Continuous cooperation *Extensive exchange of ideas *Support in professional problems *Proper setting created by administrators and support by them for professional development	*Rare guiding *Weak professional solidarity *Indifferent administrators to professional development	

Identifying the students' incomplete knowledge-base/sharing it with them and taking steps to improve it	<ul style="list-style-type: none"> <li>*Continuous evaluation of student achievement (careful and systematical follow-up)</li> <li>*Identification of incomplete knowledge-base</li> <li>*Recognition of self-defiancy (self-motivation/how can I teach?)</li> <li>*Taking personal steps for students (individualized teaching and assignments)</li> <li>*Relecturing on incomplete topics</li> <li>*Assigning projects and presentations</li> <li>*Reviewing exam papers</li> <li>*Special attention and support by administrators</li> </ul>	<ul style="list-style-type: none"> <li>*Summative evaluations based on examinations instead of continous and time-consuming evaluations</li> <li>*Being informed to inform school supervisors</li> <li>*Interest in student achievement since it is obligatory</li> <li>*Not taking special steps to improve student achievement</li> <li>*Additional assignments for unsuccessful students</li> <li>*Responding students' questions only during recess</li> <li>*More exercises</li> <li>*Interest by school administrators to inform school supervisors</li> </ul>	<p><b>*Non-project schools</b></p> <p>In this regard the school administrators only take into account the teacher views about using various sources.</p>
Taking risks over teaching/ trying new activities	<ul style="list-style-type: none"> <li>*High levels of interest in teaching-learning activities</li> <li>*Eagerness to have additional education on professional development</li> <li>*Openness to new activities</li> <li>*Encouragement and support of administrators (for additional education, being informed about new approaches)</li> </ul>	<ul style="list-style-type: none"> <li>*Limited learning about new activities</li> <li>*Involunteerness to try new ways</li> <li>*Limited administrator support</li> </ul>	

### 3.3 Teacher views about social and cultural activities

The views of the teachers about social and cultural activities working at project schools and non-project schools were collected through the questions given below.

1. Is there any school or class newspaper or bulletin in your school? What is the attitude or reaction of school administrators to these activities?

2. Is there any active drama group in your school? What is the attitude of school administrators to these activities?

3. Is there any competition of sports or a poetry reading and quiz competition or in other fields? What is the attitude of school administrators to these activities?

4. Is there any school or social trip that school administrators, teachers, parents and students take part in? What is the reaction of school administrators to these activities?

5. Do you have opportunity to come together with your administrators outside of school? What is the attitude of school administrators to these activities?

6. Do administrators and teachers regularly generate a fund among them to spend for certain common objectives (i.e. for any social activity, for poor people, educational grant for some students, etc.)? What is the reaction of school administrators to these activities?

Table 4 presents the teacher responses to the questions above in relation to the features of schools and characteristics of collaborative leadership. The responses of teachers about teaching-learning activities were grouped under six sub themes and it is found that there are no difference in their views.

Table 4. School features and collaborative leadership characteristics based on teacher views about social and cultural activities

### 3.4 Teacher views about school-parents cooperation

The views of the teachers about school-parents activities working at project schools and non-project schools were collected through the questions given below.

1. Do parents regularly participate in school meetings? What is the attitude of school administrators to these activities?
2. Do parents come school to be informed about their children excepting official school-parent meetings? What is the reaction of school administrators to these activities?
3. What is the level of interest of parents to social-cultural activities in school? Do you invite them to participate in these activities? What is the attitude of school administrators to these activities?
4. Is there any cooperative activities with parents? Do you have any cooperation with parents? What is the reaction of school administrators to these activities?

Table 5 presents the teacher responses to the questions above in relation to the features of schools and characteristics of collaborative leadership. The responses of teachers about school-parents activities were grouped under five sub-themes and it is found that there are some differences in their views.

Table 5. School and collaborative leadership characteristics based on teacher views about school-parents cooperation

Themes	Views of teachers in project schools	Views of teachers in non project schools	Evaluation in terms of collaborative leadership
Participation in parent meetings	<ul style="list-style-type: none"> <li>*Higher levels of participation</li> <li>*Good communication</li> <li>*Sharing problems or solutions between administrators and teachers</li> </ul>	<ul style="list-style-type: none"> <li>*Lower levels of participation</li> <li>*Infrequent participation</li> <li>*Parental concerns about asking for financial support</li> <li>*Controlled by administrators</li> </ul>	<p><b>*Project schools</b> The school administrators exhibit the following characteristics: trusting in teachers' professional judgements and facilitating common teacher work.</p>
Meeting with parents other than in meetings	<ul style="list-style-type: none"> <li>*Higher levels of parental sensitivity</li> <li>*Frequently</li> <li>*Telephone calls</li> <li>*Administrators are pleased with</li> </ul>	<ul style="list-style-type: none"> <li>*The same parents participate</li> <li>*Infrequent</li> <li>*Near to the end of semester</li> <li>*No reaction by administrators, no</li> </ul>

Common activities	*Avoiding non attendance by students *Social activities *Support by administrators	*Kermesses *Support by administrators	

#### 4. Discussion and Conclusion

The activities carried out by organizations are among the distinctive features of organizations (Aydın, 1994). The way they carry out activities can also be taken into consideration. It may further provides information about characteristics of centralised organizations.

The present study analysed school features through teacher views and highlighted the functioning of schools asking how. The findings about project schools show that the school administrators have higher levels of participation and interest in activities. In addition such schools are found to have the following features: provision of proper setting, continous cooperation and support, support for professional development, constructive professional solidarity, careful and systematical follow-up and support for students, openness to new practices, positive school-community relationships, common and shared decision-making process, higher levels of interest in activities by school administrators, teachers and parents. The findings about non-project schools revealed that these schools have the following features: lower levels of interest and participation by school administrators in activities, activities limited to regularities, weak communication and cooperation, weak professional solidarity, interest in student achievement due to its being obligatory, cautious approach towards new practices, decision-making based on authority, and weak school-community relationships.

It is seen that project schools exhibit much more desired features. It can be argued that project schools are much more eligible for the features that are pertinent to common activities such as problem-solving, sharing of experience, efficient and continous attempts (Hammick et. al., 2009), eagerness to achieve, working with others, and consecutive and simultaneous activities (Morrison & Arthur, 2013). Therefore, the administrators of the schools which are planning to be involved in project-type activities can review the schools in terms of such features.

In terms of collaborative leadership characteristics the findings are similar. School administrators of project schools are found to have more collaborative leadership characteristics. More specifically, they exhibited eight of eleven such characteristics proposed by Gruenert & Valentine (1998). The collaborative leadership characteristics that were not found in the sample are as follows: "Leaders take time to praise teachers that perform well", "Leaders inform teachers on current issues in the school", "Leaders reward teachers for their experimenting with new ideas and techniques". In non-project schools it is found that school administrators exhibit the collaborative characteristics of "Leaders value teachers' ideas" and "Leaders facilitate teachers working together". The main result of the study is that schools must have certain characteristics that are required to plan and implement projects such as the Comenius Projects which requires continous, systematical, time-consuming common work and school administrators should have collaborative leadership characteristics.

# The Finland of poetry revisited four snapshots

Matti Itkonen\*

*University of Jyväskylä, Department of Teacher Education  
PO Box 35, FI-40014 University of Jyväskylä*

---

## Abstract

A poem is a condensation of signs and a method characteristic of every human being for investigating a shared reality. Accordingly, a human being also lives and exists poetically in this common world. This being so, the primacy of the mother tongue refers to the lived language, which mediates the possibility for us of carving out our own unique imprint on existence. Similarly, the native land signifies a milieu where a human being takes on a reality amidst other objects, surrounded by them and as one of them. Poetry creates harmony between past and present.

## 1. Motto

"Our home area, the place in this land which our being is tied to with unbreakable roots, the sphere of being for our childhood and youth, the eternal dwelling place of our heart, the most beautiful and precious on earth, beautiful even in its ruggedness, and all the more beautiful for its ruggedness, and the object of our longing if we have left it, – it is the natural circle of our life outside of which we always somehow feel cut adrift from life." (Hollo, 1931.)

## 2. To Begin With

Poetry does not simply mean melodiousness and rhythm. If lyric poetry means that a person expresses their worldly pain through song accompanied on a lyre, then poetry denotes something entirely different. Poetry is every person's individual way of looking at a world that is communally shared. The aspect of uniqueness is also essential: moments do not return as such, and nobody experiences any situation twice in exactly the same way. In poetry a person carves out their own mark in the centre of a common reality with an outline already formed long ago. This is precisely why the landscape of one's home feels so precious. It is the archetype of all other landscapes, which are merely reflections of it. The home radiates its warm glow all the days of a human life. It puts the humanity into humanity.

## 3. Poem

### 3.1. *A glimpse from afar: Yrjö Kokko*

The same thing can be described in reality through several different narratives. To the tellers of these tales, each in their own age, the tales are equally true. The essential point here is the view of culture as a tallying of what has gone before. Perhaps it can be seen as the idea of some kind of collective settlement, a national reckoning. Yrjö Kokko pondered this same question in post-war Finland. His thoughts were published in a fine travel book, *The Islands of Good Will*, which appeared in 1953 during the period of reconstruction. Kokko takes a look at his native land from far away, the Canary Isles, and writes in the following touching way: "Is one's native land then a period when a person is born, where he has grown up, and which will die along with him? Perhaps your native land is just the earth and soil where you were born, the local area which, compared to infinity, is no bigger than the grave where you will be buried when you die. But isn't your native land the people who speak your language, the people you have shared joys and sorrows with, common destinies? But, as we know, the generations depart. New generations do not think or feel in the same way. Opinions change just as circumstances do. When our own generation dies, does our own nation also die then?" (Kokko, 1953.)

In addition to the nation's shared settling of accounts, there is also another individual and very personal view opening up on the past. A private person can also go to an existential confession and try to clothe his own yesteryears in some kind of self-comprehending linguistic garb.

### 3.2. *Aleksis Kivi: a full-length portrait*

At the end of Jari Halonen's film *The Life of Aleksis Kivi* (2001), the writer Kivi climbs up high onto a hill, almost a mountain, a kind of metaphysical point: from there it is possible to look into the far distance, into the remotest past and into the shimmering future, lying at the furthest extreme. The time has come to weigh up the old and the new, as well as that which is here and now.

From where he stands on high Kivi sees the sparkling waters and the forests glowing in their summer green. High above all this there stretches the vault of the eternal blue sky. The words of his poem "Suomenmaa" (1878) ring in our ears:

"A land of hills and valleys,  
What are you, my beauty?  
Your glow of summer days,  
Your lustre of northern fires,  
This delight of winter, summer,  
What is this lovely land? [...]"  
(SR 1, 1990.)

The full-length portrait is nearing completion. Why can a particular place or landscape feel so close that even the thought of losing it hurts? Is the place beautiful in itself or is it the feeling, the loving of it, that gives it beauty? One

answer to this can be found in the work quoted in the motto above, *Self-education and the Skill of Living*. It was written by Juho Hollo, philosopher and professor of adult education. His ideas continue to stir the heart: "We like beauty, it pleases us, fills our being with a powerful sense of inner bliss. Is beauty perhaps created by love? Or is beauty the subject and cause of our love? Or is it mostly a matter of love creating beauty and beauty inspiring love?" (Hollo, 1931.)

In order to describe, we need our own mother tongue, its expressive power and resilience. Otherwise the words are mute – lacking the immediacy of lived truth.

### 3.3. Kersti Bergroth: memory and longing

Kersti Bergroth writes the following poem, *Beloved City*, in her collection of the same name<sup>1</sup>:

"Karelians! Hail to you,  
To you that have strayed westwards!  
In your hearts you carry an image  
That will be forgotten only in death.  
Perhaps a far-off lake,  
A cottage and close by a sauna.  
Perhaps the dark stripe of the Vuoksi river  
Bringing to mind that eternal yearning.  
Perhaps what is dearest to you  
Is a street in the old city,  
Perhaps the park of our Torkkeli,  
An aching memory of the castle.

How long in this world  
Will these pictures exist?  
The dear country of our memories  
Will disappear when we die.

But there are still some of us here  
A few who know,  
How everything looked then:  
The old ramparts on a spring evening,  
The colourful yawls in autumn,  
The annual market at Punalähde,  
The winter snows, the summer rains,  
Hundreds of places vanished."  
(Bergroth, 1951.)

---

<sup>1</sup>The Winter War was fought between Finland and the Soviet Union. It began on 30.11.1939 and ended 13.4.1940. For Finland, it was a defensive war. Finland lost the war and, in accordance with the terms of the Moscow Peace Treaty, had to surrender 12% of its surface area to the Soviet Union. This involved the loss of, for example, the Karelian isthmus and parts of Karelia surrounding Lake Ladoga, as well as the three largest cities in these areas: Vyborg, Sortavala and Käkisalme.

With the surrender of territory, 12% of the population, i.e., over 400,000 people, lost their home. Accommodation was found for them elsewhere in Finland. The ceded areas were evacuated and the Karelians called evacuees. There was born a home-sickness, lasting across generations, for the Karelia that was lost.

Vyborg was granted municipal rights in 1403. Before the outbreak of the Winter War Vyborg was Finland's second largest city, with a population of over 80,000 in 1939. Vyborg was also a cosmopolitan and multilingual city where Russian, Swedish and German were spoken alongside Finnish. Places of note in the city include Torkkeli Park, Torkkeli Street, Monrepos Park and Punalähde Square. The city's important buildings are Vyborg

Castle, the Round Tower and the functionalist library designed by Alvar Aalto.

Vuoksi is an outlet of the Vuoksi lake and river system running from Lake Saimaa into Lake Ladoga. Its total length is 156 kilometres. In its upper reaches there are huge rapids, for example, the Imatrankoski rapids.

INTE 2014

The Karelia that was lost lives on in people's minds as a longing that crosses the generation gap. It will not disappear even though the number of those who remember has indeed diminished. The story, however, is not interrupted: the tale is told and passed on from one generation to another. And of course there are photographs and written fiction. Bergroth's use of language in her novel about the activities of the Lotta-Svärd organization, *The Diary of a Young Defence Volunteer*, moves us<sup>2</sup>: "These days we are all thinking about Vyborg. We've begun to understand that perhaps the time has come to leave Vyborg. [...] Vyborg, my home city. To me, you are almost like a living being. [...] Nobody who has lived in Vyborg can imagine anything so crushingly sweet as spring on the Vyborg ramparts. There I encounter all my wistful longings – longing for the sea, longing for my hopes, longing for Karelianness, longing for history. When you are young and walk on the Vyborg ramparts, the elation of the entire world fills your whole heart. [...] And Vyborg castle. It gives joy to the whole of Finland. Every heart holds the memory of its mysterious beauty. A thousand times, and a thousand times again, I have looked at it as if looking would give me strength. Are you to fall to strangers who cannot behold you properly because they have not loved you for such a long, long time. No love is truly moving at its very outset, only memories make love tender." (Bergroth, 1940.)

### 3.4. Arvi Kivimaa: a multidimensional perspective

As Arvi Kivimaa's song to Finland's beautiful young capital city rings out, we are hushed by his words and our hearts respond with tender feeling:

"You have the beauty of the sea,  
Its clarity, its freshness,  
You youthful Helsinki of ours!  
We, this tribe of this great Finland,  
We raised you through toil and deed  
Into our shield against Europe

Into the granite of your face  
We carved the yearning of this nation,  
Yet upon your open sea and in your trees  
Your murmuring song rings out,  
And across the centuries  
In them have rippled your memories.

You have the beauty of the sea  
And the love of winter, summer,  
Our youthful Helsinki!  
They are blissful who once enter  
Your sunlit life,  
Which we dream into greatness!"  
(Kivimaa, 1935.)

Kivimaa's splendid collection of poems *"Longing and Life"* reminds us of a multidimensional perspective, also examining the present moment through the eyes of the bygone. The observers change but the allure of Helsinki continues to captivate. It ceaselessly charms new generations of travellers. As long ago as 1914, V. A. Koskenniemi chose to include our capital city in his celebrated travel book *Cities of Poetry and Other Writings*<sup>3</sup>. The modern Finnish reader joyfully approves of the striking characterization of Helsinki made by this Turku poet and professor: "Is there any inhabitant of Helsinki who has not at some time experienced the stirring of poetic feelings towards his city, almost

<sup>2</sup>The Lotta Svärd was a voluntary national defence organization for women. It operated from 1920 until 1944. The volunteers initially worked in support of Civil Guard groups and later of all Finnish defence forces. The Finnish Lotta Heritage Association was founded in 1991.

<sup>3</sup>The Grand Duchy of Finland was an autonomous area of the Russian tsardom from 1809 to 1917. Finland became independent on 6.12.1917. Turku was Finland's first capital, although it retained this status for a rather short time: 1809–1812. In 1812 Helsinki became the capital of the Grand Duchy of Finland. In 1917 it then became the capital of independent Finland.

INTE 2014

like an intimation of what is to come. Returning from overseas, standing on the ship's deck on a clear autumn morning, with Helsinki's familiar white silhouette rising from the waves, girdled by forest, the roofs gleaming in the first frost, he finds this view compares with the most beautiful in the world, and, setting foot on Helsinki's soil and seeing Engel's colonnades unfolding before him, he has called his city all those names that home-sickness has uttered to him. He has called it the Athens of the North where Apollo, god of light, could take up residence, fleeing the laurel groves for the lands of the Hyperboreans." (Koskenniemi, 1914.)

#### 4. Postscript: Never-Ending Sunday

The poet Lauri Pohjanpää published his novel *Song of a Summer's Night* before the war, in 1937 before Finland was divided. The book contains a description of a summer's evening, of a radiant sunset at the height of summer. The moment the sphere of life sinks below the horizon is a moment of magic. Within it there exists something ceaselessly transient and eternally enduring. Pohjanpää's text comes across powerfully: "Sunset. Its glow still lights up the southern sky and tinges the clouds with a dark purple. Beneath them the blaze of a yellow streak, the beautiful red-brown gleam of the pine trunks, the golden shimmering of a far-off beach. The area around the channel lies in deep-blue shade, the rock at its mouth flashes a blue redishness. In the west the sky is a creamy yellow band of cloud, and above the blue-green crowns of the forests there lingers a languid lustre, as if exhausted from the day's radiance, as the sun sets in the north-west as if into a fire. All of these tints and hues are reiterated as pastel colours in the calm waters, with light streaks here and there like silver threads. The nuances change with every blink of the eye – there is no more sensitive a mirror than a lake, it is like the human soul. Into the glow of the sunset a rowing boat appears, with red and white sides, and from the boat a song is heard, – in the middle it is golden and yellow like the boat of the blessed on its way to the island of the blessed." (Pohjanpää, 1937.)

Fig. 1. Never-ending Sunday.

In myself I dimly glimpse the summer sunsets of my grandparents and parents. It's as if inside me I can hear the ringing of those summer bells and their peals travelling across the open lakes. Then it was a summer Sunday, a never-ending Sunday. Bustle and anguish were nowhere near. Serenity and peacefulness prevailed. My mind drifted back to those tranquil waters. They were days of reverie, brimming with happiness. They were also a counter to daily routine: timeless and unchangingly everlasting. Let the poem that follows be a tribute to the summers lived by three generations:

A man looks into a window pane,  
His gaze is met by that of a boy.  
One of them is the future that has gone  
and the other a past yet to come.  
The boy of summers, straw and copper,  
still building away at his days.  
The man of memories,  
the bitter-sweetness of his moments.

The reflection begins to retreat,  
melts into nothingness.  
The boy fades away,  
merges into the man.  
He is alone  
and full of the boy.  
Like back then,  
on the opening pages of being.

Translated by Glyn Hughes

## Abstract

The use of e-Portfolios over paper-based portfolio which provide a more effective means of information storage has become very popular nowadays. However, assessment indicators for e-Portfolios can vary according to a particular educational system. This also implies for the field of Technical Vocational Education Training (TVET). For TVET in Malaysia, students would undergo a technical competence certification called the Malaysian Skills Certification Malaysia (MSCM), established by the National Occupational Skill Standard (NOSS). This certification ensures that TVET students achieve certain competency standards in their area of specification upon graduation. These students are required to create paper-based portfolios to demonstrate their knowledge and competence level. The problem is that current studies show that paper-based portfolios are problematic and e-Portfolios have the potential to address this problem. Nevertheless, recent studies show that there is a lack of an e-Portfolio indicator for TVET. In an attempt to address this problem, the study aims to investigate the factors and indicators of e-Portfolio in accordance to the standards of MSCM. A modified Delphi study was conducted with a panel of 11 experts who are competent and experienced in the use of portfolio and ICT in TVET. The study consisted of three Delphi rounds. In the first round, 17 indicators of a TVET e-Portfolio were identified via the literature. These elements were categorized into four main groups: (i) the recognition of prior achievements, (ii) virtual learning space, (iii) competency assessment, and (iv) operating system. In the second and third rounds, the elements from each previous round were assessed by the expert panel until a consensus was achieved. These findings were then analyzed using mean analysis and inter quartile range. The analysis indicated that the 17 indicators identified were important in assessment of TVET graduates. The new indicator for MSCM could be used to measure whether TVET students have achieved the level of knowledge and competency required by NOSS in order to be competent for the workplace.

## 1.Introduction

Electronic Portfolios or “e-Portfolios” are a collection of artifacts in the form of digital, interactive, systematic way to monitor students' knowledge and easier to use in publishing information on-line (Bullock & Hawk 2005; Handa et al. 2011; Kilbane & Milman 2005; Young & Morris 2007). It can be used to store information in digital form and can be

accessed regardless of place and time (DiMarco 2006; Ku & Chang 2011; Montgomery & Wiley 2008; Stefani et al., 2007). Halstead & Sutherland (2006) explained the benefits of converting portfolios electronically, which are: (i) the work of many students now are in electronic form, (ii) most of the students have access to the Web, and (iii) database available through the Web allows students to store information more easily.

To date, current studies suggest that e-Portfolios seems to work only as a repository of artifacts without connecting to the actual learning process (Ku & Chang 2011). As a result, although e-Portfolios are aimed in providing to assist learners through the use of technology, but the actual aims of e-Portfolios are not achieved. Zeichner and Wray (2001) describes seven questions in the development of e-Portfolios: (i) The purpose of the e-Portfolios?; (ii) Who makes the decisions? What should be included in the e-Portfolios?; (iii) How is the evidence in the e-Portfolios managed?; (iv) What are types of artifacts to be stored in e-Portfolios?; (v) What type of information to be made available by teachers during the process of teaching and learning?; (vi) How e-Portfolios are evaluated?; and (vii) What should happen to the e-Portfolio after it is produced?

When an educational institution chooses to use e-Portfolios in teaching and learning, it is important to understand and define the characteristics of e-Portfolio required to meet the needs of that particular institution. The aspects to be considered are: guiding, types of artifacts, evaluation, communication and collaboration, course management, hosting, learning outcomes, reflection, report, rubric, information sharing, templates and technology requirements. Other aspects that also worth considering during the e-Portfolio design process are: consumer characteristics, potential e-Portfolio, technology features and capabilities and usability of e-Portfolio (Jafari 2004).

Various e-Portfolio design models have been developed to be applied in education such as models developed by Ku and Chang (2011) and Balaban et al. (2011). Ku and Chang's (2011) developed an e-Portfolio design model to be used as a platform for learning and evaluation. There are three key elements of the model, which are: the exhibition space, learning management systems and social space. Meanwhile, Balaban et al. (2011) developed a model of e-Portfolios that are used as a platform for lifelong learning. The model consists of four key elements of the exhibition space, learning management system, social space and job application. In comparison, both e-Portfolio design models suggest that e-Portfolios should include aspects such as exhibition space, learning managements system and social space. The difference between the two models is that Ku and Chang's (2011) model did not include the job application aspect which indicate that e-Portfolios design models for different educational systems may be different and should be developed according to the needs of that particular educational system. Moreover, e-Portfolios should also be designed to meet the requirements and need of students in learning.

## **2. Background of research**

In the Malaysian Skills Certification, portfolios are used as a archives to evaluate the knowledge and performance level of students in which their use is paper-based and limited as a mere artifact storage. Nowadays, the use of a paper-based portfolio is become irrelevant for the Malaysian Skills Certification. This is due to the fact that paper-based portfolios are: (i) static; (ii) limited in allowing information to be shared with others; and (iii) the management, evaluation and updating of materials process is difficult and are not capable of improving professional skills (McAllister & Hauville 2010; Smyth et al. 2011; Stefani et al., 2007). An alternative tool to paper-based portfolios are e-Portfolis. e-Portfolios can be utilized to store and organize material more easily, facilitate information searching, enable sharing of information anywhere, anytime, as well as enhance the professional skills of graduates (Bhattacharya & Hartnett 2007; Halstead & Sutherland 2006; McAllister & Hauville 2010; Smyth et al. 2011). Since e-Portfolios are online, it offers a a means of a more secure data repository system and aid towards a greener environment as it can reduce paper usage. Therefore, e-Portfolios have a great potential in improving the quality of Malaysian Skills Certification and expand the usage of ICT in education.

However, assessment indicators for e-Portfolios can vary according to a particular educational system. This also implies for the field of Technical Vocational Education Training (TVET). For TVET in Malaysia, students would undergo a technical competence certification called the Malaysian Skills Certification Malaysia (MSCM), established by the National Occupational Skill Standard (NOSS). This certification ensures that TVET students achieve certain competency standards in their area of specification upon graduation. These students are acquired to create paper-based portfolios to demonstrate their knowledge and competence level. The problem is that current studies show that paper-

based portfolios are problematic and e-Portfolios have the potential to address this problem. Nevertheless, recent studies show that there is a lack of an e-Portfolio indicator for TVET. In an attempt to address this problem, the study aims to investigate the factors and indicators of e-Portfolio in accordance to the standards of MSCM. In order to prepare TVET students in facing the ever-challenging work market, the e-Portfolio indicator should be open, flexible and focus on the use of technology in teaching and learning process (Assessment and Teaching of 21st Century Skills-ATC21S 2011; Neal 2011). Moreover, the e-Portfolio should be designed according in aiming to upgrade the existing training system, to further enable the nation in producing a more competent labor force that are knowledgeable, competitive, innovative and competitive.

### **3. Methodology**

This study is quantitative research, where a modified Delphi technique is used in the creation indicator of e-Portfolio Malaysia skills certification system. Modified Delphi study approach was chosen to identify indicators of e-Portfolio required through the validation experts.

#### *3.1 Data collection method*

In the first round the researcher gathered information by doing a literature review of previous studies on the concept of a virtual learning and e-Portfolio model that has been applied in teaching and learning. The review was conducted to identify appropriate indicators in Malaysia skills certification. Next, the researcher identifies indicators for each factor to develop the questionnaire used in the modified Delphi study. The Delphi panel is a panel of experts selected by referring the list of specialties from the Malaysian Department of Skill Development.

In the second round, questionnaires (the factors and their respective items were given) were distributed to the Delphi panel. In this round the experts required to state their level of agreement with each item using a five-point Likert scale. The results of the second round is then brought to the third round. The process is the same in the third round, where the expert is required to state their level of agreement with each item. To enable the experts examine and answer these instruments, they will be given a period of two weeks in each round to interact with the instrument.

#### *3.2 Delphi Panel*

The Delphi panel consisted of 11 experts. The criteria used in the selection of experts are those who have experience in the issues discussed, capable of contributing opinions, capable of conducting assessments and decision-making to achieve the consensus (Pill 1971). Delbecq et. al (1975) indicate that two groups qualify as Delphi expert, which are: (i) the top-management – decision-makers who will use the results of the Delphi study; and (ii) professional staff in the relevant field. Thus, in this study, the selection of experts were based on the following criteria: (i) experts who are involved in the implementation of the Malaysian Skill Certification; (ii) experts who are knowledgeable in the curriculum of Malaysian Skills Certification; (iii) experts who are directly involved in portfolio management; and (iv) experts who are knowledgeable in e-learning. As such, the Delphi panel was selected from the Department of Malaysia Skill Development (DMSD). DMSD is a department under the Ministry of Human Resources that serves to coordinate and control the implementation of skills training to produce K-workers to the job requirements. It also functions in the research and development of occupational standards of competency and expertise to improve the quality of skilled human resources to contribute to economic growth.

#### *3.3 Research procedure*

The modified Delphi approach is used in producing e-Portfolio system indicators. The modified Delphi technique is a procedure to find a consensus among the experts by using a questionnaire that does involve face-to-face interaction (Wiersma & Jurs, 2009). The modified Delphi technique proposed by Wiersma & Jurs (2009) applied in this study, where the first round of interviews in the Delphi method is not needed and modified Delphi process started with a

second round of exploration questionnaires subject. This is because the issue in the first round of the Delphi method is sufficiently defined by the researchers.

In the first round, the first step taken researcher in conducting this study is by making a literature review on models of virtual learning, e-Portfolio models and analysis of documents related to skills education in Malaysia. This step is to aimed in creating a benchmark to directly identify the relevant variables and indirectly formed to be the domain of study. Next, the instrument in the form of questionnaires are produced. A panel of experts in the relevant field were selected, based on their qualifications to evaluate and provide feedback on the criteria required for each of the items selected. The experts selected are those that have experienced and responsible in the formation of the Malaysian Skills Certification System.

In the second round, a panel of experts selected by the Department of Malaysia Skill Development are given the questionnaire. The panel of experts is required to assess, indicating their level of agreement and comment related on the Malaysian Skills Certification portfolio. All questionnaires received back were analysed. In the third round, each expert provided a questionnaire based on the feedback from the second round of the consent of each item. Respondents were asked to review the assessment of all the items that have been analysed by the researcher. After considering all factors, the experts were asked to decide on the choices they made. They can maintain their choices or change any of the answers. The results were analysed and the findings the researchers conclude the agreement on the elements of e-Portfolio selected.

#### 4.Data analysis

Data obtained from the questionnaire results in each Delphi round was analysed using the Statistic Package for Social Science (SPSS). Results of the analysis are presented in the form of descriptive statistics of percentages, mean and median to represent the results of the expert panel consensus. Descriptive statistics are used to describe a variable phenomenon and it needs to be explained logically by using certain methods (Balnaves & Caputi 2001; Chua Yan Piau 2006; Vogt, 2007). One of the methods is by using a central tendency measurement. According to Asnul Dahar Minghat (2012), in the descriptive statistics based central tendency measurement per cent can used to seek the views of an expert panel about items of the questionnaire.

The mean scores reflected the order of prioritized items. The median score refected statement required to form questionnaires in each Delphi round. To reflect the degree of consensus panel of experts on the questionnaire items, the Inter Quartile Range (IQR) of 0-1 (high consensus), 1.01-1.99 (moderate consensus), and more than 2 (no consensus) were used in this study.

#### 5.Findings and discussion

Data analysis in the formation of indicator for e-Portfolio Malaysia Skill Certification are categories as the following: (i) review of literature (the first round modified Delphi) (ii) the second and third modified Delphi rounds.

##### 5.1 Findings of the first modified Delphi round: Literature review

In the early stages of a modified Delphi study, a literature review of previous studies and documents related to e-Portfolio was conducted to create a questionnaire that was used in the first Delphi round. The literature survey identified four main elements of e-Portfolios in education, namely: (i) the recognition of prior achievements, (ii) virtual learning space, (iii) competency assessment; and (iv) operating systems (Balaban et al. 2011; DiMarco 2006; Ku & Chang 2011). Table 2 shows the findings that have been classified according to their categories.

Table 1 Element and indicator of e-Portfolio

Element	Literatur Review	Indicator
Recognition of prior	(Bahril Balli & Wahid Razzaly	Personal detail

<b>achievements</b>	2011; Department of Malaysia Skills Development 2011; Noraini Kaprawi et al. 2010; Perry et al. 2009; Singh 2007)	Academic Qualifications Non-academic qualifications Prior experience Core abilities Declaration authorization
<b>Virtual learning space</b>	(Ku & Chang 2011; Nunez et al. 1998; Pereira et al. 2000; Punie 2007)	Exhibition Learning Management Learning assessment Personal space
<b>Competency assessment</b>	(Ministry of Human Resources Malaysia 2013)	Competency information Achievement record Achievement evidence
<b>Operating systems</b>	(Barrett 2010; Galatis et al 2009; Gibson & Barrett 2003; Sweat-Guy & Buzzetto-More 2007).	Information sources Information management Communication Reflection

## 5.2 Findings of the second and third Delphi rounds

In this round each expert is required to state their level of agreement on the indicators presented. Table 3 shows the modified Delphi findings for the second and third rounds. In the second and third rounds all of the six indicators personal detail, academic qualifications, non-academic qualifications, prior experience, core abilities and declaration authorization for recognition of prior achievements element achieved a high degree of consensus among the expert panel. IQR value of the item was 0 and 1, while the median was 4 and 5.

For the virtual learning space element, results of the analysis in the second and third round showed a high consensus and agreement among expert panels, with IQR achieving a value of 1 and the median is 4 and 5. The mean value of the virtual learning space indicators (learning management, exhibitions, learning assessment and personal space) in both Delphi rounds were high. In relation, the concept of virtual learning space should contain four elements such as the knowledge space, collaboration space, consultation space and experiment space (Nunez et al. 1998; Punie, 2007).

Here, it can be concluded that the structure of the virtual learning space should have three main environments, namely: (i) an environment that allows users to interact with each other; (ii) an environment that allows the user to interact with the source; and (iii) reflective space and social space. With the revolution of information and communication technology, TVET training institutions should create a learning environment that is more open and flexible to students. Virtual learning should be much more student-focused, where students actively solve the given problem through exploration, discussion and high thinking.

The next in the second and third elements competency assessment, the analysis shows that all three indicators of competency information, achievement record and achievement evidence reached a high consensus based on the IQR score which was 1. The median is 4 and 5 and the mean values for all three items are also high. In Malaysia, the National Occupational Skills Standards (NOSS) developed a competency profile chart for the Malaysia Skills Certification program. The main elements of the profile are the profile of core ability charts, chart paths for programs, matrix core ability, achievement record and evidence achievement for all work activities were evaluated (Ministry of Human Resources Malaysia, 2013).

All three indicators agreed by experts are important in assessing student competence. Competency assessment was used as a benchmark for identifying and evaluating the effectiveness of learning as well as improvements to the training needs in the workplace. Aspects of competency assessment refers to the knowledge, skills and behaviours that individuals should have in order to perform a task or take responsibility on their tasks. Nowadays, the industry requires competency assessment among technical resources that enable employees to be competent to the task and become more competitive.

Finally, research data modified Delphi for second and third rounds of the operating system element indicates the degree of consensus and agreement among the panel experts is high. The IQR score achieved was 0 and 1, while the

median is 4 and 5. The mean value was high for all four items: information resources, information management, communication and reflection – indicating a high level of agreement among the experts. Barrett (2010) states the e-Portfolio operating systems should contain elements of information presentation, information management, reflection, collection of artifacts, assessment, feedback, and social networks. Gibson & Barrett (2003) describes the required operating element in the development of e-Portfolios are communication, collaboration, reflection and information management. In the development of e-Portfolio operating system is very important, that the system developed can be used properly and meet user requirements, in this case the TVET students.

Table 2 Modified Delphi study for the first and second rounds.

Indicator	First Round				Second Round			
	Mean	Med	IQR	Level of Consensus	Mean	Med	IQR	Level of Consensus
<b>Recognition of prior achievements</b>								
Personal detail	3.37	4	1	High	4.39	4	0	High
Academic Qualifications	4.20	5	1	High	4.70	5	1	High
Non-academic qualifications	3.71	4	1	High	4.38	5	1	High
Prior experience	4.73	5	0	High	4.85	5	0	High
Core abilities	4.00	4	1	High	4.50	5	1	High
Declaration authorization	4.55	5	1	High	4.73	5	1	High
<b>Virtual learning space</b>								
Learning Management	3.97	4	1	High	4.35	5	1	High
Exhibition	4.64	5	1	High	4.57	5	1	High
Learning assessment	4.03	4	1	High	4.25	4	1	High
Personal space	3.98	4	1	High	3.36	4	1	High
<b>Competency assessment</b>								
Competency information	4.51	5	1	High	4.27	4	1	High
Achievement record	4.64	5	1	High	4.27	4	1	High
Achievement evidence	4.64	5	1	High	4.46	5	1	High
<b>Operating systems</b>								
Information sources	4.48	5	1	High	3.99	4	1	High
Information management	4.39	5	1	High	4.88	5	1	High
Communication	3.68	4	1	High	4.26	4	0	High
Reflection	4.21	5	1	High	4.54	4	1	High

## 5. Conclusions

The analysis of the literature review and descriptive analysis of the modified Delphi study has identified three elements and 17 indicators in the development of an e-Portfolio system for Malaysia Malaysian Skills Certification. It is categorized under four domains, which are: (i) Recognition of Prior Achievement (personal details, academic qualification, non-academic qualifications, prior experience, Core abilities and declaration authorization), (ii) virtual learning space (learning management, exhibition, learning assessment and personal space), (iii) competency assessment

(competency information, achievement record and achievement evidence) and (iv) operating system (information sources, information management, communication and reflection).

When an institution chooses to use e-Portfolios in teaching and learning, it is important to understand and define the concepts and indicators necessary to meet the needs of an institution (Jafari, 2004; Sweat-Guy, & Buzzetto-More, 2007). To produce an e-Portfolio system, it requires detailed planning to ensure that the resulting system meets the needs of users, as well as the educational institutions. This study provides an overview of the importance of an e-Portfolios indicator. Thus, it can be concluded that the modified Delphi study conducted produced indicators and items that could be useful for the implementation of e-Portfolios for Malaysia Skills Certification in the field of TVET.

## Abstract

Knowledge is the basic communication means of human being. It has reached today's world as the most important and influential means of communication although a part of it disappeared and another part was stored in a way and transferred from one generation to another through out the history. In the meantime, the drastic role of technology in forming and spreading the knowledge should never be ignored.

Public relations is an activity of a variety of recognition and publicity. If we take it in a broader way, we can say that it expresses the total of researches to know the target groups better so as to realise its purposes and also its all activities and applications in the direction of objectives of the organisation in order to introduce and advertise it to the whole public opinion.

The experts of public relations have to prepare plenty of information and also documentaries which are subject to them. They are constantly shared with the rest of the world on the web page of the organisation. As it is known, web sites and social network have become inevitable parts of all sorts of institutions nowadays.

In this work, we are going to investigate the notion of information management and obtained information with regard to this issue is going to be displayed at full length in the interest of internal corporate and usual corporate relations.

In this context, the relationships among information management, Internet and public relations are going to be brought up and their efficient utilization is going to be researched in terms of the organisation.

Formation, handling and especially share of information in business enterprises have no doubt great effects on its transparency, image and openness to the target groups. This situation introduces a positive effect in the process of the publicity of enterprise itself. In this study, we are going to dwell particularly upon the formation, handling, storage and distribution of information in terms of in-house (intra-company) and external public relations. In this context, a vocational school of a university which is worth to be examined from this angle is going to be taken on as a sample.

*Keywords:* Public Relations, information management, communication.

---

## 1.Public Relations (PR)

Public relations (PR) on which there have been lots of definitions is basically an activity of publicity. Peltekoğlu who is one of the leading PR specialists in Turkey defines it as “a strategic communication means” which is realised or set up between the organisation and its target groups whose level of importance varies according to the consumers, distributors or employees of the organisations. It carries out the task of helping the organisations realise their purposes (Peltekoğlu, 2004;6). Public relations is a function and communication of the management. So it is also a way of influencing the public opinion. According to Buda ve Budak (1998: 8), it is a total of activities of a person or an organisation which aims to establish relations with the other people or organisations so as to make relations, to sustain and develop the available relations on the purpose of getting some interests. “Interest” that is mentioned here is rather different from the “material interest” that is used in the field of advertisement and propaganda. It will probably turn out to be a material interest in the long term. However, it is not the main target of public relations. The organisations which has made an “institutional image” in a long time will no doubt take many advantages of that image.

The applications of public relations can be mentioned in all places where there is a discrimination between the managers and employees or sellers and buyers because public relations which in essence depends on the organisational output is naturally an effort of organisation which tries to regulate that order and controls the related environmental factors at the same time. Taking the inevitable organisation-environment relations into consideration, public relations

can be seen as an instinctive and natural activity in every place where the organisation exists (Kazancı, 2009; 39). But it is often mixed with the other similar notions because of its inter-relational nature and multi-dimensional structure. Those similar notions are usually “advertisement”, “publicity”, “propaganda”, “human relations”, “communication”, “image” and so forth...

To specify where the activities should be directed to and which technics and strategies should be used in those areas are accepted as the keys to success in public relations. The target groups should be known and the organisation should introduce and advertise itself very well (Budak ve Budak, 1998: 149).

To know and determine in which areas the activities of public relations should be concentrated and which methods and means should be used to execute them will undoubtedly effect the level of success of the activity of public relations to a large extent. If the target group is known very well in the process of communication, the most convenient technics and means to be used can be modified and applied easily. Otherwise, all the efforts might be of no use. The activities to be carried out in that direction are divided into two categories: The first category contains a variety of recognising methods in public relations like citizens’ personal applications, the relations with the representative persons and groups, recognising through the technics of surveys, meetings, browsing the mass media, face to face relations with the public, referendum and public opinion researches. The second one contains face to face relations, the art of public speaking, plausibility, talking on the phone; printed media such as newspapers, magazines, brochures and manuals, notices, placards, rosettes, stamps, letters, annuals and books; audio-visual means such as radio, television, films, internet, intranet and other visual means; and the other means such as competitions, exhibitions, fairs, festivals, conferences, symposiums, seminars, organisation tours, panels, openings, anniversaries, welcome ceremonies, photographs, and sponsorships (Yavuz, 2006: 25-55).

As to computers, they are used as one of the means of both recognition and publicity. Those contains almost all means of communication.

As everybody knows, one of the productions of computer technology is the Internet. It is impossible to stay away from the computer technology and the Internet for the individuals of information society. Serious efforts have been made in order to advance and expand the use of the Internet in the areas like education, culture, health, public services, legislation and justice not only in the world but also in our country. People can actively and directly take part in the process of producing and sharing the information over the Internet so as to satisfy themselves and to put forward to their own ideas (Selvi, 2012: 208).

## **2. Information Management**

Information management is a total of theories and applications rendering production, depiction, evaluation, development and distribution of intellectual resources of the organisation within the framework of a specific plan. The information should be formed through activities or else it is not going to have a purpose and value. Those activities bring forward the necessity of knowing what sort of information should be used to run the businesses within the organisation. The information at issue may directly be the information of running that is needed in every level of developing work and actions of the organisation or to put it in another way, it may be the information of management needed to control and develop the activities. Most of those kind of information are formed in the documents which organisations have produced in the process of activities. Therefore, those first-hand documents are the most important institutional resources of organisations. From time to time, they can also be a part of the national archives just since they include institutional information. In other words, they are not only the actual memory of the organisations, but also the nation’s memory in later centuries (Özdemirci, 2001; 180).

Besides, all the organisations and institutions form the information producing documents within the framework of recognition and publicity while they are running their businesses. Information in question which were produced for the in and out of corporation take their places in the archives as the memory of the organisations and institutions. However, they make a great contribution to the memory of the country.

The answer of the question “Who produces the information?” can be “all employees”, especially the ones who can be defined as the “information workers” who intensively deal with the information. Most of them are white collar workers for instance medium and high level managers, researchers, instruction providers and appliers (Çapar; 2005: 50).

Not only the activities and means of recognising and publicity but also formation and sharing of the information in the organisations are carried out by the specialists of public relations. In addition to that, they are

responsible for doing the researches that the organisation itself need. They produce a great many of information while they are doing these businesses and all those information and documents are saved in their Internet sites as a part of their corporate identity.

Information management can be probed in the basic processes below: They are production, development, classification, protection, transmission, share, utilization and evaluation of the available information. Those basic processes demonstrate that information management operates in an unbelievably vast area in effect (Yalçinkaya, 2011: 158).

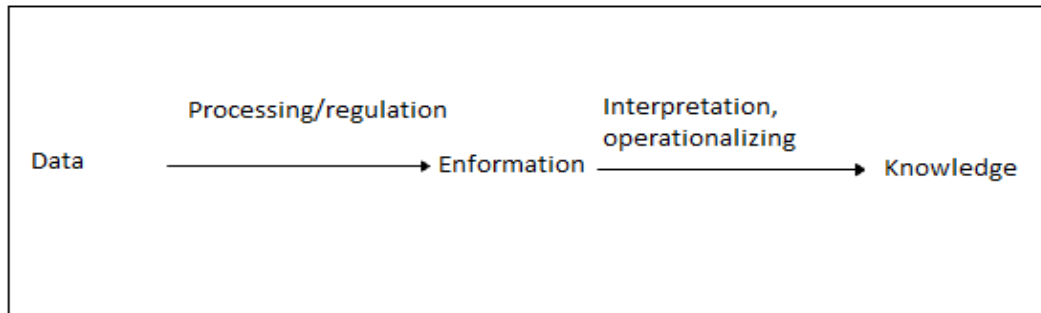

The main purpose of knowledge management is to reflect and inform the business about the scientific and technological innovation around the business with the conceptual development. To be informed in time about innovation and change has a great importance for educational institutions that produces and shares information. (Celep ve Çetin; 2003; 31) Following innovations and discoveries is the task of educational institutions. Schools that are incorporating with researchers can continue to play leader and interchanging roles as long as they follow innovations and changes in the community.

### 3. Formation of Information and Public Relations

Formation of information is related to data and knowledge. Information consists of objective realities regarding the facts and they are not made connected with one another yet. Data is the saving of the operations in an unconstructed form in accordance with purposes of the organisation. Data which are considered as not unassimilated the uncommented observations and uncultivated facts is saved by the technological systems in the modern organisations. For instance, 710x370 A41 is a datum, but it may mean nothing for most of the people. Whereas, information that was not put in an order may also be identified as the data. It has got a meaning for only the person who is relevant with it. Information which has got a much richer content than data is usually a written, oral or visual message (Barutçugil, 2002:57).

Güçlü and Sotirofski (2006: 354) developed a table which tells about the relationship among data, information and knowledge.

Figure 1: Formation of Information

Reference: Güçlü ve Sotirofski (2006: 354)

All those stages can be seen clearly when it is looked at the applications of public relations. When the example of brochure is taken in hand;

There are identifying sorts of data. After they are classified, ordered and added pictures, they turn into the brochures.

Brochures are short term and printed communicative means which consists of six or more pages and distributed to a target group for a particular purpose a certain time ago. The basic steps to follow to prepare a brochure are stated below:

- The purpose should be identified openly.
- A notion around the purpose should be developed.
- The content should be determined before.

-Information which will be given, formative features which will be designed, visual materials which will be used and also colour and white space should be identified.

-It should be printed in a way that it can be increased when it is necessary.

-It should be distributed (Peltekoğlu, 2004:247).

If the subject is taken in hand in terms of archives and public relations, it can be said that the public opinion perceive the archive resources as very important documents forasmuch as they are the evidence of great importance for the persons, organisations or nations. Besides, it should not be forgotten that the public relations provides with the value that the archives and the employees of it deserve. There are a wide range of means in public relations to introduce and advertise the institutions of archives to the public opinion, their vocations to the intra-company employees and their archives to the country and the whole world. However, the archivists should not ignore the measureable benefits and advantages brought by the mass media. Advertisement equivalents which are rendered by the reflections of mass media have been utilized for a long time (Ataman, 2006: 221).

The public relations which can not be ignored on account of its advantages in today's contemporary societies have moved up to a higher position nowadays than it was in the industrial and modern societies. One of the reasons of that escalation is the fact that people and organisations have needed much more exchange of information then ever before. People may be exposed to uncountable messages from different places in information societies which keeps on developing the information means and technics. Because this case causes the problems of not being understood enough and being misunderstood in terms of both of the resource and the receiver, some unwanted effects comes out unavoidably. The only way of understanding the demands of target groups and explaining itself to them by preventing those sorts of negative effects at the same time is definitely the public relations (Canöz, 2008: 357).

In this study, knowledge management of an educational institution was investigated in accordance with the public relations activities.

In this survey, document analysis method was used. According to Yıldırım and Şimşek (2005:187); the public, private record collection or of the analysis of written materials containing information about case or cases have to be investigated and examined in a systematic way at the first step. Movies, videos and photos may be used in document analysis. In addition, using qualitative data collection methods such as observation and interviews can contribute to the validity of the research.

In this study, knowledge management of an educational institution was investigated in accordance with the public relations activities. In this context, as a public institution, the University of Aksaray Ortaköy Vocational School was selected. There are 1,350 students and 40 academic and administrative staff at institution. Institution was examined in terms information management and public relations. At the end of study, documents that has been created by the institution as a public relations agency method were included in the study. Letters that are written by public institutions to individuals and organizations is called as "official letter". Besides ; student document , report, notices ,board decisions are documents created in public institutions.

In the Yağmurlu's study (2010), public relations communication tools are divided into two as recognition and promotion. These are written-tools , social-cultural tools and audio- visual tools.

In this study, according to Yağmurlu's study (2010) Aksaray University ,Ortaköy ,Vocational High School was examined with considering in recognition of public relations as in Table 1.

Table 1. Public relations tools

	Written tools	Social-cultural tools	Audio-visual tools
Promotion	Press release Press file book magazine annual Annual reports Brochures and manuals Letter (954) banner Bulletin boards poster banner Flyers Router and way showers	Press conferences Press releases Press trip Press Cocktail Ceremony (2) Conferences (3) Exhibitions Excursions (1) Events Competitions (3) Sponsorship / patronage	Visual materials prepared for Television Photo (3) Movies (2) Slides, pictures, power point, (4) The graphic design, corporate identity, logos, banners, business cards, Material intended for radio TV / radio interviews

Promotion	Wishes / Complaint boxes petition Application for information Surveys	Interview days Advisory Units interviews meetings	Telephone lines
-----------	--	--	-----------------

Reference: Yağmurlu, 2010.

The information and documents created in Vocational School were examined in terms of public relations At the end of review ; letters that belong to 2013 are the most important information-"as official texts" .According to Table 1; in order to perform in-house and inter-agency communication 954 texts has been written in this year. Two ceremony , three conferences ,one trip and three contests were made as socio-cultural tools at the institution.

On the other hand, three photo presentation that identifies the institution, two film screenings and four-slide presentation are done as audio-visual tools.

#### 4.Result

Corporate design and corporate identity consists almost visual element such as in-house publications, visual aids, architectural and decorative events, printed papers for external target audience , brochures, posters, announcements on billboards, clothes, attired tools, architecture and product-based visual design, corporate symbols. In addition, reports of corporate communications, annuals, advertising, publicity and the key elements of press, can be added to visual aids. (Sezgin, 2008).From social-cultural and audio-visual communication tools information about introduction of the institution is given.

When official texts that are created mostly at institutions are examined, the name of institution ,the official emblem of the institution and communication address of institution are seen in this document .

In terms of public relations, this communication tool reveals corporative identity of institution .

In this respect, 954 documents that were related to the information about Ortaköy Vocational School in terms of public relations activities were created in 2013. In addition to this, such as ceremonies, conferences, festivals and competitions and social - cultural activities are limited, and photos, movies and slide presentation have been found to exceed an average of 3 as well as.

According to this condition, It was identified that in the framework of information management that is developed public relations practices in social-cultural activities and audio-visual communication vehicles is very weak, in addition to this; except letters writing vehicles are inadequate.

Introduction and definition tools used in PR are required more intensive and efficient use for successful knowledge management and public relations activities

For a healthier conducting with the relationship between audiences and institutions transferring the message means of communication with the relevant stakeholders is very important.

From this point; Ortaköy Vocational School for different target audience , producing different knowledge context

And introducing this knowledge with using tools efficiently to reach the desired segments would be appropriate

# The heritage central Asian Turkish music culture left to Anatolian music culture: similar elements in central Asian-Anatolian Turkish music cultures

Gulsen G. Erdal<sup>89</sup>

*\*Kocaeli University-State Conservatory, P.O. Box 41300, Turkey*

---

## Abstract

In this research, it is aimed to present the elements which are thought to be left as a musical cultural heritage by Central Asia to Anatolian Turkish music culture within the context of similarities among the musical cultures shaped in the respective geography. It can be observed that Turkish music, which gained a new structure and identity, preserved the effects of Central Asia and brought them to the present despite the various musical culture elements it encountered in Anatolia. It can be noted that some similar elements which were in a sense conveyed as “a musical cultural heritage” from Central Asian Turkish music culture to Anatolian Turkish music culture and included in this origin served as a model in the context of music for acculturation between Central Asia and Anatolia. It is possible to list these similar elements as follows: “The Minstrelsy tradition”, the origin of which dates back to pre-Islamic period in the Central Asia and the name and function of which changed in Anatolian territories and which is in a sense a different form of Shamanism tradition; Rhythm similarities in musics; Modes as a method of processing musical scales in Turkish music system, their names and use; Musical instruments and similarities encountered in the names and structures of the instruments.

## 1. Introduction

The Turks, who spent their life in a nomadic lifestyle in Central Asia, encountered various cultures as moving westward. The musical culture the Turks settling Anatolia, which they chose as their new homeland, brought from Central Asia showed a change through the cultures interacted. It can be said that music cultures of the Turks, whose music cultures were also influenced by the cultural environment they encountered in Anatolian territories as in many points, structured in this mosaic, contain a configuration synthesizing Central Asia as the origin and Anatolia as the homeland.

### 1.1. *Mıñıñmıñlı at oru bū*

The Turkic tribes and the Turkmen who came to Asia Minor (Anatolia) in the later 11<sup>th</sup> century encountered music cultures of other societies here, interacted with each other and enriched the cultural elements they brought from the territories they came from combining them with the cultures they encountered (Budak, 2006, p.139) . The cultural effects of Islamic circle and Shamanism, the cultural heritage of the nature faiths of the Turks in the Central Asia, were two important sources of the heritage they carried (Say, 2010, p.205). It is thought that musical interactions lie behind

E-mail address:ggoksel@kocaeli.edu.tr

the similarities between the Central Asian Turkish music and Anatolian Turkish Folk music in the new homeland of the Turks. As the interaction in music is mutual, the Turks influenced as well as being influenced. For example; classical Chinese music influenced Turkish music and Turkish music also had an effect on China in a certain area. This interaction continued later on. (Baykara, 2001, p.201). It was stated that there were similarities in areas such as minstrelsy tradition, the origin of the instruments of Turkish origin, folk singing tradition, the modes used and their names (Gürdal, 2010). This study is limited to the examination of the origins of minstrelsy tradition, a Turkish origin instrument; lute and the folk singing tradition taking place in the Turkish world, in Anatolia and the Central Asia.

## *2. A journey from the Central Asian minstrel to Anatolian ashik*

### *2.1. Minstrel-bakshy tradition in the central Asia*

A lot of minstrels came to Anatolia from the Central Asia, Khorasan, Samarkand, Tashkent and other Turkish provinces in the great migration occurred from the Seljuk Empire in Iran, collapsed due to the attacks of Mongols to Anatolia. These minstrel philosophers brought The Central Asian cultures to Anatolia. They combined these cultures with the cultural heritages of various civilizations which lived in Anatolia (Kaygusuz, 2000, p.124-125). The word ozan (minstrel) is derived from the root of the verb “ozmak” meaning “to be ahead of”. As the letter g in the middle and at the end of the word is dropped in Oghuz language, the term ozgan turned into ozan. (Feyzi, Halıcı, 1992, p.7) The folk singers performing jobs such as medicine, witchcraft and musicianship in the position of the representatives of the communities in the Turks were called “Kam (Shaman)” in Altai Turks, “Baksı (Bakshy)” in Kyrgyz Turks, “Oyun ” in Yakut Turks and “Ozan (Minstrel)” in Oghuz Turks (Budak, 2006, p.16). The term ozan has been used in the sense of minstrel-folk musician in Oghuzs since time immemorial. After the 15th century, the Turkish term ozan was replaced by ashik in Azerbaijan and Anatolian geographies and by Baksı and Kam in Turkmen geography. The tasks bakshies and minstrels performed in Turkish geography seem similar. “The father of the lute playing minstrels” was Dede Korkut (Korkut Ata). He was also the inventor of the stringed instruments called kopuz (lute), tanbur (tamboura) and dombra. In Anatolia, Korkut Ata was a highly respected wise man. Kyrgyz bakshies used to ask for help from Korkut Ata when they started treatment or fortune-telling with magic and spell accompanied by lute. Minstrels also used to consider their own lutes as Dede Korkut’s lute and show respect to them, sleep on the waist of the lute and think that lutes had a divine power. Greeting confronts us as an important custom among the minstrels travelling from province to province, from beylic to beylic. Minstrel greeting putting one hand on the chest as in “bağır basma (embrace)” was attached importance as it showed the respect, unity and hierarchy in the society and Turkish customs in terms of social respectability and the fact that minstrels did not kneel down before the khan. This greeting type is stated to be also widespread in Anatolia today. (Ögel, 91, p.405). We also learn from the book of Dede Korkut that minstrels’ both playing and singing is a feature seen in the Central Asia and Anatolia. Minstrels both played and sang on the days of feasting and grieving and they emphasized the meaning and importance of the day. It is also stated that the capital of the minstrels is their lute and their mastership and the recompense of their work is their fame. The lute of the minstrel being invaluable also shows the importance attached to the lute (Ögel, 1991, p.407).

### *2.3. Ashik Tradition in Anatolia*

Minstrels, who have an itinerant and individual life style, are considered to be the ancestors of ashiks (Budak, 2006, p.17). Artun (2005, p.1) states that wandering poets singing and playing saz (a stringed instrument) and telling folk stories were called ashiks. The ashiks, which emerged after the Seljuks in the 15<sup>th</sup> century, and the ashik tradition, which arose with the new culture the existing cultural background encountered in Anatolia, tally with the national essence in terms of origin. The cultural change and development with the acceptance of Islam brought a new perspective to minstrels. The new ashik type based on Islamic essence replaced minstrels bearing the identity of the old culture. The replacement of term ozan with ashik due to the religious sufistic folk literature occurred by assigning a humiliating meaning to the identity of the minstrel singing epopee with his lute (Artun, 2005, p.3).

Ashiks (bards) replaced the minstrelsy tradition towards the middle of the 15th century. Bards are the continuation of this minstrelsy tradition. Ashik poetry was influenced by the Anatolian dervish literature patterns as of the 13th century. Ashik being furnished with extraordinary powers and the structure of “dolu içme” ceremonies (a religious oath-giving

ceremony drinking koumiss from sacred animal shaped containers called rhyton) tallied with the essence of the Central Asian belief systems. From these aspects, ashiks were differentiated from the lodge dervishes and minstrel- bakshies, wise men singing epopee. Therefore, ashiks the new version of minstrels in the Anatolian geography and ashik tradition acquired a new perspective and form regarding the sense of life (Artun, 2005, p.28). Ashik tradition is also continuing in Azerbaijani and Turkmenian territories other than in Anatolian geography. Ashik tradition started to live in a new structure with the structure and theme elements of the dervish literature and minstrel-bakshy tradition in Anatolia (Artun, 2005, p.31).

### **3. Instruments of Turkish origin from the central Asia to Anatolia**

Instruments of Turkish origin can be mentioned to have a history of over a millennium starting with their arrival in Anatolia from Oghuz tribes (Nas; Altun, 2009, p.421). Turkish culture dating back to equestrian nomadic savannah civilization is also considered as the main basis of the Turkish instruments (Ögel, 1991, p.4).

#### *3.1. Lute and its function in the Central Asia*

Lute is the leading in the known oldest instruments of the Turks. The term kopuz (lute) is of Turkish origin and gobyz (kopuz) is the name given to the bowed string instruments by the minstrels and shamans in modern Central Asia and Kazakhstan. The findings of Meragi show that Oghuz Turks used the term kopuz (gopuz) for the plectrum lute in pre-Ottoman periods (Feldman, 2012, p.170). Lute is a stringed instrument played with the help of a string, commonly used by the Turks dating back a long way. The one with a long fingerboard and neck is called “kolca kopuz”. It has two types as “Kopuz-ı ozan” and “Kopuz-ı rumi”. The lute which originally had three strings underwent a change; the lute played by minstrels was called “kopuz-ı ozan” and the one played by Western Turks as “kopuz-ı Rumi”. Kopuz-ı ozan is three-stringed and kopuz-ı Rumi is five-stringed. Kopuz-ı ozan means the lute of ashiks and minstrels (Reinhard, 2007, p.83). In Turkish culture, the lute or saz is a social instrument which relaxes souls, strengthens willpowers, creates unity in the society (Ögel, 1991, p.5). The lute, which has several types, was categorized as “çertme kopuz (lute played with fingers)”, “kolca kopuz (necked lute)”, etc. by Reinhard (2007, p.411). This type of lute formed by attaching frets on the neck of the necked lute was later called “bağlama”. Bağlama had several names such as kopuz, saz, sazılak, çöğür, kara düzen. Also, the term kopuz was replaced by the terms such as dutar, dambura, dombra in Turkmenin-Uzbek-Turkish cultural environments (Yener, 2009, p.695). The oldest lute was an instrument played with a bow. In shaman prayers, each part of the lute is described separately. Shamans also used to play the prayers of treatment, fortunetelling and magic with these stringed lutes.

#### *3.2. Transition from kopuz to bağlama in Anatolia and its function*

The lute used by the Turkic tribes in the Central Asia and containing multiple stringed instrument types with its history of about 2,000 years came to Anatolia through “itinerant minstrels” and continued its existence with the civilizations it represented (Yener, 2009, p. 695). The lute is distinguished with its fame and glory among the Anatolian stringed instruments. Its playing style is similar to “şelpe (tapping)” (performed by striking the strings with fingers), a present day bağlama playing technique. (<http://www.shazinem.com/muzik-enstrumanlari-ve-turleri/130945baglama.html#ixzz344euiN4B>.access.9.6.2014))

The lutes with a wooden body and a long neck were called saz or bağlama later on. Among the first written evidences in the 14<sup>th</sup> century regarding the arrival of the lute, which was very similar to the stringed instrument Oghuz bards played, in Anatolia from the Central Asia together with the bards in the 13<sup>th</sup> century are the mentioning of Turkish lute instrument in Uighur texts, the book of Dede Korkut, the literary work of Kaşgarlı Mahmut entitled “Divan-ı Lügati Türk”, collected poems of Yunus Emre (Yazıcıoğlu, ilknur,p.181), the epic Oghuz Turks wrote about the heroes of Dede Korkut and a poem of famous sufi poet Yunus emre (Reinhard, 2007, p.84). The origin of the term used as “playing the saz” in the Central Asian and Northern Turks and Anatolia today is “playing the lute”. The lute is a kamancha in the Central and Northern Asian Turks. Kamanchas made of pumpkin which were called “eğit” and “Yörük kemençesi” can be considered as the continuation of the lute. As a matter of fact, the lute was originally a kamancha played with a bow

(Ögel,1991, p. 293). There is a unity and similarities among the kamanchas stretching from Anatolia to the Northern Asia. The terms “İklığ”, “kıyak”, seen in the entire Turkish world are commonly encountered in Anatolia (Ögel, 1991, p.295). “İklığ” is known in Anatolia with its original form (Gazimihal, 1958, s.76). In the studies of M.R.Gazimihal, the origin of the instruments based on the bağlama family in Anatolia is observed to be the lute (Gedikli,1999, p.72). Today, the term kopuz is encountered in various places in Anatolia both in the sense of an instrument and in the other senses. Some of these can be exemplified as follows:

Kopuz ve kubuz – generally instrument in Alucra, Uşak regions

Kubur –single stringed lute in the villages in İçel region

Kövür – 8-10 or 12 stringed instrument in Gaziantep and its surroundings

Kobuz-Köylüce - hand harmonica (from the compilations of Karaçay-Tokat, 1933). Fuat Köprülü states that the term ozan is the name given to the minstrel musicians of Oghuz Turks and minstrels are a special community among the Oghuz Turks. They tell old Oghuz epics, Dede Korkut stories with their lutes in foreign places and write new poetry about new events ( <http://www.turkuler.com/baglama/tarih3.asp>)

### *3.3. The modes used in the Central Asia and Anatolia*

The term makam (mode) pronounced as “mukam” in Uighur Turks is of Arabic origin. It means location, position and degree. It refers to a complete systematized musical work in music (İnayet, 2007, p. 366). Modes and tempos (makamlar ve üstiller) are the basic musical patterns enabling the formation, performance and transmission of music culture specific to Anatolia (Güray, 2011, p.11). Rhythm design is shaped on the basis of tempo and melody design on the basis of mode. Although the names of the frets, which give their names to the Turkish modes, partly differentiated in Azerbaijani and the Central Asia, there are some common names such as segah, düğah, rast, çargah, uşşak, ırak, etc(Gürdal, 2010). Modes are encountered in Anatolia and Uighur Turks as well. Modes differentiating according to the cultural, regional and local characteristics exist in Anatolia as “uşşak” and in Uighurs as “oşşak”, as bayati in Anatolia and bayat in Uighurs and segah with the same name in both (İnayet, 2007, p.366).

### *3.4. Tradition Of Folk Song/Ballad In The Central Asia And Anatolia*

It is possible to find the origin of Anatolian folk songs in the countries of Turkistan and Kyrgyz (Gazimihal, 2006, p.121). It is possible to find the origin of Anatolian folk songs in the countries of Central Asian. Today, there are folk songs in the entire Turkish geography. The folk songs sung in the countries near the boundaries of Turkey resemble the Anatolian dialect. They are known as “mahni” in Azerbaijani Turks, “Türki-türk” in Kazakhs, “ır-türkü” in Kyrgyz, “halk koşuğutürki” in Uzbeks and “halk cırı” in Tatars. The Northern Turks used the term “yır” or “cır” coming from the same root for them (Özdemir, 2007, p.225). The creator of “folk songs” considered as decasyllabic folk poetry type are usually anonymous. One of the folklore literature types sung with a specific melody and anonymized in time is the folk song in Anatolia (Yıldız, 2006, s.64). “Bozlak” and “ağıt (elegy)” are two important folk song types in folkloric respect. They do not have modes. The melody structure in bozlaks is encountered in the pastoral melodies in the Central Asia even today. Elegy formed with hendecasyllabic and octosyllabic verses is the heritage the Turks brought from their first homeland the Central Asia (Reinhard, 2007, p.33-37). Shepherd folk songs, songs of mounted shepherds, songs of agriculturalists and hunters, wedding songs and elegies are the folk song types encountered in the Central Asia. Wedding songs and elegies are the types maintaining their identity in Anatolia as well as in all Turkish societies.

## **Conclusions and Recommendations**

The Turks spread over a wide geographical area migrating far from their homeland in the history. The geographical location where the nation lives is very important in the formation of the cultural geography. The birthplace of the culture is called the source of the culture. In this sense, the Central Asia constitutes the sources of Anatolian Turkish culture. Throughout the history, the cultures such as language, architecture, music were originated from these sources (Tanrıku, 2014, p.178). It is obvious that the minstrelsy tradition existing in the ongoing structure turned into the ashık tradition in the Anatolian Turkish folk culture and was fed from this essence, the modes and folk song tradition in

the Anatolian Turkish folk music originated in the Central Asia and they have structural similarities with the present day Anatolian Turkish folk music. It is also obvious that bağlama having its basis on lute, the main instrument of the Central Asian Turks, is the continuation of lute in the Anatolian Turkish folk music instruments. Thus, it has been observed that musical cultural heritage Anatolian Turkish folk music received from the Central Asia has been conveyed to the present day and in a sense is maintained today as well.

# The historical development of the foreign language education in Ottoman Empire

Fuat Boyacioğlu<sup>a\*</sup><sup>90</sup>

<sup>a</sup> Faculty of Letters, Department of French Language and Literature, Selcuk University, Konya, Turkey

---

## Abstract

The education in the Ottoman Empire as a public work had been realized since the Ottoman Tanzimat Reformation. The foreign language education after the Tanzimat has been carried out by the European methods while the education before the Tanzimat was based on the religious basics. In the rising periods of the Ottoman Empire, Arabic and Persian were taught whereas European languages especially French were taught in its period of stagnation and decline with the adoption of the European supremacy. The westernisation and modernisation movements such as Tanzimat and Islahat were launched firstly in the Ottoman military schools then, in the public schools. After the First Constitution in 1908 French teaching became obligatory and German and English teaching became elective in all Ottoman schools.

## 1. Introduction

Throughout the history Turks have established generally multi-national empires. When they didn't make any discrimination of race, religion, language they became successful in the administration. The Turks didn't impose their language to the non Turkish communities and gave the freedom to them. Thus, they had a multinational structure. The Balkan and Muslim Arab communities are a good example in the Ottoman Empire. On the contrary, the Ottomans tried to teach and learn the languages of the communities under their domination, especially Arabic and Persian in their peak periods and the French, German and English in their periods of stagnation and decline.

Arabic being the language of Quran, became more important than Turkish language by the adoption of Islam by the Turks (932-1212). Although Arabic is the language of Islamic civilization, Persian became the cultural language because the bureaucrat class in the government had been Persian origin since the Abbasid period (750-1258). In the Great Seljuk Empire period the Persian language was the court language. The literature courteous was written in Persian. However, the public language was Turkish. The difference and the alienation between the court literature and the public literature, between the court language and the public language have been continuing for centuries. Omar Seyfettin, Turkish writer said in this matter: there are two important stages and influences in the history of Turkish Literature 1-Persian influence 2-French influence. He emphasizes the dimension of the superficial and blind imitation in Turkish literature (Ali Canip, 1935).

The Ottoman State continued the political supremacy until 1606 and its absolute military superiority against Europe until the Treaty of Karlowitz (1699) after which it began to lose more and more its political and military supremacy. The Ottoman administrators approving the superiority of the Europe had to send delegates to Europe in order to know it very well (Uzunçarşılı, 1998; Sander, 1987). The Ottoman rulers were considering as inferiority its representation before another State until this period. On the contrary, it regarded the delegates coming to the Ottoman State as a

e-mail address: fboyaci2000@yahoo.com

symbol of respect for it. For this reason, the Ottoman State didn't want to establish a regular foreign affairs system for the diplomacy. After the Treaty of Karlowitz, the Ottoman statesmen begun to give a great importance to the diplomacy in the international relations because of the prominence of the international diplomacy in Europe (Akyılmaz, 2000). As a reason of the fact that the Ottomans could not learn a foreign language, we can enumerate these reasons: the Ottomans had the complex of superiority; they made a few trades with Europeans; they had self-enclosed, self-sufficient, religious and ideological feelings (Kara, 1994; Findley, 1996; Lyber, 2000).

The Ottoman Empire was constantly and militarily face to face with European countries during the wars. In XVIII<sup>th</sup> century, Ottoman armies were defeated not only by Europeans armies but also by Russian and Egyptian forces benefiting from European military techniques. This case necessitated that Ottoman military schools had been established accordingly with European techniques. In the XVIII<sup>th</sup> and XIX<sup>th</sup> centuries the experts coming from various European countries, recommended the military education in the European manner (Mustafa Ergün, 2013).

The loss of importance of the Mediterranean Basin because of geographical discoveries and the economical dissolution of Ottoman Empire and the capitulations enabled many foreign merchants to come to Anatolia and make commercial activities. The commercial relations had been executed relatively and equally until 1838's. But the Ottomans territories had been completely a European market after the 1838 Treaty of Commerce (Cengiz Poyraz, 2013).

We are going to study the foreign language education in two periods: The period between 1299 and 1773 before the foundations of the schools in the European manner and the schools period between 1773 and 1923.

## **2. The foreign language education before the moderns schools in Ottoman Empire (1299-1773)**

The education had been realised as a public service accordingly with the European methods in the schools period between 1773 and 1923 whereas it was carried out by the establishments affiliated to the religious foundations in the period between 1299 and 1773. The Ottoman Empire improved the education heritage and tradition that it took from Seljuk's and other Islamic states. In this respect, some basic exact sciences such as mathematics and astronomy besides theological sciences had been given in the education institutions of Ottomans adhering to the Seljuk traditions in its formation (Selim Hilmi Özkan, 1999). In this period, the Arabic education was given in madrasahs since the textbooks were written in Arabic. But the Turkish lectures were preferred. It can be said that the majority of students graduated from madrasahs in the classical Ottoman period knew Arabic and Persian as well as mother tongue (Ramazan Şeşen, 2002). During this period, the Infant's Schools, Madrasahs and Enderun Schools were giving the education service.

*Infants/Sıbyan Schools:* They were elementary training schools. In these schools called also as the local school, the prayers on the Islamic religion were memorized in Arabic, practising the prayer, psalmodying the sacred texts and writing in Arabic were taught to children (Oya Soner, 2007).

*Madrasahs:* In the Ottoman Empire, the first madrasahs had been established by the Ottoman sultan Orhan Gazi in 1331 in Iznik. The most well-known madrasahs were Fatih (1451-1481), Sulaymaniyah (1520-1566), the Hagia Sophia and Beyazıt Madrasahs. All Ottoman Madrasahs were educational institutions affiliated to the religious foundations. Mother language Turkish was not taught in these educational institutions. Arabic was holding the most important place in the education. The purpose of teaching Arabic was to understand Arabic textbooks and other resources. Therefore, Arabic grammar was taught firstly. These books had been written to teach the Arabic morphology and the syntax (Özcan Demirel, 2004). As an expression of respect to Muslim Religion, the Ottoman Empire took an extreme interest in Arabic. As a requirement of respect and interest in Arabic, it became the most important language in madrasahs. Even it was said that Ottoman Sultan Yavuz Sultan Selim was intending to make Arabic as the official language of the state.

*Enderun a special school in the Ottoman Palace:* Enderun School was established to train cultivated and experienced men for the services of the palace. In this school, Arabic and Persian other than Turkish were taught as a foreign language. One of features of these schools was to teach Turkish as a second language to devşirme/ Christian children conscripted to brought up for the janissaries in terms of language teaching (Özcan Demirel, 2004).

The Persian teaching begins to be taught in the Ottoman madrasahs by means of Grand Vizier Nevşehirli İbrahim Pasha. There was not much more attempt for the Persian teaching until this period was not well considered. However, the works "Masnavi", "Gulistan" and "Bostan" written in Persian were taught in the Ottoman madrasahs. Especially the darülmecnevis had been opened to read only masnavi (Osman Nuri Ergin, 1977). Although The Ottoman rulers had a great interest in Arabic and Persian they were aware that Turkish should be the state's official language. For this reason,

the Ottoman administrators wanted that Arabic had been taught in the madrasas as a means of the love and respect of religion and learning religious values instead of making Arabic the official language of the state (Selim Hilmi Özkan).

As the Ottoman classic period since XVII<sup>th</sup> Century couldn't produce information and follow developments in the world, they became inefficient. Ottoman Empire wasn't occupied in rehabilitating a lot the madarsas being the oldest educational institutions and begun to establish modern schools along with them. The dichotomy between Madrasa and school in Turkish history has emerged in this way. This duality had been terminated in 1924 by the law on Unity of Education (Giyasettin Aytaş, 1999).

### 3. Modern schools period in the Ottoman Empire (1773-1923)

We can enumerate several factors concerning the establishment of these modern schools: the dissolution of Ottoman Janissary military system, the defeats of the Ottoman army by European armies against which they triumphed until the Treaty of Karlowitz (1699), the influence of European military experts suggesting the military reformation on Ottoman Army.

The first serious attempt of the Ottoman modernisation was Nizam-ı cedid/New Order of the Sultan Selim III. Trained in the reformist tradition of the XVIII<sup>th</sup>, Sultan Selim III, while he was crown prince, corresponded with XVI<sup>th</sup> Louis, the last king of France before the French Revolution and received some advices from him. New Order Reform (Nizam-ı cedid) of the Sultan Selim III had been applied firstly in the military field. The European teachers and the specialists had been brought from Europe especially from France in order to give course (Kara, 1994; Lewis, 2000).

In addition to Arabic and Persian languages, the French language, took place in the Ottoman education system in the schools opened XVIII<sup>rd</sup> and XIX<sup>th</sup> centuries after the activities of the Bab-ı Ali Translation Chamber. In fact, in the Ottoman Empire, the first French-language education begins in İstanbul in 1669 in the School of Language for Boys (Dil Oğlan Okulu) built by Capuchin priests. It gets official status with its new name: *College of Capuchin Fathers of St. Louis*. Turkish and French were taught for three years in this school (Gündüz 1977; Frederic Hitzel).

#### 3.1 The military educational schools

In the duration passing until the declaration of Tanzimat the classic education institutions of the Ottoman State were the infants' schools, madrasahs and Enderun schools. These schools maintaining their existence since the foundation of the Ottoman State had completed anymore their life in the beginning of the XIX<sup>th</sup> century. Apart from that, the schools such as Ottoman Imperial Maritime Engineering School /Mühendishane-i Bahr-i Hümayun (1776), Ottoman Imperial Land Engineering School/Mühendishane-i Berri Hümayun (1796), Ottoman Medical School/Mekteb-i Tıbbiye (1827) and Military School/ Mekteb-i Harbiye (1834) had rendered service as education schools opened in the European style. After the declaration of Tanzimat, the education reforms had been performed (Poyraz and Öztop, 2013).

*The Imperial Maritime Engineering Schools/ Mühendishane-i Bahr-i Hümayûn (1776):* A serie of defeats of the Ottoman navy in XVIII<sup>th</sup> century and especially the incineration of the Ottoman Navy by the Russian Navy caused the opening of a military school upon the recommendation of the Algerian Hassan Pasha in the Imperial Shipyard. Baron de Tott in the school's opening has been a significant share of the recommendations. This school continued the choppy and mixed development in the periods of Sultans Selim I and Mahmut II. Since 1838, the compulsory foreign language in the school became English instead of French. In the school the British teachers begun to give courses. In 1910 this Maritime Engineering School was introduced into a new arrangement according to British Naval School system (Mustafa Ergün, 2013).

*The Imperial Land Engineering School/Mühendishane-i Berr-i Hümayûn(1796):* The Engineering School/ "Mühendishane-i Sultani" in 1791's and the Imperial Land Engineering School/Mühendishane-i Berr-i Hümayûn in 1796's were established in order to educate literate mathematician artillery officers. French military schools program had been applied in this school. The land and marine geometry and accounts and the war information and education about the geography fields were given to all military students. The artillery officers were usually trained in the Imperial Land Engineering School. Then the staffs of the Land Army were usually trained in this school. After the War College was opened in 1834, this school became the Engineer Corps School.

*Medical School/Mekteb-i Tıbbiye(1827) :*The XIX<sup>th</sup> century was a century when the important changes were

occurred in the medical field as in all scientific areas. The European medicine from the Renaissance already making a very significant development has left back the Eastern medicine. In Ottoman Turkey, an attempt to establish the modern medical school began in 1826 by the initiative of a medical chief physician Mustafa Behçet Efendi. This school was founded in order to cure the sick and wounded soldiers of the newly established. Sultan Mahmut II underlined the importance of learning French in his speech addressing to students in the opening of Medical School: "Here you will study the medical science in French. My purpose isn't your study only in French, but your learning the medical science and adapting gradually it into the Turkish language. Try to learn the medical science from your teachers"(Lewis, 1998). Thus, the foreign language education took place in the school programmes by the westernisation movement in the military schools in the Ottoman State and the French became the first European language to be taught.

The Islahat and Tanzimat reform movements gave acceleration to the foreign language education and this case was reflected on the education institutions. The fact that the education language was the French in these schools was resulting from the fact that the teachers giving courses were French teachers. In the university successively named Darülfünun (1846), Darülfünun-u Osmanî (1870), Darülfünun-u Sultani (1874) and Darülfünun-u Şahane (1900) the courses were taught both in French and in Turkish. In the school named Tıbb-ı Şahane, opened in 1839 the education language had been French since 1871. On the other hand, the education language was English in the school Mühendishane-i Bahr-i Hümayun because the teachers were English (Ergün, 2013).

### 3.2 The civil educational institutions and schools

The international relations in the Ottoman State were carried out generally by non-Muslim dragomen. Ottoman Muslims did not learn all the European languages, languages of the infidels according to them, especially during their heyday and their period of stagnation. In their relations with Europe, they used translators and interpreters belonging to non-Muslim communities, especially Greeks Phanariots until 1820-1830 years and then Armenians dragomen (Ekrem Aksoy, 2007). However, the fidelities of these Greek and Armenians dragomen could not be trusted sometimes. For this reason, the Bab-ı Ali Translation Chamber had been founded in 1821. The Ottoman Foreign Language School named "Lisan Mektebi" had been opened because the Bab-ı Ali Translation Chamber had lost in time the mission of teaching the foreign language in the administrative organisation of the Ottoman State.

*Bab-ı Ali Translation Chamber (1821):* It is deduced from the activities of the Bab-ı Ali Translation Chamber that one of European languages as foreign language was taught in addition to Arabic and Persian languages in the Ottoman schools opened in XVIII<sup>th</sup> and XIX<sup>th</sup> centuries. We can say that the French teaching was seen in the modernisation movements in the education starting in XIX<sup>th</sup> century. The morphology and the syntax of the Arabic, Persian and French languages were taught in the programmes of the schools named "Rüştiye" opened in 1838 and the schools named Mekteb-i Maarif-i Adliye opened in 1839. The tradition of a second foreign language and a third foreign language education had been sustained and continued always both in the classic period and the modernisation period of the Ottoman State.

The Ottoman Greeks were performing the translation and interpretation until the opening of the Bab-ı Ali Translation Chamber. The family Mavrocordato from Istanbul Phanar Quarter executed the translation affairs in the Ottoman State during one century (Ağıldere, 2010). During the revolt of Greeks against the Ottoman State, the Ottoman statesmen feel anxiety of the dragomen originated from Armenian and Greek for fear that they would divulgate the secrets of the Ottoman State and mistranslate deliberately during the translation (Genç, 2003; Ekrem Aksoy, 2007). This situation continued until the opening of the Bab-ı Ali Translation Chamber in 1821. This obligatorily founded translation chamber can be considered as the first institution teaching systematically the foreign language in the Ottoman State. Knowing a European language in the XIX<sup>th</sup> century would be an indispensable quality for the young Turks purposing to obtain a career in the Ottoman Government. For this reason, the Bab-ı Ali Translation Chamber would take place beside the Palace and the Army in order to promote and come to power (Balçı, 2008).

*Lisan mektebi/The Ottoman Foreign Language School (1864):* Due to the insufficiency of the foreign language education in the Bab-ı Ali Translation Chamber and the necessity for the staff knowing the foreign language a language school named Lisan Mektebi had been opened in 1864. Its study period was 4 years. It was the first school giving the foreign language education. The privileged foreign language in this school was French. Moreover the languages of the nations under the domination of the Ottoman State such as Romanian, Greek and Bulgarian etc. were taught in this school. In this school closed after a given period and opened again in 1892 by the order of Sultan II<sup>nd</sup> Abdulhamit. English, Russian and German languages in addition to French were taught in this school (Önen, 1971).

This Foreign Language School opened and closed several times had been definitively closed in 1892 by the common official message of the Minister of Foreign Affairs Mehmet Sait Pasha and Grand Vizier Cevat Pasha. The reason of closing this school was to not to obtain the required yield from this school. It was decided that another foreign language school will be opened in the name of Mekteb-i Ali-i Diplomasi. Thereafter, it was given up from this new school project.

*Galatasaray Sultani High School (1868):* Due to some failures in the foreign language teaching, it was decided to open a new school in Istanbul to teach a foreign language in a good level and to satisfy the need of the civil staff of the State. This is why, a school named Galatasaray Sultani had been opened in 1868. The opening of Galatasaray Sultani High School has been the first in this direction"(Genç, 2003). In this school, the education was given in French. This school where the French teachers also were working was well known in a short time in Europe with its foreign language education quality. Those who were graduated from this school knew perfectly French. In the fallowing years Arabic, Persian, Armenian, Latin, Greek, Bulgarian, English, German and Italian had been given as elective course in the school programme. Galatasaray High School became a turning point in the foreign language education in Turkey. It was the first State school where the education was given in foreign language. In this school, the Muslim and no-Muslim students were receiving together education (Özkan, 2010).

In 1874, three schools were founded by the initiative of Sultan Abdulaziz: Galatasaray Darülfünun-u Sultani Hukuk Mektebi (Law School), Galatasaray Mühendis Mektebi (School of Engineering) and Galatasaray Edebiyat Mektebi (School of letters). These three schools were united under the name of Mekteb-i Aliye-i Sultaniye (Great Imperial School). These schools were largely based on the model faculties of the Sorbonne programs, both in their administration and in their teaching. The education quality of Galatasaray Law School being comparable to that of Western universities was a major step in the development of Faculties of law in Turkey. Galatasaray Sultani High School has been a turning point from viewpoint of learning a foreign language in the Ottoman State. The foundation of Galatasaray High School in 1868 marked the peak of the Francophony in Turkey (Ekrem Aksoy, 2007).

### **III-The German teaching as a foreign language in Ottoman Empire**

The international relations in the Ottoman State had influence on the preference of foreign language to be taught in the schools. The Ottoman and French relations and the supports of French specialists in the different fields, played a great role on the preference of French language as foreign language in the Ottoman schools. The Ottoman and German relations developed in the different areas caused the preference of German language as foreign language in the Ottoman schools. In XIX<sup>th</sup> century, the Ottomans maintained balanced economical relations with Germans. These relations caused that the Ottomans came under the political and military influence of the Germans. The military officers and specialists tried to widespread the German language teaching as well as their permanent duty.

In the period of Sultan Abdulhamit II, the Ottoman State made more relations with Germany rather than France and England which tried to make political pressures and interventions to the interior affairs of the Ottoman State. Thus, the Ottomans developed the political, commercial and economical relations with Germans. Sultan Abdulhamit II demanded the military advisors from Germany to reorganize the Ottoman army declined after the Ottoman-Russian War between 1877and 1878 (Beşirli, 2004).

Especially the Ottoman relations with Germany and German language had been improved with the reorganisation activities of the Ottoman Army in XIX<sup>th</sup> century. Then, the cultural relations had been developed between Ottomans and Germans. In order to improve the German teaching, the German High School and Sank Georg Austrian high school had been opened. After 1908, teaching German as foreign language had been widespread in the Ottoman territories. Moreover the German Hospital, the German Archaeology Institute and Turkish-German Associations opened in Istanbul had improved Turkish-German relations. (Önen, 1974). German Teaching started to be given regularly in the Ottoman military schools after 1882. The German education in the Ottoman State had been realised mainly by the military officers and specialists such as Goltz Pasha charged by German Emperor Wilhelm I to reorganise the Turkish Army (Genç, 2003).

Baghdad Railway project had an important place in the development of Ottoman-German relations. The admiration of some people for Germany by the Ottoman-German military and commercial relations decreased partially the French influence. By the influence of Goltz Pasha, the German began to be taught as a foreign language in Galatasaray High School giving education in French (Önen, 1974). The Young Turks came to power after the Dethronement of Ottoman Sultan Abdulhamid II in 1908 and the proclamation of the Constitution. Their German admiration and partisanship

continued increasingly. The powerful States excluding Germany begun to make agreements among them in order to divide the Ottoman State. German Empire took the part of the territorial integrity of the Ottoman Empire. German supporters of the government have led to this situation.

After the Second Constitution, the Ottoman relations developing with the Germans increased the German teaching as a foreign language in the Ottoman schools. A great importance was given to foreign language teaching in the High Schools named Sultani increasing after 1908. It was adopted to teach German and English as an elective foreign language as well as French as obligatory foreign language.

During the First World War, the Ottoman and German relations in economical and political areas arrived to the culminating point. The fact that the Ottomans were sided with Germans during this war increased the desire of learning German in the Ottoman public opinion. In those years, it was seen that the German language teaching was given in Darülfunun/Ottoman University, even in Madrasas. By the letter of instruction published in 1916 the decision was taken to teach German as well as other foreign languages in the Foreign Languages department /Elsine Şubesi of Darülfunun (Önen, 1974). In 1915 German Prof. Dr. Franz Schmidt became the consultant of the Ottoman National Education Minister Şükrü Bey. Besides this Turkish-German co-operation strengthening with the commercial, cultural and military agreements, a Turkish-German Friendship Association had been founded by the support of Prof. Dr. Franz Schmidt (Turan, 2000).

After the beginning of the First World War, the disruptions and the interruptions in the foreign language teaching as well as in many areas had been occurred. According to Serves Treaty after the Mondoros Armistice signed after the First World War and in particular by the desire of Britain as an occupying power, the Ottoman government was obligated to close the institutions giving German education and send back Germans and German teachers and professors to Germany (Widmann, 1970).

## Conclusion

The Ottomans gave a great importance to the education language as well as the form and quality of the education. In the peak periods of the Ottoman Empire Arabic and Persian were taught in the classic schools such as infant's schools, Madarsas and Enderun schools. In its periods of recession and decline, they decided to reform and reorganise their education system after the Treaty of Karlowich. The European languages especially French as well as Arabic and Persian begun to be taught in the modern schools in order to make the international relations. The Islahat and Tanzimat reform movements gave acceleration to the foreign language education and this case was reflected on the education institutions.

French was taught as a foreign language in the military schools such as Ottoman Imperial Maritime Engineering School /Mühendishane-i Bahr-i Hümayun (1776), Ottoman Imperial Land Engineering School/Mühendishane-i Berri Hümayun (1796), Ottoman Medical School/Mekteb-i Tıbbiye (1827) and Military School/ Mekteb-i Harbiye (1834) in order to accelerate the military reforms. In order to train the statemen, official staff, dragomen knowing a foreign language the civil institutions and schools such as Bab-ı Ali Translation Chamber, Lisan mektebi/The Ottoman Foreign Language School and Galatasaray Sultani High School continuing yet its existence today were opened. It was aimed to teach German and English as well as French and to train the dragomen in these Ottoman Schools. Especially the Ottoman Sultans Mahmut II and Abdulhamit II gave a great importance to European language teaching as a foreign language in the Ottoman education system.

German teaching as a foreign language under the period of Sultan Abdulhamit II was given firstly in the Ottoman military schools, then in the other civil schools. It was understood that there were economical and political plans and interests behind the efforts of putting forward the German teaching against French and English teaching. The Ottoman and German relations in economical and political areas arrived to the culminating point with the First World War. The alliance of the Ottomans with Germans during this war and their powerful cooperation in military, educational and cultural fields caused that the German language and culture were spreading in the level of formal and non-formal education in the Ottoman State.

## Abstract

The global economic recession with deepening regional and professional dissonances is significantly reflected on the labor market opportunities. University graduates, who should get the attention, are at the forefront. Within the labor market, typical for its constant transformation, preferred and employers' (ie. commercial and non-commercial subjects) sphere requirements conflict with the quality of the workforce. The most prominent is the educational system being the reflection of the graduates' quality and readiness for required skills. The study presents the specifics of tertiary education in the Czech Republic with the labor market opportunities for university graduates based on the market demand.

## 1.Introduction

The Czech society, as well as many other countries of the former sc. *Eastern Bloc*, underwent numerous significant changes and transformations after 1989, which are reflected in the continually growing demands on expertise and readiness of all the members of the society being it the area of everyday life (technical, political, social and human) or conditions in the wider European as well as global context.

Especially the fitness to accept these constant and hardly predictable changes and transformations has been becoming the platform of a personal and civic life, as well as the fitness to manage one's orientation within the changes and namely to adequately adapt oneself to these. The antecedence of the newly forming democratic society is the ability to sufficiently dispose of the creative potential of all its members not only in relation to the economic growth, improving employment, social and individual prosperity.

Democracy needs critically and independently thinking citizens who realize their own dignity and who respect the law and the rights of another. It needs individuals able to take responsibility for themselves and for the communal decision-making.

New possibilities for social advancement predetermines above all education as it provides opportunities for development of all faculties to every member of the society by which this becomes the basic social, ethical as well as political requirement. Education and qualification thus represent the only source that the mankind will have in an unlimited amount, and human capital thus becomes the most precious wealth. The fundamental condition for achieving the given aim is to make the education process more effective. Then it is the higher education without whose development it will not be possible to significantly upraise the level of no other groups of human resources. Expansion, diversification, improvement and close relation of higher education with scientific research and economic practice (profit and non-profit sector) are becoming one of the most significant ways towards the nationwide prosperity today. The priority task is to provide graduates with such knowledge and skills to become employable and so that they are able to assert themselves in the rapidly changing requirements of the labor market. (Göttlichová, 2007)

A number of significant changes were reflected also in the education system. They consequently resulted in an unusual expansion of the structure of the provided education services in regards to the new opportunities in the choice of an education method as well as in the choice of individual types of schools. The most significant transformation of the Czech tertiary education as a whole since 1989 was establishing of self-governing mechanisms at universities, incorporating the sector of higher professional education, the possibility of private universities operations, marked growth of students and graduates, and other. The changes within tertiary education led not only to satisfying the growing demand for university education, but they were also a strong and powerful incentive for the further direction of the Czech economy to higher competitiveness, sustainable development, growth of the innovational potential, and at the same they accentuated the social, cultural and historical values.

## **2.Theoretical Background**

### *2.1 Human resources development*

The content of the concept of human resources is conceived in the Strategy of human resources development (HRD) for the Czech Republic in accordance with the prevailing current international practice. The given term is defined in the form of lifelong education and learning (formal and informal) including learning through experience (informal). The aim is namely to improve employability, to increase competences and performance of the individuals and teams. The strategy of human resources development thus includes a wide range of activities, opportunities and stimuli of the education system in the economic practice, public administration and in other sectors. Besides informal education aiming at certain target groups and being realized by other types of institutions standing outside the formal education system, and informal education (not controlled and coordinated by institutions) representing the process of acquiring knowledge, skills and forming attitudes within everyday life, formal education becomes the priority. Formal education is provided by education institutions whereas a school becomes a typical representative, and all this by necessity of clearly defined and legislatively determined objective, content, function, means and ways of evaluation (Strategie rozvoje, 2003)

### *2. 2 Tertiary education*

It is then particularly higher education without whose development it would not be possible to significantly upraise the level of no other groups of human resources. Reinforcing the importance of the whole tertiary education (ie. all the standard education following the matura exam which completes the secondary education in the Czech Republic), especially the higher education sector in continuity with the research and development, plays the priority role in the way to the nationwide prosperity. Higher education development, it means its expansion, diversification, improving and its close relation with the scientific research, as well as with the economic practice. The given fact is also proved by.

#### *2.2.1 Expansion and diversification of higher education*

Among the important aspects contributing to the expansion of higher education mainly opening a certain space allowing development of the private higher education sector belongs. The academic year 2000/01 becomes the milestone because next to 24 public universities, the sector is also entered by the first 8 private universities. While the number of public universities increased in the academic year 2004/5 to 25 and in 2007/08 the increase to 26 remains with no change also in the academic year 2012/13; the situation with private universities is completely different. Already in the academic year 2001/02 the number of private universities increased to 17, in 2002/03 to 27 and in 2004/05 to 36. In the academic year 2008/9 the number was 45 and with the exception of the academic year 2010/11, when the number reduced to 44, the given number of universities remained the same until the academic year 2011/12. In 2012/13 academic year, the number of private universities was 44 again. The increase was recorded also in the number of faculties at public universities. While in the 1989/90 academic year, we encounter the number of university faculties of 69, the (pre-revolutionary) year 1990/91 is presented by 82 faculties, 1991/95 by 95 faculties. In 2000/01 the number of faculties was 111 and with a gradual increase the number in 2012/13 reached already 141 faculties, which represents

the increase approximately by 50 %.

In the Czech Republic in the academic year 2012/13 26 public, 44 private and two state universities (University of Defence in Brno managed by the Ministry of Defence, and the Police Academy of the Czech Republic in Prague managed by the Ministry of the Interior) were executing their education activities. 24 public universities, three private universities (Jan Amos Komensky University Prague, Metropolitan University Prague and the University of Finance and Administration) and both the state universities are institutions of a university type (bachelor's, master's and doctoral programs). The other higher education institutions (two public and 39 private) are non-university type institutions (only bachelor's and master's programs). (Czech Statistical Service [online], 2014)

The increasing number of private universities, as well as the increase in the number of public university faculties, are the sign of another indicator which is diversification of higher education. The reflection of the increasing life standard in the higher, more complex and more differentiated consumption in continuity with multifaceted and diverse demand, the necessity of a wider and more complex offer and a higher differentiation of the market into sub-markets is reflected also in the direction of the market of education needs. That results in the need of a prompt reaction from the education institutions, ie. the ability to react with an offer of new products in a flexible way, being it for instance incorporation of new education programs or various other services thus filling the empty and not covered market gaps.

A significant role has also been played here by a gradual implementation of the structured study model within the sc. Bologna Process that represented dividing bachelor's, master's and doctoral programs, which consequently reflected in the substantial growth of the higher education supply.

### 2.2.2 *Quantity or quality?*

However, for the universities to fulfill all the requirements that are posed onto them, they must first of all develop and run activities supporting the quality of their activities and of their effective operation on the education market. The important factor of the effective university activities are ensuring the sufficient number of high-quality students and fulfilling the message of higher education within the society. The Czech higher education has currently been undergoing a long-term reform and due to the demographic crisis a gradual reduction in potential applicants for higher education has been taking place. This is proved by the statistical figures. In the academic year 1989/90 there were 113 417 students at the public universities (out of who there were 3 396 of a foreign nationality), in 1990/91 there was only a slight increase to 118 194 students, whereas the following two years marked a slight decrease (111 990, 114 185). The increase of students in the 1994/95 academic year was contributed by expanding the full-time study form with distance and combined learning (in total 133 342, full-time study form 121 613, distance and combined 14 953). Another considerable increase, although rather slow at first, then represents the above mentioned entry of private universities into the education market. In the 2000/2001 academic year the total number of students was 190 209 out of which 2 056 at public universities. We can notice the greatest expansion in the 2010/2011 academic year when the number of students represents the peak and at the same time the thought milestone in the number of university students (in total 396 047, out of which: 358 510 with the Czech citizenship, 37 557 with a foreign citizenship, 283 607 in full-time study form, 116 728 in distance and combined learning, 57 387 at private universities) in the Czech Republic. In the academic year 2012/13 we can already see the expected decrease in the number of university students (in total 381 272, out of which: 341 599 with the Czech citizenship, 39 696 with a foreign citizenship, 282 082 in full-time study form, 102 788 in distance and combined learning, 48 392 at private universities) in the Czech Republic. (Czech Statistical Service [online], 2014) The given decrease in the number of students, however, does not seem to be any dramatic and the tendency shows that the endangering decrease can be expected first in the private institutions and only then in the public ones, as well as in the combined learning in comparison with the full-time study form. It is, however, obvious that the total decrease in the number of applicants for higher education study is an unavoidable process. The overall tendency of the number of students evolution at the Czech universities is shown in Fig. 1, where the evolution of the number of university students since 2001 is apparent.

Fig. 1 – Evolution of the number of higher education students in 2001-2012, the numbers are given in thousands of persons  
( red line – summary of universities in Czech Republic, green line – public universities, dark blue line – private universities, blue line – foreign universities)

The expansion of higher education, which the Czech Republic had been undergoing since the 1990s, was the highest of any developed country in the world. This is also proved by the fact that 60 % of the population age goes to study at university and 7 % at other vocational institutions which are also a part of tertiary education in the Czech Republic. However, neither the economic situation nor the sufficient adaptability of universities to create primarily an appropriate high-quality offer responding to the market do not correspond to the given state of things. With regards to the demographic evolution and its prognoses it is currently necessary to orientate long-term intentions of universities to suspend the quantitative growth and pay more attention to the quality of higher education, ie. to increase competitiveness of universities especially within the European competition. (Fig. 2) (Soukalová, 2013)

Fig. 2 Demographic evolution of the population at the age 18-26 (line - - - -) and 18-19(line .....), the numbers are given in thousands of persons

### 3.Problem formulation

Increasing the quality of higher education means the fundamental connection with the scientific research as well as with the economic practice. To make the education process effective, interlinking of the theory (universities) and practice (commercial and non-commercial subjects) is unavoidable, as well as it is important for the university students to be sufficiently practically prepared for starting their jobs in connection with the development of abilities leading to sufficient orientation in business processes. A significant role here is played mainly by the need to harmonize the offer of the structure of graduates with the labor market demand. Diversification of study offer is related to this, which, among others, aims at the development of professional study and practical teaching at universities with regards to the increasing employability requirements. Higher education thus represents a tool for its sustainability and renewal by orienting its attention towards development of competences in specific areas and contributes to the growth of knowledge and skills increasing the success rate of university graduates on the labor market. It is the employability and employment, ie. active participation of workforce in the social and economic activities that rank among the priorities of the human resources development. The objective of employment policy is to aim at achieving the equilibrium between the supply of workforce and their demand, at productive utilization of workforce and at ensuring the citizens the right for work. It is, however, essential that every student realizes their responsibility to ensure their future employability because the positive feature of the free choice of a study subject can on one side lead to the negative feature of the market glut in certain areas of work on the other side. This may result in unemployment, which is caused by oversupply. Those graduates with higher qualification, ie. those who will be able to prove their abilities, knowledge, skills, routines and experience needful for acquiring officially proven competence for exercising a certain profession or position based not only on their diploma but on the basis of their skills, will obtain a more favorable positions with their employers.

#### 3.1 Tertiary education and the labor market

An important aspect leading to simplification of the entrance of university graduates on the labor market is that their abilities, skills and knowledge, which are reflections of the education process, manage to meet employers' requirements as much as possible. The tertiary education system thus becomes an indispensable factor predetermining the future employability of university graduates. It is thus necessary that it is capable of a flexible reaction (and that it actually reacts) to the current as well as future needs of the labor market.

In spite of the fact that the results of the research performed as a part of the project called *Higher education systems and institutions. Development tendencies and social context (2013)* showed that in the Czech Republic in 2000-2010 the number of persons with tertiary education in all fields of study increased, the particular increase was not enough to offset economically active individuals with tertiary education with the number of vacancies requiring the tertiary education level. The greatest lack of economically active individuals (in comparison with the number of vacancies) with tertiary education was recorded in 2010 in technical sciences, production and construction where the number was lower by approximately 20 thousand than the number of the relevant vacancies. Among other areas with an oversupply of vacancies (for individuals with tertiary education) there were education and training, as well as natural sciences (mathematics and IT technology). In 2010 there thus was about 13 thousand vacancies more (only vacancies requiring tertiary education!) than the number of economically active people.

By 2020 the increase in the number of economically active individuals with tertiary education as well as of vacancies requiring tertiary education level should be continued. Such increase on the both sides of the labor market (supply as well as demand) should include all areas of education. The largest number should be noted for the social sciences, business and law. This increase will be influenced by the number of new university graduates, however, together with the number of individuals graduated from the given field of study who will retire among the economically inactive. "Due to the expected changes, the number of economically active persons with tertiary education should exceed the number of vacancies designed for them in all fields of education. Most of all it will be true for the individuals with a qualification in social sciences, business and law, the least for the individuals with a qualification in technical sciences, production and construction." (Lepič, 2013)

If we look at the development of the share of university graduates in the total economy on the time line (Fig. 1), even though there is an apparent increasing tendency: 1995/14,20 %; 2000/15,52 %; 2005/17,80 %; 2010/20,62 %, in the

overall context of the EU countries, the Czech Republic is so far in the background. In terms of the tertiary education requirements on the vacancies in a coherent view we can see that while in 2000 the vacancies with requirements of higher education on the labor market in the Czech Republic formed 24 %, in 2010 it was more than 28 % and in 2020 it should be a bit less than a third of all vacancies.

#### 4.Problem solution

The problem still remains lying in the fact that the Czech Republic in its system of production and transfer of knowledge draws from the old-fashioned industrial model for which it is typical that there is a constant persistence of relatively high level of separation of individual partners (academic sphere x commercial and non-commercial subjects) and this reflects in the incapability of interconnecting university research with the needs of the industrial companies practice. It is then especially the inability of constructive communication negatively reflected in the effectivity of cooperation of all the main subjects involved. One of the important data sources are *Employer surveys* as their opinion on the quality of workforce and requirements on university graduates contribute to identification of the problematic areas onto which the education system should focus its attention.

##### 4.1Research objectives and methodology

The objective of the carried out researches is to obtain a sufficiently reliable opinion of employers on the knowledge, abilities and skills (competences) preferences which they find as the priority ones in university graduates. The objective is also to obtain the information on what attitudes they assume towards the graduates, what is important for them when hiring a graduate, which is also related to employers' expectations from the education system. Speaking about the goal of the paper, we follow the development in the employers' requirements in comparison with the results of a research carried out in 2012 (latest published data) under the auspices of the National Institute for Education, School counseling facilities and Further education of pedagogical staff facilities, and at the same time in confrontation to the results of a test carried out by Tomas Bata University in Zlín at the same period of time.

##### 4.1.1 Nationwide research

The survey was carried out from November to December 2012 when 8 300 organizations had been addressed, whereas 543 completed questionnaires were sent back, out of which 333 were completely filled out (6,5 % return). Significant findings from the point of view of a university graduate were on one hand evaluations of the importance of competences of employees with university education, on the other hand the definition of preferences on which higher education should focus, as well as the reasons or obstacles for their acceptance.

The results of the survey clearly showed that in terms of “absolutely essential” competences the following stand at the forefront: *take responsibility* (91,6 %), *ability of problem-solving* (90,5 %) and *reading and understanding of work instructions* (90,2 %), in which we can see the representation of more than 90 %. The following necessities are equally significant: *skills in oral and written communication* (88,2 %), *ability to decide* (85,7 %) and *willingness to learn* (84 %). An important indicator here is an expansion of the requirements matrix from 2012 (compared to the original matrix from 2004) by the necessity of *skills in oral and written communication*, *ability of presentation and expressing one's own opinion* and *ability to solve stressful situations*. The newly established requirements were the stimulus for the creation of university educational courses focusing their attention on making communication and presenting skills more effective. In terms of the absolutely essential competences the following were least preferred: *proficiency in foreign languages* (54,9 %), which, however, offset the perception from the point of view of the importance of the given requirement (34,6 %).

The result values became the stimulus for the specification of identification of the key competences, on which universities should focus according to the employers' requirements. In these terms, these preferred requirements are emphasized: to be able to *take responsibility* (40,3 %), *to be able to deal with people* (39,2 %) and on the contrary the accentuated necessity of the competence to *be proficient in foreign languages* (37,0 %), consequently followed by others from the newly acquired abilities: *ability to solve stressful situations* (36,1 %) and *skills in oral and written*

communication (36,1 %), followed by the ability of *problem-solving* (35,0 %). The competence of *reading and understanding work instructions* (18,6 %) ranked at the lowest position of the key competences requirements.

An important benefit of the survey was also having found out the requirements for the corporate criteria for acceptance of university graduates for a job position. The following criteria ranked at the forefront: 1. *interest in the position* (10,1 %), 2. *willingness to learn* (8,6 %) and *required qualification* (8,6 %), 3. *flexibility* (7,1 %), *diligence* (7,1 %) and *communication skills* (7,1 %), 4. *capability of teamwork* (6,9 %), 5. *professional qualification and orientation within the particular field* (6,7 %), 7. *willingness to take responsibility* (6,3 %). At the bottom line we encounter the requirement for *proficiency in foreign languages* and the last position is taken by *the requirement for former experience and professional experience* (1,1 %).

For universities as well as for students themselves the reasons for the refusal to accept the graduates are very important. According to employers these are first reasons for refusal: unrealistic expectations of the salary amount, of working hours or the job title. Most of the employers believe that some positions cannot be taken by graduates as the particular positions require experience and applicants without experience cannot be hired for these positions. This is closely linked to a rather frequent reason of refusing an applicant-graduate, which is the lack of work and professional experience. Another limitation is then a longer time needed for incorporation and training of a graduate. Graduates with some experience are preferred by 86 % of employers (Doležalová, G., Vojtěch, J. 2013)

#### 4.1.2 Tomas Bata University (UTB), Zlín

Getting feedback from completed work internships of the university students and graduates at working positions is coming into the center of interest of the universities. Under Tomas Bata University in Zlín there had been surveys carried out to find out the requirements for competences of the UTB graduates and students according to their readiness. importance/quality. At present, the attention is aimed at feedbacks from the master's program students completed internships (6-week long ones) when for instance since this academic year compulsory internships have been established also for the bachelor's study programs (a 4-week long internship) based on the employers' requirements.

Table 1: The UTB students competences ranking according to their readiness importance/quality - 2012

	Importance	quality/ readiness
Active approach/interest in the position	1.	1.
Interest in new information /in learning	2.	3.
Competence of personal negotiation/effective communication	3.	2.
Professional knowledge/professional qualification	3.	5.
Teamwork/ability to cooperate	4.	2.
Independence/own invention	5.	4.
Communication in a foreign language	6.	4.
Soft computer skills	Matter of course	Matter of course

Also the results of the research test (see Chart 1) clearly showed that active approach of the students towards new

knowledge with the need of education is at the forefront of employers' interests, which directly corresponds with the results of the nationwide survey from the point of view of the required criteria of employers on university graduates. Relatively an equal concordance can be seen also in other preferred competences which are communication, teamwork and independence. Another concordance is found also in proficiency in foreign languages where on one hand it does not become the priority of the employers, on the other hand it does not meet their needs and ideas. Professional qualification is, however, still a problem as on the basis of students' readiness evaluation, professional qualification is still at the lower evaluation border.

#### 4.1.3 "Cooperation" project – a solution option?

The results of the survey clearly showed that the priority of university education and professional training is not only achieving a certain percentage of individuals with higher education but ensuring a proper quality of education and employability of graduates on the labor market. It has thus become a necessity to find a way of interaction between study areas and the market demand, eg. by means of cooperation of employers, education institutions as well as the public administration. The need for effective communication with the transfer of information, acquiring knowledge not only from the Czech but also foreign environment, but particularly the support of all the mentioned subjects involved and their mutual cooperation development – these were the main stimuli resulting in the project officially named *Cooperation of higher education, public administration, business and non-profit sectors for socio-economic development of the region (Kooperace vysokého školství, veřejné správy, podnikatelského a neziskového sektoru pro socioekonomický rozvoj regionu)*. The aim of the project is development of international cooperation and exchange of experience in the area of human resources and employment development on the basis of cooperation and interlinked activities of the academic sphere, non-profit sector, public and business sector under the partnership principle – a partnership whose members are Tomas Bata University in Zlín, the Zlín region, the town of Zlín, Chamber of Commerce and Business in Kroměříž, the Labor Office in Zlín and the Association of non-governmental organizations of the Zlín region. The task of the established partnership is to function as a platform for monitoring the needs of the target groups, monitoring effective distribution of sources, exchanging experience, creating expert studies, searching for innovative solutions, creating methodological suggestions, legislative proposals and above all as a platform for a constructive discussion on the options of socio-economic development of the region with the focus on employment and human resources development (Project of Cooperation, 2013). It is then possible to compare these results with similar studies have been realization. (Juříková, Jurášková, Tolarová, 2013), (Šviráková, 2014)

## 5. Conclusion

As was already mentioned, it is the constructive cooperation and communication of universities with the economic sector that may be the reflection of creating a better-quality curriculum drawn from the requirements of the practice sphere where also for instance a feedback in requirements and criteria of employers can become a significant benefit. What is important is the consequent reflection of innovated teaching and enrichment of the education program aiming at enhancing (such a problematic) quality of professional education, whether it is a form of participation of experts from practice in the teaching, or controlled professional internships in companies (public institutions). The students thus have the opportunity to gain the necessary amount of information and documents to be utilized within the education process. Professional internships may give students an insight into realistic conditions of employment, provide them with a complex set of theoretical and practical knowledge and skills, which may become the base for their future professional orientation. The economic subjects of commercial as well as of non-commercial types on the other hand gain the opportunity to realistically prove the level of knowledge, abilities and skills of the university students and thus gain awareness of their approach to work, which is ranked at the first position among the required competences. Based on the acquired information they then can present the university students an offer of employment, which represents an important positive for both sides. Mutual cooperation does not represent submission of universities to the political sphere and employers' interests but on the contrary it represents a really beneficial opening of the academic sphere to the employers' interests, general public and the regions themselves.

## Acknowledgements

The survey of the employers' needs and readiness of graduates for entering the labor market is carried out under the "ISA – Information system on graduates employability on the labor market" project whose objective it is to build a functioning information system which will allow to gather, process and analyze relevant information (economic development, demographic evolution, demands and needs of the labor market or employers, the education system development).

## Abstract

The purpose of this study is to determine the impact of Peace Education Programme (PEP) that is applied to university students on their intercultural sensitivity. The participants of this study consist of 25 university students who took Peace Education course which was an elective course. This study is pre-experimental. Intercultural Sensitivity Scale developed by Chen and Starosta (2000) was used as data collection tool. Pre-test was applied to the students who chose this course before the programme started. Then, at the last week of the course, post test was applied. It was found out there was a significant difference between participants' pre-test intercultural sensitivity scores and post-test intercultural sensitivity scores ( $Z=-1.117$ ;  $p=0.00<0.05$ ). Also it was found out that there was a significant difference between participants' pre-test and post-test scores of interaction engagement ( $Z=-3.162$ ;  $p=0.00<0.05$ ) and their pre-test and post-test scores of interaction attentiveness ( $Z=-1.735$ ;  $p=0.00<0.05$ ) which are the sub-dimensions of intercultural sensitivity. However, it was found out that there was not a significant difference between participants' pre-test and post-test scores of respect for cultural differences ( $Z=-0.948$ ;  $p=0.07>0.05$ ), their pre-test and post-test scores of interaction confidence ( $Z=-1.189$ ;  $p=0.137>0.05$ ), and their pre-test and post-test scores of interaction enjoyment ( $Z=-0.85$ ;  $p=0.172>0.05$ ) which are the sub-dimensions of intercultural sensitivity.

## 1. Introduction

With globalization and transition to knowledge era, borders between countries have been removed. Because of the borders between countries have been removed, cultures have interacted with each other more than ever before. Along this interaction process, individuals who are representatives of various cultures have interacted with the people from different race, ethnicity, religious, sect, language, accent, and culture willingly or unwillingly. Unless this interaction process is peace oriented, intercultural conflicts may rise. For individuals from different cultures to live together in peace without conflict, it is important to be sensitive to others' cultural differences.

Intercultural sensitivity can be gained to individuals via peace education programmes. Peace education contributes to behave peace oriented, to be reconciliatory (Salomon, 2002); and develops intercultural understanding (Harris, 2002). Thus, in this study, peace education programme (PEP) was applied to the university students, and the impact of the PEP to the intercultural sensitivity scores of the university students was tested.

## 2. Theoretical framework

### 2.1. Peace education

Reardon (2002) defines peace education as developing reflective and contributing capacities for achieving and maintaining peace. Peace education which adopts an education understanding for more equitable and peaceful world and which is based on taking action in this direction (Wulf, 1999) is a process during which abilities as problem solving, cooperation, reflection, conflict solution and attitudes as love, respect, tolerance, and empathy are taught to individuals and students (Sagkal, 2011). Peace education aims to solve conflicts without violence, to build peace for mutual harmony, and to transform individuals' mental models (Reardon, 2002).

Peace education incorporates students and teachers into a process for change, contributes them to behave peace oriented, and contributes to be reconciliatory. This contribution continues permanently after peace education. Thus, this contribution makes possible atmospheres which are solution oriented, environments which result in a functional way of conflict without damage, and environments that don't have any violence elements. Therefore, this is seen as very important for education and instruction processes, development, and life quality (Salomon, 2002). Peace education is dealt with a peaceful pedagogy, and peaceful pedagogy consists of concepts as cooperative learning, democratic society, moral sensitivity, and critical thinking (Harris, 2002).

#### 2.1.1. The goals of peace education

According to Johnson and Johnson (2005), the primary purpose of peace education is to establish peace between humankind, interpersonal relationships, groups, countries, societies, and cultures. Harris (2002) lists the purposes of peace education as understanding the richness of the concept of peace, examining fears, gaining knowledge about security systems, understanding violence, developing intercultural understanding, promoting social justice with peace, encouraging respect to living, and ending violence. Moreover; Sommers (2002) lists the purposes of peace education as ensuring the students to assess disagreements with a more positive attitude; gaining cooperation oriented reflective thinking ways for problem solving; to handle in societal problems with a more universal perspective; ensuring enhancing tolerance for political, religious, and racist differences; gaining responsibility for decision making and reflective thinking; and ensuring people to find peace both in their inner world and in their society via all of these. Additionally, PEP's primary purpose is bringing methods and strategies which are requirements of living together in peace in societal life to the university students, in this study.

#### 2.1.2. The principals of peace education

Peace education programmes are formed based on some principals. According to Bar-Tal (2002, pp. 29-33); peace education is condition dependent and based on social agreement, serves as social platform, and it is an orientation, has to be open-minded and relevant, requires experiential learning and is instructor dependent. Danesh (2006, pp. 57-61) asserted that truly efficient peace education can only take place in the context of a unity-based worldview. Peace education can also best take place in the context of a culture of peace, peace education best takes place within the context of a culture of healing, and peace education is most efficient when it constitutes the framework for all educational activities. PEP that is applied to university students in this study was designed according to these principles.

#### 2.1.3. Peace education models

Peace education models in the literature can be listed as integral model (Brenes, 2004), learning to abolish war framework (Reardon & Cabezudo, 2002), flower-petal model (Toh, 2004), living systems model (Burns & Aspeslagh, 1996), integrative peace education model (Clarke-Habibi, 2005).

*Integrative model* builds on person's integration, balance, and harmony with himself, others, and nature (Brenes, 2004). Moreover, *learning to abolish war framework* (Reardon & Cabezudo, 2002) is a peace education model which focuses on the issues of the reasons of conflicts, conflict management, international law, and global disarmament. Toh's

(2004) *flower-petal model* includes dividing disagreements to parts; living with justice and compassion; building reconciliation, solidarity, and respect for cultures; supporting human rights and responsibilities; living in harmony with world; and enhancing inner peace. *Living systems model* handles in international system, peace, development, human rights, and nature in personal, societal, national, regional, structural, cultural, and global contexts (Burns & Aspeslagh, 1996). Additionally, *integrative peace education model* which was developed for Bosnia-Herzegovina and which was applied there had been developed based on the purposes and concepts of peace (Clarke-Habibi, 2005). PEP, which is the independent variable of this study focuses on the university students, and programme which is based on above models was designed with the purpose of ensuring intercultural sensitivity to the university students.

## 2.2. Intercultural sensitivity

Intercultural sensitivity which is conceptualized as an intercultural communication competence that prevents negative emotions as prejudice, anxiety, lack of confidence, and avoidance towards different cultural features (Fritz, Mollenberg, & Chen, 2002) can be defined as being sensitive towards cultural differences and viewpoints of the people from different cultures (Bhawuk & Brislin, 1992). Intercultural sensitivity is an ability that promotes and encourages appropriate behaviour, and develops positive emotion towards understanding and appreciating cultural differences (Chen, 1997).

Intercultural sensitivity is examined in two periods in Developmental Model of Intercultural Sensitivity. First period is an ethnocentric period, and in the ethnocentric period individual judges all humanity with own values, unconsciously. In this period; there are denial, defence, and minimization stages. On the other hand, second period is an ethnorelative period, and in the ethnorelative period individual experiences other cultural contexts. In this period; there are acceptance, adaptation, and integration stages. Briefly, in Developmental Model of Intercultural Sensitivity, individuals ignore others' cultures, or defend because of perceiving differences as threats, or think their worldviews are universal in spite of accepting differences in the ethnocentric period. However, it can be said that individuals enjoy cultural differences, change their behaviour as adapting different cultural atmospheres, and assess behaviour from a large cultural framework in the ethnorelative period (Bennett, 1986).

Chen (1997) acknowledges that intercultural sensitivity is a dimension of intercultural communication competence, and lists the components of intercultural sensitivity as self-esteem, self-monitoring, open-mindedness, empathy, interaction involvement, and non-judgment. *Self-esteem* expresses positive emotion towards respect the situational differences in intercultural interactions. *Self-monitoring* is a speaking and behaving in control ability when individuals meet limitations. *Open-mindedness* refers to the wistfulness of individuals to appropriately express themselves and accept other's explanations. Open-minded individuals recognize, accept, and value different thoughts and viewpoints, willingly. *Empathy* is an ability that is about to perceive and understand others. *Interaction involvement* is an ability of sensitivity for individuals' interactions. *Non-judgment* consists of listen to others sincerely, avoidance of making decisions quickly and creating values about others (Chen, 1997, pp. 6-9). These components have been handled in five dimensions in Intercultural Sensitivity Scale which is developed by Chen and Starosta (2000), and these dimensions are interaction engagement, respect for cultural differences, interaction confidence, interaction enjoyment, and interaction attentiveness. According to Chen and Starosta (1996), these components and dimensions ensure the individuals to show intercultural sensitivity during intercultural interaction. Individuals' intercultural sensitivity can be enhanced through various experiences and education programmes. And also, peace education can be handled in one of these education programmes.

## 3. Methodology

### 3.1. Model of the study

Single group pre-test post-test model which is a type of pre-experimental designs was used in this study. In the single group pre-test post-test model, independent variable is applied to participants, and measurements are carried out both before experiment (pre-test) and after experiment (post-test). If post-test scores is much more than pre-test scores, this is considered to result from independent variable (Karasar, 2008). Also in this study, with the purpose of examining the

change in university students' intercultural sensitivity scores pre-test was applied to the participants before starting programme, post-test was applied to the participants after the programme, and difference or lack of difference between pre-test and post-test scores were determined.

### 3.2. Participants

The participants of this study consists of 25 university students from different faculties who took and attend Peace Education course which was an elective course at Kocaeli University in Turkey in 2013-2014 academic year.

### 3.3. Instrumentation

While gathering data during this study, "Intercultural Sensitivity" scale developed by Chen and Starosta (2000) was used. There are *strongly disagree*, *disagree*, *uncertain*, *agree* and *strongly agree* options in the five-point likert scale for each item. Scale has seven items in the interaction engagement sub-dimension, has six items in the respect for cultural differences sub-dimension, has five items in the interaction confidence sub-dimension, has three items in the interaction enjoyment sub-dimension, and three items in the interaction attentiveness sub-dimension. Totally, there are five dimensions and 24 items in the scale.

### 3.4. Peace education programme

PEP was applied to participants within this study. PEP lasted 14 weeks and 28 hours. In this study, PEP's primary purpose was bringing methods and strategies which are requirements of living together in peace in societal life to the university students. With this purpose, a programme was designed to develop university students' physical, psychological, and social environments; viewpoints to individual differences; communication, empathy, anger management, problem solving, and peacemaking abilities. There were two-hour sessions for each week in the programme. The contents of the session, respectively as follows: I. The concepts related with peace education, II. The reasons that require peace education, III. Professional and characteristic features of the peace education teacher, IV. The purposes of peace education and examining curriculums via peace education lens, V. The content in peace education and examining curriculums in this respect, VI. Preparing learning environments in peace education and sample activities, VII. Communication skills and empathy for peace, VIII. Peaceful problem solving skills and sample activities, IX. Managing emotions in peace education, X. Anger and conflict management in peace education, XI. Peacemaking in peace education and sample activities, XII. Micro teaching practices based on peace education (two sessions).

## 4. Results

The main hypothesis of the study is "*H1. There is a significant difference between participants' pre-test and post-test scores of intercultural sensitivity.*" The sub-hypotheses are;

- "*H1a. There is a significant difference between participants' pre-test and post-test scores of interaction engagement sub-dimension.*"
- "*H1b. There is a significant difference between participants' pre-test and post-test scores of interaction attentiveness sub-dimension.*"
- "*H1c. There is a significant difference between participants' pre-test and post-test scores of interaction confidence sub-dimension.*"
- "*H1d. There is a significant difference between participants' pre-test and post-test scores of interaction enjoyment sub-dimension.*"
- "*H1e. There is a significant difference between participants' pre-test and post-test scores of respect for cultural differences sub-dimension.*"

With the purpose of testing the hypotheses, participants' pre-test and post-test scores of intercultural sensitivity scale were tested via Wilcoxon signed ranks test. Analysis results were given in Table 1.

Table 1. Wilcoxon signed ranks test results for participants' pre-test – post-test scores

Posttest Scores – Pretest Scores		N	Mean Rank	Sum of Ranks	Z*	P
<i>Intercultural Sensitivity</i>	Negative Ranks	10	12,1	121	-1,11	.012
	Positive Ranks	15	13,6	204		
	Ties	0				
interaction engagement	Negative Ranks	3	9,83	29,5	-3,16	.000
	Positive Ranks	19	11,76	223,5		
	Ties	3				
interaction attentiveness	Negative Ranks	7	9,5	66,5	-1,73	.000
	Positive Ranks	14	11,75	164,5		
	Ties	4				
interaction confidence	Negative Ranks	10	9	90	-1,19	.108
	Positive Ranks	12	13,58	163		
	Ties	3				
interaction enjoyment	Negative Ranks	11	13,86	152,5	-0,85	.057
	Positive Ranks	11	9,14	100,5		
	Ties	3				
respect for cultural differences	Negative Ranks	16	11,44	183	-0,94	.288
	Positive Ranks	8	14,63	117		
	Ties	1				

\* based on negative ranks

As a result of this study, there is a significant difference between participants' pre-test and post-test scores of intercultural sensitivity ( $z=-1,11$ ,  $p<0.05$ ). Thus,  $H_1$  is confirmed. When sum of ranks and mean rank are considered, it has been found out that the difference between pre-test and post-test scores is in favour of positive ranks score. According to this result it can be said that PEP helps participants' intercultural sensitivity scores increase.

Analysis results of the hypotheses related to sub-dimensions indicates that there is a significant difference between participants' pre-test and post-test scores of interaction engagement ( $z=-3,16$ ,  $p<0.05$ ), and there is a significant difference between their pre-test and post-test scores of interaction attentiveness ( $z=-1,73$ ,  $p<0.05$ ). Based on these statistical results,  $H_{1a}$  and  $H_{1b}$  were confirmed. Sum of ranks and mean rank indicate that the difference between pre-test and post-test scores is in favour of positive ranks score. This result can be interpreted as participants' interaction engagement scores and participants' interaction attentiveness scores were increased via PEP.

Analysis results of other sub-dimensions show that there are not any significant differences between participants' pre-test and post-test scores of interaction confidence ( $z=-1,19$ ,  $p<0.05$ ), pre-test and post-test scores of interaction enjoyment ( $z=-0,85$ ,  $p<0.05$ ), and pre-test and post-test scores of respect for cultural differences ( $z=-0,94$ ,  $p<0.05$ ). Based on these results;  $H_{1c}$ ,  $H_{1d}$  and  $H_{1e}$  were rejected. This finding can be interpreted as PEP didn't show the expected effect of increasing participants' interaction confidence, interaction enjoyment, and respect for cultural differences scores.

## 5. Conclusions

According to the results of this study, it is seen that there are significant differences between university students' pre-test and post-test scores of intercultural sensitivity, their pre-test and post-test scores of interaction engagement, and their pre-test and post-test scores of interaction attentiveness. And also these differences are in favour of post-test scores. These results can be interpreted as university students' intercultural sensitivity, interaction engagement, and interaction attentiveness levels can be increased with PEP. This result supports Harris's (2002) thought that intercultural

understanding can be enhanced via peace education programmes. In this sense, it can be suggested that PEP achieved its goal in general, and the programme can be used as a tool for building peace and enhancing intercultural sensitivity.

PEP which was applied to the university students didn't reveal any significant difference between pre-test and post-test scores of interaction confidence, interaction enjoyment, and respect for cultural differences. Thus, it can be said that PEP didn't show expected impact in terms of these sub-dimensions. Danesh (2006) suggests that there must be activities which are based on experiences in the peace education programmes. The reason of not revealing expected impact for these sub-dimensions can be that PEP doesn't have any activities which are based on experiences for these sub-dimensions. In this sense, it can be suggested that PEP must develop in terms of these ways.

PEP was applied to a group that consisted of participants who were the university students in this study, and programme achieved its goal in general. Some recommendations for future research can be conducting studies with various and larger groups, with different experimental methods which can also enable us to test the effectiveness of PEP in terms of these groups and methods.

# The impact of progress testing of students on their results at final exam

Tomáš Moravec<sup>a</sup>, Petr Štěpánek<sup>a</sup>, Petr Valenta<sup>a92</sup>

<sup>a</sup>University of Economics, Prague, sqw. W. Churchill 4, 130 67 Prague 3, Czech Republic

---

## Abstract

The paper analyses impacts of the system of progress testing of students in mid-term and at the end of semester on their knowledge of lectured topics presented at oral exams. The data was collected from progress computerized tests of all students of obligatory course Law basics at the University of Economics, Prague in the period of 2008-2014. The research confirmed the positive influence of progress testing of students on their final results. The analysis also proved that it is necessary to continuously modify certain number of questions in the entire set to keep the pressure on students to study and not to rely on the historical information from their predecessors. The paper examines what share of questions it is necessary to modify to keep the certain level of knowledge of students.

*Keywords:* Progress testing; Computerized examination; Final exam; Knowledge of students

---

## Introduction

The course Law basics is an obligatory course for all students of the University of Economics, Prague (UEP) and is assured approximately for more than 2 000 of students per school year. The main aim of this course is to provide students necessary basic knowledge of law especially in the field of the theory of law, theory of state, civil law and main principals of contract law. Special emphasis is put on business law at the national and also European level. This knowledge is necessary for further consecutive courses in all study programs at UEP and should be useful for students after finishing their studies at their work and also in a real life.

The knowledge of students is checked at final oral examination. To successfully pass the course students should be acquainted with basic terms of theory of law; they should identify the applicable legal provisions, know the basic types of contracts, determine the differences among types of business companies and identify the conditions for liability and the consequences of breaching obligations.

To ensure the high level of standard and the highest possible benefit of the course for students there are constantly considered its possible improvements. One of the improvements was the introduction of the system of progress testing of students which is done by computerized tests in the mid-term and at the end of the course. The benefits and limitations of progress testing of students, its computerized method and the analyses of the data gained so far are discussed further in the article.

## Literature Review / Research rationale

In the literature there exist many studies which examine the evaluation of students in general and the improvements in examination implemented by introduction of automated systems.

Rudman concludes that testing and teaching are not separate entities, testing still remains an integral part of teaching and students feel that frequent testing helps them retain more content, reduces test anxiety, and aids their own monitoring of their progress. Rudman also deals with question of using standardized tests and carries out the results of

---

\* Corresponding author. Tel.: +420 224 095 227

E-mail address: valenta.pe@gmail.com

research in which he claims that students report a higher level of test anxiety over teacher-made tests (64%) than over standardized tests (30%).

The importance of continuous testing of students confirms Oagle who describes formative evaluation models in his work and proposes its improvements.

Horovčák et al. conclude that electronic version of testing presents modern and effective form of feedback from students to teacher and that electronic testing has its own unique place in the whole education process.

Stanescu et al. also prove the advantages of an e-learning tool that permits generation of questions from the certain bases of question defined previously.

Viciana et al. describe a computerized system that allows researchers creating, applying and tabulating surveys and paper instruments in an automatized way and consider them as a useful tool since it permits to input data with higher precision and no need for previous codifications. Dindar et al. also describe the role of multimedia in education and in testing of students.

Deep research of using multiple choices testing at entrance exam for University of Economics in mathematics which is also computerized was conducted by Klůfa who perceives multiple choices testing as optimal and objective for entrance examinations at University of Economics, Prague.

### **The context of the study and the research questions**

The main aim of the paper is to analyse available data from computerized system of testing and the effect of introducing the progress testing on the knowledge of students and to discuss further details. For this purpose the essay discuss following research question for the first.

Q1: Has the introduction of continuous progress testing positive influence to the knowledge of students and their evaluation at final exam?

At the same time we presume that students slowly share questions from the tests after their finishing and that the question basis is gradually spread among students. To confirm this presumption we will set a representative sample of questions and examine the correctness of answers to them in time. In this context we pose following research question

Q2: How does the correctness of answers to certain sample of questions changes in time?

According to us to keep the constant level of knowledge of students and thus constant average results achieved by them at their final exam it is necessary to continuously modify a question basis a and add a certain share of new questions to the whole question basis each year. To analyse this problematic following research question is discussed:

Q3: What share of questions is necessary to modify to ensure the constant level of knowledge of students?

### **The effect of introducing the progress testing**

The research was carry out by analysing the data collected from progress computerized tests of all students of obligatory course Law basics at the University of Economics, Prague in the period of 2008-2014. Table 1 describes the average results of students archived in each year after introduction the computerized progress testing in 2008. Average of results row shows the average of grades received by all students in each year at final oral exam. During the oral exam the overall knowledge of students is verified and students obtain their evaluation from grade 1 (excellent knowledge) to grade 4 (insufficient knowledge) which means failing the exam.

Table 1 Average result of students in each school year

School Year	Y08/09	Y09/10	Y10/11	Y11/12	Y12/13	Y13/14
Average of results (grade)	2.43	2.24	2.04	2.21	2.23	2.11
Change of the average grade	N/A	0.19	0.20	-0.17	-0.02	0.13

As indicated in the Table 1 we can see that average results (grades) of students had improved from average grade 2.43 in the school year 2008/2009 to 2.24 in the school year 2009/2010 and to 2.04 in 2010/2011. I the school year

2008/2009 the computerized testing system was introduced and checked during its initial phase and the system went into full operation in the school year 2010/2011. We can therefore conclude that one and two years after introduction of computerized progress testing the average grades gets improved approximately by 0.2 point of average grade in each year.

When examining the average grades in following years presented in the table we can see that the results became to oscillate. Especially in the school year 2011/2012 the average results gets worse by 0.17 point comparing previous year. Next year the results are nearly the same and in the current school year 2013/2014 average grade were 2.11. It is by 0.13 better than in previous year. We suppose that this asymmetry is caused by other factors which are discussed in following sections of the paper.

Derived from the Table 1 we can conclude that in all years after the introduction of computerized progress testing of students the average results of students are better than in the school year 2008/2009 when the computerized system of testing was only in its initial phase and the progress testing had no relevance at all in this year. The summarized data of average results of students at final exam in previous years which would be necessary for further analysis are unfortunately not available.

Nevertheless mentioned oscillations we can therefore formulate a positive answer to the question Q1 and conclude that the introduction of continuous progress testing has positive influence to the knowledge of students and their evaluation at final exam.

This conclusion also confirms the above mentioned statement of Rudman who claims that testing is very important part of the process of teaching students and that frequent testing helps students to retain more content, can reduce their anxiety at final exam and enables them continuous monitoring of their progress.

### Changes in correctness of answers in time

We presume that one of the reasons why the average results of students began to oscillate in last three years is the fact that question base is gradually spread among students especially through social networks, shared databases, smart phone applications and other arrangements for information sharing. In preparing for progress tests students therefore rely further more on questions which are available for them and underestimate their preparation by deep study. This has a negative impact on their results at final exam afterwards.

To confirm our presumption we have chosen a representative sample of twelve questions which are part of the test basis. These questions had been chosen from different areas of law which are presented during the course. Afterwards we have deeply examined the correctness rate of answers to each of this question in each school year in past four years when the computerized testing is applied and correctness rate data are available (the data concerning the correctness of answers are fully available since the school year 2010/2011).

Table 2 displays the correctness of answers to the representative sample questions in each year and the calculation of its linear trend in time for each question. Correctness of answers shows which share of students correctly answered each particular question and is stated as a percentage share of all answers to this question registered by the computer system in each year. Positive linear trend indicates that correctness of answers to particular question increases. On the contrary negative linear trend signalizes decreasing correctness of answers.

Table 2 Correctness of answers of students in each school year

	Y10/11	Y11/12	Y12/13	Y13/14	Linear trend
Q1	29.93	45.74	68.94	54.59	9.72
Q2	43.11	32.58	25.40	42.62	-0.86
Q3	31.73	39.67	39.64	57.92	7.85
Q4	77.15	76.20	77.02	77.50	0.19
Q5	60.85	70.47	71.98	91.78	9.43
Q6	47.78	61.35	54.10	60.93	3.22
Q7	32.24	32.07	31.42	29.79	-0.80
Q8	54.28	68.09	76.82	75.13	7.13
Q9	57.31	59.51	62.84	75.53	5.80
Q10	12.81	17.07	17.98	14.77	0.68
Q11	31.54	42.59	35.06	31.56	-0.75

Q12	45.26	49.46	72.25	73.50	10.75
Average	43.66	49.56	52.79	57.13	4.36

As it can be seen in Table 2 positive linear trend was registered in nine questions and negative trend in three of them out of twelve sample questions.

When deeply analysing the results we can see that in seven questions the Linear trend is higher than plus one and it means that considerable grow of correctness was recorded at these questions. For example we can point out at the Question five where the correctness continuously grows from 60.85 % in the school year 2010/2011 to 91.78 % in the 2013/2014. In no cases the linear trend below minus one was registered and it means that any significant drop of correctness of answers was recorded.

To summarize this results we can find that in seven questions out of twelve the correctness of answers increases. In remaining five questions linear trend oscillates around zero and the correctness of answers therefore remains relatively stable.

To confirm these results we have also calculated the average of correctness of answers to twelve sample questions in each school year which continuously grows from 45.26 % in 2010/2011 to 73.50 % in the school year 2013/2014. The linear trend for these average results is 4.36.

Concluded mentioned data we can answer question Q2 and state that correctness of answers to particular questions changes positively in time. We also continue to presume that question base of our test is gradually spread among students. We can therefore confirm the statement of Dindar who describes the increasing role of multimedia in education but in this case it is unfavourable to our system of testing students.

### Updating the question basis

To keep the constant level of knowledge of students we had decided try to modify a question basis and to add a certain number of new questions into it. For the first we would therefore verify the influence of these changes on the results of students at the final exam.

Table 3 Number of added questions in particular school year

	Y08/09	Y09/10	Y10/11	Y11/12	Y12/13	Y13/14
Average grade	2.43	2.24	2.04	2.21	2.23	2.11
Change of the average grade	N/A	0.19	0.20	-0.17	-0.02	0.13
Total number of questions	80	326	620	620	629	850
Number of added questions	80	246	294	0	9	221
Share of new questions	N/A	75.46%	47.42%	0.00%	1.43%	26.00%

Table 3 shows the average grade of students in each school year compared with the share of new questions added in appropriate year. The basis of questions consisted of 80 questions in the beginning and in certain years was occasionally extended by other new questions. For example 246 questions were added in the school year 2009/2010. Derived from the table we can see that in school years when new questions were added the positive change in average grade was registered. On the contrary in school years when no or minimal number of questions were added the change of average grade was negative. This analysis therefore proves that it is necessary to modify certain share of questions in the data basis each year to keep the pressure on students to study and not to rely on the historical information from their predecessors.

By further processing of available data we would liked to quantify which share of question basis it is necessary to add or modify each year to ensure a constant knowledge of students at the final oral exam which means to archive zero change of the average grade between two following years. For this purpose we will construct a simple linear regression in Chart 1.

Chart 1 Linear regression of change of the average grade and the change of new questions share

Chart 1 displays a simple linear regression of dependence of change of the average grade on the change of new questions share. As it is shown the positive statistical dependence was confirmed and we can do a simple calculation to set that to archive zero change of the average grade of students it is theoretically necessary to modify 14.83 % of the question basis. In answer to the question Q3 we can state that to ensure the constant level of knowledge of students it is necessary to modify 15 % of questions in the progress tests data basis.

### Limitations

Presented study has also certain limitations. In the lectured topics of law which are presented at the course there are from time to time made some changes which have to be implemented into the course and also into the questions of the test. These changes could slightly distort the results of the research and their further analysis would be necessary.

The computerized system designated to testing of students is continuously developed and new tools and functions could be added which could also influence the data. Together with this the time series of available data is relatively short and same indicators are available even from later period (e.g. the indicator of correctives of answers described in section five).

To ensure clearer feedback and less complicated process of analysing results a definite number of questions in the question bases should be set and when changing the questions in the basis old questions should be simply replaced by new ones. Each added question should have the similar level of difficulty as the previous one.

Computerized system of testing is without any doubts very helpful both sides for teachers and also for students and despite mentioned limitations will be further deeply analysed and continuously improved.

### Conclusion

We have analysed and answered all three research questions set at the beginning of the paper. We can summarize that progress testing forces students to prepare themselves for final exam continuously during the semester. The results of the tests which are available for students immediately after finishing the test give students appropriate and early feedback of the level of their knowledge and students can modify the methods of their preparation for final exam in due time. We have therefore confirmed results of available studies which consider progress standardized testing as a useful tool in the whole process of education.

It is necessary to continuously analyse available data and results of students at progress tests and at final exams at the same time. Computerized method of testing and the available data of correctness of answers to certain question helped us to confirm our presumption that it is necessary to continuously update the question basis and replace a share of questions by some other new questions. Computerized method of testing has also other advantages. It enables us to gain other useful data for further analysis for example in identifying of problematic lectures, parts of the course, misleading questions, differences among particular lecturers etc. At the same time it is the method more preferred by students and also helps to save time of academic staff spend on correcting of tests. There are also savings of material costs for example for paper and printing.

## Abstract

This text presents new possibilities for using technology in education within the context of critical theories of education. We try to view these theories, which focus on the risk of applying classical curriculum, in the light of new options that appear due to technological developments. With this development new consequences are beginning to emerge which could not be reflected in the theories due to the time in which they were developed.

## Introduction

The development of technology is bound up with education in two basic ways. First, it creates a need for training, such as training staff when new equipment arrives in an organization (Emad, 2010), but also with less formal and more educative effect on the development of computer skills in personal life. The second way in which technology is integrated into education is by opening up new possibilities that allow one to increase the effectiveness of the educational activity. At the same time technological changes express themselves in questions about the current curriculum and the methods by which it is implemented (Fung, 2005). Considering the speed of change seen over the last few decades is likely that some theories which arose before some of these changes in possibilities can take on new forms and acquire new tools to achieve the desired results. This paper aims to review some of these theories and provide them with new footholds which are to be found in new technologies. In doing so, we will focus mainly on Ivan Illich's theory of deschooling society, Malcolm S. Knowles's self-organized learning theory and the critical theory of Paulo Freire's pedagogy of the oppressed. The work is primarily focused on the consequences for adult education, but at some points the text does deal with education in general and thus also addresses the education of children and adolescents.

## Theories of education

### *Ivan Illich*

On the basis of his experience with various global models of education, in the 1970s Ivan Illich came up with the requirements of the deschooled society. In his theory he describes school as an oppressive system, which, despite some efforts at reform (higher funding or even the introduction of new methods and technologies in education) always tends to favor those who are already advantaged (Illich, 2001). Schooling as a whole, according to him, does not operate purely according to its formally established goals, but also conveys a hidden curriculum, hidden behind the knowledge transmitted. The content of this hidden curriculum is the creation and legitimization of the class structure of society

(Illich, 2001). He thus goes much further than thinkers like Jarvis, who see a function of the social system in the modality of education from above, which is approaches the classical curriculum (Jarvis, 1989). As one of the major conflict theorists, Pierre Bourdieu, sees the educational system in a similar way to Illich. Bourdieu likens school to Maxwell's demon, which in a thought experiment by the physicist J.C. Maxwell can distinguish fast from slow particles (Bourdieu, 1998). Likewise, school, despite its declared primary function of education, above all carries out the task of selecting and allows only those students who have a greater ability to continue in education to acquire symbolic wealth (i.e. the education required to understand information). In this way schools select those faster elements and thus confirm the social status of students, regardless of their potential (Bourdieu, 2008). The cards are thus already dealt, and school plays no role other than to represent justice in an unjust system.

The specific role of the school is also perceived by Illich, who points to the role of the school as an advertising agency for society that wants man to believe that they need society to remain just as it is. In effect, this function of school supports social polarization and mental passivity on the part of members of the society. In this way school encourages the perception of institutionalized rules as social norms (Illich, 2001). This approach to institutionalized education is one of the reasons why Illich proposes the elimination of the school system and its replacement by learning, which is not dependent on the general school system (Illich, 2001). This deschooling society begins with the removal of the cultural myth of education and then continues with the elimination of all core curriculum (Illich, 1976).

Illich sees the path from the world of institutionalized learning to lie in learning networks, which allow one to build on individually motivated learning instead of employing teachers who force students to find the time and the will to learn. Another possibility which learning networks reveal is connections with the real world (we also find this possibility, or rather necessity, in Freire). These learning networks rest on four basic possibilities for obtaining information (Illich, 2001):

1. Arranging access to educational objects (libraries, labs and museums as well as businesses or airports).
2. Skills Exchanges – a catalogue of people and their skills.
3. Arranging learning partnerships through communication networks
4. Arranging teachers of all sorts

Thus, the educational system in Illich's model breaks down into individually selected and configured combinations of the options above, which replace the need for a general curriculum.

#### *Paulo Freire*

P. Freire's concept responds to the education system that he describes, and which is called the pedagogy of the oppressed (Freire, 2000). This system, in which one meets with the narrator (teacher) expecting that the student will listen to the narration and mechanically remember it (Freire, 2000), prevents education in liberation and the achievement of the status of a complete and equal member of society. According to Freire, this approach needs to change to a dialogical approach. The dialogical approach overcomes the problem of the unavailability of information, which in the classical pedagogical approach the teacher transfers to the student and the student accepts uncritically (Freire, 2000). Here we can find similarities with Illich. Illich criticizes institutionalized education, among other things, for the fact that learning about the world is presented as more valuable than learning through the world, which reinforces the monopoly school has as the only institution with the authority to transfer knowledge (Illich, 2001). In both authors, we this meet with criticism of one-way communication, which in the process of education alienates individuals from their world.

The essence of Freire's proposal for the reformation of the educational approaches rests in reconnecting man to his own world. This is done through dialogue, followed by a reflection on his own world and a final action, which makes it possible to transform the world (Freire, 2000). This transformation is then capped off by the process of liberation. The moment a person obtains knowledge about themselves and their own world, s/he can make decisions about their own lives (Freire, 2000), just as much as the knowledge they need for a better understanding of the context of their world. Freire's model is an attempt at achieving liberation from the oppression of fixed curriculum which have little in common with the life of a particular individual. A person thus is not taught useless content (which often has oppressive potential), but rather content which can help to reflect on and transform the world – learning thus ceases to be an instrument for maintaining the status quo, and becomes an instrument of change.

Unlike the previous authors, Malcolm S. Knowles focuses primarily on adult education. At the same time he supports the theory that the foundation of good adult education is personality, which Knowles identifies as a self-directed person. This personality is a logical developmental element in human evolution – from the initially dependent personality of a child to an independent adult. Knowles points out that even when adolescents are already able to take on responsibility, despite this maturity the educational system keeps them in certain state of dependence. Everything changes with the entry into adulthood when individuals no longer feel themselves to be full-time learners (Knowles, 1980). Knowles here presumes a change in approach – whereas previously the role of educators of children and adults were perceived to be the same, that is to tell students what they should know – Knowles describes a different approach. The educator here does not act as the bearer, judge and authority (who gives students the answers), but more as a facilitator and consultant, focusing on the role of being an assistant in finding answers to the students' own questions (Knowles, 1980).

The question of self-directed learning and its use with adults is also addressed by Brookfield, who to some degree critically responds to Knowles's often excessively optimistic approach to adults. Among other things, he questions the tendency of adults to move towards a state of self-management (Brookfield, 1986). This challenge becomes a problem when thinking about educational networks and education outside educational institutions, as we have outlined above in relation to Illich. The question is to what extent we can rely on participants in the educational process as subjects fully competent to determine effective means of (self-)education. Brookfield also points to the fact that the transfer of control over education in the context of institutionalized education is a counterproductive and self-negating concept (Brookfield, 1986). Brookfield and in response to Illich, imagines a changed in the role for educators who move from Knowles's facilitator role (as a source of ways in which education can take) to the role of movers, which allows the formation of relationships in networks, i.e. a kind of mediator of transactions between entities/objects in education.

### **The relationship between technology and institutional education**

Having introduced the models and theories above, we would like to point out the possibilities that the authors mentioned may not have counted, considering the level of technological development. The question of whether it is necessary to control the learning process or whether it is possible to rely on the self-directed personality and what possibilities of such a personality has in guiding its own development. It is also questionable whether adult educators should enter into the process of learning as a mediator of contacts in educational networks. In response to more complex approaches, the issue of curriculum emerges. How can it be prescribed in such a way that it does not yield to the pressure of society, as formal education behave in Illich's view? How is it possible to provide learners with tools for discovering their own world, in a way which then leads to changing it? What role should or can an educator play?

The development of technologies brings with it the possibility of achieving some of the ideas presented above. This can be found, for example, creating a so called Personal Learning Environment. We will discuss what such an environment can look like and what it may include in terms of the previous section of this article.

### **Personal Learning Environment (PLE)**

We conceive of a personal learning environment as a virtual learning space connected with practice, its creation and use go hand in hand with a more or less conscious decision of the learner to take education into their own hands. This can be useful in both in institutional education, and in less formalized approaches to learning (Alharbi et al., 2013). This concept of the PLE is closely associated with the concept of self-organized learning, referred to as self-directed learning, advocated by Malcolm Knowles. The idea of self-organized learning, however, applies not only to andragogy, but to education in general. For example, in his book *Freedom to Learn* the American psychologist Peter Gray wrote that a desire for freedom is rooted human nature. We want to take advantage of help, but on our own terms. From birth we have a desire to explore the world around us, but this desire, according to Gray, is destroyed by schooling. It convinces us is that we are not competent, our questions are irrelevant and the goal of our life is to obey those who govern us (Gray, 2012). Learning is an active process controlled by the learner and motivated by curiosity. However, what is created, as Gray writes, is schools, which prevent self-regulated games and exploration. What is most important

is not what we learn in the classroom, but what is learned by following our own interests and goals with a deep passion. In this way we can discover what we enjoy most, which is according to Gray is the first step to finding a satisfying career (Gray, 2012). If school really destroys the desire for self-directed learning, it Brookfield's skepticism would be understandable. If we build on the thesis that an adult cannot automatically assume the characteristics of self-directed personality, then it seems clear that whether or not the efforts of teachers have lead the student to adopt such an approach will certainly have played a role in this. Here lies the answer to the question of how much the facilitation of the instructor is necessary in directing students towards self-directed learning and self-directed personality.

This brings us back to the vision of Malcolm Knowles. We see its advantage precisely in the creation of PLE. What does a PLE look like? Considering it from afar, PLE begins with opening a web browser, if not the computer itself. A PLE is not a specific piece of software or application. We see it rather as the space that the learner fills with different content based on their choice and judgment. It is filled by the path to the goal. Next, we will look at the path the learner can use.

### *Personal Learning Plan (PLP)*

In order for self-directed learning to live up to its name and in its content, that is for it to be directed, it seems appropriate to provide a curriculum model.

An example might be the Edventure design model. This calls for several steps. 1. The educational field. Setting concrete and clear tasks. 2. Objectives and time. Setting achievable and measurable goals for a particular period. 3. Motivation. Why do we want to be educated in a particular field? 4. Online Resources. Online courses, e-books, blogs. 5. Offline resources. Books, lectures, screenings, workshops or universities. 6. People Experts in a given field, academics, practitioners, community. 7. Tools. Equipment, software and other equipment needed for training. 8. Outcomes. A record of what has been learned. Blogs, e-portfolios, journals, or lectures (Edventure, 2014). Lesson plans and models such as Edventure have partially implemented certain rules, for example, quite similar to the known rule SMART(ER) – specific, measurable, achievable, realistic, time-bound, evaluated (this can be self-evaluated) reviewed.

Adherence to a plan in its simplest form (in summary) can be monitored by the learner him- or herself, but software and applications can also be selected that support and facilitate adherence. Comprehensive solutions for managing the learning environment can be offered by specific software for education, but, as of yet, we do not see this practice to be particularly widespread. What, however, is widespread and accessible is software for project management. Education is also a project, and therefore it is possible to use such software. The advantage is that such software is available in various forms as open-source programs and does not cost the learner anything. It allows learners in one place to set goals, plan, collect and sort documents, track their progress on a time-line or Gant chart and set individual targets on a calendar or to-do list, which, after linking to it with their email, will send reminders to learners.

Another option for administering one's educational progress is an E-portfolio. This is a summary of what we have progressed or are progressing through in the learning process, in whatever the form. Components can include be learning plans and goals, or visions. The learner can upload text documents, images, videos or other documents. An E-portfolio is an interesting tool in at least two respects. The first is self-reflection. It is basically a training diary to which the learner can come back and see what they have gone through as well as what to expect and what targets are set. The second aspect is the ability to facilitate job searches on the basis of a public e-portfolio, where a potential employer can quickly gain an overview of the education of the individual concerned, this leads to linking study results to the labor market (Cohn & Hibbits, 2004). On the other hand, this advantage also represents a pitfall due to the issue of the security if information disclosed on the Internet.

Blogs can also be useful in this area. Blogs are used to publish information such as diaries or portals. The learner may publish about the field which they are currently learning about. Likewise, they can follow other blogs to enhance and support their learning by sharing knowledge.

### *Personal Learning Network (PLN)*

Personal learning networks are sometimes perceived almost as a synonym with Personal learning environments. In essence, these are the links between different elements in a PLE. They thus form nodes in networks and connect people

with the same interest. This applies in particular to social networks, blogs and online communities. Thanks to this, education can be linked to the real world, with the actions and experiences of real people. The role of the educational network is then not only to provide support for students during and after the course, but also to stimulate students to share their knowledge and experience (Ivanova, 2009).

Facebook is often used to group people with the same interest. It thus forms a normal part of a PLE. Here, education may reveal important content, connect to the announced events and expand one's horizons by sharing information. The great advantage is the possibility of interaction. Learners can respond to the contributions of others and vice versa, they have the option to participate in chats and discussions. Establishing Facebook pages for universities, schools, departments, and educational centers is now a common practice.

The social network Twitter is characterized by short messages known as tweets. It differs from Facebook mainly due to the ability to search content using hashtags and keywords. Learners, for example, can search for #education. In this way they can open a network of posts that mention the keyword, as well as a network of people they can potentially follow. They thus attach the posts to certain people (or organizations or groups) on the wall of their profile. The user can create a list, such as Education, into which they can place the relevant content. Twitter can even be used by educators when they create a particular keyword for their group, e.g. #group123, and thus can help expand their network by including this word in their tweets. As can other members of the group.

Youtube is a social network for sharing videos. It long ago ceased to be a mere "storage space" for music videos, and has become a place which educators themselves have chosen as a place for education. Not only individuals, but also groups and organizations share their lectures here. In the Czech context, we should mention, for example, Charles University, which is a frequent contributor. Learners can subscribe to the content, which is automatically saved to their profiles and they can be informed about newly created content via email.

Although Facebook, Twitter and YouTube have likely become the most used social networks, they are far from the only ones. The social network Slideshare allows one to share presentations online. Others we should mention include Instagram, Pinterest and Flickr.

#### *Massive open online courses (MOOC)*

MOOCs are courses conducted in an online environment. Among the best-known providers are Udacity, Coursera or I-versity. MOOCs erase geographical barriers and anyone with access to the internet can learn at such places as "Harvard". The Courses are often offered by truly world-class universities. The courses cover various different areas and typically last several weeks. Each lesson includes its own video lecture. These are sometimes enriched with notes directly in the video or questions to check understanding. The lessons are generally also accompanied by study materials, wikis or links. Some of the most interesting features include discussion forums and online meetings. Students can discuss and address questions to each other and their educators.

#### **Conclusion**

Although Ivan Illich was not a direct supporter of technology, it is precisely technology that now makes possible the creation of personal learning networks in a personal learning environment on a global scale. This makes partly possible the emancipation of learners previously oppressed within the system of formal education. Learners can thus compose their curriculum themselves. A PLE does not allow for the mental passivity which is characteristic of classical lectures in formal education, because learners themselves actively seek, process and sort information. The Internet makes it possible to gain access to different types of education, a catalog of people and their skills, learning partners and teachers. MOOCs result in the disintegration of the curriculum between the institutions selected by students (educational nodes), which allows to weaken the power these institutions have in the case of a monopolistic institution. This does not result in one-way communication in the process of education and training so, in Freire's words, learners are not alienated from their world, because they themselves enrich and transform it for their own purposes. The hidden curriculum of formal education in school is thus disrupted. However, we believe that it is not completely removed, since it can be transmitted to another institution selected by the learner. Unlike in traditional schools, however, within the context of a PLE, this hidden curriculum constitutes only a particular part.

Ivan Illich was a supporter of the so-called deschooled society. Support for the creation of an independent PLE thus comes back to his ideas. In addition, now we can track such trends emanating from the learners themselves, not from the upper levels of the education system. One example is the project Uncollege, from which comes the "manifesto" *Hacking Your Education* by Dale J. Stephens (2013). The Czech projects Edventure and Mimo školu [outside school] are tied to this movement. These projects, like the name of the book, suggest how to learn on one's own. But as F. Dalecký writes in the preface of the book, the goal is not to convince learners to leave school but take responsibility for their education (Dalecký, 2013). Like Illich we see in the creation of PLE a certain liberation, emancipation in "Freire's" *Pedagogy of the Oppressed*. Education here is not dependent on the number of teachers – the learner is not a passive listener condemned to mechanical memorization to pass tests. In PLE we also find a place for the cherished dialogue, for which the school system has so little space. The role of educators in the context of PLE is changing. The educator is not as an oppressor, but a component in a network. Dialog also gets space in the discussion forums in which the original recipients of educational content become its creators and facilitators of its transmission.

We do not wish to present this article merely as a search for the connections between theories of adult education and technological progress. We would like to point to the fact that learners raise questions, which are worth investigating. Whether the ideal of self-directed learning is possible on a large scale and personal learning environment can contribute to this can only be determined through future research.

# The importance of aesthetics in theological education: a philosophical reading of the recent discussions in the Turkish case

Rifat Atay\*

Akdeniz University, Theology Faculty, Antalya, 07070, Turkey

---

## Abstract

When the quality of theological education is discussed within the theological circles, the problem mostly focuses on the ability of the graduates in terms of their ability to read, comprehend and interpret the religious texts. The implied conclusion is that they possess none of these outcomes; thus the curricula need be strengthened in that aspect. However, the most important point missing in the discussion is the aesthetic aspect of the theological curriculum, since the service provided by the theology graduates is aimed at humanity in general and aesthetics is the mian bond in human relations, especially religious. The paper will try to explain how and why aesthetics can play a vital role in theological education not only on the services provided but also in daily social relations of human beings.

## Introduction

The question of theological education has always been an important one in the history of Islamic civilization. The Prophet himself educated the companions around him first in Mecca in the House of Arqam (Dar al-Arqam), then in Medina in one corner of the Masjid al-Nabawi. The latter is most precisely called Ashab al-Suffa and is considered by some as the first University of Islam.

Throughout the passage of time, in the Islamic world, several educational institutions were developed and evolved from these humble beginnings. In the Ottoman times, *madrasas* were the main educational houses where the professional organized education was provided at several levels. It is a well-known fact that the newly established Turkish Republic entirely revolutionized Turkish society as well as many areas of public life. Within the higher educational system, theological education was left to the theology faculties, initially one in Istanbul and then in Ankara, some time later in other cities, now reaching to almost a hundred in numbers.

The question of fine arts, especially of music, in Islam has always been a controversial and critical one (Goodman, 2003: 34-37). Because of the emphasis on unity of faith (*tawhid*) and on ethical codes, there have been some ambiguities about the decree on painting and music. In painting, the tendency was developed towards more abstract branches of fine arts, such as miniature and calligraphy while in music, though religious music was considered as generally *halal*, permissible, the non-religious was thought to be either *haram* because of what it associates with like women and wine or due to what it inspires such as infidelity, ungodly thoughts and despair.

Although there was not much formal aesthetic education in Ottoman madrasas, there were many informal ways of improving one's thirst for fine arts. The most prevalent places for acquiring informal education of fine arts were takkes

---

E-mail address: rifatay@akdeniz.edu.tr

and zawiyas, that are sufi *tariqats* in various ways and forms. One can claim that the *takkes* have operated as the informal fine art faculties and institutions of the Ottoman period (Ünver, 2002:199).

With the establishment of the young Turkish Republic, all sufi institutions, e.g. the *takkes* and *zawiyas*, and their associates were banned and abolished from public life on 30<sup>th</sup> November 1925. From then on, one can certainly conclude that the closure of the sufi institutions seriously undermined the informal education of fine arts. Approximately three decades later, the only partial exception was brought to *Mawlawis* by allowing them to conduct touristic celebrations of *sama* ceremonies (Atay: 2007, 8-9).

### Why are we in this state?

It is a general habit of the Islamic world to ask how and why they are in the state that they are when they face troubles by hitting hard to the face of reality. The usual answer to this very real and disturbing question is almost unanimously throughout the Islamic world runs usually in these lines: Because we are not good Muslims, because we detracted from the way of the Prophet and the Companions, because we do not read the Qur'an and follow the *Sunna* of the Prophet. Thus, to be able to get back to the track, the solution lies in sticking to the Qur'an and the *Sunna* at one's utmost power, which can be acquired through studying more of them. What is missing in this quick conclusion, however, is that knowledge does not always necessitates acting and acting in a nice and polite way, as the Turkish proverb professes, "diploma erases ignorance but stupidity remains perpetually." In the words of Whitehead, the founding father of the process philosophy, one "cannot be wise without some basis of knowledge;" but one "may easily acquire knowledge and remain bare of wisdom." (Whitehead, 1962:46). One can claim that many of the companions of the prophet did not have as much knowledge as many modern Muslims do; nonetheless all Muslims agree that the companions were far better Muslims than modern Muslims.

The Turkish theology graduates are often complained about their inability to read, comprehend and interpret the main religious texts. The implied conclusion is that they possess none of these outcomes; thus the curricula need be strengthened in those aspects. Out of such laments came some proposals by the end of Summer 2013 vis-à-vis theology curricula by some members of the Turkish Higher Educational Council, the highest authority to decide on these issues. A casual look at the Table 1. below will show that the proposed changes endeavor to meet those criticisms by increasing the level of theological knowledge not of wisdom.

It can be read clearly from the table that the aim of the proposed curriculum change was to increase the credit and numbers of, what I shall call, the purely theological courses such as Tafsir, Hadith and Fiqh. On the other hand, since the

number of credits are limited and the Bologna Process requires the reduction rather than the increase of the credits in addition to varied courses, the only way to increase those desired credits was to appropriate them from others. The table witnesses this solution even though it runs counter with the spirit of the Bologna Process. The courses related to thought, philosophy, culture and arts were proposed either by total annihilation or partial reduction in credits and combination by other courses by the proposers. More specifically from an aesthetic perspective, one proposal suggested the combination of Ottoman Turkish and Turkish Islamic Literature into one course with the same credits (4) and Islamic Arts and Religious Music were also combined into one course with a half-reduced credit of only 2. The problem with the first combination is that the fate of either course is left to the mercy of the lecturer; depending on her/his expertise s/he may choose to focus on or teach one or the other by resulting the definite loss of some literary taste on the parts of the students. As to the latter, it is almost tantamount to the demolition of aesthetics in theological curriculum since it first combines two equally important subjects into one, then with a second strike, tries to finish off the arts by reducing their weight to two credits. One last point about the proposed changes to be remarked is on selective courses, which were reduced to 12 from 16 in numbers and to 24 from 32 in credits. This reduction also means less variety in available course, thus negatively affects the quality of education.

The proposals caused public outrage both within and outside the academia. With mounting pressures from the media and the academia, the Council eventually decided to scrap the proposals all together and by following the orders of the Law 2547, left the issue to the faculty committees all together. However, the proposers are still in their posts so is the director himself. It is almost certain that they withdrew the proposals not because second thoughts but out of public pressure; thus, the changes can be brought back when the tides reside and the time is right. Moreover, there is nothing to prevent some faculties from already attempting to follow these changes. Therefore, these seemingly hypothetical proposals need careful, critical examinations as of their direct relevance to the problems in hand.

## The Way Out

It is time now to examine the role and function of the theology faculties. They mainly cater for three institutions, which are the Religious Affairs Department (RAD), the Ministry of Education (MoE) and the universities. The graduates who opt to enter to the RAD can choose from four main areas of profession: *mufti*, *preacher*, *imam*, *muazzin* and the *Qur'an* teacher. Those who wish to join the MoE can work as teachers either in mainstream public or private schools, ranging from primary to high school, in Religious Education classes. The other schools run by the MoE are Imam-Hatip Secondary and High Schools that can employ theology graduates in several basic theological sciences such as *fiqh*, *hadith*, *tafsir* and the *Qur'an*. Last but not least come the academia as employment opportunity for those qualified theology graduates who would like to further their studies. Without further ado, one last point should also be remarked here at this stage and it is the fact that some quite serious number of theology graduates do not actually hold a public office but prefer to work in private sector in various areas, e.g. management, production, human resources, etc. Although they do not officially represent theology or Islam in general in any office, they still represent religion and as a result could benefit as much as public office holders from a more aesthetic-based theology curriculum.

Let us have a closer look to the usual profession that the theology graduates prefer, starting with RAD, as of their relation to aesthetics. The general rule is that all the duties in RAD somehow carries significant importance about having a well-trained voice since they all are somehow correlated with voice. Thus the Prophet used to say to Bilal al-Habashi the *muezzin* "Comfort us Oh Bilal," meaning "do give a nice call for prayer so that people come to mosque happily right away." Not only him but there were other companions with comforting voices whom the Prophet used to ask to recite the Qur'an in order to listen to their reading and enjoy it. It should also be noticed that when the means to call for prayer was discussed among the companions, the customs of the Jews (horn), the Christians (bell) and the Zoroastrians (fire) were all rejected because they were already associated with another religion. Then the *adhan* was revealed in dream not only to the Prophet himself but to some of the companions as well (Bukhari, 2009). Compared with the other options, the effect of *adhan* as a means is far more superior than the others discussed since it is human voice in its purest form. However, it should be noted that this is a double-edged sword due to the fact that if it is not performed properly it would also have negative effects on the hearers. Hence there are several stories circling around, both positive and negative, related to the effects of *adhan*, some are moved by it to convert to Islam while others salvaged their own religious

tradition for it was performed so badly. A simple search on the internet will yield hundreds of results, even a zealot atheist like Sam Harris would confess his blog that he is moved by the *adhan* (samharris.org/blog, 15.06.2014).

The arguments for *adhan* is almost equally valid for prayer as well; the only difference between the two is that the latter is particularly aimed at believers whereas the former is open to the participation of any by passer. It should also be pointed out that in three out of five daily prayers, including the Friday and *eid* congregations, the Qur'anic recitations must be made aloud. Even this proves the central importance of musical education in theological curricula. In that sense it is almost unanimously agreed that the Qur'an as a whole has a unique central place in Islamic arts, as Michon rightly emphasizes: "Recitation, the art which manifests the sound and modulations in Arabic of the verses of the Koran in time; calligraphy, the art which transcribes visually the vocables and fixes them in space ... with these two modes of expression we find ourselves at the very source of the art of the Muslims, the source from which the artists of Islam have never ceased over the centuries to draw their inspiration" (Michon, 2011: 128). As another testimony to this remark, I should also point out that the Qur'an talks to its non-Arab interlocutors through its musical character.

The rest of the three duties in RAD, namely, *mufti*, *preacher* and the *Qur'an teacher*, are less voice-centred but more knowledge-based and public related. Having a well-trained voice that enables one to beautifully recite the Qur'an means added bonus in these duties but not necessary. The same argument actually is valid for the other professions that the theology graduates may choose, that is teaching in schools and faculties and researching. Here comes another aspect of fine arts that needs utmost care in theological education: the education of the soul, that is, ripening, fine-tuning and perfecting of emotions and feelings, in other words, the teaching of patience. The situation of the theological curricula, both in practice and proposed, is well illustrated almost a hundred years ago in the United States on the other side of the Atlantic: "A people may be scientifically well educated, intellectually well educated, yet they remain spiritually illiterate. Arts, if I understand it, depends upon feeling, not upon knowledge. Art comes out of the response of the emotions to the things about one: then, when an expression is formed, external knowledge begins to play a part" (Claxton, 1921: 28).

It is not knowledge that matters much, it is the action, or rather feeling, that counts. Some basic common sense knowledge is certainly required for one to be able to act as moderate human beings do, but the essential element is reaction. The latest research in philosophy suggests that we act on emotions first, then rationalize that action later. The question is not how much we know but how better we act or rather react on certain situations. It is not a matter of belief versus unbelief; it is rather humane acting versus inhumane acting. There seems to be a mistaken connection between religiosity and knowledge. More knowledge does not necessarily make one a better human being, a better believer or more religious. Religiosity is a matter of feeling rather than knowledge. Thus the theological curricula needs to be more focused on emotional education than on informational education. In this aspect the arts has vital significance for the arts is not solely art but rather a serious way of educating people through patience, focusing, politeness and interaction both by people and nature.

It should may be asked at this stage what type of a human being Islam proposes and who embodies that type. The short answer to this question is the perfect human being (*insan al-kamil*, in Sufi terms), who was vividly personified by the Prophet himself. It was also best expressed in the famous Gabriel Hadith, as it is known, that explains three components of the faith of Muslims: *iman*, *Islam* and *ihsan* (Bukhari, 2009). It is understood from the hadith that an action of a Muslim represents *Islam*, while the reason behind that action amounts to why s/he does it whereas how s/he does that action forms its *ihsan* aspect. In other words, this triangle can also be read as believing, acting and acting aesthetically, which was thoroughly exemplified by the Prophet and his closest companions. "*Ihsan* is a revelation of *iman* at the level of ethics and aesthetics." (Koç, 2008:7). Any theory of Islamic aesthetics should be based on *ihsan*. Whitehead calls this as "the most austere of all mental qualities; ... It is an aesthetic sense, based on admiration for the direct attainment of a foreseen end, simply and without waste." (Whitehead, 1962: 19).

Several studies in Turkish religious education system suggest that having a good character and being a righteous educator appears to be as first priorities of all parties involved in the sector, that is, students, teachers, administrators (Öcal, 2002:129-138). Whitehead believes that "the function of the scholar" should be "to evoke into life wisdom and beauty," (Whitehead, 1962:147) and "religious education is an education which inculcates duty and reverence" (Whitehead, 1962:23). To be able to achieve duty and reverence in religious education, theology faculties should offer basic and advanced education in aesthetics. As the basic education, every student should gain enough credit in the History of Turkish Islamic Arts and applied fine arts. Then, to further advance these skills, they should pass compulsory

music credits plus some branches of plastic arts (Aritan, 2003:376-378). Hence it can be possible to create a culture that is based on the “activity of thought and receptiveness to beauty and human feeling.” Otherwise the present curricula in theology faculties will yield a “merely well-informed man” who is “the most useless bore on God’s earth” (Whitehead, 1962:1)

## Conclusion

To be able to move and reach beyond the boundaries of mosque and reach out the message of God to all human beings, fine arts is the most indispensable means one cannot do without. Without fine arts, the effect of theological education is reduced by as high as 70-80%. The lack of knowledge in other areas of theological domain can be tolerated by the success of fine arts. If an imam or a teacher can either vocally or aesthetically impress his audience, they would easily pardon his defects in the areas of pure theological knowledge. Certainly, one cannot deny the importance of basic theological knowledge since it is necessary for one to be able to lead prayers and enlighten society. The point here is to put the priorities right and have a balanced education on the whole.

The problem with most of the contemporary Islamic movements is that they either totally dismiss the importance of fine arts or unwillingly approve of its necessity. Consequently, it is not surprising to find very harsh and extreme interpretations of Islam in many of the contemporary movements. To be able to better understand and follow the way of the Prophet, theological education should give considerable emphasis on fine arts, since it is wisdom that matters first, not knowledge, as the sufis like Rumi and Yunus Emre have shown us much clearly not only theoretically but also practically. Unless we comprehend, implement and realize a fine arts-based theological education, the ground under the feet of the theologians will keep eroding to the extent that even they loose their own foundations.

# The importance of family and kinship in Turkish literature : family and kinship tie in Sâmiha Ayverdi's works

Meva Apaydin

*Bülent Ecevit Üniversitesi, Zonguldak, Türkiye*

---

## Abstract

Family and kinship are one of the most important values of cultural heritage in our literature . Therefore ; Sâmiha Ayverdi , who is one of the most important women writers from the Republican Period , gives an important place to the family and kinship tie in her works . Ayverdi , whose sufistic side outweighs , tries to instill people to shape in Islamic style in her books . Considered the importance family and kinship tie in Islam , the question that why she uses these terms so often is answered in that way .

In that research , we have focused on the use of these terms in her works such as ; Human and Demon , Fire Tree , Mesihpasha Imam , The Last Range , the Sun Not Going Down in search of family and kinship tie in our society by detecting the frequency of the use of words and word – comparison.

## 1. Introduction

Kinship ties is very important in Turkish society . It is one of the most delicate indicators of family , spirituality and culture . With Turk' s becoming Muslim , important changes have developed in our kinship system and also our traditional understanding has taken its shape in that way . Developing and shapening , our society has always kept kinship alive and impressed our human relations on a large scale . When compared with it , family union has protected its importance and the family has been cherished since the very early Turks .

## Sâmiha Ayverdi

Sâmiha Ayverdi was born in Şehzadebaşı , in Istanbul , on 25th of November , in 1905 . Having read sophisticated books such as Kısas-ı Enbiya and Servet-i Funun even at a little age as ten or twelve , she took education from history , philosophy , spirituality , mysticism and literature . In addition to it , she was also into fine arts , took special courses from French and protected her love of education and self-development throughout her life .

The person who profoundly influenced her life and improved her world of thought and spiritual side was Ken'an Rif' ai , who was the sheikh of Umm-i Ken' an Dervish Convent . She was impressed by the great philosophers such as Mevlana , Hafız- ı Şirazi , Sadi , Muhiddin- i Arabi . In addition to it , she also kept abreast of thought and literary movements of the West . Sâmiha Ayverdi ; who devoted her all life to putting into practice the realities that she believed , educated people in styles of religious sciences , kept the Turkish Islamic culture on behalf of Allah ; passed

away on 22th of March , in 1993 , then , she was burried into the South side of Ken'an Rif' ai's tomb in Merkez Efendi Haziresi and Ken' an Rif' ai was Ayverdi' s teacher . Her zeal in the branches of religion , spirituality , history , philosophy , literature and fine arts during her period of education joined with spiritual and mystic wealth after her religious affiliation to Ken'an Rif'ai Dervish Convent and this affiliation reflected to Ayverdi's works . The writer , witnessing the periods of Abdulhamid II , Second Contitutional Era , Committee of Union and Progress , Years of Truce and Republican Period in Istanbul in her life time period , she chose especially these synthesis in her novels . That' s why Sâmîha Ayverdi chose the themes of love of Istanbul , Ottoman lifestyle , westernizing , religion and spirituality in her masterpieces .

### *1.1.Familial And Kinship Nouns That Are Frequently Used In Sâmîha Ayverdi*

As one of the most important women writers from the Republican Period in Turkish Literature , she was a philosopher , who was born in Istanbul , and she grew up in mansions with the influence of Ottoman Empire . Having preferred a lifestyle with her family and kins instead of having an individual life , she produced her works in that atmosphere .

Family and kinship ties has an important place in her works . This preference parallels with her point of view on Islam . Overweighing her spirptual side , Ayverdi tries to instill people to take shape in Islamic style . Considered the value of family and kinship ties in Islam , the question that why she frequently used these notions is clearly answered .

In this research , we have focused on the use of the nonuns related with family and kinship in her books : İnsan ve Şeytan , Ateş Ağacı , Meshpaha Imamı , Son Menzil and Batmayan Gün .

When these works which we will evaluate are cerafully examined , it is easily noticed that the word which she used most is 'father' . This word meaning ' the person that who has a daughter or son , male parent , begetter of offspring' in the dictionary of Turkish Language Association is used 528 times with inflectional suffixes in these books . The writer used this word 'baba – father' so many times as the symbol of ' the leader of the family and protectionalism' .

'There are some knowledge which are thought to people by their parents , traditions and books that we think that we already know them , however , the moment when we virtually learn them for sure we notice that we didn't really know their meaning beforehand .' (Ateş Ağacı, p. 115 )

'When Aliye saw the cries running down from her father' cheeks without stop , she she flinged out of seating embraced him by budging up to him in her seat . (Batmayan Gün, p. 95 )

'When my eyes got accustomed to the sombreness , I noticed tere was a man with very black complexion and drew near my nanny because I had never seen an Arabic before that moment . ( İnsan ve Şeytan, p. 46 )

The word 'father' is followed by the word 'girl' . This means 'female child' in Turkish dictionaries . That word which was used in 307 times in all of these five books generally means ' daughter' . Apart from those uses , girl is also took place with the maning of ' young lady' .

'The girl , listening to her father with indifferet weariness in betle browed and tired attitude , stood up and took a bottle from the table , shook it and had the old drink it .' (İnsan ve Şeytan, p. 122 )

'Despite all their wrechedness and desperations , he had such lithe and occupied wife and daughter , they were unable to see other people out of from their house because of caring for the patient .' (Mesihpasa Imamı p. 166 )

'As the young girl know that the painter , Hasim , hops from one emotion to another one , and does the thing that he didn't want to do a few minutes ago , so s he doesn' t find it strange then they – one front and the other back – walked through the darkness of the hall .' (Son Menzil, p. 181 )

The third noun which Ayverdi used most after 'father' and ' girl' is 'child' . The 'child' , fruit and indispensable member of the family , is the heritor of the human being . The child who will shape the society for it is used totally 273 times in those books . The noun , 'child' , which is depicted as 'the little male /female offspring , soın / daughter in terms of descent' is also the symbol of the next generation .

'Many of us , have , in our opinion , meaningful and ostentatious pealsures such as making ovens or houses with muddy soil or whipping his / her wooden horses , tough they are considered as ridiculous things .' (Ateş Ağacı, p. 76 )

‘When I was a little child , if I couldn’ t recognize my mother’ s or nanny’ s handkerchieves and scarves from their colour or shapes , I would detect them from their smell’ . (İnsan ve Şeytan, p. 176 )

‘With great pleasure , the child would breath deeply hte smell of fuel or phosphor filling his nasal passages as soon as the oil lamp was lit since the smell that announcing the good news from the light was a rescuer from the woman that the child was watching her sillhouelette in dark throughout his nightmares to bring him back to his books .’ ( Mesihpasa Imami, p. 202 )

After these words there comes the noun ‘wife’ in terms of frequency of use . It means ‘dame , woman lady’ in our society . It is used 260 times in Sâmiha Ayverdi’ s works and defined as ‘ the woman who is married to a man , married woman , woman’ in Turkish Dictionary .

‘Kadriye , my aunt’ s dauhter ... My friend from my childhood - Kadriye -... My fiancee , Kadriye , who is my wife and finally my children’ s mother .’ (Ateş Ağacı, p. 120 )

‘By thinking from the point of emotion’ s of a man - Husnu’ s emotions - , Sezai Bey has clearly recognized the young dactor’ s interest in his daughter , but in order to put an end to this matter , he maade up this lie by disuniting the wife and the husband .’ ( Batmayan Gün, p. 187 )

‘Ilyas Bey , never marrying after his wife’ s death , accelerated his heart that was addicted to enjoyments and amusement while letting himself to the world of pleasure giving the management of the house to Şöhret and his daughter .’ ( Son Menzil, p. 52 )

The word , ‘son’ , which is used totally 233 times withinflectional suffixes , means ‘ male child’ . Also , its use such as ‘my son’ ‘ the boy’ , ‘your son’ , ‘my child’ are seen, too .

‘He used to say : ‘My child ! Reading or writing just kills illiteracy , not ignorance . They are not enough to be accepted as a human .’ Then , he would show his wholw talent tp inculcate all of his knowledge namely for my morality as he charged himself in my cultivation . (İnsan ve Şeytan, p. 52 )

‘It is strange that behind that aegis which also shieds to both father and son , there was a third refugee whom neither father nor son knows , however , she with her very young and fresh mood would hide herself behind that shield whenever her bright yet inexperienced eit intuits the timas of danger .’ (Mesihpaha Imami p. 231)

When we count the number of the words by adding the inflectional suffixes , it is clear that there are 117 mothers , 90 uncles , 89 sisters / brothers , 78 family , 74 nephew / niece , 42 relatives , 33 mamas , 33 brother in law by marriage , 27 offsprings , 26 sons / daughters , 25 aunts (father’ sister ) , 21 mother in law-dame’s mother , 21 brother in law- dame’s brother , 21 aunt in law uncle’s wife , 17 aunt(mother’s ssister ) , 11 elder brothers , 11 sister in law ( a man’ s wife’s sister ) and 7 times spouse are used .

### 3. Conclusion

The position of the family and kinship is very important in Turkish society .Therefore ; the quatity of the words which are used in these masterpieces are a lot . This sitiation , seen in Ayverdi’ s works , is a proof showing how much importance and value she gives to the issues of family and kinship .

The information which we have got shows that the familial notions are followed by kinship nouns and many of them constitutes of ‘ daughter’ and ‘son’ . In addition to it , the word ‘father’ ranks as one of the mostly used nouns and rhe word ‘ kari – wife , woman’ takes the third rank with other meaning of ‘mother , mama’ in terms of the frequency of use . In this research including examples of five frequently used words shows that familial and kinship intercouses which glorifies any society is really precious in Sâmiha Ayverdi’ s works and these notions are the basic elements feeding the plot/themes of the books . According to Ayverdi , the family constituting the social- basic intercouses is profoundly important for the development and spirituality of humanity . It is of course natural that we frequently see the words of family and kinship in Ayverdi’ s works thatrearching for the development of the society in her own roots , not in Western world .

When we take into consideration the knowledge which we have gotten , it can easily be said that Ayverdi is one of the most important writers who pioneered to the notions of family and kinship as well as Turkish spirituality and sufism .

## Abstract

This text talks about teaching methodology in the field of higher education institutions and reflects on the loss of importance of this area, like other areas of humanities and social wins. This in a Mexican context where policy reforms are based on the requirements of the business and economic world, from logic of capitalist production. In other words, it raises questions about how education tends to decrease production, ignoring its social function: the intellectual development of a society.

## Introduction: From where do think the loss of importance of methodology and teaching?

How to understand this shift or minimizing the importance of methodology and teaching? From where to reflect the loss of importance of methodology in the intellectual training of university? In the search for arguments to answer these and other questions, we can say that it is possible to address this issue as part of a multi-causal phenomenon is not limited to the contexts of education (where both the mean and higher education is involved) but that is part of related economic and political dimensions processes.

It seems that as a specific problem is not related to these dimensions, it is very far from having any type of relationship and might also think that this is a purely pedagogical problem, as to how to teach research techniques or, to a matter of conceiving the methodology according to particular perspective, i.e., to raise this issue as a problem of techniques and tools and not as a problem of method (commonly methodology only associated with instrumental aspects of the research process ) as part of an articulated process .

However, this problem is immersed within a broader process involving displacement, minimization and even the disappearance of subjects related to philosophy (ethics, logic ), History and other subjects in the field of Humanities

(For example you can see the guidelines of the Comprehensive Reform of higher - RIEMSER Media Education). So that the subjects related to these fields of knowledge have been considered unnecessary because it is not directly linked to the sphere of economic production company, obtaining profits. In other words, not being associated with the market.

These ideas come from economic processes, typical of the neoliberal stage of capitalist development (standardization processes to streamline the production world, introduced system-wide) globalization. From central to peripheral economies, local governments then become guiding public policy of economic, political, educational, and so on. It is articulate social processes to the market dynamics. So that education is part of the fabric of systemic strategies. It can be seen from the perspective of the link that has the dynamics of production with the political direction of society, education and culture and, in general, all areas of society. This is the context in which to locate our problem of reflection.

In education, the problem is presented as a series of transformative politics: several education reforms, changes to plans and curricula that meet the needs of the world of production, quantitative evaluation processes (through indicator matrices), incentive programs, etc. In this sense what prevails in the academic reforms are political decisions, to realize, in terms of educational and pedagogical models and content guidelines imposed by the logic of the market (see for example the implementation of the competency model as a driver for Comprehensive Reform Superior- RIEMSER - Media Education and the adoption by many Institutions of Higher Education -HEI; recently Pact for Mexico, at the initiative of President Enrique Peña Nieto involving the constitutional reform of Article III and thus a series of, even unweighted, changes in education . Moreover, the excessive growth of private universities from the 90s of last century.

So that the context in which the methodology its teaching and its importance in the academic and intellectual training, and not just for the training of scientists is located, can be seen from a related logic with an articulated process: market dynamics - control and direction of social - training skilled workforce according to standardized criteria.

### **I. - Linking economic processes under the guidance of education**

Since 1982 the world has changed drastically, were set aside Keynesian formulas hitherto subsisted, in which the role of the state played a central role in the organization and management of social processes. Formulas that allowed face the consequences and aftermath of the economic crisis of 1929, which in one way or another it possible to consolidate the global hegemony of the United States became a new model of accumulation, which was given to the market and not the State the lead for the organization of social life on a global scale paper.

The changes resulting from this model were in all spheres of social life, from the world of production to the sphere of public life, to health, culture and education course.

On the one hand , production processes were standardized , international standards were established whose purpose was not only to streamline and accelerate the recovery of profits, but mainly standardize and simplify the production process where skilled labour was not as important as that a series of labour , replaceable , docile and undemanding in terms of salary skills (e.g., unions themselves became the less spaces of resistance to these changes or in legitimizing instances of economic processes ) .

In this context, two aspects are central. First, the need to accelerate the accumulation of wealth and, secondly, modify the schemes relating to the workforce. Hence the imperative to standardize the profiles to form the new type of worker required by this economic model, a convenient ideology to accumulation scheme. It was treated by multiplying the market action and limit state intervention, because the market is not corrupt and the state itself.

The production processes require competent staff in specific stages. The core competencies required for the

standardization of production are defined. Hence the structure of the core competencies model is exported to other spheres of social life, so relevant to education. You have to remember multiple assessments and recommendations the Organization for Economic Cooperation and Development (OECD) has been formulated to Mexico as a result of joining this organization and that have guided the changes and reforms in the education sector. Of the most recent, the Cooperation Agreement Mexico - OECD Improving the Quality of Education in Mexican Schools (2010), Education at a Glance (2012), OECD Perspectives for Change (2012), among other guidance documents.

These circumstances have had at least two important implications for education. First, move the training process for institutions of higher and higher in order not to sacrifice profits secondary education. Through incorporation into the curricula of the idea of internships, entrepreneurial programs responsibility to educational institutions to train future employees according to the competency model moves.

Put another way, what has been discussed is that institutions of higher education and media absorb the cost of training for the formation of labour force according to the needs of businesses, i.e., the market. The second transformation plans, curricula and content according to this logic.

The problem is not professional practices, entrepreneurs or programs, but the bias standardization gives only benefit the market. As most of the graduates of universities (and public baccalaureate) are formed under the same powers, become interchangeable and expendable parts. Under these implications have been made various changes and reforms in the middle and higher education system.

These are some of the reasons why some subjects of Social Sciences and Humanities and teaching (methodology, philosophy, logic, history, arts and other cultural expressions) are unnecessary to the market and therefore can be expendable. Thus, the methodology only technical aspects necessary backing required to produce quantitative, descriptive knowledge. It matters only what fits the competency model. Then, the methodology is useful for opinion polls, market research, trends and consumer behaviour, political orientations, and so on. Nothing else comes into the scheme and can minimize or even eliminate shifting of academic and intellectual development of students.

Although very brief way, the above are observation points where we can reflect and explain what has been happening with teaching methodology and little importance is given to the training of students. We can summarize the above in the following aspects:

1. The processes of the neoliberal stage of capitalism have required rebuilding the workforce from logical standardization with certain powers in specific segments of the production process, from manufacturing to consumption.
2. The responsibility for job training has been fully transferred to educational institutions, which has meant shifting the costs to the financing of public education.
3. Own market interactions have built a legitimizing discourse for educational institutions, expressed in the competency model, professional practices, entrepreneurs and programs linking Business College.
4. Market needs do not require a critical training in the sense of imaginative thinking, creative but pragmatic graduates with skills, usefulness and immediate application, while the competition model has been transferred from the world of production to academia.
5. These educational processes have formed a pliable, flexible, expendable, standardized workforce.
6. The teaching methodology is the predominant regards training manuals based on and limited to teaching technical and instrumental resources, but do not seek explanations quantitative data.

According to the above, it is possible to approach to understand the logic of the transformations and changes that have generated plans and curricula, the importance of the methodology and its teaching and relationship with economic processes and the displacement, minimization of secondary and higher education.

## **II - . Policy and teaching methodology**

It seems an exaggeration to speak of a relationship between the political process and the importance of methodology and teaching. However, there is a relationship, but certainly not directly but as a result of political decisions materialized in the form of government programs.

It is reasonable to think that the year 1982 marked one of the first steps in the development stage of global capitalism in the sense that gives De Sousa (2005, p. 260 ) "Globalization is a set of policy decisions both identified over time and in relation to its authorship . The Washington Consensus is a political decision of the central states, such as the decisions of the states that adopted demonstrating autonomy and a more or less relative selectivity". The fact is that these events from the world begins to change depending on the decisions that were traversed by economic interests. It is understood that the globalization process is proposed to refine a model of accumulation for the benefit of the core states.

It should distinguish globalization as an ongoing process of product development incorporating science and technology to social processes, changes that have occurred in the economic progress. In both processes the changes have occurred on a global scale. The first will continue on the ruins of the neoliberal stage.

In the field of politics is where decisions have given more emphasis to introduce the changes necessary for the development of the neoliberal model. Says David Apter (1971) that no modernization efforts of economic processes can occur without the corresponding political modernization of the countries. That is, without the introduction of mechanisms to control and direction that enable the social introduction of economic innovations. This process of introduction of neoliberal strategies is given as a kind of paradox, because while the policy is necessary for the implementation of the model, while it is relegated to the background in order to limit the state's participation in the processes economic.

The result of this paradox was the subjugation of politics to private interests, or economic interests. Public life was subordinated to the action of the privatization process. In other words, these are interests that dominate the field of public life. Each time the privatization effort invades social spheres, as health and social security education and culture.

In Mexico, for two examples, public health has been changing the popular insurance, a responsibility of the state to an individual problem, not part of institutional responsibility and other, subject recruitment, those who can do, insurance medical expenses that offer private health care. Another case is that of education, through the growth of the supply of private education and the rise of public education services (as reflected in the fees and administrative services). Both health and education have been transformed from state responsibility for raw material market.

Governments (mainly from 1988 to date) have defined strategies and public policies to realize these processes, while they have transferred their political and social forces of the market (Hertz, 2002) responsibility. This means that the policy has been subordinated to economic processes. These are the underlying circumstances of the crisis of politics: public administration under the logic of the private. So that policy decisions are oriented to bring to market all spheres of public life that can be highly profitable, as in the case of education.

To illustrate transcribe a note from the mexican newspaper La Jornada (Thursday January 3, 2013, p.4 ) states that "Suddenly , public education has become a new market, thanks to the reforms implemented over the past decade An investor conference ... stakeholders in the education sector for profit (Capital Round table for- profit education Private Equity conference) , in July last year, said that education is now the second largest market in the United States , valued at \$ 1.3 trillion ... Indicates that are expanding opportunities in the education sector profit -oriented , thanks to initiatives promoted in Congress ... "

In our country, under the pressure of international organizations ( IMF, World Bank and OECD), which highlights the diagnoses, guidelines and agreements in relation to education, the OECD has proposed guidelines to "improve the quality of education " that since the nineties have been given (see for example the Cooperation Agreement Mexico -

OECD, Improving the Quality of Education in Mexican Schools , OECD, 2010, which is one of the underpinnings of educational reform Raised by the President Enrique Peña Nieto and approved by the Congress ) have become guiding government policies .

Two points can be highlighted from the introduction of such strategies for education, in this case for higher education (e.g. the establishment of the Comprehensive Program for Institutional Strengthening ( IIFT ), which has involved the management resources through the implementation of indicators or Incentives Program Teaching Performance representing , through the assessment of teacher productivity, financial compensation), one of them is the political control of the institutions through allocation of resources and funding, without which public universities could not function, the other aspect is the financial control of institutions by the federal education authorities. It is clear that the problem did not have any assessments or financial control, but the political bias that have been given.

On these approaches, essentially political, have boosted academic reforms within universities and institutions of higher education, seeking to establish the competency model and management guidelines as the preferred option for the transformation of the plans and programs of study and modifying its contents. And this comes from the logic of wealth accumulation model to guide policy decisions and the nature of government programs.

So, you can locate some central features that give meaning to political -education- teaching methodology for:

1. The neoliberal policy has subordinated the interests of the market.
2. The State, understood as government becomes an instrument to guide the privatization impulses in all areas of social life.
3. Education has become a vehicle for market consolidation in a twofold way: it has turned education into a commodity and has become a space for forming docile, flexible workforce with the basic skills required by production processes.
4. Movements have arisen academic reform oriented policy decisions to stimulate and shape the processes of transformation of education.
5. Have moved all content and assignments that are not functional or can be linked with market needs.
6. Politics has become the means and scope to boost privatization currents.

### **Final comments**

From here, it can locate at least three central aspects of the importance of the methodology:

1. The declining importance for the low value and character that has been awarded the management of a set of techniques, tools and instruments taught easy application, making it unattractive to students.
2. The contents of the materials related to the methodology have been limited to instrumental techniques and management tools cut qualitative or quantitative. This has involved recognizing only the empirical dimension of the research process. So that the method and the method is confronted.
3. The teaching methodology is to be characterized as a practice based on manual and often taught by teachers with an inadequate profile to provide content related to the epistemological dimension of the process of knowledge generation. Correspond to consider the epistemological and methodological dimension as a basic articulation in the production of scientific knowledge (knowledge object reconstruction and its empirical verification).

Finally, after the foregoing it should ask the question what will happen when the constraints imposed by the economic model change and needs to solve the new problems of the world are other societies? It is highly likely that this trend will continue to increase, future generations (in the short term according to the idea of Braudel) confronted with the problem of the loss of scientific vocations.

From this perspective the loss of importance of teaching methodology and represents a problem in the future if universities are neglecting teaching thinking and thereby build the resources to explain the emerging problems , to produce knowledge that respond to emerging problems they present to future generations .

# The importance of working integrated learning and relevant laboratory experiments in engineering teaching

Dorina Ionescu

*\*Mechanical Engineering Technology Departmen, Faculty of Engineering & Built Environment, Doornfontain campus, Johannesburg 2000, South Africa, +27 11 559 6509; dorinai@uj.ac.za*

---

## Abstract

The shortage of highly skilled engineers in South Africa is of public knowledge and became one of government's priorities. Although the engineering student numbers increased dramatically over the last 10 years, as high as 290% compared to 1988 figures<sup>(1)</sup>, the number of Engineering graduates is very low compared to the industry needs. A major reason for the poor performance of the engineering students is the lack of engineering infrastructure at high school level. Also, many engineering students lack basic self-study skills which for engineering studies are essential. In a study carried out at the University of Johannesburg by Ionescu<sup>(2)</sup> over a sample of 114 mechanical engineering technology students, it was found that the lack of proper career advising at high school level for many students results in the wrong choice for tertiary education. However, once in the system the industrial exposure through work integrated learning and a proper choice of laboratory experiments for the engineering modules can increase the ability of the future engineer to understand his/her profession and successfully finish his/her engineering studies.

## Introduction

South Africa as a developing country saw in the last ten years a sharp increase in the industrial investments, especially in companies involved in engineering work. The engineering manufacturing and mining fields are seen as top revenue generators and job providers. Although there is a general drive to facilitate the access to engineering education of an increased number of high school senior certificates holders, the number of technical university graduates is low compared to the entrance numbers. The low number of engineering graduates impacts negatively on the engineering manufacturing expansion. The inability of the majority of engineering students to finish their studies and obtain the engineering qualification is due to several factors, some going back to the high school education. In a study carried out at the University of Johannesburg<sup>(2)</sup> over a sample of 114 mechanical engineering technology students it was found that the lack of career advising combined with the very poor technical infrastructure at high schools level, plays a major role in the poor performance of the engineering students. Based on the findings there are several steps that can be taken to alleviate to a certain extent the failure rate. On very important step is to familiarize the future engineer with his/her profession through industrial exposure and another important step is to introduce relevant laboratory experiments for the engineering module, to facilitate the proper understanding of the theory.

## High school challenges

Although the majority of the engineering students are from rural areas, the study carried out on a sample of 114 mechanical engineering technology students yielded very encouraging results, to the credit of our very poor and

---

undereducated rural communities. It was found that in South Africa the parental attitude toward tertiary education is very positive as compared to a study done by Felder RM and others<sup>(3)</sup> at the State University of North Carolina, where a poor parental attitude impacted negatively over the number of black American engineering students. However the ability of a South African child to enroll for tertiary education is restricted sometime by poverty or tradition in the case of female child. Table 1 reflects the statistics regarding the career choice for the mechanical engineering technology students. Although only 21 % of the students had a family role model, 67 % were supported by their families to fulfil their dream of becoming an engineer. This clearly shows the parental positive attitude toward engineering education.

Table 1. Career choice statistics <sup>(2)</sup>

Reason for studying engineering								
Family role model			Family support toward engineering studies			Career choice advice during high school		
yes	no	na*	yes	no	na	yes	no	na
24	80	10	76	35	3	77	36	1
21%	70%	9%	67%	31%	2%	67%	32%	1%
Bursary offer only for engineering studies			Will be easy to find a job					
yes	no	na	yes	no	na	* na = no answer		
27	77	10	65	40	9			
24%	67%	9%	57%	35%	8%			

A challenge faced by the young engineers to be, is the inability of many high schools due to scarce material resources, to meet the modern education demands. Table 2 shows the problems faced by high schools learners who opted for engineering career.

In a similar survey carried out in 2005 on a sample of 418 mechanical and industrial engineering students by D. Ionescu and others <sup>(4)</sup>, the findings were very close to the 2014 ones, except for two important issues. The engineering subjects offered at high school level increased from 14 % to 26 % but unfortunately the computer literacy offered at high school level decreased dramatically from 54 % in 2005 to only 41 % in 2014. This is a very worrying situation as the computer literacy is essential for a modern engineering education. Another change is the number of students choosing the high grade mathematics and physical science which increased from 51 % in 2005 to 81 % in 2014. This change is not as positive as it looks, as the high grade mathematics and physical science modules were changed to be more accessible to the average student and the old “standard grade” of these modules was not offered any more at high school level. These changes did not have any positive impact on the quality of high school graduates as can be seen from the national statistics released by the minister of education in 2012<sup>(5)</sup>.

Table 2. High school challenges statistics <sup>(2)</sup>

High school challenges

Figures 1, 2, and 3 show the South Africa's national senior certificate (NSC) statistics over a period of four years<sup>(5)</sup>. As can be seen from the graphs in figures 1 and 2 there is a steady decline in the number of full time students who entered the senior certificate examination but a sharp increase in the part-time students. The part time students represent the students who failed the previous year examination and those who are not full time high school students for various reasons. However, in the end, only 79% (196,090) of the total students enrolled in 2011 were able to write the exam.

Fig. 1. Enrolments NSC Full time candidates 2008 – 2011<sup>(5)</sup>

Fig. 2. Enrolments NSC Part time candidates 2008 – 2011<sup>(5)</sup>

The most worrying statistics are presented in figure 3 where in 2011, 46.3 % of the students obtained 30 % in the mathematics examination and 53,4 % in the physical science examination respectively. Although the most recent statistics (2011 – 2014) are still being processed, the statistics from 2008 – 2011 apply to the current situation (with a certain degree of approximation), as different official reports released and the 2013 senior certificate results show that the situation did not improve, o contrary in some fields worsened.

Fig. 4 Candidates' performance in selected subjects 2008 – 2011  
(at 30% level) <sup>(5)</sup>

### University teaching challenges

The statistics in figures 1, 2, and 3, show that there is much work to be done in the future to improve the quality of the incoming engineering students. Due to lack of material resources at their school, the new engineering students are unprepared for university level teaching. Also their self-study, library use and research skills are inexistent, as shown in table 3 (sample of 114 students) <sup>(2)</sup>.

Table 3. University teaching challenges statistics <sup>(2)</sup>

University of Johannesburg teaching methods as compared to high school								
Very different teaching method			The student is unable coop and feels left out			Self-study time in the library		
yes	no	na (no answer)	yes	no	na	never	everyday	average 3 times/week
99	17	0	62	47	5	34	20	60
87%	13%	0	54%	41%	5%	30%	18%	52%
The ability to access the library database via computer			Study method (only before tests and exams)			The student has difficulties in understanding some subjects		
Yes	no	na	yes	no	na	yes	no	na
85	24	5	17	92	5	71	39	4
75%	21%	4%	15%	81%	4%	62%	34%	4%

Although the ability of the new students to self-study and solve problems by themselves or in working groups, are strongly encouraged at the university, due to poor high school teaching the students are unable to do so, hence a very high rate of drop-out especially in the junior years. Although 54% of students felt that they cannot keep the pace with the teaching rhythm and 62 % have problems understanding some engineering subjects, 34% of the students never study in the library where learning material is available, only 18% study every day and 15% study only before tests or exams.

There is a tendency of perpetrating high school learning methods by limiting oneself to learning material and text book recommended by the subject lecturer. The catastrophic unpreparedness of the engineering students is reflected in the fact that although 81 % of the students study over the duration of the semester, the drop-out rate is very high.

### Understanding engineering modules through relevant laboratory experiments

Beside the poor high school preparation of the students for tertiary engineering education, a bigger problem yet, is that many of our students lack completely “hands on engineering” knowledge. For this reason, the work done by the students in the laboratories is absolutely crucial. Table 4 shows the students opinion relative to the laboratory work integrated in the theoretical module<sup>(2)</sup>. Although the laboratory relevance for engineering modules varies from 79% to 87 %, mainly due to the lecturer’s teaching method, 79 % of students agree over the relevance of the laboratory work.

Table 4. The importance of the relevant laboratory experiments <sup>(2)</sup>

The relevance of laboratory experiments in engineering modules								
The students struggle to handle the laboratory equipment			The laboratory experiment is relevant for all mechanics of machines modules			The laboratory experiment is relevant for all strength of materials modules

86%	2%	12%	87%	1%	12%	79%	9%	12%
The integration of the laboratory experiments into module enhanced the students understanding of the module and their academic performance								
Yes	No	Na						
90	10	14						
79%	9%	12%						

In South Africa, the Engineering National Diploma programs have the work integrated learning module as part of the qualification. The National Diploma students spend 12 month working in industry before they can graduate, thus giving them an important cutting edge on the labour market. The whole year spent in industry is even more relevant considering the fact that 96 % of the students do not have family / friend running a business in the engineering field. As can be seen from table 5, the experiential training plays a crucial role in helping the students to develop a general understanding of the engineering subjects and overcame the hurdles of problem subjects. Unfortunately the student placement in industry, especially for P1 training is a huge problem that our Faculty is trying to address, via cooperative education and active involvement of industry Advisory Committees, in all aspects of engineering department activities <sup>(6)</sup>. Due to a total lack of basic engineering skills of the majority of our students, the placement of P1 students is very difficult as the industry tend to see them as a liability. The P2 placement is easier because the company use the student as a technician while training, thus adding value in the working place. The industry prefers students who completed their two years of academic training and offer them P1 and P2 training over a whole year, with the idea of employing the young graduate after the completion of the experiential training. Over a whole year, the company can assess the student’s ability to successfully integrate in the working environment <sup>(4)</sup>.

Table 5. The importance of work integrated learning in training the future engineers <sup>(4)</sup>

Experiential training, first phase (P1) and second phase (P2) a total of 24 students

16	3	5	13	5	6	1	23	0
67%	12%	21%	54%	21%	25%	4%	96%	

### Conclusions and Recommendations

Considering the challenges faced by the future engineering students, action should be taken starting from the high school right through the tertiary education. Based on the students response to the survey there are several steps that should be considered in order to improve the engineering education in South Africa.

- Develop from high school the learners ability for self-study,
- Encourage learners to use the school library facilities where existent,
- Expand the high schools engineering books library database
- Introduce engineering workshop classes at high school levels,
- Bursaries and study loans to be extended for controlled environment P1 training payment, to reduce the “bottle neck” created by P1 placement.
- As the Engineering Faculty organizes each year the Open Day, when high school learners visit the University and all departments present their program giving career choice advices, the mechanical engineering department representatives should start an intensive career advice program in the high schools.

## Abstract

This article presents the Institutional Program for Scholarships for Initiation in Teaching (Pibid), in Brazil, with its characteristics and organizational forms and analyzes it from the perspective of a Licentiate Program in Music which recently began its participation in this scholarship program. It seeks to analyze the possible difficulties which could present themselves throughout the process. To analyze the subject documents and legal orientations will be used such as the presidential decree instituting the Pibid and the current Pedagogical Project of the Licentiate Program in Music. Besides this the theoretical referential is based on Tardif, Keil and Vygotsky.

## Introduction

The teaching formation programs, the licentiates, are little sought after programs, or, at most, less sought programs than other bachelor's programs. Obviously this has to do with the lack of social and financial recognition of this so necessary and important social task. One of the criticisms made of the formation is that students from the licentiate programs go out ill prepared for work in the schools, with little practical knowledge for an efficient work. The main criticism, therefore, consists in the lack of coherency between the epistemological knowledge taught in the undergraduate programs and the practical capability in carrying out the teaching roles. Even though all the Licentiate programs include internships in their curricular organization, for some reason, this has not had the desired effect. Within this context, a program arises in Brazil which seeks to diminish this existing gap between theory and practice, between epistemological and didactical knowledge. Thus, in the first part of this paper, the Program is presented, with its characteristics, goals and organizational forms. Next, there is an analysis of this Program from the perspective of the Licentiate program in Music of the Faculdades EST in São Leopoldo, RS, Brazil.

## 1. Getting to know the Programa Institucional de Bolsa de Iniciação à Docência (PIBID) [The Institutional Program for Scholarships for Initiation in Teaching in Brazil].

The Institutional Program for Scholarships for Initiation in Teaching in Brazil – PIBID – was instituted by Federal

Decree N. 7,219, of June 24 of 2010, and executed through the Coordenação de Aperfeiçoamento de Pessoal do Nível Superior – CAPES [Coordination of Personnel Improvement of Higher Level Education]. This federal organ, which originally financed betterment at the Master's and Doctoral levels, turns also toward “fomenting initiation in teaching, contributing to the improvement of teacher formation at the higher level and to the improvement of the quality of Brazilian fundamental public education” (Art. 1) To begin the analysis, it is important that the goals of the Program be known.

### *1.1. Goals*

In Art. 4 (Ordinance Nr 096, of July 18 of 2013) the goals of the Initiation in Teaching Program are expressed:

- I – encourage the formation of teachers at the higher level for basic education;
- II – contribute to the valorization of the teaching profession;
- III – elevate the quality of the initial formation of teachers in the licentiate programs, promoting the integration of higher level education with basic education.
- IV – place licentiates in the daily life of the schools of the public education network, propitiating for them opportunities for creation of and participation in methodological, technological and practical teaching experiences with innovative and interdisciplinary characteristics which seek to overcome the problems identified in the teaching-learning process;
- V – encourage the public schools of basic education, by mobilizing their teachers as co-trainers of futures teachers and making them protagonists in the initial formation processes for the teaching profession;
- VI – contribute to the articulation between theory and practice which is necessary for the formation of teachers, elevating the quality of the academic actions in the licentiate programs.
- VII – contribute so that the licentiate students can place themselves in the school cultures of the teaching profession, through the appropriation of and reflection about instruments, knowledge, and peculiarities of the teaching job.

The first goal externalizes the problem expressed above in the introduction with regard to the low demand for licentiate programs. With the amount of the scholarships, the students can qualify their study, as well as finance part of the credits. With the designation of funds for teacher formation, one can perceive the existence of public policies and the interest in the teaching profession at the level of society. This interaction that is so necessary between the basic schools and higher education begins to take place, since the fragmentation of the knowledge and the separation between Higher Education and the social reality caused a great distancing of the university in relation to the society as a whole.

Within these goals, some aspects stand out related to the quality of the initial formation, which make a relation between the daily life of teaching and the academic study, which create a balance between theory and practice, which provoke the insertion into the public school and , with this, become the school, educational and formational contexts of the new generation. With this type of proposal, a possible tendency to be incorporated into the way of being a teacher will be that there will be a greater connection between the school concepts and the daily life concepts. (L. S. Vygotsky, 1993, p. 259.)

One factor which motivates the quest for improvement in the teaching performance is the low indexes attained by Brazil in international evaluations and which put it within the last places in quality of education.

### *1.2. Principles which arise from the creation decree of the Program.*

Brazil is characterized as a multi-ethnic country because of the existence of different social classes and a great cultural diversity. Art. 6 of the decree deals specifically with this diversity and indicates the target public of the institutional projects in question: “The PIBID will tend to the higher level formation of teachers to work at the infant, fundamental and middle school levels of basic education, as well in the education of people with disabilities, youth and adults, quilombola [African-Brazilian slave descendant] communities, indigenous people and education in the rural areas.” Thus the principle of respect for diversity comes to be an orientating factor for the work of the teacher. This principle impacts the formation foreseen in the projects of the courses (programs) involved in the Program.

The public school in Brazil, by its own vocation, constitutes itself as the space by law for the schooling of children and adolescents in situations of social vulnerability. From within itself strategies can arise for seeking their rights or, at least, for analyzing the possible causes of the risk of social exclusion and for strengthening for confronting the risks of vulnerability. Keil (2011, p. 23) points out that one of these strategies of confrontation of the historical conjuncture is

the local development. Besides this he affirms that this development has as its center the individuals and the environment. Thus, the school could be a space in which the more vulnerable social classes could become aware of themselves and strengthen themselves as subjects with rights and implement the development of this conception. "Principles such as solidarity, cooperation, unconditional hospitality, autonomy among others, are threads and the needle which weave it" (Keil, 2011, p.23). Due to this, the school has, or should have, as its main target this age group of children and youth with their specific needs and with their possible vulnerabilities.

Public policies have been put forth in favor of children and adolescents with the goal of protecting them from vulnerabilities. And the public schools are propitious spaces for executing and weaving these policies and for the development of concepts of citizenship that are not simply theoretical. This process was put into motion in the year of 1990 when the Statute of the Child and of the Adolescent [Estatuto da Criança e do Adolescente (ECA)] – Law n. 8,069 was approved. As of this law a new background for infancy and adolescence arises. "Children and adolescents are sociological types elevated to the category of juridical types, therefore, detainers of rights foreseen in laws and with public and social policies with very specific cuttings." (Silva, Souza Neto, 2009, p.11). Faced with the advance coming from the public policies, this theme is also necessary in the analysis of the social issues in the public school. New languages enter at least the theoretical focus of the subject. The issue of social vulnerability, and because of it, the themes of human rights, become part of the new vocabulary. And thus the Program fulfills what is foreseen in art. 7 of the decree "the PIBID must be exclusively executed in schools of basic education of the public school networks, being forbidden the placement of scholarship students in activities of administrative or operational support". Thus, the public school becomes a formation agent and abandons the passive status that was attributed to it before.

## 2. Music in the school

In dealing with the subject of the territoriality of Music, it is necessary to point to the problem of Musical Education in the Brazilian school or to the mandatoriness of the content of music in basic schooling coming from the Law 11,769 of 2008. As to the applicability of the legislation, the long time of absence of Music as a part of the formal school curriculum makes it difficult for it to be truly inserted or reinserted within the daily school life. Another issue is related to the reason for which the return of Music as a curricular component in the school is considered necessary. Does it have a role to fulfill? What would it be? In some teaching systems new legal possibilities arise to increase the presence of Music in the school. But, at the same time, there is a need to delimit the intentionality of its presence. At this moment of returning to the school, there is a need to justify the task of Music in the school. Upon entering the school world, the Music teacher is required to justify his or her presence. The school still strongly maintains the territorial reserves of specific fields. That is why the first could be an epistemological motive and not a didactic one per se. To say that Music is an area of knowledge that is as necessary as the others could be a simple apologetics for the area. But if Music is not defended, there will also not be the space which still needs to be conquered in the Brazilian schools. One begins with the presupposition that "Music in the school contributes to the development of a potential that every subject is capable of" (Santos, 2009, p. 193). The methodologies to reach this goal, obviously, are differentiated among the teacher formation programs in the Music Licenciates throughout the nation, but the challenge is the same for all.

The teaching of music in Brazil was absent from the schools for a long time, with the exception of one or another school which had human resources on their staff prepared in the area, but working in Visual Arts or, even in other areas of knowledge. This situation brought about informality to the area.

In dealing with Music Education, one of the elements of the educational problem has to do with the professional formation of teachers for this area. The first question which arises is what type of formation is necessary: a generic formation for the four dimensions of the Arts curricular component or a specific formation in each one of the typologies? Besides this, since Music was excluded from the formal school space, a parallel "market" arose made up of Music Schools which have their own demand. One needs to consider that the programs in the area of teacher formation, the licenciates in general, have been the target of criticisms of educational analysts because of the excessive existence of theoretical disciplines and too little practical orientation acquired in these programs. These criticisms point to a real situation: beginning teachers arrive in the classrooms, with, at the least, doubts as to the "routine" procedures to be carried out in their professional activities. This is a problem which most of the professionals in the areas considered technical do not have.

This discrepancy between the so called educational theorizations and practice points to a dichotomy between epistemology and didactics. Even though a practice without a theory which orients it does not exist, many times the

activism demanded by the daily teaching life of the teacher impedes an awareness of the causes and consequences of this practice. Or the theoretical dominion of the concepts and conceptions is not translated or transferred to the teaching task. Thereupon, a separation arises between theory and practice or a dichotomy develops between the epistemological field and the didactic field. And the result appears in the failure to learn or the lack of zest of the children and youth for the school. In the area of Music the situation is aggravated due to the need to deal with the four dimensions of the Art component previously mentioned.

Knowledge and action form a conceptual unit. They are, therefore, inseparable. This should be a referential for all the areas of knowledge taught in the school, but it is also essential for the area of Music. In this way one arrives at the necessary theoretical referentials, the analyses which need to be done and the possible practical framework for its pedagogical execution, that is, the know-how to be developed in the process of teaching formation for Music.

Upon entering the school doors, Music shows the fulfillment of what is said by Tardif (2008, p.25): "...the formation of teachers is a collective responsibility of the whole teaching profession, as well as of the school authorities: establishments, school commissions, etc. A program is vigorous and its formation of quality when this set of collective actors works together and shares a common vision of teaching and of the work of the teachers". In this way, the public school no longer simply receives teachers whose preparation is deficient, but takes on a preventative and formative role.

In continuity with this recognition of Music in the school, a resolution emitted by the Municipal Council of Education and which foresees the specific space for Music (CME, 2012), appears in the municipality where the Faculdades EST is situated, that is, São Leopoldo, RS and which is the geographical space in which the PIBID is carried out. This resolution foresees the presence of Music as a curricular component in Infant Education and Fundamental School, including the work of teachers with specific formation in Music.

### **3. The PIBID at the Faculdades EST**

"Here is the first responsibility of a true team of teacher trainers: to define the program in which it wants to work, enunciating its creed in terms of formation for teaching, that is, their ideals, values, ambitions" (Tardiff, 2008, p. 19). Among these ideas is the methodological principle of the theory and the practice which is an essential factor. The program project for the Licentiate Program in Music of the Faculdades EST calls for "an academic formation which propitiates the establishment of relations between theory and practice". Since, as Tardiff affirms, (2008, p. 21), "one of the main problems with teacher formation is the fragmentation of the programs, their fractioning into disciplines and fields, their division into disparate activities." To avoid this fragmentation the program tries to unite theory and practice from the first semester on through internships, an aspect which the PIBID also develops, and through constant dialog with the different professionals who seek the integration among the different curricular components. Beyond this an attentive Structuring Teacher Nucleus can help, through constant accompaniment and analysis of how the program is working.

Among other criticisms of the graduates from the Licentiate programs is their difficulty in the area of oral and written communication. In this sense the institutional PIBID/EST project foresees improvement courses in the Portuguese Language for its scholarship students since it believes that a music teacher needs to have dominion of his/her language. As the Pedagogical Project of the Licentiate Program foresees: "the encouragement of reading, writing and rational logic for the knowledge, analysis and interpretation of the social issues should be part of all the units of teaching in a Program/Course". In practical terms and in keeping with this demand, the group is challenged to maintain a field diary and register in it impressions, feelings, anxieties, experiences. Besides this, the group has weekly meetings at the program center to exchange ideas, recount the happenings of the week and plan meetings and work activities. In these meetings the minutes are written up by the scholarship students themselves in order to develop this communicative skill and to be able to officially register school activities.

In terms of the profile of the graduates the PPC says: "He/She should also, besides exercising musical teaching in regular school situations, tend to people with special needs – be they physical, and/or mental and/or emotional -, and in non-governmental organizations and other spaces of promoting citizenship and social well being" (Pedagogical Project of the Program, p. 17). In this sense, art. 6 of the decree which institutes the PIBID, also finds a parallel in the referentials of the course program. With the goal of getting to know the impacts on the life of the scholarship students as well as on the schools where they work, the PIBID will be the focus of Research Projects of professors involved in the Program. They will seek to investigate if there are limiting elements and if so what they are, if the different levels of knowledge and the different stages of advancement of the scholarship students in the program interfere in the

performance and how this happens.

For the initial procedures and to minimize possible negative impacts upon approaching the teaching practice, the counsel is to, where appropriate and if necessary, work in pairs for teaching work in the classroom in the first months of the project, especially for those who are closer to the beginning of the program and have not carried out supervised internships. For carrying out special projects the work in pairs has been recommended to have a greater reach. In the institutional accompaniment of scholarship students we seek a participative and group pedagogical style in which the students appropriate for themselves all the documents of the institutional process of the PIBID. The documents are studied and their contents are shared in the meetings. The steps taken in the practice in the schools are evaluated and the next steps planned. As Tardif says (2008, p. 24): "A quality program should have spaces and moments in which the trainers and the other actors may reflect and work together on their formation project".

Toward this end, the goals of the PIBID and the licentiate program project itself are organized to work in the direction of a shared reflection, in which the scholarship students receive the challenge to position themselves facing reality, the theory studied in class and the practices exercised in the classes and to seek pertinent procedures together.

According to international research, we think that the transmission/acquisition of school know-how (which encompasses knowledge, but also values and competencies) and the management of interactions in the classroom constitute the two most important tasks of the teacher. In the first, the teacher situates him/herself in the order of didactic competencies: he must transpose and teach the curricular contents, cover the program, assure him/herself that the various elements are assimilated, facilitate the retention of the material, conceive of situations of problem resolution, actively supervise the development of the class, evaluate the assimilation of the material, etc. The second task is about competencies specific to the conduct of the class: he/she must organize the groups, establish rules and procedures, react to unacceptable behaviors, link the activities, etc. These two competencies constitute the center of teaching in class and should, therefore, form the base of a referential of competencies in the programs for initial formation" (Tardif, 2008, p.37).

This contribution of Tardif leads to the analysis of two factors: the epistemological and the didactic, fundamental aspects which can serve as criteria for the accompaniment of the initiation into teaching incremented by the PIBID. Toward this end, the scholarship students receive accompaniment of the Licentiate in Music Program coordinator who monitors the development of the epistemic part of the musical school content and the PIBID institutional coordinator and Didactic professor accompany the part of the teaching planning and practice.

#### 4. Conclusion

Since the application of the program is recent there are still no evaluative aspects to be reported. However, some hypotheses can be put forward as to possible difficulties to be confronted. One of them has to do with the permanence of the students so as to develop a sequence and continuity, thus reaching fidelity with the Program. This is one aspect which is being worked out after two students, with acceptable justifications, asked to cancel their participation. It is also necessary to have a constant interaction between the institutional coordination, supervisors of the schools and the students so that the goals can be constantly cross checked with the practice. Therefore, the scheduled meetings, in the schools in which the students work as well as in the forming/training institution and the constancy of their being carried out can minimize possible negative impacts.

However, the first impressions communicated in the group already confirm that the PIBID can have an excellent scope as an aggregating element in teacher formation, especially in the challenge of connecting theory to practice. To get to know the school culture from the beginning of the program, be it through internships or through work within the PIBID, can help test the real interest in becoming a teacher. Maybe this can be an element which can help avoid that people without a liking for teaching go on to exert the teaching role only because they have the formation and nothing better has shown up for them to do for their survival. The hope is that this contact with the practice from the first semester on, as in the case of the foreseen supervised internships, or through the PIBID, may develop people more focused on reality and with sufficient knowledge that conveys the conviction that they truly want to be teachers.

## Abstract

The present study aims to investigate attitudes and readiness of Information and Communication Technologies pre-service teachers toward web-based learning. In the study group of the research are 165 pre-service teachers. The study was conducted in the survey model. As data collection tools, 'Web-based Teaching Attitude Scale' and 'Readiness and Expectation Scale for e-Learning Process' were utilized. In analysis of the collected data, descriptive statistics, t-test, and ANOVA analysis were conducted. As a result of the research, it was found that attitude levels of pre-service teachers were lower than median; and their readiness levels were above the median. Moreover, in terms of gender, there was no significant difference between attitude and readiness scores. While there was no significant difference among attitude scores in terms of number of years in education, there was significant difference in readiness scores.

## 1. Introduction

In the current information age, fast-paced developments experienced in the information and communication technologies have reflected on education area like all areas of life. Along with the technological innovations, countries have started to rearrange their education programs and policies (Çetin and Günay, 2011). In this scope, the internet, one of the significant technology advancements, has started to be used a resource with priority to fulfill education need and life-long learning demand. Internet environment enabled educational institutions to transfer their activities onto the web environment independent from spatial and temporal conditions due to the advantages of the internet (Demir, Kaymak and Horzum, 2013). At this point, one of the new learning – teaching models developed recently by educators was web-based teaching model (Çetin and Günay, 2010). Web-based teaching was defined as a learning environment in which the educational content is presented through a web browser (Karataş, 2008).

Through web-based teaching, learners are enabled to have access information from anywhere and on anytime by means of computer and internet technologies (Yiğit, Yıldırım and Özden, 2000). Besides the internet-based education applications, web-based teaching has also enabled developing interaction and communication, creating discussion platforms, and taking advantages of chat programs (Cömert, 2012). Moreover, it is possible to fulfill learners' personal learning needs and to develop their motivation by means of web-based teaching (Yeniad, 2011). Visual structure,

communication and interaction capabilities and personal education opportunity can be considered as advantages of the web-based education (Alessi, & Trollip, 2001, referenced by Arkün, Baş, Avcı, Çevik and Gürcan, 2009). Additionally, web-based teaching have advantages without spatial and temporal dependency such as ability to work with materials enriched with audio and video animation, self-learning, self-regulation, and time management (Tüysüz and Aydın, 2007). Moreover, Cook (2007) enumerated the advantages of the web-based teaching as reusability of resources and materials, flexible scheduling, updateability of resources, personalized teaching, new teaching methods, evaluation and documentation. In addition to its advantages, web-based teaching exhibits several disadvantages as well. Some of these disadvantages are social isolation, cost, technical problems, and weak educational design (Cook, 2007).

Although there are numbers of advantages, online learning is required to have readiness characteristic so that students can utilize from these advantages similar to ones in the web-based learning environment (Yurdugül and Alsancak Sırakaya, 2013). In these environments, it is important for students to have readiness in terms of technical skills, motivation, and access to technology in the context of the efficiency and productivity of the process. In web-based systems, interests, expectations and required competencies of students may differ according to the conventional education (Frith and Kee, 2003). Hence, it was stated that readiness in distance learning, web-based learning, blended learning and online learning is a factor that must be taken into consideration (Usal and Bayrak, 2005; Tezer and Biçen, 2008; Demir Kaymak and Horzum, 2013).

When it is considered in terms of web-based education environments, besides the readiness, attitude is another variable that must be considered. It is important taking sensual characteristics such as attitude into consideration to create learning experience (Küçükahmet, 1997). As it is same with the conventional education environments, success of the web-based education environments depends on attitude of students toward web-based teaching (Erdoğan, Bayram and Deniz, 2007); and it largely affects learning process (Alomyan & Au, 2004). Along with the changing student roles, it is important for students to develop positive attitude toward this environment and to embrace them as part of their learning culture (Erdoğan, Bayram and Deniz, 2007). In the literature, students' attitude toward web-based teaching has been focused and its significance has been emphasized through researches (Kurubacak, 2000; Manzares, 2004; Özgür, 2011; Uzun, Özden and Yıldırım, 2013).

Application of web-based learning environments in education and number of studies in this subject has been increased significantly. Essential reason behind the expansion of web-aided education is their contribution to the learning-teaching environments (Yağcı, 2012). While effects of the web-based learning environments are being investigated, characteristics of environments and learners are required to be considered for successful results. In the web-based teaching environments, learners' characteristics are the factors to be considered. Readiness, attitude, gender, learners' grades are some of the factors to be considered. In terms of effectiveness and productivity of the process, it is important for learners to have positive attitude and to be at certain readiness level.

Attitude and readiness of pre-service teachers studying at the department of computer and teaching education toward web-based teaching are important since they are more related with technology compared to the other departments and they would take role in expansion of technology usage in the institutions where they perform their occupation. While pre-service teachers are in the user position regarding web-based learning environments during their undergraduate education; they will be designer and applier position for these environments in the future. Therefore, their high level of attitude and readiness toward web-based teaching would increase their potential to use these environments in their own courses.

The purpose of this research is to investigate attitude and readiness of pre-service teachers at the department of Computer Education and Instructional Technology toward web-based learning. Within this framework, following purposes were responded:

1. What are the attitude and readiness levels of pre-service teachers toward web-based learning?
2. Do the attitude and readiness levels of students toward web-based teaching vary significantly based on gender?
3. Do the attitude and readiness levels of students toward web-based teaching vary significantly based on their grade level at the school?

## **2.Method**

In the present study, attitude and readiness levels of pre-service teachers toward web-based learning were investigated. Since an existing condition was investigated, a survey model was used. The survey model is appropriate approach for studies aiming to describe a circumstance which existed in the past or still present (Karasar, 2009).

#### *Participants*

The study group of the research was consisted of 165 pre-service teachers at the department of Computer Education and Instructional Technology in the Faculty of Education at the Ahi Evran University during spring semester in the educational period of 2013-2014.

Table1. Gender distribution of the pre-service teachers

Gender	f	%
Female	94	57
Male	71	43
Total	165	100

When Table 1 is considered, it can be seen that 94 of pre-service teachers were female (57%), and 71 of them were male (43%).

Table 2. Distribution of pre-service teachers according to their grade level

Class	f	%
1	43	26.1
2	43	26.1
3	41	24.8
4	38	23.0
Total	165	100

When Table 2 is investigated, it was seen that the number of first grade students were 43 and they constitute 26.1% of general population; the number of students on the second, third and fourth grade were 43 (26.1%), 41 (24.8%) and 38 (23%) respectively.

Table 3. Distribution of pre-service teachers according to type of high schools where they were graduated from

Type of the high school	f	%
General high school	18	10.9
Occupational high school	106	64.2
Science high school	1	0.6
Anatolian high school	27	16.4
Other	11	6.7
Undeclared	2	1.2
Total	165	100

When Table 3 is investigated, it was observed that the number of graduates from general high schools were 18 (10.9%), from occupational high school were 106 (64.2%), from a science high school 1 (0.6%), from an Anatolian high school 27 (16.4%), from other type of high school were 11 (6.7%), and the number of undeclared were 2 (1.2%).

#### *Data Collection Tool*

As data collection tools, demographic information form, 'Web-based Teaching Attitude Scale' developed by Erdoğan, Bayram and Deniz (2007); and 'Readiness and Expectation Scale for e-Learning Process' developed by Gülbahar (2012) were utilized.

**Demographic Information Form:** At this section, gender, graduate level and graduated high school information of pre-service teachers were acquired.

**Attitude Scale for Web-based Teaching:** ‘Web-based Teaching Attitude Scale’ developed by Erdoğan, Bayram and Deniz (2007) consists of 26 items whose validity and reliability analyses were performed, and in five-scale Likert form. It is composed of two dimensions called “Web-based Teaching Efficiency” and “Resistance against Web-based Teaching”. The overall Cronbach’s Alfa internal consistency coefficient of the model was determined as 0.917.

**Readiness and Expectation Scale for e-Learning Process:** ‘Readiness and Expectation Scale for e-Learning Process’ was developed by Gülbahar (2012) and its validity and reliability analyses were performed while it was formed in five-scale Likert structure. It was totally consisted of 26 items in five dimensions: “Personal Characteristics” in 4 items, “Access to technology” in 4 items”, “Technical Skills” in 8 items, “Motivation and Attitude” in 4 items and “Factors effecting success” in 6 items. The general Cronbach’s Alfa reliability coefficient was found as 0.93 for the scale.

The data collection process was performed based on voluntary participation for the spring semester of the educational year in the period of 2013-2014 and distributed in the printed form.

### Data Analysis

In the data analysis, SPSS (Statistical Package for Social Sciences) 20 package program was employed. Skewness and kurtosis values of application data were investigated and it was seen that it presents normal distribution. Skewness and kurtosis values were in the range of 0.04 and 2.57. Description and correlation analyses were performed. Descriptive analyses were also employed in analysis of demographic data and in calculation of measurement tool scores. Correlation analysis was performed to investigate relationship between readiness and attitudes of pre-service teachers.

### 3.Findings

In this section, findings supporting purposes of the analysis were included.

1. To determine attitude and readiness levels of students toward web-based teaching, average scores were investigated in terms of total score and factor score. The relevant data were exhibited on Table 4 and Table 5.

Table 4. The attitude level toward web-based teaching

	Min	Max	$\bar{X}$	S.S
Efficiency of web-based teaching	1.00	4.65	3.40	.60
Resistance against web-based teaching	1.67	5.00	2.85	.61
Total score	1.77	4.23	3.21	.35

When Table 4 is investigated, it was observed that average score of students toward web-based teaching were found as 3.21. When average scores were taken into consideration for average scores, efficiency of web-based teaching, the average score for sub-factor was found as 3.40; and resistance sub-factor against web-based teaching was found as 2.85. Based on these findings, it can be said that students’ attitude levels are on the median level due to both sub-factors and general total.

Table 5. Readiness level toward web-based teaching

	Min	Max	$\bar{X}$	S.S
Personal characteristics	1.00	5.00	3.33	.84
Access to technology	1.00	5.00	4.12	.88
Technical skills	2.00	5.00	4.49	.61

Motivation and attitude	1.00	5.00	3.67	.78
Factors affecting success	1.00	5.00	4.19	.72
Total score	2.19	5.00	4.06	.57

When Table 5 is considered, it can be seen that readiness average score of the students toward web-based teaching was found as 4.06. When the average scores were considered in terms of sub-factors, it was found for personal characteristics as 3.33; for access to technology as 4.12; for technical skills as 4.49; for motivation and attitude as 3.67; for factors affecting success as 4.19. Based on these findings, it can be said that both for sub-factors and for general total, readiness levels of students were in the range between median level and high level.

2. To determine whether attitude and readiness levels of students toward web-based teaching vary according to gender significantly, t test was applied. The analysis results were summarized in Table 6.

Table 6. Attitude and readiness level according to gender

	Gender	N	$\bar{X}$	Ss	Sd	t	P
Attitude toward web-based teaching	Female	82	3.24	.33	150	1.20	.232
	Male	70	3.17	.36			
Readiness toward web-based teaching	Female	86	4.06	.54	150	-1.33	.185
	Male	66	4.13	.61			

There were no significant difference between attitude levels of students toward web-based teaching and their gender ( $t = 1.20$ ,  $p > .01$ ). Similarly, there was no significant difference found between readiness of students toward web-based teaching and gender ( $t = -1.33$ ,  $p > .01$ ). According to these results, it can be said that there was no significant difference in attitude and readiness levels of female and male students toward web-based teaching.

3. To determine whether there is significant difference between class year of students and their attitude and readiness levels of students toward web-based teaching, ANOVA analysis was performed. The analysis results were exhibited on Table 7.

Table 7. Attitude and readiness level according to grade level

Dimension	Grade level	N	$\bar{X}$	SS	sd	F	P	Significant Difference
Attitude toward Web-based Teaching	1	36	3.1271	.29289	.11	4.267	.006	2-4
	2	40	3.9067	.56331	.05			
	3	40	4.1317	.60198	.06			
	4	35	4.1451	.60296	.09			
Readiness toward web-based teaching	1	37	4.0655	.48632	.13	1.457	.229	
	2	41	3.1051	.34434	.04			
	3	41	3.2861	.36539	.05			

As it can be seen from Table 7, according to the results obtained from variance analysis, there was significant difference was found between grade level of students and their attitude scores toward web-based teaching [ $F(3-151) = .006, p < .05$ ]. To determine the origin of this difference, the Bonferroni analysis was performed and as a result of the analysis, it was revealed that attitude levels of the 4th grade students were higher than the 2nd grade students.

Regarding the readiness scores of students toward web-based teaching, there was no significant difference according to their grade level [ $F(3-151) = .229, p > .05$ ]. In other words, readiness levels of students toward web-based teaching did not present variation according to their class years.

#### 4. Result and Conclusion

Attitude levels of pre-service teachers toward web-based teaching were found at the median level in terms of both sub-factors and general gross total. The similar results were also obtained in the study of Uzun, Özden and Yıldırım (2013). Moreover, in the study of Yakın and Tınmaz (2013), the positive attitude of pre-service teachers toward e-learning explains this findings as well. Additionally, in the study conducted by Yeniad (2011), it was found that students have positive attitude toward web-based education process.

Readiness of pre-service teachers toward web-based teaching was found in the range between median and high levels in terms of both sub-factors and general total. In the study of Hung, Chou, Chen and Own (2010), readiness levels of students toward online learning was determined high. Stokes, Cannavina, and Cannavina (2004) researched readiness levels of medical school students for web-based learning environments; and it was found that there was no sufficient readiness level.

There was no significant difference between attitude levels of female and male pre-service teachers. In their study, Yakın and Tınmaz (2013) found that attitudes of pre-service teachers toward e-learning do not exhibit difference based on gender. Chen and Tsai (2005) found significant difference between attitudes of university students toward web-based learning in the favor of female students.

Similarly, regarding the readiness levels of female and male pre-service teachers toward web-based teaching, there was no significant difference. Other studies investigating readiness levels of female and male students toward online learning revealed that there was no difference among them (Hung and et al, 2010).

There was significant difference was found regarding attitudes of pre-service teachers toward web-based teaching on the grade level. It was found that attitude level of the 4th grade were higher than the ones in the 2nd grade. This finding confirms the results of Yakın and Tınmaz (2013). It was found that attitude levels of the senior students toward e-learning were found higher than the first grade. It can be said that this is an expected result because along with the years at school, students gain more technological experience and sufficiency, which enhances their attitude levels.

Among the readiness scores of the pre-service teachers toward web-based teaching, there was no significant difference at the grade level. In the literature, there are different studies revealing various findings. In the study of Hung and et al (2010), it was reported that there was significant difference in online learning readiness levels of students among according to their grade level.

---

## Abstract

The purpose of this study was to investigate the visuospatial functions in children, 7-15 years of age, diagnosed with Attention Deficit Hyperactivity Disorder (ADHD). Within the framework of this overall purpose of the study, Benton Face Recognition Test and Benton Judgment of Line Orientation Test were carried out to evaluate the visuospatial perception skills. Rey-Osterrieth Complex Figure - Copy and WISC-R cube design subtests were applied to evaluate the visuospatial construction skills. Within this scope, thirty five children diagnosed with ADHD by a psychiatrist or neurologist and thirty nine normally developed children with no health problems were examined. The results of the study indicated that the comparison between the children diagnosed with ADHD and normally developed children revealed that there was a meaningful difference in the dorsal surface visuospatial perception, regarding being diagnosed with ADHD or not. However, within this skill, the children diagnosed with ADHD were found to spent less time than the children not diagnosed with ADHD.

## 1. Introduction

Brain does not include different centers for each function. For example, there is not a separate center to identify faces we know, to concentrate when we focus on something, or to call to mind a word etc. Connection networks bridging various zones in the brain carry out cognitive functions (Madi, 2011).

Attention Deficit Hyperactivity Disorder (ADHD) indicates more frequent and severe hyperactivity- impulsivity by comparison with ones in similar development period (DSM IV, 1994). As well as it's not accepted that there is a center for attention system, it's also considered not related to all parts of brain (Güneş, 2004). Findings of studies on attention and brain show that there is a complex neural system related to attention. For instance, a higher-level emotional cortex such as inferior temporal cortex functions to recognize emotions and to get details of each sensory stimulus by the way posterior parietal cortex operates to pay attention for conducting in time and space. In addition to these, prefrontal cortex runs for operating higher-level mental activities such as regulating attention, focusing, keeping attention, inhibiting unrelated stimulus (Güneş, 2004).

Children with ADHD may have difficulty with visual spatial functions. Visual spatial functions consist of visual spatial sensation and visual spatial configuration. Brain includes "what" and "where" pathways representing these two sensation types. Oksipitotemporal (ventral) pathway identifying subjects is important for recognizing shape, color, and properties of subjects by projecting it from oksipital cortex to temporal cortex. Oksipitoparietal pathway, which is

---

E-mail address: selin.alpanda@gmail.com

defined “where” pathway, transfers data from oksipital cortex to parietal cortex. Oksipitoparietal pathway is involved with places, parts, and positions to other ones of subjects. Although brain includes two different pathways that are related to what/ where the forms are, we perceive them as a whole. As “what” and “where” pathways and data converge in prefrontal cortex, perception of forms as a whole takes place. Thus prefrontal cortex has a role to perceive visual characteristics of stimulants, and place they occupy as a whole (Karakas, 2008).

Despite there are various studies on ADHD and executive functions, it's not found out any study presenting relationship between ADHD and right hemisphere. In a study titled *Investigating Relationship Patterns of Attention, Executive Functions and Metacognition Performance in Subtypes of ADHD*, it's found that cognitive disorders in ADHD may result from disorders in functions of a common and complex neuroanatomical network system including front parietal zones and their subcortical projections (Soysal, 2007). According to Erdoğan & Bakar (2007) 7 studies of 12 shows that total children with ADHD's brain volume (especially on the right part of brain) is %3-5 smaller than the other ones (as cited in Mostofsky, Cooper, Kates, Denckla & Kaufmann, 2002). Literature indicates that ADHD is in relationship with prefrontal cortex functions (Semerci & Turgay, 2008). Hence it's not presented attention affects and discrepancies on visual spatial functions. In this study, the purpose was to exhibit visual spatial differentiation levels according to development periods, and to investigate relationship between ADHD and visual spatial functions on the basis of findings in researches setting out activations in parietal lob, and volume change on the right hemisphere.

In this study aiming to investigate visual spatial functions of 7-15 year-old children with ADHD, these questions were answered:

- How are 7-15 year-old children according to ADHD and visual spatial functions?
- Do ADHD levels of 7-15 year-old children differentiate into age and gender?
- Do visual spatial functions of 7-15 year-old children differentiate into age and gender?
- Do visual spatial functions of 7-15 year-old children differentiate into their ADHD diagnosis?

## **2. Method**

### **2.1. Model**

This research targeting to examine relationship between ADHD and visual spatial functions was designed with relational screening model, which is one of the general screening models. In this research, Personal Information Form, Benton Facial Recognition Test, Benton Line Orientation Test, Rey Osterrieth Complex Figure Test, and Wisc-R Block Design Test were used.

### **1.2. Participants**

Research sample was composed of children with ADHD. Study group of the study consisted of 35 7-15 year-old children with ADHD who went to Istanbul Çapa Faculty of Medicine Child Psychiatry Service and private practices and didn't take medication. Research was conducted between July 2010 and October 2010. 39 7-15 year-old children without any mental symptom who went to Istanbul Çapa Faculty of Medicine Neuropsychology Service was randomized as into control group. Research group and control group were conducted according to some demographic variables such as age, gender, and educational level.

### **1.3. Tools**

#### **1.3.1. Personal Information Form**

Personal Information Form developed by the researcher questions demographic variables of children such as age, gender, and educational level.

#### **1.3.2. Benton Facial Recognition Test**

It's measured how facial recognition skills of children by this form. It's expected children to pick the same face, which was shown to children before, between six pictures in six items of used short form. After first part of the form, it's asked for children to find 3 poses on different light, shade, and side view of the same person. This test is related to oksipitotemporal (ventral/ “what”) pathway and sensitive to right posterior association cortex disorders. It's examined

visual spatial sensation skills by this test.

### **1.3.3. Benton Line Orientation Test**

The purpose of this test is comparison of angular positions of 11 lines numbered and put in order on a hemicycle. Test includes 30 items. Before administrating the full test, it's passed a set of 5 practice items. The test consists of line segments of varying spatial orientation, which must be matched with a set of longer lines on a response card. It's posed which lines fit asking 2 lines looking at the picture including 11 lines. After practice items, it's passed full test. At this point, parts of 2 lines of 11 are submitted and it's asked which line parts fit the lines. This test is related to dorsal (oksipitoparietal/ "where") pathway. The test sensitive to disorders behind of right hemispheres is used for diagnosing perceptive disorders.

### **1.3.4. Rey Osterrieth Complex Figure Test**

Rey and Osterrieth Complex Figure Test is a test measuring the coordination between space perception and visual skills. This figure named as 'drop' is a basic version of the figure developed by H. Lambelin. The figure needed to be copied and a blank page is given to participants and the duration of copying is recorded. 3 minutes after finishing the copy, children are asked to redraw the figure again. So, immediate visual memory is tested. After 20 minutes, children are asked to draw the figure with what is left in their minds in order to evaluate long-term visual memory. Scoring is done according to correctly-placed components.

### **1.3.5. Wisc-R Block Design Test**

In this study, an improved version of Wechsler Intelligence test for Children, which is a sub-test of WISC-R, is used. The test was developed by Wechsler in 1949. For the purposes of the study, 'cubical forms' part is taken from WISC-R's performance section. The test consists of 9 blocks (cubes) colored red on two sides, white on two sides, and red/white on two sides. There are 11 figures to be done. Participant is asked to make figures within requested time. This sub-test is thought to measure performance speed, visual perception and motor coordination skill, non-verbal reasoning skill, analytical thinking skill, three dimensional thinking ability and perceptual organization capacity (Sancak, 2006).

## **3. Findings**

### **3.1. Findings concerning ADHD**

%47,3 of the Participants who joined the study are diagnosed with ADHD. %52,7 of them are defined as normally-developing.

- A significant relationship is found between ADHD and age. Among 7-15 year-old children, %32,3 of them is diagnosed with ADHD before the age of 9; %61 of them is diagnosed after 9 years.
- It is indicated that there is significant relationship between ADHD and gender at .01 level. Findings show that %62,2 of male population and %24,1 of female population are diagnosed with ADHD.

### **3.2. Findings considering visual-spatial functions of 7-15 year-old children**

Minimum and maximum scores of visual-spatial perception and configuration test are compared. Participants' visual-spatial mean score ( $X=27,30$ ) is higher than the median (18); their visual-spatial (Wisc-r) mean score ( $X=12,09$ ) is lower than the median of the scale (31). Participants' line orientation mean score ( $X=17,45$ ) is higher than the median (15); mean score of face recognition test is higher than the median (27).

- There is no significant correlation between 7-15-year-old children's ages and the time period they do visual-spatial configuration test.
- There is positive correlation between 7-15-year-old children's ages and visual-spatial configuration test scores. Accordingly as the age rises, visual-spatial configuration skill rises .
- The negative correlation between ages of 7-15 year-old children and wisc-r test on visual spatial configuration is found significant at .01 level. Accordingly as the age rises, visual-spatial configuration skill decreases.
- There is no significant correlation between 7-15 year-old children's ages and Line Orientation Test.

- There is positive correlation between 7-15 year-old children's ages, visual spatial configuration perception and face recognition test at .01 level. Accordingly, as the age rises, face recognition skill rises or vice versa.
- The time period children aged 7-15 do visual-spatial configuration test does not exhibit significant difference with ages (below and above 9 years old).
- There is significant difference between visual-spatial configuration tests of 7-15 year-old children and their ages (below and above 9) at .05 level. Accordingly, children above 9 got higher scores than children below 9.
- Significant difference between wisc-r test scores on visual spatial configuration and ages of the children (below and above 9) exhibit at .01 level. Accordingly children above 9 got lower scores than children below 9 years old.
- There is no significant difference between visual spatial configuration perception and Line Orientation Test scores considering the age (below and above 9).
- There is significant difference between visual-spatial perception, face recognition test scores and age variable at .05 level. Accordingly, children above 9 years old got higher scores than children below 9.
- Significance differences between the time period 7-15 year-old children do visual-spatial configuration tests and gender exists at .05 level. According to findings of the study, male children do the test faster than female children.
- Visual-spatial configuration tests do not exhibit significant difference according to children's gender.
- Wisc-R test scores on visual-spatial configuration perception of children aged 7-15 years does not exhibit significant difference with respect to gender.
- Judgment of Line of Orientation Test scores of children aged 7-15 years does not exhibit significant difference with respect to gender.
- Significant difference is not noted in face recognition test scores on visual-spatial configuration perception of 7-15 year-old children and gender.

### **3.3. Findings on the differentiation in visual-spatial functions of children aged 7-15 years and children with ADHD**

- The time period 7-15 year-old children do visual-spatial configuration tests with respect to having ADHD exhibit significant difference at .01 level. According to the findings, children with ADHD use less time than children who do not have ADHD.
- Visual-spatial configuration tests of 7-15 year-old normal children and children with ADHD do not show significant difference.
- Wisc-R test scores on visual-spatial configuration perception of children aged 7-15 years does not exhibit significant difference among children with ADHD.
- There is significant difference among 7-15 year-old children with ADHD and with no ADHD with respect to Line Orientation Test scores at .05 level.
- 7-15 year-old normal children and children with ADHD do not exhibit difference with respect to face recognition test scores.

## **4. Discussion**

Children with ADHD can have difficulty in responding to possibly dangerous stimuli. This is because they have difficulty to gather information and stimuli coming from the environment. In other words, it is hard for them to transfer the information collected at the hindbrain to frontal lobes. Nowadays, training programs to increase the attention span are prepared with the help of various tests evaluating attention deficiency. However, there is insufficient number of studies exploring hindbrain. So, we can say that all parts of brains of children experiencing both academic difficulties and visual-and spatial incapacities must be examined. Karakaş and et al. (1999) argued that parallel systems selectively scattered around the brain work together. Therefore, results of cognitive procedures that require planning and attention can be considered close to each other.

Delay in visual-spatial skill development might affect the attention performance of a child. This might also result from the impulsivity of children, which causes attention deficit. According to Kirby and Williams (2000); psychologists define spatial ability as transformations generated as a result of figure out and storing forms in mind. Recognizing an

acquaintance's face, finding directions in map and figuring out how a seat will stand in a different place can be considered as examples for such ability. Spatial skills are of great importance to understand forms in our daily lives and academic studies. But, they haven't been investigated deeply as verbal skills. Mental imagery is seen as a powerful memory technique. According to Pavio (1971)'s studies; remembering a word is a good technique to visualize an object. An image is as powerful as 1000 words. For Brooks (1968); an image can involve a lot of information and it can be related more effectively. In addition, imagery forms a code for verbal information facilitates recalling and prevents overloading to verbal system. In a study named 'Relationship Patterns of Attention, Executive Functions and Metacognition with respect to Subgenres of ADHD', ADHD is reported to be seen 1/2 to 1/10 times more among male children than female children. What causes such finding is unknown. The study included 39 normally-developing children and 39 children with ADHD. Researchers found significant difference between normal children and children with ADHD with respect to age and gender.

In another study, when Judgement of Line of Orientation Test scores are examined, it is shown that participants labeled under different subtypes of ADHD exhibit lower performance than their peers (Soysal, 2007). In parallel with this finding, when children with ADHD and the other children are compared, significant difference is shown with respect to dorsal path visual-spatial based cognitive functions. However, significant difference is not shown between normally-developing children and children with ADHD as to their ventral path visual-spatial based cognitive functions.

In a study on ADHD, Wisc-r Intelligence scores are examined and children with ADHD and normally-developing children exhibit significant difference considering Wisc-r cubical pattern sub-test (Soysal, 2007). Children aged below 9 got lower scores than children aged above 9 in Wisc-r Cubical Figures sub-test. These findings might indicate that education system focuses more on two dimensional visual activities.

Visual-spatial configuration test scores do not exhibit difference in children with ADHD and normal children. But, children with ADHD are observed to use less time than normally-developing children.

In summary, findings indicate that ADHD group seems to be different from control group in right hemisphere based, neuro-psychological visual-spatial test. Considering that findings are affected by age, ADHD group and control group can be distinguished from each other.

Sub-types of ADHD can be counted as factors affecting the findings. However, findings overall emphasize that supporting visual-spatial skills are quite important in future research. Moreover, findings underline the importance of neuro-psychological evaluation results that give us safe and solid findings for education, treatment and preparation of neuro-rehabilitation programs.

# The issue of need analysis and assessment of quality in teaching English for medical purposes

Petra Zrníková\*

*Institute of Foreign Languages, Jessenius Faculty of Medicine in Martin, Comenius University in Bratislava, Malá Hora 5, Martin 030 01, Slovakia*

---

## Abstract

The purpose of the paper is to discuss the current state of issues and to present the results reporting the situation at Jessenius Medical Faculty in Martin. A brief history of ESP and the importance of teaching English for Slovakia are introduced at the very beginning. Next, the theoretical background including the definition, principles and approaches to ESP/EMP, trends in need analysis and assessment of quality in language teaching are explained. The analysis of the course-design of particular medical faculties in Slovakia compared with Czech academia and academia in Arabic countries are at the center of our attention.

## 1. Introduction

English for specific purposes (ESP) started to be an independent field of study in the second half of the 20<sup>th</sup> century when the World War II was over and the Anglo-American culture began to spread around the world. Other important aspects influencing the origin of ESP as a field of science are the concept of communicative language teaching and development in linguistics. Moreover, to speak a foreign language was a sign of good social position in those times.

For Slovakia the need to speak English rose in 1989 when the Soviet Union was broken down, and later in 2004 when the country became a member of the European Union. Nowadays, communication in English represents an inevitable part of one's education in order to be able to develop international co-operation in the field of science and research, to exchange knowledge and experience in conferences as well as to apply for study programmes and internships abroad. Therefore, improving quality of teaching English and enhancing the level of one's language skills should be one of the main educational goals of the medical faculties in Slovakia.

## 2. The principles and approaches to English for Specific Purposes

According to Hutchinson & Walters (1987), ESP is not about teaching the specific variants of English at all. When comparing ESP and General English, the key difference lies in using specific terms and applying specific macro- and micro-composition rules in writing instead. However, it is not meant to be an "artificial" language of science or particular profession. Specific communication (more precisely here communication in Medical Studies) is a common everyday matter based on the general rules of a language too. Thus, in this way English for Medical Purposes (EMP) can be viewed as the process of enhancing medical terminology deriving from the knowledge of general rules of the language. As it is shown in the figure 1, ESP is a branch of English as a Foreign Language (EFL), which is placed slightly above General English (GE), and English for Medical Studies (also known as English for Medical Purposes)

represents just one of the branches of the tree preceded by English for Academic Purposes (EAP) and English for Science and Technology (EST).

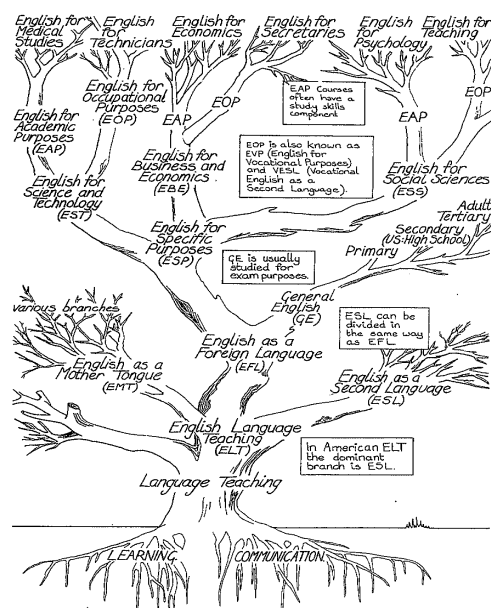

Fig. 1. English Language Teaching Tree by Hutchinson & Walters (1987, p. 17)

There is similar attempt by Dudley-Evans & St. John (1998) to say what ESP is and what is not, as well as to design a diagram of particular branches of ESP. In their work they emphasize the role of register analysis, discourse analysis, textual linguistic, pragmatics, functional-notional approach, genre analysis and many others, which contributed on the ESP theory development in their specific way. The essential characteristic common for all of them is the fact that there is always a particular text written according to specific requirements and needs of the environment, which it is aimed for.

The trends in need analysis reported by Mohammadi & Mousavi (2013) summarized the situation in teaching ESP in the 70's and 80's of the 20<sup>th</sup> century. At first, target situation analysis mainly used for investigating necessities was dominant. Later the focus was turned towards the learner's preferred learning styles and strategies. The shift from what to teach (content-oriented approach) towards how to teach (learning-centered approach) has become significant for further development of ESP. Nowadays, thanks to need analysis carried out in interviews, questionnaires or any other form, the teacher can obtain very valuable professional and personal information about the learners, their motivation to learn and use the language, their lacks and needs in communicative skills development, their expectations of course-design, and their everyday contact with the language (e.g. watching movies, reading book, informal communication with friends, formal communication for academic and occupational purposes, etc.). The similar categories might be used in the quality assessment of language course provided by the students during or at the end of the course in order to show the teacher how effectively he/she meets their needs.

To sum up the issues of definition, principles and approaches to ESP, the viewpoint by Molhim (2011, p. 3) is presented: "It is also noticeable that almost all ESP definitions are circled around two areas: the ESP participants or learners' needs (e.g. medial English) and the language used in real-life context (e.g. hospital); the two features of ESP are closely related to every aspect of ESP teaching in order for a utilitarian purpose to be achieved. What seems problematic in describing ESP is the meticulous effort in deciding the kind of discourse, such as vocabulary jargon or register that is to be taught and to reflect accurately the communicative purpose in a specific context the learners need (e.g. patient-nurse talk). Discourse diversity can be so overwhelming and confusing to ESP course designers as the

learners' needs analysis can yield a large numbers of needs, purposes, discourse, etc.” In addition, it is important to keep in mind that what works in one group of learners does not have to work in another.

### 3. Purposes Survey of teaching EMP in Slovakia and abroad

If the non-native speaker graduates poor in their English proficiency decide to work abroad, it can end up with such scandalous articles as published in the British newspapers in 2011-2014 (e.g. The Daily Mail, February 2014, The BBC News, January 2013, The Telegraph, January 2013). The increased number of cases when the insufficient communicative skills of a health professional coming from (as well as out of) the EU led to serious, even fatal consequences in patient's condition, provoked the British government to call for re-establishment of testing English proficiency of incoming medical staff in job interviews in order to ensure patient's safety.

Considering this issue, the approach to English language teaching at the faculties of medicine in Slovakia will be introduced in this section, namely the Jessenius Faculty of Medicine in Martin, the Faculty of Medicine in Bratislava (both belong to Comenius University in Bratislava), and the Faculty of Medicine in Košice (Pavol Jozef Šafárik University in Košice). Then the comparison between Slovakia and Arabic countries will be made because both of them have to cope with similar problems in teaching EMP. And finally a pilot project, which is currently running in Czech academia, will be introduced as the example of increasing the quality of language education and ensuring better communicative skills of the students and graduates.

A brief outline of the situation in language education is needed before analyzing the particular faculties of medicine. Generally speaking, the teachers at tertiary level expect the students to have basic knowledge of grammar and to be able to speak out their minds clearly. They rely on the fact that most of their students will achieve B2 level in General English at a high school, but it can be level B1 when English is chosen for the final leaving exam as the second foreign language, and in rare cases level C1 is achieved by the students leaving the bilingual grammar schools. Unfortunately, in many times the reality is completely different and the teachers at tertiary level face inappropriate use of grammar rules, lack of vocabulary, mistakes in pronunciation made by their students in the 1<sup>st</sup> grade. On the other hand, there are ambitious students who are aware of the importance to speak English at the highest level as possible if they want to achieve success abroad or in the science. To meet the needs of those some medical faculties offer the course of Medical English at the level C1. The issue of language proficiency becomes more complicated when speaking about nursing, public health and other programmes of study. Thus, this contribution deals with the students of General Medicine only.

At the Jessenius Faculty of Medicine in Martin ([www.jfmed.uniba.sk](http://www.jfmed.uniba.sk)) the students of General Medicine are taught English language as a compulsory course in the winter and summer term of the 1<sup>st</sup> year. In the 4<sup>th</sup> year the students of General Medicine can choose the course “Foreign Language for Specific Purposes” focused on communication with a patient and clinical disciplines.

The Institute of Foreign Languages has responded to the complaints on insufficient language proficiency of the non-native English speakers in several ways. The need of teaching EMP was emphasized and the future perspectives were outlined on the Pedagogical conference held at the faculty in December 2013 (<http://pedagogika.jfmed.uniba.sk/>, Mokřý, 2014). One of the issues mentioned in the presentation were the goals oriented to development of all four communicative competences (Bujalková, 2013):

- reading comprehension skill – searching for relevant sources of information, getting particular information and its critical evaluation and application;
- academic writing – to compose a formal letter, annotation, abstract, paper, essay;
- presentation skills – to compile a specific topic from various sources in the form of a paper as well as in the form of PowerPoint presentation followed by an oral performance;
- the skills of critical thinking – active listening, giving reasons and arguments, expressing own opinions, comparing advantages and disadvantages of particular phenomena in medicine.

The most significant success of this academic year can be regarded a membership in the international system for certification and accreditation for language education at universities known as UNICert® III (level C1 in CEFRL) around the Europe. From the academic year 2014/2015 the course of English (or German) for medical science is ready for the students of the 2<sup>nd</sup>-6<sup>th</sup> grade, graduates and doctorate students of the faculty. The course is designed to enhance the participants' knowledge acquired in the compulsory course, to develop reading comprehension of scientific and

research papers, to learn to communicate with specific groups of patients (e.g. children and the elderly), to distinguish between medical and non-medical terminology, to learn how to analyze the data of the experiments and to present the results to the audience, to discuss up-to-date medical issues, etc.

While the UNICert® III course had been designed the need to innovate the content of the compulsory course of English language in the 1<sup>st</sup> year (level B2) occurred, what is a prerequisite for the course at the level C1. The main change will be in using the short authentic texts presenting rather general kind of information, but attractive to the new generations of the students, which will be more resistant to changes in course of time instead of the current textbook containing long, boring and out of date texts. The students' presentations on the topic of their choice will be kept because it seems to be a good tool for practicing their presentation skills and speaking, and moreover, it makes the study atmosphere friendlier, supports peer-to-peer learning and motivation, and brings in new knowledge. Also the new textbook will be written providing the teacher enough space for developing his/her creativity and innovative approach by means of using various topics and texts in the lessons (e.g. the news in medicine, the latest research published in the journals and the Internet).

At the Faculty of Medicine in Bratislava (<http://www.fmed.uniba.sk>) English is taught in the winter and summer semester in the 1<sup>st</sup> year of the study too. Also all four communicative skills are developed. To prepare own project and its oral presentation is a part of student's final assessment as well. However, more emphasis is put on grammar which is taught from the semantic-functional approach.

Since the academic year 2011/2012 English and German courses in UNICert® system (level C1) have been offered as a response on the needs of students and graduates because the compulsory two-semester long course didn't meet the demands of praxis. In the first year neither English language course, nor German language course was taught because of the little interest of the students or insufficient level of their language skills (level B2 was required). In the previous academic year the students enrolled for English only, and in the current academic year German has become more popular, because of the rising trend of applying for a job in Austria or Germany among the graduates in Slovakia (Jamrichová, 2012).

The questionnaire of need analysis disseminated among the participants at the beginning of the course revealed that some of the topics weren't covered in the syllabus for compulsory lessons at all (e.g. intercultural aspects), so it was necessary to implement them in the course curriculum. Based on the experience in the pilot course a handout aimed on practicing creative writing has been made because writing skills turned out to be the least developed in the course participants who took the final certificate exam. The average successfulness was 76 % in comparison with 92 % achieved in reading comprehension. Other change was needed for the minimum limit of the certification exam. It has been reduced from 240 minutes to 200 minutes. When asked for feedback, the participants said that the course is a great thing, which they miss in the field of language certificates for specific purposes because it increases their competitiveness abroad (Jamrichová, 2012).

At the Faculty of Medicine in Košice teaching English is provided by the Faculty of Philosophy (Petruňová & Timková, 2013). The students of General Medicine in the 1<sup>st</sup> year of their study are attending the compulsory lessons of English language aimed on enhancing knowledge in grammar and pronunciation, on communication skills development and medical terminology. In the course of their study (from the 2<sup>nd</sup> to 5<sup>th</sup> in winter term) the students may enrol for some of the following complementary courses:

- "Medical communication for General Medicine" to learn how to communicate with the patients and their relatives, the colleagues and other health professionals in medical and hospital environment, forward a short message, write a medical report, fill in the forms, give a presentation on particular medical topic, etc.);
- "Academic Writing in English" base on applying own experience in composing formal or informal letter such as application, complain, CV, motivation cover letter, announcement, note,
- "Presentations in English" to develop fluency and accuracy in their oral performance.

Besides developing language skills and transferring medical knowledge the language teachers in Košice support creativity, autonomy and co-operation in learning, because they believe that these abilities are closely related to development of individual's intelligence. Instead of traditionally oriented "reading and word-by-word translating text approach", in which the teacher plays a role of a dictionary, they highly recommend to use the semi-controlled activities, such as (Bednáriková & Kolaříková, 2013):

- brainstorming and mind maps when presenting new vocabulary;

- practicing pronunciation of the words starting with *au-, eu-, ae-, bi-, di-, ge-, hypo-, hyper-, ph-, ps-, pseudo-*, etc. (because the students are prone to apply the rules of Slovak pronunciation – i.e. “read as you see it”) in a way that students read the non-existing words composed of these problematic groups of phonemes (e.g. pheuloses, augnosis, psychametry);
- using the selected words in a role-play dialogue;
- giving one-minute presentation, i.e. to speak for 1 minute on a given topic without stopping, applying particular grammatical rule or specific vocabulary;
- a competition in guessing and defining medical terms from the list;
- making a dialogue between a doctor and a patient, in which the medical terms are substituted by the non-medical ones.

Next, the comparison between Slovak academia and the academia in Arabic countries will be drawn because the teachers have to cope with similar problems. As reported in Ibrahim (2010), Molhim (2011), and Ghalandari & Talebinejad (2012) the state of things in teaching ESP at the universities is not very favourable. They complain of average, or even very low level of communicative skills of the students when beginning their university studies. This state of things makes the teachers to substitute medical education by completing and enhancing knowledge of General English, and this leads to low level of communicative competence and lack of courage to use the language in the professional life after completing the studies. The other problem is that the students put more energy in searching for the ways how to avoid their duties and pass the course with minimal effort than in increasing own motivation when enlarging their theoretical knowledge and communicative skills; that's the reason why teaching EMP is restricted only to memorizing the lists of vocabulary and particular grammatical phenomena, translating texts from/in L1-L2. In order to change the situation the relevant and long-term linguistic and pedagogic research providing the teachers with theoretical background as well as the data verified in the experiments (e.g. textbook analyses), and taking into consideration the requirements of modern education of ESP and EMP are very necessary.

The role of language education for specific purposes at the tertiary level is influenced by many other factors, and so is the attitude of the language teachers and students. It is the topic itself, which deserves to be presented in separate piece of paper, so it won't be explained in more details for now. Up to this point, the comparison of education environments which are too far from each other from the geographical, historical and cultural point of view has been made. Next example of academia will show that even the close connection between two countries doesn't have to mean a thing. Despite the fact that there is a lot of common features in development of the Slovaks and the Czechs, in terms of following the trends set by the most developed academia in the world, the Czech society is definitely more progressive than Slovak one.

Though the teachers in Czech academia have to deal with the similar problems as stated above, a group of tertiary teachers has decided to run a unique project called *IMPACT – Innovation, methodology and quality of language education and professional education in foreign languages for specific purposes in the tertiary sphere in the Czech Republic* (2012 – 2015) to improve the situation. “The main objective of the project IMPACT is to transform the quality of foreign language education in the Czech higher education environment. The uniqueness of the project lies in presenting a wide range of the latest educational approaches and tools having yet to be methodically elaborated in the Czech Republic” (<http://impact.cjv.muni.cz>). The teachers from all around the country are offered free participation in seminars, methodical workshops, course and rich variety of interesting events guided by the experts from the Czech Republic and abroad. The project should result in higher compliance with needs of labour market and supporting competitiveness of the Czech graduates in the world.

Similar attempts were discussed in Slovak academia some time ago too. There are the language teachers as well as the teachers of medical studies who do feel the need to educate themselves in pedagogy and language for specific purposes. Unfortunately, there are also those who do not attach importance to this field, and their power is stronger at the moment. And what makes the current situation even worse, it is the trend of reducing the amount of language lessons (from two semesters to one) and the category of the course (from compulsory to optional) by the management of the medical faculties. Therefore, in next section of the contribution the students' viewpoints will be demonstrated based on the two kinds of feedbacks.

#### 4. Assessment of the quality of education and the need analysis

It is a part of academic culture at well-developed universities to ask students for their need analysis at the beginning of the course as well as for their feedback at the end of the course. Slovak academia is trying to do so, but there is a long way to go. In this section, firstly, the data concerning language teaching obtained in the faculty-organized feedback will be analyzed. Secondly, the results from the feedback carried out in particular group of students will be included in order to illustrate their needs in more details. Of course, some drawbacks of the assessments will be mentioned too.

The report called *Students' Assessment of Subjects and Teaching Process* published by the Jessenius Faculty of Medicine in Martin includes the data from both semesters of the academic year 2012/2013, respectively. The faculty questionnaires were disseminated twice – once by the representatives of each grade in March 2013, and then on the enrollment day in September 2013. In the winter term 115 (74 %) students out of 156 took part in the survey, and in the summer term it was 138 (86%) students out of 161.

The common assessment scale of students' performance was used, i.e. A-FX (excellent – failed), plus X ("I don't know/I miss this information"). The students of the 1<sup>st</sup> grade assessed the quality of teaching the courses of "Foreign language 1" (FL 1) and "Foreign language 2" (FL 2) in 7 categories:

- in general – meeting their expectations, attractiveness, managing the content, forming their relationship towards their future profession;
- the conditions of education – the number of students in the group, the technical and material equipment, up-to-dateness and accessibility of the study materials and textbooks;
- the course organization – the requirements for completing the course, the syllabi, classroom management, comprehensibility of the contents, meeting the goals, the balance in difficulty between teaching process and the examination;
- self-evaluation, own opinions and comments – their active participation, activity of the students in the group, working atmosphere in the group;
- knowledge and readiness of the teacher – knowledge from the field of study, readiness for the classes, using ICT;
- teacher's pedagogical skills – clarity and comprehensibility of the lecture, checking the students' comprehension of the topic, motivating the students to enlarge their knowledge and understanding the topic, making positive working atmosphere, following the time schedule and content plan;
- teacher's attitude to the students – his/her approach to the students, giving space for asking questions and expressing students' opinions, being objective in knowledge assessment, teacher's verbal and non-verbal communication skills.

As the conclusion the overall assessment of the course as well as the overall assessment of the teacher made by the students is included in the report. Also they were given space to express their suggestions and opinions, to comment on any of the seven categories both in positive or negative way in more details on the passed courses if they wished.

The following table 1 and table 2 displays the results for each semester. The values in percentage for particular groups of grades can be interpreted as satisfactory (A – C), 2) unsatisfactory (D – FX), and none (X).

Table 1: The Assessment of the Quality of Education.

FL 1, WS, 2012/2013	A-C	D-FX	X
In general	58%	41%	1%
The condition of education	90%	9%	1%
The course organization	77%	13%	10%
Self-evaluation	84%	16%	0%
Teacher's knowledge and readiness	79%	19%	2%
Teacher's pedagogical skills	74%	25%	1%
Teacher's relationship to students	85%	15%	0%

The overall assessment of the course	65%	35%	0%
The overall assessment of the teacher	85%	15%	0%

Table 2: The Assessment of the Quality of Education.

FL 1, WS, 2012/2013	A-C	D-FX	X
In general	90%	10%	0%
The condition of education	79%	20%	1%
The course organization	84%	15%	1%
Self-evaluation	84%	16%	0%
Teacher's knowledge and readiness	84%	16%	0%
Teacher's pedagogical skills	78%	22%	0%
Teacher's relationship to students	86%	14%	0%
The overall assessment of the course	82%	17%	1%
The overall assessment of the teacher	72%	18%	0%

For the course FL1 taught in the winter term (WS) 3 531 answers were collected in total. In more details, they are composed of: 1066 (A), 994 (B), 672 (C), 324 (D), 174 (E), 215 (FX), 66 (X). The students' in their comments and suggestions called for reduction of the length of the course from two semesters to one semester only (1 student), 6 students would cancel the subject at all, and 7 students said that the current textbook is bad and also the teacher's relationship to the students is awful. For the course FL2 in the summer term (SS) was collected 4143 answers including: 1258 (A), 1151 (B), 891 (C), 389 (D), 251 (E), 180 (FX), 13 (X). In the comment was just one note from a student complaining on English, which was horrible and for nothing at all.

In the first category "in general" the students assessed FL 2 better than FL 1. The value of 90% can refer to two facts: the students got used to the teacher and his/her system of teaching and managing classes, or to the possibility to negotiate the content of the lessons by the means of their presentations which are part of their final grade. Probably that's why the category "course organization" was given 84%. The attractiveness of the lessons was raised up by the fact that it was a student who had chosen the topic of his/her presentation and managed its content and post-activity (e.g. quiz, video, crossword, discussion, comprehension tasks, etc.). On the contrary, the students were less satisfied with "the conditions of education" (from 90% to 79%). In this category belongs using ICT, but also the textbook which might be the main cause of their criticism. For example, in the FL 2 in English the students have to read the authentic, but out-of-date articles about cancer (1990) or AIDS (1991) (Poláčková et al., 1996, pp.111,120). When it comes to assessing the teacher, the students were satisfied in 70-80% in average considering all three categories in both semesters.

Data in this kind of feedback may be easy to process, but the grade assigned by the student to each category and afterwards turned to percentage seems to be too general. They tell nothing about the true needs of students in terms of language needs, and thus it is almost impossible make conclusions aimed on the improvement of teaching process or teacher's relationship to students. Another drawback of the feedback is the fact that it does not differentiate between languages (English or German), nor the teachers of the subject. Thus, in terms of students' satisfaction, it makes the results vaguer, giving low possibility to solve the particular problems in language teaching in order to meet the real students' needs. The faculty management is aware of the negatives and it is constantly searching for the solutions. It has to be said that such assessment does not have a long tradition in Slovak academia among various faculties and universities. It will take lot of time to get the students used to express their opinions without fear of being punished by the teacher in the examination, and at the same time to get the teachers used to face the students' appraise as well as their criticism.

The shortcomings stated above led to the idea to provide the students of particular groups (those I was teaching in) the space to express their opinions and needs in learning EMP. At the end of the winter term in the academic year 2012/2013 47 student in total were asked to give their opinions about the activities, extra study materials and overall course organization and studyload in their own words anonymously, i.e. no structured questionnaire wasn't provided, that's why only the most important points will be mentioned

At the first place, I would like to comment on the atmosphere in classes. One of the pieces of the instructions given for this feedback collection was dedicated to the atmosphere and our relationship. I was doing my best to ensure them they won't be punished for their words, and it won't have any (especially negative) impact on their final grade. Their praise of the friendly, non-stressful atmosphere, when they were looking forward to our lessons, gives evidence for it. In this way, they didn't consider preparation for the lessons too time-consuming, because as they reported they have achieved sufficient level of General English at the high school. This might be the reason, why they preferred discussions, group work, interactive tasks and listening comprehension tasks instead of reading and translating the texts in the textbook or grammar exercises. They claimed that reading and translation can be given as homework for self-study time. They noted that they have acquired most of the study content at the lesson already, so studying for tests didn't take long time. However, the length of a class, which is 90 minutes, seemed to be too long for some of them.

The students appreciated the idea of giving presentations on the topics of their choice, which were introduced and assessed as the extra activity to the standard syllabus in the winter term. It was intended to be a five-minute presentation, so the students' hadn't been asked to make PowerPoint, what turned out as a drawback retarding the comprehension of the unknown medical topic. On the other hand, the students were missing games and quizzes to enhance their vocabulary and knowledge, describing pictures, guessing games, crosswords. They were given opportunity to use them when having their own presentation. Also they were asking for watching videos or movie from the medical environment or about health issues. To meet their wish a documentary movie promoting healthy lifestyle and bad impact of fastfood on the human body was chosen in the summer term. To avoid the common misinterpretation of the lessons when the movie is implemented as a teaching tool ("it's just a movie, its content won't be tested, so there is no need to pay attention"), it was followed by the post-activity, an essay writing.

The same was done at the end of the winter term 2013/2014. This time it was only 23 students who were asked for their opinions, because fewer students have been admitted for study this year. The students appreciated the friendly atmosphere again, which allow them to revise their knowledge of biology and to acquire English medical terminology. Also they were glad that speaking activities were emphasized instead of grammar exercises. They asked for reading texts presenting the news in medicine (e.g. new technologies, ways of treatment, research studies), applying patient's medical records and doing role-plays at the lessons. They criticized the out-of-dateness of the coursebook which contains a lot of text ("too difficult and useless"), long lists of vocabulary and the overall graphics and layout of the book. On the contrary, there were students who would like to use the book more frequently at the lessons.

Absolutely new issue in the student's feedback, which wasn't commented on in the previous academic year by any of the student positively or negatively, was a cloze-test reading comprehension task. The option with randomized words as a kind of hint was used in the mid-term test and the written part of the final examination in both academic years. However, this time the students have found it to be the most difficult task of the test. Moreover, they believe that it is unfair to let them read an un-known text because there is no chance to study for this

In the same way they commented on the complementary up-to-date texts found in the Internet. The students complained on unknown words of General and Medical English which retarded their comprehension a lot, and thus the texts were found difficult and the whole reading process was too time-consuming to them. As they noted down, because of this they didn't manage to get ready for next lesson properly. They believe that English course at the medical faculty should be more relaxing, in other words „subject to pass” easily.

## **5.Conclusion**

To sum up, the theoretical background to ESP and EMP as the fields of study was explained at the very beginning. Within this framework the principles and approaches to them were outlined. The need analysis and the assessment of quality of teaching EFL were in the center of our attention in the following section. The core of the paper was built up by the analysis of three medical faculties with the longest tradition of education in Slovakia. Their approaches to

language teaching, course design and future perspective were introduced. The situation in Slovak academia was compared to Arabic countries and the Czech Republic. The analysis resulted in detection of the identical problems which the teachers at tertiary level have to cope with. Generally speaking, the long-term linguistic and pedagogic research providing the language teachers theoretical background for their professional development as well as the experimental studies showing the relevant and valid data, assessing the quality of textbooks in terms of the requirements for modern English language teaching for specific purposes is missing at the medical faculties.

Both, the results of the quality assessment and comparison of academia around the world have revealed a lot about Slovak academic culture and students' language needs. The shift in didactic approach of the teacher and more efficient forms of receiving feedback is very necessary to find as soon as possible, otherwise Slovak graduates won't be able to keep steep with the standards of the well-developed economies around the world.

Insufficient level of communicative competence of the 1<sup>st</sup> grade students, non-attractive study material, unfriendly and stressful atmosphere at the lessons, traditional role of the teacher as "the authority who knows everything", unwillingness to discuss different viewpoints as well as to negotiate the content of the lessons in order to meet the student's needs is the biggest problem. Regrettably, very slow progression in this sphere results in very strong belief that course of EMP is nothing more than a "by-product" in comparison to the medical courses. The teacher should not be surprised then if the student is searching for ways how to make his/her duties easier or to avoid them at all because his/her main motivation is just to pass the exam doesn't matter what assessment grade s/he will be given or how much of the language s/he will be able to use in the future. On the contrary, the students have to realize their own role in the teaching/learning process, i.e. to be reading to take responsibility for the inputs and outputs, to be active, motivated for life-long learning, and to forget to look back for the excuses, such as the insufficient proficiency of GE acquired at high school.

Definitely, the solution lies in more detailed need analysis of the students directed by the teacher of the course, or the head of the foreign language department. Of course, it has to be followed by transformation of the results in teaching process, and the consequences concerning the particular teacher should be made, otherwise the need analysis does not have a point. The goals of the course should be realistic and adequately difficult, not to be too demotivating. The balance between General language (giving instructions, advice, arguments, describing, listing, reasoning, etc.) and medical terminology should be found. Implementation of ICT in language teaching as well as the traditional teaching methods needs to be used to ensure the wide scale of techniques assessing the students' performance and overall level of communicative competence.

The following comment of a student gives evidence that English for specific purposes deserves its position in the curriculum of medical faculties in Slovakia and around the world: "I think that English is important in many field of life and also in medicine. Learning English should be compulsory at medical faculties because it would definitely help future doctor, not only when they are studying, but also later when they start working in hospital. One of the reasons is that almost all the newest inventions and researches in medicine are published in English. In my opinion, it is important to understand this, and to be able to learn something new. Another thing is that there is high probability that young doctors will travel abroad for a work... English is a language spread worldwide, so it is the basic knowledge doctors should have when they want to communicate with their colleagues or patients."

## Acknowledgements

# The male identity in professions in the field of education: a qualitative investigation

Francesco Iovine\*

*\*University of Salerno*

---

## Abstract

This paper intends to analyze some aspects related to the perception and representation of education-related professions for what concerns the male audience.

According to statistics, work in the field of schools and education appears to be a domain composed of mostly female workforce, confirming a society structure as has been traditionally and historically configured and based on gender duality and on a subsequently rigid role separation. In such separation some differences going back to an old biological as well as anthropic-cultural paradigm keep having a large weight and seem to justify the different levels of aptitude towards child care, and especially towards infants, that are seemingly recorded in men and women.

According to such a stereotyped view, child care should be a prerogative of women only, thus legitimating the scarce male responsibility in this field. But what do men think about it? In the following work some professional working in the field of education have been interviewed. It is therefore possible to read the orientation of three educators and detect how their masculinity and subjectivity have had an impact in the determination of their gender and professional identity while enforcing their respective educational roles.

## 1. Introduction

The initial assumption that inspired this investigation is the observation that in Italy educational professions are characterized by a significant disparity between genders. On the basis of data concerning the only act of signing up for degree courses in the pedagogical field it appears that male students between the academic years 2000/2001 and 2010/2011 make up just 13.20% of total enrollments. (Mapelli, Ulivieri Stiozzi, 2012) The trend reversal, however small, relative to the academic year 2010/2011, with a share of 15,584 units, 474 members more than academic year 2009/2010, is related to degree courses belonging to “non-pedagogical” fields of the Faculty of Education. For example, this occurs in both undergraduate programs in Communication Sciences, University of Udine, where the males were the majority (respectively 64.50% and 60.61% of the total). In addition, male students accounted for more than 30% of the total members in both the three-year courses in Psychological Sciences and Techniques hosted at the University of L'Aquila (42.72% and 34.67%) and in both the degree courses of Science of Public Communication Business and Advertising at the University of Trieste (30.86% to 31.15% and the master's degree). (Ibid, p. 220)

Why male students seem to be the minority in education-related professions is considered in some hypotheses that lead back to the ideological construction of gender identity. In our era an old-fashioned prejudice still persists about characteristics that are allegedly typical of males, while the female profile is (still, allegedly) characterized by qualities related to care and affectivity. This cultural background is reflected in the employment data. Our society is still too characterized by an occupational segregation of men and women. The first are present in large numbers in the scientific and technological sectors, and underrepresented in the humanities and in the field of social development. In the case of women, instead, they are over-represented in education, which is still a stronghold of the female workforce. Specifically

in the school system, the lower the level of education, the lower the number of male teachers. This is easily verified in the segment of nursery schools and primary schools, educational levels associated with primary care which do not enjoy the social prestige and authority that used to belong to elementary school teachers in the past. For nearly a decade, in Milan there was a further increase in the feminization of primary education: from 94.8% in 2000 it has gone to 96.2% in 2009. (Idem)

## ***2. A qualitative investigation***

In order to achieve a deep understanding of the perception of male identity within education-related professions, I have conducted three interviews, one in person, one by telephone and one by the popular social network Facebook, to people engaged in social and educational services, trying to investigate the current world view (Weltanschauung) regarding masculinity. I have chosen a few tracks and their sub-themes, through which I have gathered testimonials, explicit and implicit opinions, and ways of looking at:

- the motivations that have prompted commitment to education-related professions;
- the qualities both personal and professional a male educator should have;
- prejudices about the alleged poor attitude to education and care typical of males;
- their way to live masculinity;
- what should be solid and what instead dynamic in gender roles;
- the interaction between public and private behaviors/attitudes.

Trying to avoid the risk of a forced convergence of thought, during the interviews I have given space to the more subjective aspects, with an emphasis not on mere ideological constructs, but rather on individual experiences, accompanying each of the interviewees on the path of reflection and interactive reworking of their experience.

It was my care not to adopt an interpretative synoptic paradigm, which could have been useful only if I had meant to track down an artificial objectivity for the drawing up of statistics and quantitative patterns. Therefore, I chose to commit to the analysis of the personal sphere and remained anchored to the strength of the biographic element. From the stories I gathered, several types of masculinity were revealed, each of which is reflected in their owner's way of interpreting and practicing his or her profession.

During the interviews, I tried to create a climate of trust and empathy, avoiding interruptions, and I gave special inputs to the interviewee to walk him through the outlined tracks. With these premises, I chose not to be not neutral and did not operate as if it was a questionnaire, pretending that the significant relationship (Furlotti, 1998) between interviewer and interviewee was not itself a major part of the interview, since establishing a true communication is a necessary precondition to qualitative research. (Merrill, West, 2012) The active involvement of my subjectivity was part of the method. The track was used in a flexible manner, so as not to meaninglessly repeat a sort of vocal questionnaire, structured by standard questions that would not leave the interviewees free to express themselves, as they would not have been allowed otherwise to pick priorities and preferences according to their unique individual subjectivity.

## ***3. Alfonso, the idealist of solidarity***

The first interviewee is Alfonso Di Bartolomeo, a sociologist aged 39, who in 2000 started a process linked to social policies and all services related to law 328 [Act No. 328 of 2000 - Framework Law for the implementation of the integrated system of interventions and social services] and among his various experiences he recalls a commitment at the "Centro aiuto minori" held by the Court of Salerno for minors; the foundation of the "Superabile Onlus", of which he is president, with almost 10 years of experience as a socio-educational center aimed at people with disabilities and with which he handled the socio-educational center of the city of Pagani, in the province of Salerno; the coordination of socio-educational centers of Nocera Inferiore, Scafati and Sant'Egidio del Monte Albino (also in the province of Salerno). In addition, he used to deal with services for the elderly, such as that of "house care for the elderly" back when he was the coordinator of the group of social enterprises "Gesco".

Besides the tasks of management/coordination, for about 6 years Alfonso played the role of a social worker in the project "specialistic assistance to schools" aimed to students with disabilities. Its field of professional action is directed to "vulnerable groups".

Alfonso says right from the start that «there is a strong woman component in the educator role», but he does not

mean to reduce the issue to a gender dispute. Professional success, in fact, is not linked to University education, but to life history, professional experience, and above all education received at home. If we add the element of kindness of heart, all of that together makes you a «very good educator».

There is a good number of women graduates, I mean in the faculty of Educational Sciences, then [the] path to becoming educator [...] is not theory, but fact, in that it is made especially [...] of practice that begins before [...] the University. As for males, given their concentration, I mean in Pagani and Nocera Inferiore, I do not know many, but because of this concentration, you choose him for quality, that is, in the sense that quality is what characterises the male educator. I don't mean that he's superior to a woman, it is not easy, it is not easy to be an educator. It's easy to walk the theoretical path, what you do at the University, then you live it every day by working, by practicing, doing volunteer work, trying to help people, doing assistance and then later doing your job that is trying to transmit to them the fundamental elements, cognitive elements that may be crucial [...] because, let's say, it is linked to the personality, the type of family, the type of education that was given, then surely there is University education, then later if you are a good person, if you have the basic elements such as solidarity and the desire to help others, then you become a very good educator.

A first element on which to reflect it is the low value attributed to the degree, the achievement of which is only the first step in the path leading to the entrance into the world of educational services. The weight of the theoretical background it is strongly subordinate to the practice and the constellation of experiences, both work-related and not. Who has a better aptitude towards education usually has the most success. Those who practice this profession must have personal characteristics differing from those needed to work in other sectors. A significant influence is attributed to the person's family and the education imparted by those who are considered «the first educators». The familiar experience conditions the professional success of people committed to social and educational services. Having a degree is not enough to be educators, but a solid family orientation and a personal history based on the internalization of good principles are needed. This facilitates the development of a sense of solidarity, also explicit in the context of daily and personal experiences, addressed particularly to vulnerable subjects, which include people with disabilities, the elderly and minors.

Although the risk of making the mistake of reviving old traditional views and of limiting the good male educators to those who adhere to a given ethic or political ideal based on selflessness is always present, the practical experiences seem to reinforce such belief.

I hinted at politics before because it almost looks like all good male educators I know are left-wingers or coming from the former left wing, which is mistakenly confused as displaying peace flags, loving each other, freely smoking weed, eliminating corruption from the face of the Earth. Now that is an ideal [...] but among the educators I know, the best are those having a good family education. Those who got enrolled in the University (*he slams his hand on the table*) only to get their degree in Educational Sciences, honestly, I know them, they end up... end up selling furniture, and I also know some who graduated in Sociology before me who got a job in transportation companies [...] "I'll just give private lessons to earn my 80 euros but I still want to continue doing my job", that's what makes a good educator.

Referring to sexual orientation, that is determined by a biological factor because «you were born a female, you were born a homosexual [...] that is not a fault», it is not choice or a life path. Historical, social, cultural, environmental, familiar and relationship-based forces do not have a say in sexual identity, which is created by genetics.

It is curious that Alfonso, although he declares himself not a religious person and unaffected by the christian and catholic rules, still uses concepts as "sin" and cites religious quotes.

Today gender is divided in male, female, and homosexual [...] which is something that unfortunately is not accepted in most cases, I don't know why, actually it is fully normal, it's fully normal [...] it's normal!

The important is that the fundamental qualities... it's genetics: you were born homosexual or you were born a male or female. So you were born homosexual, you find out. I'm glad you find it out less in modern times [...] in a less dramatic way than it happened back then. I know tales of people who killed themselves when [they] discovered themselves to be homosexual, when it's normal: if you're homosexual, no problem [...]. It's not like we have to share our sex life. Because that's where the problem is, there is great ignorance about homosexuality or being male or female, because you're always looking at sex, but are we supposed to go around fucking each other every day then? [...] I'll say it again: you were born male, female, you were born homosexual, it's not a sin, not a fault. What matters is that your life path goes on normally, I mean males be males, women be females, be females, homosexuals be homosexuals, I mean without being mean, without hurting other people, without being mean, always looking at the common good, I mean, can you be like, the way he used to say... who was it? Pope Francis saying "who am I to judge?" Seriously [...] we can

only judge when someone hurts someone else! And we link that to the role of the educator: you can be a good educator, you can be not as good, but if you help, if you help yourself, if you're trying to help, or to [get] a disabled boy to learn you're already doing a great job, then we would need a whole lot of educators like this [...].

Even on such a wide and articulated topic Alfonso can't help connecting the base constitution of a subject with his educational potential. In full harmony with the philosophy of helper professions, the sociologist believes that helping others is «crucial» and that it can suggest whether an educator is good or not. Intentions, especially if noble ones, are what matters, and they're dominant compared to theory and operational competences.

Homosexuality is accepted without conditions. The stigma only hits evilness.

Alfonso draws a scheme of actions in which to operate: a family that orients, interventions aimed to the specific situation and lots of dedication. His profile could be defined as an idealist of solidarity.

The way he strives towards common good and his pro-social attitude look like they are stimulated by politic and solidarity-based reasons. He incarnates the kind of sociologist who does not stop at watching society and describing it, but that with his work he tries to improve not only the users he deals with, but society in its general sense, feeling called upon to intervene even in daily situations.

#### **4. Antonio, the missionary**

The interview to a younger subject, Antonio Ferrara, born in 1986, who has recently turned to educational practices, can outline an identikit mirroring the idea that Alfonso has of an educator meant as «a good person». It is necessary to anticipate that this interview has been conducted through Facebook, so the limits of the material did not make a deeper analysis possible, but still it offered interesting ideas for research.

After obtaining his degree in Educational Sciences at the University of Salerno, Antonio obtained the professional qualification of Social Animator in 2013. He currently works as «home educator for the assistance to non-self-sufficient minors within the project “Home Care Premium” promoted by the zone plan by zone S2 ex S3 Cava – Amalfi Coast».

About the reasons who pushed him to start an educational path in the field of pedagogics, Antonio reveals his missionary aptitude: «I chose to study Educational Sciences since I had in mind to do a job which allowed me to help others». His intent is going in the contrary sense of masculinity intended by ideological and stereotyped concepts, since he does not go after prestige, money or authority, but he chose to become a “crocerossino” (member of the red cross). This generates that «every profession requires determined features from the one practicing it. This is why I believe that a male educator owns features, that he acquired, elaborated and developed throughout his study and work path, features that are different from those owned by people working in completely different fields. To be an educator means to be an example for the others, to be a good host to the pupil, to inspire trust, to have patience and respect, to be humble and coherent with what you say and do».

Central aspect of an educator's mission is to favour the development of the pupil by offering him directly a virtuous model of behaviour. This is the dividing line between the expert of educational processes and any other professional: the educator cannot split theoretical wisdom from good practices, and cannot look the other way from the pupil's gaze, for whom he must become the hypostatization of the pupil's ideal type. He is exposed in such a way that gives him the moral obligation of maintaining a correct behaviour that can be of practical example.

As we speak about the alleged «greater aptitude towards education owned by women compared to men», Antonio acknowledges that it «must be» a «common prejudice, because women have taken care of their children or other children's education forever. In my brief – for now – work experience I must say I did not feel much of this difference because I was accepted as an operator just as much as others were». The certainty that this is a stereotype has matured inside him also because of his personal condition of a man who has chosen to help others by educating. In his rapport with the user pool, he found a preference shown by children towards same sex educators: «male children tend to look for male educators, while female children for female educators».

Antonio tells a story, which he perceived as uplifting feedback, and which suggests that his aptitude towards educations might have romantic or sentimental roots: «I remember a boy, who was about to leave the community, who asked me to speak in private and told me that he was very happy to have met me and even if we hadn't gotten much

time to spend together, he felt he could trust me. He wished he could meet a boy, a friend he could trust as much as he could trust me. These words of his greatly pleased me because I think earning the trust of boys that most of the times have experience of abandonment behind them is a gratification for the work I've done».

In his words, masculinity is then perceived and concretised as far from chauvinistic or patriarchal concepts, openly revealing its attributes of fragility and care, which are not exclusive to the feminine: «To be a male means in the first place to acknowledge yourself as human, blessed with intellect and feelings; recognize your strength but your weakness also; be dominant but not domineering; take care of close ones not only catering to economical or material needs, but also sentimental needs; to have your presence felt in happy as well as unhappy moments in life».

In agreement with the *modus operandi* of Alfonso's, who can tell a good educator from his behaviour in his or her private and professional life, Antonio also believes that you can't stop being an educator: if you are, you keep being it even if far from your working contexts. Traces of what you do on the field remain in daily activities and private ones. «I think it's difficult to completely separate the professional dimension from the private one because those who are educators are such in their own life when they give the good example, when they're coherent, caring, humble, people inspiring trust, points of reference for those who surround them. Still it is advisable that the educator cuts out his or her own spaces and moments of rest, thus avoiding to bump into high-stress periods that can lead him to burnout».

Reflecting on data inherent to violence on women, perpetrated by men, in the majority of cases husbands, mates, boyfriends, former mates, relatives or friends, and acknowledging that there are statistics suggesting that men are usually more violent than women, Antonio holds that «man is not violent by nature, because within him are mechanisms who push him to keep what good they have, their health, even at the expense of the good and health of others, but also because of cultural elements that incentivate violence, in particular on women, only as a way to affirm one's masculinity, the arab culture coming to mind».

These statements hold different cultural aspects worth working on. First and foremost, violence would be born by *physis* and be part of the natural economy of species to guarantee self-preservation, by expliciting a vision adhering to the Freudian theory of the subconscious of impulses, as discussed in *second topics*<sup>94</sup>.

On the other hand, it is acknowledged that violence can be the result of social-cultural constructions, agreeing with the conundrum of male supremacy that is ensured through subordination of the female. The example utilized, which describes a surely controversial reality, namely the Arab one, indicates that after all in our culture the gravity and urgency to fight misogyny is not very perceived. The cases of women being killed in the West is overshadowed by a generalization and a "sidetracking" phenomenon provided by the Arab culture.

Speaking of homosexuality, Antonio's thought is definitely straightforward in manifesting a rigid closure, by negating civil rights to same sex couples: «My opinion on this topic sprouts from my Christian-catholic beliefs, which is

94

As Sigmund Freud theorises, the human psyche has two main impulses – “*Trieb*” in German – *thanatos*, the death impulse (*Todestriebe*) or aggressivity, and *eros*, the life impulse (*Liebestriebe*) or sexuality, both useful to the economy of species. These two impulses, in perpetual conflict, would regulate the psychic life and its working order: *thanatos* with its tension towards (self)destruction, and *eros*, expression of libido, would guarantee self-preservation of the I. The psychic instance, localized in the subconscious in which *eros* and *thanatos* are contained is the *Es*, the reservoir in which such impulses tend to the immediate achievement of pleasure and egoistic needs, ignoring the *principle of reality*, logical thought and every sort of ethical and moral inhibition. The *Es*' counterpart is the *Superego*, the psychic instance that contains the deepest prohibitions, behavioural codes and values. It's where the subconscious sense of guilt takes form. The *Ego* is the psychic instance called upon to mediate between the pulses of *Es* and the moral censorship activity of *Superego*, regulating the balance between the pulse for pleasure and the principle of reality. For further information see FREUD S. [1920], *Al di là del principio di piacere*, in *Opere di Sigmund Freud (OSF)* vol. 9. *L'Io e l'Es e altri scritti 1917-1923*, Bollati Boringhieri, Torino, 1986.

why I oppose homosexual unions as much as I oppose adoptions by homosexual couples. I believe that, to be brought up well, a child needs a father and a mother».

Antonio immediately warns that his answer is influenced by his creed, and his position is actually concordant with the official position of the Catholic church. From that we could infer that his faith orientates his thought and his actions. This would explain his rigid opposition to adoptions by homosexuals, ascribed to the wellness of the child who would need a male and a female, not promiscuous parents. He thinks the same about gender roles:

«Personally I believe gender roles should be well-defined so as to give and guarantee a solid and stable point of reference to the child (in case of families) or pupil (in case of educators)». He elevates the nuclear family model to a model to be implemented in the educational offer, by implicitly evoking the threat of liquid society that can only be defeated by ensuring stability and solidity to the pupil. Antonio's profile can be defined missionary-romantic-traditional.

### **5. Aniello, the professional**

Another young educator interviewed is Aniello Mazzeo, born in 1986, who after obtaining his degree in Educational Sciences and his master's as Professional Educator, both at the University of Salerno, he dived into the working world through various experiences, among which traineeship, volunteer work and ordinary working contracts.

Chronologically, he can boast a first experience in Salerno, city in which he was raised, in secondary and primary schools; then he was enrolled in the association "Mentoring USA/Italia – Onlus" within a project regarding school dropouts, for about 10 months. Afterwards he had a three-month experience in the association "Gruppo LOGOS Onlus", in Salerno, as facilitator in a group of self-help addressed to anonymous gamblers, then people addicted to gambling. After this experience, Aniello moved to the North of Italy where he was an intern for about a month in Novate Milanese, province of Milan, at a kindergarten run by the cooperative "Koiné Sociale Onlus". He is currently working, and has worked for a short time, about a week, for the cooperative "La nuova famiglia", located in the province of Monza, at a community providing hospitality to disabled subjects from 25 to 65 years.

In his case as well his opinions reflect his professional experiences, which reconfirms the dominance of practice upon theory. He acknowledges that his opinions are just opinions and not general rules, and in almost every answer of his he specifies that it's his personal point of view, by reiterating expressions such as "as far as I know", "in my judgement (10 times)", "I've seen now", "the way I see it" (2 times), "I noticed", "I think" (5 times plus 2 times "I believe"), "based on what I've seen", "in my opinion".

At first approach, when asked whether his supervisors or coordinators have shown particular expectations due to his being a male, Aniello speaks about a topic that is dear to who deals with *gender studies*: male authority. From his words you can infer that it is a key component in education-related professions, and a clear distinction is shown between male and female identities.

It happens in research – let's say in the job market – that there are particular requests for what regards the male field, I mean a specific figure of male educator for specific environments, for example, like for example in communities of drug addicts or for what concerns anyway communities for abandoned minors or people with serious disabilities, so the male figure is specifically... specifically the male educator is required, as far as I know, in these communities... so anyway the male figure in specific social-educational environments is required to have even more authority and physical strength, in my judgement, so it's okay to have a specific request for a male educator [...].

In explaining his rapport with children, motivated by the question «so you were not afraid of showing signs of affection and emotivity even through physical contact with kids, weren't you?» Aniello tends to shift the topic from an emotional level to the professional level as if he meant that the two dimensions live on different levels, and he neglects the importance of rapport.

No, with children anyway I've had a good rapport, not only sentimental let's say, but also professional anyway because anyway I was in a professional traineeship there, it was educational, so anyway I was perceived by the children as, uh, I mean, a sort of...elder brother, obviously they were children with immense difficulties at home, like for example school dropouts, separated parents and situations of uneasiness in the family, so let's say the children would perceive me, perceive me as a – I won't say father-like figure – but still as a point of reference and support.

The rapport with kids, among which «the males grew fonder than the girls, let me tell you», is defined as good and the fact that his figure was perceived as an elder brother indicates that still the relationship aspect which Aniello does not valorize has played a major role.

On the idea that women can be better educators than men, at first Aniello sees the topic as multidimensional, by listing different variables that “in his own opinion” concur to educational success:

no, I think it depends on the individual, on the environment you're in, who you deal with, what the user pool is composed of, and so there are many factors, let's see, for what regards our sector so you should not generalise, in my opinion you should not generalise on who's better and who's not, it depends of course from the professional experience you have under your belt, it depends on the user pool you deal with, it depends whether there is rapport with peers or not, that also [...] if it's good it depends a little bit from the environment you're in as well, if they put you at ease or, anyway, let's say, there are evident difficulties such as limited resources, money or let's say [...] lower [...] life quality, culture, society [...] I think anyway the difference let's say of services [...] I can say between North and South [...] there's the economic crisis here as well but I noticed that here the families, let's say the community in general, spend a minimum of resources to have the boys engage in activities.

Speaking more in general, about female aptitude to education and care, Aniello agrees with the common opinion stating that women have a greater aptitude to education. It is worth noting that this opinion is coming from a professional, which makes us think: should this widely accepted idea by educators themselves move us to consider it as more than simply a prejudice but instead as an accredited hypothesis, or should we ask ourselves questions about the educators, about their education and its subsequent limits? Shouldn't the awareness that in education different variables are to be considered imply that the matter is less biological – women could be more inclined to educate – than we might think? Shouldn't educators, be they male or female, be the first to operate towards a reworking of prejudices and dominant beliefs? Our witness' answer does not seem to deviate from common thinking:

maybe, uh... no, I think women notwithstanding the maternal instinct and things like... um, let's say they might be a little bit more inclined compared to us men towards things like education, anyway the [...] the strictness, I won't say strictness but anyway [...] in determinate things, but anyway I'm telling you, I can't see a man in determined environments as bad, for example drug addictions, disability, or even minors because anyway the male figure in my judgement can be useful in determined cases [...].

The conversation seems to lead us back to another prejudice, which I explicit to him as a question: «are men more indicated to *manage* disabilities or drug addiction compared to women?»

In determined cases that come to be, for as far as I have seen, yes. I mean that anyway if there are difficulties anyway, let's say, in the family or in relationships anyway, fights, conflict, as far as it comes to determined environments where if you find yourself working with them there are fights or conflict, or difficulties, the male figure will emerge anyway in fights in my judgement more than the woman, I'm not implying that the woman has lower expectations or can't manage a fight, but man, also because of his role, can help more, supported by women, as far as it concerns dispute resolutions. [Answering the question «because of his authority?») maybe [man] is seen as a father-like figure anyway so anyway stronger, I'm not saying, I'm not saying a woman can't manage those difficulties, right, but maybe a man, the figure of man maybe I won't say can intimidate but anyway for as much as it concerns the management of determined environments, like drug addictions, can anyway have an impact [...].

The indirect concluding proof of such a match, in this perspective, between masculinity and authority/strength/hardness/impetuosity comes from the subsequent answer to the question «what if you have to deal with children, teenagers, young adults?» in which you can infer the equality of gender in the educational intervention, again considering the other variables already mentioned before:

In my opinion it depends, because it kinda depends who you're dealing with, how the user pool is composed [...] you said teenagers so I think anyway teenagers, be they male or female, anyway, anyway is a difficult problem to manage so I don't feel like, anyway, sub-specifying woman or man who can better cope with the situation. You need to see the environment where this conflict, this difficulty is generated and the operator based on the experience [...] he has and see a bit how to deal with this difficulty, this conflict [...].

This point of view reveals the idea by which the necessity for a male educator is inscribed within contexts in which you deal with a difficult user pool, such as abandoned minors, serious disabilities and drug addictions, subject grouped into a single category that supposedly needs the male intervention. Here Aniello reinforces his previous statements, especially the one by which «the male figure in specific social-educational environments is required to have even more authority and physical strength, in my judgement, so it's okay to have a specific request for a male educator».

A recurring expression is «conflict management», indicating that the educator is not seen as a figure aiming to favour, in the etimological sense of “*educēre*” – to pull out – of development and creation of mental, social and behavioural faculties of an individual, in the perspective of humanization. He is more like a sort of mediator, or to say it Aniello’s way, a facilitator, role that he played during his experience in the self-help group for gambling addicts. If the educator is someone intervening in conflict management, it comes natural that those who are the targets of the educational intervention are living a difficulty chained to a conflict, and require negotiation, which implies that the actors of the conflicts are two or more, which requires an interpersonal mediation to solve the situation or cause.

Aniello believes that «it depends a bit who you’re dealing with». The theme of conflict management is recurring even while speaking of female educators:

in general... dunno... let’s say [...] it’s not like um... not like she’s overwhelmed, in the conflict or unpleasant situation that can arise, but anyway in certain environments, I’ll say that again, maybe especially in dealing with drug addictions there can be a, a, a greater impulsiveness, violence coming from the users maybe the male figure is a bit more advisable but not because of physical strength, more than that because of a sort of, anyway, experience which a male educator can have compared to a woman, not like a woman can’t manage this conflict [...] anyway [...] a sort of authority that anyway can be created, a sort of respect, you know if you see a male figure, among men you don’t generate conflict straight away, you try a bit of mediation, you don’t want to get to brute force, I think [...] maybe man is in... in, intrinsically he can manage this little conflict situation better [...] anyway always speaking of drug addiction, the male figure I repeat can be a bit more of help compared to, not because a woman can’t impose herself [...] but because in my judgement a man is seen with more respect, sort of, for what regards problems [...].

Again, a mostly traditional view of gender roles arises, since man is yet again seen as carrier of authority, more expert than a woman in dealing with difficult or dangerous situations, a figure that can obtain respect more easily. Thanks to these elements, even in difficult situations you would avoid escalating into violence, like saying that if you are dealing with a man you are going to think twice before resorting to violence. This way a picture is drawn that is stereotyped and patriarchal of gender differences. Hints at the emotional dimension are absent or almost absent, it is only considered under explicit stimulation – the question about whether it is better to have a female educator instead of a male one in the case of affect-deprived children – : «um...let’s say a woman for what regards familiar conflicts and let’s say above all if you’re dealing with minors maybe you can deal with I mean greater sensibility compared to man in most of cases can maybe cope better with the situations you’ve just, you’ve just listed».

It is necessary to clarify that the word “sensibility” was spoken by me, the interviewer, more than once, and which most probably was borrowed from the interviewee, who does not seem to spontaneously employ terms that refer to the emotional sphere. This hypothesis is reinforced when he is asked if «the male educator should have personal and professional features which are different from the one in possess of a male working in other professional contexts».

Obviously every sector requires different worker activities, competences, experiences, let’s say [...] doesn’t matter if male or female, in my opinion, so it’s normal that you can’t compare a male engineer to a male educator or to a... to a boy who studied economy, then marketing, then in commerce compared to an educator [...] anyway there are different environments, the experiences that come to be are anyway different, forbidden things, conflicts are also different, of a different nature [...] you can’t do these, a difference in my judgement.

Education-related competences are as such equaled to technical competences belonging to any other professional field. There is no trace of emotional quotient, and when Aniello is openly asked if a man working in the field of education who has developed a greater sensibility, emotivity and empathy can keep using them in his private life, the answer is negative:

No, I think you must separate your work from your private life anyway, the familiar life you have [...] I don’t think you can do it [...] if one has good qualities anyway even positive personality traits and has to make usage [use] of them like as you do while you work [...] then it’s normal that conflict resolution between two disabled boys you can’t of course let it influence your outcome let’s say of personal knowledge of your personality [...] it depends on the situation, as far as I know obviously, then it’s normal that if you have positive qualities like [...] you’re a good listener, you’re empathic, you can dialogue then you must also use them in the environment in which, for example, you and I are in, like the field of education.

The abilities of creating dialogue, listening and generating empathy are seen as positive personality traits, and they therefore depend on the private dimension of the subject’s and do not have a part in the setting of an educator. In his case there does not seem to be an opening or an interest in that sense. As previously noticed, Aniello separates technical-educational competences and private behaviour, and there seems to be no exchange between the two levels. As a proof,

when I ask him if his professional path has enriched him in sensibility or empathy compared to people of his same age but working in other fields, a somewhat puzzled answer comes:

um...no, as far as it concerns me I employ a lot the theme of dialogue anyway and so... even the fact that [...] even a bit of empathy but it's normal that in our field you have to know how to behave anyway and so there's a sort of dialogue anyway and confrontation, always, not only when it comes to conflict resolution in our working field, but also in what regards anyway, a sort anyway [...] living and so also a conflict management notwithstanding the... the unpleasant situation you can come to generate, so no, I can't see why you would have this separation.

In Aniello's opinion, to be a good educator you don't need to reinforce and develop personality traits related to your emotional quotient – sensibility, empathy, pro-sociality, comprehension – but you need to be apt to dialogue, which is first. The professional and rational dimension seems to prevail, through a process of negotiation/sharing finalized to conflict resolution. The profile with which he introduces himself is that of a “professional” meant as one who works for a retribution. There are no other motivations or interests.

Dialogue becomes again the main element because it is said that it's always about conflict resolution. In the case of feminine «a woman maybe she has more sensibility compared to man in determined cases, that's for granted [...] it's normal that it's always about education, the respect that your family has... has taught you, in my opinion».

## 6. Conclusions

From these three profiles a concept emerges that we could define “relativistic” of the educational practice, since there is no hint to possible strategies, behaviours or guidelines that can be generalized. Everything depends on the specific situation and context. A common variable is the dominance of practice upon theory; theory does not have any impact on the validity of an educator, who gathers experience from the field, with human rapport-based tools in the case of Alfonso and Antonio, with dialogue/negotiation-based tools in the case of Aniello, to be better able to carry out his or her tasks. A degree would only be a starting point, a key to the profession, that needs practical experience far more than theoretical concepts.

Gender duality is conceived as a fundamental structure education as well as society can't do without. All three the interviewees hint at the importance of role separation, but only Alfonso, a spurious educator, being a sociologist working for “common good”, is open to role versatility. All three value the importance of having to dive into a real context more than contemplate some ideal that can be learned from books.

Little merit is attributed to degree courses in the pedagogical field, so it is legitimate to ask whether or not the educational choice is determined mainly by factor such as personality, the maturation of a pro-social behaviour, the preference towards a study course who is not seen as too hard, the second choice after failing the admission to another preferred degree course and/or other elements, and finally whether or not the educators learn and take a step forward on their own, or they are the result of an aimed and effective education themselves.

## Abstract

The aim of this study was to shed light on imaginative education by inquiring the meaning of imagination through Dewey's concept of experience and to find some methods for imaginative education to encourage students' self-directed learning. For these, first, the conceptions, constructs, and features of educative experience that could be interpreted as Dewey's education were investigated. Next, the meaning and value of imagination in educative experience were discovered in the process of doing. Though Dewey's meaning of experience is a situation by itself, yet it would be explained by three rhythmic developmental phases: primary, reflective and consummatory ones. The reflective phase could not become the educative experience as an experience by itself. But it would act as very important intermediary to help the primary phase reach out to the consummatory phase by understanding the primary phase and imagining the future situation. In other words, the experience cannot turn into the consummatory phase unless it goes through the reflective phase. From the three rhythmic developmental phases, the imagination is the required ability at the reflective phase. Finally, the imagination is core ability to help that educational process and activity have value or be meaningful things connecting with each other closely. In conclusion, the imagination is the intermediation and necessary factor to let experience have educational value. In other way, the imagination could be emerged while teachers encourage students to get educational experience. Therefore, it could be one of best way of the imaginative education that teachers provide students with the structured experience as educational experience.

## Introduction

Now days, tremendous knowledge and information has been pouring out. In addition, society and circumstances are changing rapidly, and because of this mainstream, Knowledge that seemed to be unchangeable has been changed and we assume that its phenomenon will be increased more speedily. First of all, human beings are requested to have 'thinking ability' that works out a solution to new challenge of situation different from before that time. Therefore, from the past till now, there is an idea that the concept of learning is gaining certain, fixed information and knowledge, but suchlike thought about learning might be turned away. So today, 'imaginative education' is needed to bring up a creative talent required from society, or to cultivate thinking ability. The aim of this study is to shed light on the educational value of the imaginative education by inquiring the meaning of imagination through Dewey's concept of experience and to raise necessity of imaginative education to encourage students' self-directed learning.

## **The Meaning of Knowledge from Dewey's viewpoint**

At present, education is predisposed to point ostensible result, as a result there is learning to inculcate of knowledge habitually and mechanically by discipline, gives a prize or punishment. Generally, the meaning of good learning under such influence is that students gain more knowledge that means a fact proposition or statement expressed by language or a symbol.

On the other hand, Dewey emphasizes that education should focus on making the student feel the meaning of truth and principle through their experience (Dewey, 1916). In Dewey's viewpoint, knowledge does not indicate only an abstract concept or fact. Rather, knowledge is itself that the human being acquires the meaning from his/her experiences. According to his perspective, an issue about knowledge is connected with all of process to solve problems raised up in life. If Dewey's perspective is accepted, the meaning of knowledge should include all of things from logical proposition to contents empirically observed. And, at this time, there is a gap between logical proposition and contents empirically observed and the gap can be filled with 'imagination.' While contents of knowledge deal with what happened in the past which is completed and evident, imagination renders something that may happen in the present and future understood based on contents of knowledge, and imposes meaning, therefor induces new knowledge.

## **Changing idea of imagination**

From Plato and Aristotle's days to the early 20<sup>th</sup> century, possibly till today, it is considered important to understand abstract thought and concept in education. The other way, it is considered inferior to take images or imagine something. So, till early 20<sup>th</sup> century, image is considered as instrument to help person who could not understand abstract concept. And imagination's position has become different in modern times by educational philosopher(e. g. Pestalozzi and Froebel) who emphasized sense-experience, but still it is understood as a function to build an image that connect abstract concept and perceptual thing from sense-experience at most.

But imagination defined by Dewey include concept of deep thought more than mere awareness. Dewey (1916) mentioned "appreciative realization" which could not be distinguished from the work of the intellect and understanding. Appreciative realization is referred to as "experience", so if the mechanism of experience is understood, it is identified that imagination acts in the process of both knowledge generation and proactive thinking.

## **The Mechanism of Experience & Reflective Thinking of Dewey**

In Dewey's perspective, some experience as appreciative realizations might be qualified to called 'an experience' that makes students feel vivid meaning by themselves. 'An experience' means that the material experienced runs its course to fulfillment, or a piece of work is finished satisfactorily(Dewey, 1934). Such experience is a situation itself, but it could be structuralized with these three rhythmic developmental stages: primary, reflective, and consummatory stage. Reflective thinking acts as intermediation to make primary stage become consummatory stage by understanding primary stage and guessing how situation will change. In other word, experience could not be completed without reflective thinking stage. And reflective thinking needs 'Imagination'.

## **Conclusion: The Meaning and Educational Value of Imagination based on Dewey's Experience**

Until 20<sup>th</sup> century, imagining is considered, at most, as having an image about abstraction by distinguishing between abstraction (theory) and reality (practice). Whereas, in Dewey's perspective imagining is like thinking about something or situation. That is, imagining is guessing about the things to come or want to occur in the future. Finally, having an imagination means that people will be got a culture of clear thought (Takaya, 2004), and it is actually different from habitual thing, fancy, or mechanical thing. Imagination by Dewey could be the medium to help students understand a symbol (e.g. a letter, concept) as appreciative realizations (an experience). That is, imagination is a catalyst for reflective thinking that helps students' interests and attention be connected to new knowledge with logicity and systemicity. Imagination makes people find another possibility about something or situations getting out of conventional thoughts, and open ways to experience more and more. Therefore, we need to stop using teaching and

learning methods that indoctrinate with fossilized knowledge, but start to foster the will (e.g. imagination) that our students are willing to face knowledge with enthusiasm by themselves.

# The mechanics of rigid bodies in mechanical engineering education

Billur Kaner <sup>a</sup>

<sup>a</sup> Yildiz Technical University Mechanical Engineering Faculty Yildiz/Istanbul 34349 Turkey

## Abstract

The mechanics of rigid bodies is the foundation of most engineering sciences and is an indispensable prerequisite to their study. Course in the mechanics of rigid bodies, the engineering student the ability to analyze any problem in a simple and logical manner and to apply to its solution a few, well-understood, basic principles. Therefore has an important place in engineering education. The mechanics of rigid bodies is subdivided into statics and dynamics; the former dealing with rigid bodies at rest, the latter with rigid bodies in motion. In this paper, the mechanics of rigid bodies consist of statics and dynamics is discussed at universities of mechanical engineering in Turkey. The needed for statics and dynamics courses programs are evaluated, by considering the International accreditation criteria.

## Özet

Rijid cisim mekaniği, birçok mühendislik bilimlerinin temeli ve bu çalışma alanların vazgeçilmez ön şartıdır. Rijid cisim mekaniği derslerinin amacı, mühendislik öğrencilerine her problemi basit ve mantıklı biçimde analiz edecek özelliği kazandırmak ve çözümler için az sayıda, iyi anlaşılmış temel ilkeleri uygulatabilmektir. Bundan dolayı, mühendislik eğitiminde önemli bir rolü vardır. Rijid cisimlerin mekaniği iki alt gruba ayrılır: statik ve dinamik. Statikte durgun rijid cisimler, dinamikte hareketli rijid cisimler yer alır. Bu çalışmada, Türkiye’deki üniversitelerin makine mühendisliği programlarında rijid cisimler mekaniği bilgilerini içeren statik ve dinamik derslerinin programları ele alınarak incelenmiştir. Uluslararası akreditasyon kriterleri de dikkate alınarak makine mühendisliği için ihtiyaç duyulan statik ve dinamik ders programları değerlendirilmiştir.

## Giriş

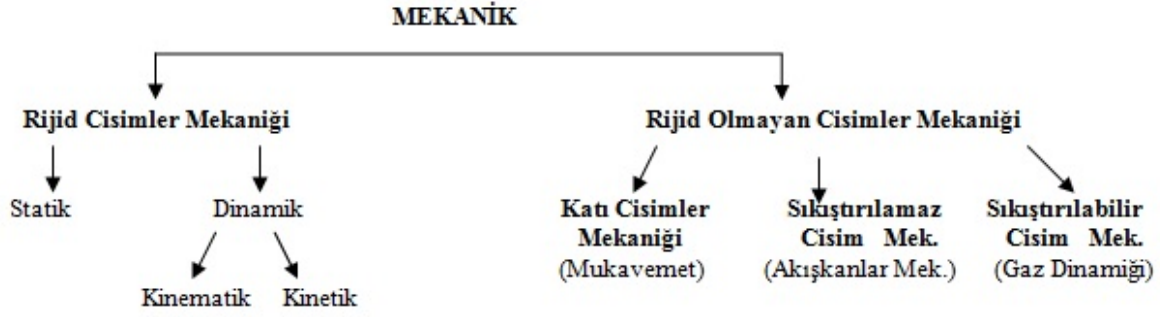

Mekanik; çeşitli kuvvetlerin etkisi altındaki cisimlerde denge ve hareket şartlarını inceleyen ve açıklayan bilim dalıdır ve mühendislik eğitiminin temelini oluşturur. Gözlemlerle elde edilen sonuçları başlangıç olarak ele alıp, fiziksel bir olayı tanımlayan çeşitli etkenler arasında değişmeyen bağıntıları, yani olayın yasalarını belirlemeye çalışır. Önerilen yasalar çeşitli varsayımlara dayandırılır ve bunların doğruluğu ya da geçerlilik sınırları deneylerle araştırılır (Beer F.P. , Johnston E.R. , 2004).

Mekanik, ilk bilimdir. Geçmiş çok eski çağlara dayanan statik, bilimsel temellere dayandırılışı yeni sayılabilir. Örneğin, paralel kenar ilkesi Simon Stevinus (1548-1620) tarafından önerilmiştir. Dinamiğin geçmişi, statikten de daha yenidir. İlk bilimsel çalışmalar Galileo Galilei (1564-1642) ile başlamakla birlikte, günümüze kadar uzanan ciddi temeller Isaac Newton (1642-1726) tarafından atılmıştır. Newton’un 3 temel yasası üzerine kurulan mekanik; D’Alembert(1717-1783) Lagrange(1736-1813), Hamilton(1805-1865), Jakobi (1804-1851) başta olmak üzere çok sayıda araştırmacının katkılarıyla geliştirilmiştir.

Mekanikte incelenen cisimler,

- Rijid (şekil değiştirmeyen) cisimler
- Şekil değiştirebilen cisimler

diye ikiye ayrılır. Rijid cisimler mekaniğinde yapılan idealleştirme, dış etkiler ne olursa olsun, cismin geometrisinde bir değişiklik olmadığıdır. Ayrıca mekaniğin kapsamı içinde katı sıvı gaz cisimleri inceleyen şekil değiştirebilen rijid olmayan cisimler mekaniği de mevcuttur. Mekaniğin çeşitli alt gruplarını kısaca tanıtmak istersek, aşağıda sunulmuş olan şemayı verebiliriz.

Rijid cisimlerin kuvvet etkisindeki davranışını ele alan bilim dalına rijid cisimler mekaniği denir.

- Rijid cisim statiği
- Rijid cisim dinamiği.

Rijid cisim statiği, duran dengede olan cisimlere etkiyen bağ kuvvetlerini araştırır ve denge koşullarını inceler. Rijid cisim dinamiğinde ise hareket denklemleri kullanılarak cismin hareketi incelenir. Dinamik, kinematik ve kinetik diye başlıca ikiye ayrılır. Kinematik; hareketi oluşturan sebepleri, yani kuvvetleri, göz önüne alınmaksızın hareketin incelenmesidir. Kinetik ise bir cisme etkiyen kuvvetler, cismin kütlesi ve meydana gelen hareket arasındaki bağıntıyı inceler (Hibbeler R.C., 1978).

## **RİJİD CİSİM MEKANİĞİNİN MAKİNA MÜHENDİSLİĞİ EĞİTİMİNDEKİ YERİ**

Mühendis teriminin İngilizcesi “engineer” sözcüğü makina anlamına gelen “engine” sözcüğünden türetilmiştir. Makina mühendisliği, terimin belirttiği gibi mühendisliğin merkezi bir konumundadır. Makina Mühendisliği (Mechanical Engineering) terimi de mechanical (mekanik) ve engine sözcüklerinden oluşmuştur. Bu da makine mühendisliği ve mühendisliğin merkezinde mekanik bilim dalının olduğunu gösterir. Dolayısı ile bir makine mühendisliği eğitiminde; maddenin rijid hali ve üç halinde (katı, sıvı ve gaz halleri), statik (sükunet) ve dinamik (hareket) durumları temel prensiplerle ilgili derslerde sırayla verilmektedir. Mekaniğin dallarının her biri makine mühendisliği eğitim planındaki ders içeriklerinde öğretilir. Öğrenci, makine mühendisliği eğitimini tamamladığında mekanik bilim dalını teorik ve uygulamalı olarak öğrenmiş olur. Mekaniğin, herhangi bir nedenden dolayı eğitim yılları içerisinde iyi sindirilememesi durumunda, genç mühendislerin uygulamada hep bir eksik ve ürkeklik hissetmeleri kaçınılmazdır (Omurtag H.A., 2011).

Mekaniğin temel prensipleri ders planlarında, rijid cisim mekaniği bilgilerini içeren derslerde ilk olarak anlatılır. Rijid cisim mekaniği, çoğu mühendislik bilimlerinin temeli ve o çalışmaların vazgeçilmez ön şartıdır. Rijid cisim mekaniği derslerinin amacı, mühendislik öğrencilerine her problemi basit ve mantıklı biçimde analiz edecek iktidarı

kazandırmak ve çözümler için az sayıda, iyi anlaşılmış temel ilkeleri uygulatabilmektir. Ve mühendislik uygulamaları için gerekli olan esasları hazırlamaktır. Bu nedenlerle; Türkiye’deki üniversitelerin Makine Mühendisliği Bölümleri incelendiğinde; rijid cisim mekaniğinin “statik” ve “dinamik” dersi adı altında iki ayrı zorunlu temel mühendislik dersi olarak eğitim planlarında yer aldığı görülmektedir. Yurt dışı üniversitelerin Makine Mühendisliği bölümlerinin de eğitim planlarında benzer durum söz konusudur. Mühendislik eğitiminin ilk dönemlerinde bu temel mekanik bilgilerine sahip olan öğrenciler, daha sonraki dönemlerde mukavemet dersi ile katı cisim mekaniği, akışkanlar mekaniği dersi ile sıvı mekaniği prensiplerini tanır. Diğer mühendislik derslerinde de bu temel bilgileri kullanmaya devam ederler.

#### *Rijid Cisim Mekaniği; Statik Dersi*

Mekaniğe giriş olan statik dersi, öğrencilerin mühendislik kavramıyla ilk tanışmalarını sağlayan derstir. Günlük hayatta sıkça gözlemlediğimiz pek çok fiziksel olaya artık bir başka bakış açısıyla yaklaşmaya, mühendislik formasyonu ile zihinlere aktarılmaya çalışılır (Omurtat H.A., 2011).

Statik dersi, %75’ inde ikinci yarıyıl, %25’ inde üçüncü yarıyıl olmak üzere zorunlu ders kapsamında Türkiye üniversitelerinin Makina Mühendisliği Bölümlerinin ders planlarında mevcuttur (Şekil 1).

Şekil 1. Statik dersi dönem dağılımı

Şekil 2. Statik dersi haftalık saat dağılımı

Statik dersi makine mühendisliği bölümlerinin eğitim planlarının %70’inde haftada 3 saat ve %30’unda haftada 4 saat (Şekil 2.) olarak mevcuttur.

Statik dersinde ACTS dağılımı ise, 4 ile 9 kredi arasında değişmektedir (Şekil 3).

Şekil 3. Statik dersi ACTS dağılımı

Tablo 1. Ders Planında Haftalık Konu Dağılımı:

1. hafta	Mekanîğe Giriş
2. hafta	Maddesel Noktanın Statiği: Düzlemde Kuvvetler
3. hafta	Maddesel Noktanın Statiği: Uzayda Kuvvetler
4. hafta	Rijit Cisimler: Eşdeğer Kuvvet Sistemleri
5. hafta	Rijit Cisimler: Eşdeğer Kuvvet Sistemleri
6. hafta	Rijit Cismin Dengesi
7. hafta	Yayıllı Yükler: Merkezler ve Ağırlık Merkezleri
8. hafta	1. Yılıçi Sınavı
9. hafta	Yapıların Analizi
10.hafta	Kiriş ve Kablolardaki Kuvvetler
11.hafta	Sürtünme Kuvveti
12.hafta	Rijit Cisimler Sisteminin Dengesi
13.hafta	Yayıllı Yükler: Kütlelerin Eylemsizlik Momenti
14.hafta	2. Yılıçi Sınavı
15.hafta	Virtüel İşler Metodu
16.hafta	Final Sınavı

Ders Öğrenim Çıktıları:

- Öğrenci vektör cebri, kuvvet ve moment tanımını hakkındaki bilgilerini mühendislik problemlerine uygulamaya başlar.
- Öğrenci maddesel noktanın, rijid cismin ve rijid cisimler sisteminin dengesi hakkında bilgi kazanır ve ilgili problemleri çözebilir.
- Öğrenci statikçe belirli taşıyıcı sistemlerin statik dengesi (çubuklar, kafesler, çerçeveler, kablolar, makineler) hakkında bilgi sahibi olur.

Mühendislik eğitiminde, cisimlerin hareketinin incelendiği dinamik dersinin öğrenilmesi genellikle statik dersini izler. Dinamiğin iki farklı kısmı olan kinematik ve kinetik tam olarak kavranması mühendislikte analiz için en yararlı ve en güçlü araçlardan biridir. Makinalar , yüksek hızlarda ve kayda değer ivmelerde çalışmaya başladıktan sonra hesaplamaların statik ilkeler yerine dinamik ilkelerine dayanarak yapılması gerekli olmuştur. Günümüzün hızlı teknolojik gelişmeleri mekanik ilkelerinin, özellikle de dinamiğin giderek artan uygulamalarını gerektirmektedir. Bu ilkeler, hareketli cisimlerin, darbe yüklerine maruz sabit yapıların, robotik cihazların, otomatik kontrol sistemlerinin, ulaşım araçlarının, pompa, türbinler, vinçler,...vb. makine tiplerinin analiz ve tasarımlarında temeldir (Meriam J. L., Kraige L.G., 2008).

Dinamiğin öğrenilmesi, fizik ve matematik arasında sürekli dönüşümlerle cisimlerin hareketlerinin tanımı, anlaşılması ve problemlerin analizi için gereklidir. Dinamik dersini iyi özümleyemeyen öğrencilerin karşılaştığı en büyük zorluklardan biri bu dönüşümü serbestçe yapabilme yetersizliğidir.

Dinamik dersi; %65 oranında üçüncü yarıyıl, %32.5 oranında dördüncü yarıyıl, %2.5 oranında beşinci yarıyıl makine mühendisliği bölümü eğitim planlarında mevcuttur (Şekil 4). Dinamik dersinde haftalık ders saati dağılımı 2 ile 5 saat arasında değişim göstermektedir (Şekil 5).

Şekil 4. Dinamik dersi dönem dağılımı

Şekil 5. Dinamik dersi haftalık saat dağılımı

Dinamik dersinde ACTS dağılımı ise, 4 ile 9 kredi arasında değişmektedir (Şekil 6).

Şekil 6. Dinamik dersi ACTS dağılımı

Tablo 2. Ders Planında Haftalık Konu Dağılımı:

1. hafta	Dinamiğe Giriş- Maddesel Noktanın Kinematiki
2. hafta	Maddesel Noktanın Doğrusal Hareketi
3. hafta	Maddesel Noktanın Eğrisel Hareketi
4. hafta	Maddesel Noktanın Eğrisel Hareketi
5. hafta	Rijit Cismin Kinematiki
6. hafta	Rijit Cismin Kinematiki
7. hafta	Rijit Cismin Kinematiki
8. hafta	1. Yılıçi Sınavı
9. hafta	Maddesel Noktanın Kinetiki; Kuvvet, Kütle ve İvme
10.hafta	Maddesel Noktanın Kinetiki; İş, Enerji ve Momentum
11.hafta	Maddesel Nokta Sistemlerinin ve Rijid cisim Kinetiki
12.hafta	Rijit Cismin Düzlemsel Hareketi; Kuvvetler ve İvmeler
13.hafta	Rijit Cismin Düzlemsel Hareketi; İş ve Enerji
14.hafta	2. Yılıçi Sınavı
15.hafta	Rijit Cismin Düzlemsel Hareketi; İmpuls ve Momentum

Dinamik dersi haftalık konu dağılımı, üniversitelerin ilgili bölümlerinde incelendiğinde konu anlatım sırasının ekoller arasında bazı farklılıklar gösterdiği belirlenmiştir. Dinamiği temelde kinematik ve kinetik olarak ikiye ayırıp, önce kinematik tanımlamalarla maddesel nokta ve rijid cisimde hareketleri tanımlayıp gruplandırıp daha sonra kinetik eşitliklerle derse devam edilmektedir. Ana başlıklarla; Maddesel Noktanın Kinematiki, Rijit Cismin Kinematiki, Maddesel Noktanın Kinetiki, Rijid Cismin Kinetiki sırası takip edilmektedir. Diğer ekolde ise; önce Maddesel Noktanın Hareketi kinematik ve kinetik analizi yapılarak incelenmektedir, daha sonra Rijid Cismin Hareketi Kinematik ve Kinetik analizi yapılarak derse devam edilir. Ana başlıklarla; Maddesel Noktanın Kinematiki, Maddesel Noktanın Kinetiki, Rijit Cismin Kinematiki, Rijid Cismin Kinetiki sırası takip edilmektedir.

Her iki anlatım sistemi tarafımdan tecrübe edilmiştir. Yukarıda 15 haftalık konu dağılımı verilen plan konu akışı olarak öğrenci tarafından daha anlaşılır bulunduğu ve derste zaman kazandırmış olduğu gözlemlenmiştir.

Ders Öğrenim Çıktıları:

- Parçacık hareketini çözebilmek için uygun eksen takımını seçebilmek ve kullanabilmek
- İvmeli hareket eden eksen takımında dinamik modeli kurabilmek

- Enerjinin/Momentumun korunumu gibi integral formdaki hareket denklemlerini parçacık ve rijit cisim için kullanabilmek
- Düzlemsel harekette, rijit cisim için model oluşturabilmek ve analiz edebilmek

## SONUÇ VE TARTIŞMALAR

Ülkemizdeki Makine Mühendisliği bölümleri öğretim planları incelendiğinde statik dersinin ağırlıklı olarak 2. yarıyılıda, dinamik dersinin ise hemen sonraki 3. yarıyılıda olduğu görülmektedir.

Her iki ders de genellikle haftada 3 saattir ve ACTS değerleri 5'dir. Bu bilgiler ikinci bölümde grafiklerle detaylı verilmiştir. 1. yarıyıl planındaki temel derslerden hemen sonra mühendisliğin temel dersi olan statik ardından dinamik dersinin verilmesi çok uygundur.

Makine Mühendisliği bölümleri öğretim planlarında sürekli iyileştirmeye gidilerek, ders sayısı ve kredi saatleri açısından çağdaş ve uluslararası ölçütlere uygun bir içeriğe sahip olacak şekilde düzenlemeler yapılmaktadır. Ülkeler arasında sınırların kaldırıldığı bir Avrupa'da üniversite öğretiminde kalite güvencesinin sağlanması zorunlu duruma geldiğinden Bologna süreci çerçevesinde üniversitelerin başarısı ve verdikleri diplomalar Avrupa ölçeğinde karşılıklı tanınmayı öngörmektedir. Bologna süreci kapsamında, Almanya'daki köklü üniversitelerin Makine Mühendisliği Bölümlerinin ders planları ile Türkiye Üniversitelerinin Makine Mühendisliği Bölümlerinin ders planları karşılaştırıldığında ders adları, içerik ve kredilerinin pek farklı olmadığını görmekteyiz (Rende, H., 2011). Bu durum, statik dersi içeriği teknik mekanik 1, dinamik dersi içeriği teknik mekanik 2 adı altında olsa da rijid cisim mekaniği derslerinde de bulunmaktadır.

Rijid Cisim Mekaniği makine mühendislik eğitimi içinde hak ettiği ilgiyi görüyor mu? Bu sorunun cevabı "evet" ise, iki alanda ciddi ilerleme sağlandığını düşünebiliriz. Birincisi mesleğin önemli bir parçası olan mekanik problemlerini algılamaya ve bunları mühendislik bakış açısıyla yorumlamaya hazır öğrenciler yetiştirmekteyiz. İkincisi ise, mekanik problemlerini çözebilmek için gereksinim duyulan matematik altyapı ve kıvrak düşünme yeteneği kazandırılmıştır.

# The need for teaching local arts as an elective course: the art of tile making in Kutahya

Nida Bayindir<sup>a</sup>, Levent Sevi<sup>b</sup>, Aynur Cukurcalioglu<sup>c</sup>, Ahmet Sami Yucel<sup>d</sup>

<sup>a</sup>Associate Prof. Dr., <sup>b</sup>Lecturer, <sup>c</sup>PhD candidate, <sup>d</sup>Master's Student, Dumlupinar University Education Faculty Elementary Teaching Department, Kutahya 43100, Turkey

## Abstract

This research will be beneficial in revealing that regional local arts, if taught as an elective course in secondary schools, will both contribute to students' development and prevent local arts from disappearing. Information about tile-making, a local art of Kutahya, is presented and opinions of secondary school teachers about the subject are sought through a survey. The sampling is composed of 137 secondary school teachers in Kutahya during 2013-2014 education period. The majority of teachers think tile-making elective course will be beneficial for both the student and the region and students will be eager to choose a local arts elective course.

## Introduction

Education is a process of changing behaviour in an individual as desired (Demirel, 2006: 6). At the end of education process, besides improving academic success of students, it is aimed to help them explore their talents and interests by reinforcing their spiritual, mental and physical development. In this context, according to MEB (Ministry of National Education) syllabus code, upon the Regulatory Board's decision, it was decided to start elective courses from 5th and 6th classes beginning from 2013-2014 education year and to conduct these courses fractionally (<http://tegm.meb.gov.tr/>). Elective courses not only contribute to students' cognitive, affective, physical and social developments but also help them develop their own interests and skill and meet their own needs (<http://yegitek.meb.gov.tr/>).

As a part of new education system in Turkey, there are no elective courses at primary school level, but elective courses are applied in 5th and 6th grades fractionally at secondary level and in 10th, 11th and 12th grades at high school level. Because the scope of this research is limited to the elective courses at secondary level, weekly course schedule published by MEB was studied and it was seen that the elective courses at secondary level are grouped under six categories: Religion, Ethics and Values, Language and Expression, Foreign Languages, Physical Sciences and Mathematics, Arts and Sports, and Social Sciences (<http://ikgm.meb.gov.tr/>); however, it was noticed that there is no elective course in which local arts, music and cultural values are emphasized.

Teaching local arts, abundant and full of cultural diversity in every corner of Turkey, as elective courses will not only provide students with opportunities for hobbies and potential future careers but also be a means of passing these arts on to the future generations. Some of the famous local arts and cultural heritages of Turkey that could be presented as elective courses are pottery in Nevsehir and Canakkale; tile making in Kutahya and Iznik; filigree in Mardin; meerscham in Eskisehir; sericulture in Bursa; clarinet in Trakya (Thrace); oilwrestling in Edirne; zeibek folk dance in Ege (Aegean Region); jet stone decorations in Erzurum; carpet and rug making in Usak and Balikesir; wood, stone and copper decorations and kemancha training in Trabzon; knife making in Kastamonu and Denizli Yatagan, etc.

It is proposed in this study to give world famous tile making training in and around Kutahya as an elective course at schools at secondary level.

In this context, in terms of the historical background of tile making, it is claimed in some resources that the name came from China with reference to Chinese who promoted porcelain to the world (Encyclopedia of Islam, 1993: 329). In some other resources, tile making is claimed to originate in Central Asia starting with Uyghur Turks, continuing with Karakhanids and Ghaznevids and brought to Anatolia by Seljuks (Kutahya Encyclopedia, 1999: 67). Tile decorations were used enormously in architectural works (Aslanapa, 1993: 147) and the art of tile making showed a rapid development in Anatolian Turkish architecture (Yetkin, 1986: 1).

Art historians also admit that the art of tile making belongs to Turks (Atalay, 1983: 5). The artifacts unearthed in archeological excavations in Central Asia, especially in Tufan, Ashkar and Kocha Regions around the city of Kashan prove that Turks used tile making as an art branch before 8 BC. (Kucukyilmazlar, 2006: 3). Today, ceramic industry exists in many European countries and some of the production is conducted in the name of tile making; however, none of it bears the characteristics of genuine Turkish tile making; every piece is decorated by hand, underglaze decorations are only done with brush, figures are unique, diverse, authentic and endemic only to Turkish tile heritage.

China tiles are produced by shaping, decorating, glazing and baking the paste composed of a mixture of such agents as kaolin, clay, chalk and quartz at certain ratios (Atalay, 1983: 6-8). In this respect, with its rich clay resources, Kutahya was a centre of tile production in Phrygian, Hellenistic, Roman and Byzantine times (Bilgi, 2006: 9). In the Ottoman times, tile making concentrated in and around İstanbul, Iznik, Kutahya and Bursa. These centres were always supported by the court (Kutahya Encyclopedia, 1999: 67; Bayezit and Ishik, 2012: 893).

The tile pieces displayed in various museums around the world date back to 16th century, which was the development age of Iznik tile art. Initially, compared with Kutahya, being close to Istanbul was a great advantage for the art in Iznik. Starting from the 14th century onwards, tile making in Kutahya was only secondary to the art in Iznik. When the Ottoman State went into decline during the 17th century, tile making in Iznik was negatively affected by the process and struggled to survive but, since the art in Kutahya didn't depend on the court as much as Iznik, it continued and even strengthened its existence (Kutahya Encyclopedia, 1999: 68-70).

Today in Kutahya, together with the traditional way of production, modernized methods are also used to satisfy the touristic demand (Bilgi, 2006: 15).

Considering the above mentioned process in which tile making continues to be carried out only in Kutahya with its historical prominence, this research aimed to reveal the factors in teaching tile making in Kutahya as local arts elective course.

## Method

This is a survey study with a sampling composed of 137 secondary school teachers working at the schools of MEB (Ministry of National Education) during 2013-2014 education year. The questionnaire was analysed by experts and accepted to have content validity.

After completing the implementation of data gathering tool, the questionnaires were transferred to SPSS program. The first stage of the analysis was conducted on the likert type items "completely adequate", "adequate", "partly adequate" and "completely inadequate". Their frequencies and percentages were computed. The research is limited to the questionnaires, statistical methods and tools involved within.

## Findings

The following are the research results of the study conducted to determine the need for teaching local arts as elective course.

**Table 1- Gender**

SMEAN (Gender)

		Frequency	Percentage	Mean	Standard Deviation
Valid	Male	65	47,4		
	Female	72	52,6	1,52	0,50
	Total	137	100,0		

According to the table, the participant 137 teachers are 52,6% female and 47,4% male.

**Table 2. Professional seniority**

SMEAN (Seniority)					
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	0-5years	11	8,0		
	6-10years	36	26,3	3,18	1,28
	11-15years	38	27,7		
	16-20years	20	14,6		
	21years and above	32	23,4		
	Total	137	100,0		

According to the table, 26,3% of the participant teachers have 6-10 years and 27,7% have 11-15 years professional seniority, so more than half of the participants are teachers for 6-15 years.

**Table 3- The case of having a workshop or an art room at schools**

SMEAN(Item-1)					
		Frequency	Percentage	Mean	Standard Deviation
Valid	Yes	56	40,9		
	No	81	59,1	1,59	0,49
	Total	137	100,0		

According to the table, 40,9% of the participant teachers stated that there are workshops or art rooms at their schools, whereas 59,1% said there aren't any at their schools.

**Table 4- The case of entering an elective course**

SMEAN (Item-2)					
		Frequency	Percentage	Mean	Standard Deviation
Valid	Yes	57	41,6		
	No	80	58,4	1,58	0,49
	Total	137	100,0		

According to the table, 41,6% of the participant teachers revealed that they were entering an elective course, whereas 58,4% stated that they weren't.

**Table 5- The factors in determining an elective course**

SMEAN(Item-3)					
		Frequency	Percentage	Mean	Standard Deviation
Valid	Students demand	57	41,6		
	Parents demand	65	47,4	2,37	1,30
	Principal demands	1	,7		
	Facilities	14	10,2		
	Total	137	100,0		

As seen in the table, according to the participant teachers, the factors in determining an elective course are 41,6% students demand and 47,4% parents demand.

**Table 6- The case of theoretical knowledge about tile making of Kutahya**

SMEAN(Item-4)					
		Frequency	Percentage	Mean	Standard Deviation
Valid	Yes	56	40,9		
	No	81	59,1	1,59	0,49
	Total	137	100,0		

According to the table, it was determined that 40,9% of the participant teachers had theoretical knowledge about tile making of Kutahya whereas 59,1% didn't.

**Table 7- The case of practical knowledge about tile making of Kutahya**

SMEAN(Item-5)					
		Frequency	Percentage	Mean	Standard Deviation
Valid	Yes	33	24,1		
	No	104	75,9	1,75	0,42
	Total	137	100,0		

According to the table, it was found that 24,1% of the participant teachers had practical knowledge about tile making of Kutahya whereas 75,9% didn't.

**Table 8- The case of contribution of local arts elective course to the student and the area**

SMEAN(Item-6)					
		Frequency	Percentage	Mean	Standard Deviation
Valid	Yes	123	89,8		
	No	14	10,2	1,10	0,30
	Total	137	100,0		

According to Table 8, while 89,8% of the participant teachers thought that local arts elective course would contribute to the student and the area, only 10,2% didn't think so.

**Table 9- The case of entering local arts elective course**

SMEAN(Item-7)					
		Frequency	Percentage	Mean	Standard Deviation
Valid	Yes	57	41,6		
	No	80	58,4	1,58	0,49
	Total	137	100,0		

According to Table 9, while 41,6% of the participant teachers stated that they were willing to enter local arts elective course, 58,4% stated that they weren't.

**Table 10- The case of contribution of local arts elective course to economy**

SMEAN(Item-8)					
		Frequency	Percentage	Mean	Standard Deviation
Valid	Yes	127	92,7		
	No	10	7,3	1,07	0,26
	Total	137	100,0		

According to Table 10, 92,7% of the participant teachers thought that local arts elective course would contribute to economy whereas 7,3% didn't think so.

**Table 11- The case of local arts elective course offering students a chance to choose a career**

SMEAN(Item-9)					
		Frequency	Percentage	Mean	Standard Deviation
Valid	Yes	125	91,2		
	No	12	8,8	1,08	0,28
	Total	137	100,0		

According to Table 11, 91,2% of the participant teachers stated that local arts elective course would offer students a chance to choose a career while 8,8% stated that they wouldn't.

**Table 12- The case of local arts elective course contributing to students' cognitive and social development**

SMEAN(Item-10)					
		Frequency	Percentage	Mean	Standard Deviation
Valid	Yes	134	97,8		
	No	3	2,2	1,02	1,46
	Total	137	100,0		

As seen in Table 12, the biggest difference in the questionnaire was seen in this item with 97,8% of the participant teachers stating that local arts elective course would contribute to the students' cognitive and social development while 2,2% stated that it wouldn't.

**Table 13- The case of preference of local arts elective course by students**

SMEAN(Item-11)					
		Frequency	Percentage	Mean	Standard Deviation
Valid	Yes	129	94,2		
	No	8	5,8	1,05	0,23
	Total	137	100,0		

As seen in Table 13, 94,2% of the participant teachers thought that students would be willing to choose local arts elective course whereas 5,8% didn't think so.

**Table 14- The case of local arts elective course contributing to institutionalization of tile making profession as formal education**

SMEAN(ITEM-12)					
		Frequency	Percentage	Mean	Standard Deviation
Valid	Yes	113	82,5		
	No	24	17,5	1,17	0,38
	Total	137	100,0		

As seen in Table 14, while 82,5% of the participant teachers thought that local arts elective course would contribute to institutionalization of tile making profession, 17,5% didn't think so.

## Conclusion

Among the total 137 participant teachers, more than half were teachers for 6-15 years, 59,1% stated that there weren't workshops or art rooms at their schools and 58,4% revealed that they didn't enter an elective course while 58,4% said that they didn't want to enter an elective course about tile making. While 47,4% thought that elective courses are determined according to parents demand, 59,1% said that they didn't have any theoretical knowledge about tile making and 75,9% stated that they didn't have any practical knowledge about tile making. Just as 92,7% believed that tile making elective course would contribute highly to the economy of the area and 97,8% thought that it would contribute greatly to the students' development levels, 94,2% were in the opinion that students would be willing to choose this elective course and 82,5% thought that it would also contribute to institutionalization of that profession. It is clear that reluctance of teachers to enter tile making elective course mostly arises from their being deprived of theoretical and practical knowledge about the art. On the other hand, the teachers still believe that local arts elective course will contribute to the student as well as the economy of the area.

## Suggestions

All in all, the benefits to be gained from teaching local arts as elective course should be explained to educational stakeholders, schools should complete their physical infrastructures according to the local arts of that area, teachers should be provided with in-service training for local arts education, and even additional values gained from the outcomes of that elective course should be used for the benefits of students and school.

## Questionnaire

## ANKET

Bu araştırma INTE(Uluslararası Eğitimde Yeni Ufuklar) Paris Konferansında Kütahya çiniciliğini dünyaya tanıtmak ve sürdürülebilirliği açısından eğitimle ilişkilendirmek üzere hazırlanmıştır. Katıldığınız için teşekkür ederiz.

### KİŞİSEL BİLGİ FORMU

# The neuroscience literacy of teachers in Greece

Deligiannidi, K. and Howard-Jones, P. A.

*Graduate School of Education, University of Bristol, BS5 8HZ, United Kingdom*

---

## Abstract

There is concern amongst neuroscientists and educators about the prevalence of neuromyths in education, which are often associated with poor or unevaluated practices in the classroom. The present study surveyed 217 primary and secondary school teachers in Greece. Analysis revealed that Greek school teachers held many misconceptions about concepts related to brain-based educational programs that have been observed elsewhere in Europe. These include believing that differences in hemispheric dominance (left brain, right brain) can help explain individual differences amongst learners, and the effectiveness of teaching to learning styles. However, international comparison with other studies also revealed some interesting differences reflecting the influence of cultural forces on teachers' ideas about brain function. For example, teachers in Greece appear to possess a more complex construction of the mind-brain relationship than observed in the UK and Netherlands, with most considering that this relationship is mediated by the soul. A relationship was also observed between attributing educational outcomes to genetics and a belief in a biological limit to student achievement.

## Introduction

As the dialogue increases between neuroscience and education, there is a growing concern about the prevalence of neuromyths in many schools. In 2002, the Organisation for Economic Co-operation and Development (OECD) defined “neuromyth” as “a misconception generated by a misunderstanding, a misreading, or a misquoting of facts scientifically established” (OECD, 2002). These myths are related to the practices of teachers and are often promoted by brain-based programmes and books marketed to teachers that are intended to inform their teaching strategies.

E-mail address: k.deligiannidi@gmail.com

There is good reason, therefore, to consider these misunderstandings contribute to poor practice in the classroom. Studies have found high levels of neuromyths amongst teachers in the UK, Netherlands, Portugal, Brazil, China and Turkey. Beyond the impact of commercial brain-based programmes in promoting myths, it seems likely that cultural contexts will influence the types of myth that become prevalent in a particular country. For example, only half of the UK population report any affiliation with any religion (Park, Clery, Curtice, Philips, & Utting, 2012) and here, only 15% of trainee teachers believed that the mind results from the spirit, or the soul, acting on the brain (Howard-Jones et al., 2009). In Brazil, however, whose people demonstrate notably high religious involvement, a small survey of teachers (N=42) showed 43% believed the mind was the result of supreme action of the soul over the brain (Bartoszeck and Bartoszeck, 2012). Greece stands out amongst European states in terms of the religiosity of its people (Hirschon, 2009), and so in our study we might expect similarly high levels of teachers who believe in a religious aspect to the mind-brain relationship. In scientific and philosophic terms, our understanding of how the mind is related to brain is intimately related to other concepts such as free-will and the malleability of our neural and cognitive abilities. It seems likely, then,

that beliefs in neuromyths in Greece may reflect the specific contexts found within Greece and the Greek educational system. However, to date, no research has been undertaken to investigate the prevalence of neuromyths amongst Greek teachers. The present study aims to investigate this issue and shed light on the role of cultural contexts in the beliefs that teachers acquire about the brain. More specifically, the study sought to determine the knowledge and misconceptions about the brain amongst Greek school teachers, and their beliefs regarding biological concepts that may have implications for their practice in the classroom.

Based on tentative findings from the UK study of trainee teachers, it was hypothesized that teachers who agreed that subgroups of teachers as defined by their response to the two questions regarding biological limit to achievement (agree/disagree) would significantly differ in the percentage of educational outcome they would attribute to genetics. We were concerned with this relationship, since it sheds light on how ideas about biology may influence teachers' attitudes in the classroom in terms of how much they expect to achieve from their students. The two hypotheses related to these questions were directional, i.e. we expected to see greater attribution to genetics would be associated with stronger beliefs in the biological limit of students.

## **Method**

### *Participants*

Participants were 217 teachers employed in Athens and the Peloponnese region of Greece (155 females and 62 males) included 102 primary school teachers (47%) and 109 secondary school teachers (50%) and 6 teachers who worked in both types of school. The mean level of teaching experience within the sample was 15.1 (SD 9.3) years with a range 1-33 years.

### *Procedure*

The translation and suitability of the survey was first validated through preliminary interviews with three teachers and piloting with five teachers not included in the final survey sample. A total of 15 schools were recruited to take part in the study by phone and email, and the head teachers of participating schools circulated electronic or print copies of the survey to their teachers asking them to be completed and returned to the researchers. The research was presented as a study of how teachers think about the brain and its influence on learning.

### *Instruments*

Participants were asked to complete a survey used in a previous study of UK trainee teachers (Howard-Jones et al., 2009). This consisted of 40 assertions (15 correct and 16 incorrect factual assertions, and 9 open to subjective opinion) to which participants were asked to respond agree, don't know or disagree and is provided in Appendix A. Of these 40 assertions in our survey, 38 statements were originally created by combining assertions used in a study of public neuroscience literacy Herculano-Houzel (2002) with ideas that have arisen in interviews with educators (see Howard-Jones et al., 2009 for further details concerning the underlying rationale for including these statements). The survey included the two additional statements of subjective opinion ("There is a biological limit to what some individuals can achieve in their education", "There is no biological limit to what any individual can achieve in their education") that Howard-Jones et al. (2009) used in a follow-up survey to explore ideas around genetic determination. Related to this issue, respondents were asked what percentage of educational outcome they attributed to a student's genes, their educational environment and their home environment. Participants also provided background information for the purpose of characterizing the sample (type of school, years of experience, gender, age, etc.)

## Results

The summary of responses of our sample of teachers to our 9 statements of subjective opinion is shown in Table 1. Summaries of responses to assertions related to general knowledge and educational issues regarding the brain are shown in Tables 2 and 3.

Table 1. Beliefs of our sample of Greek teachers regarding 9 statements that might be regarded as open to subjective opinion, including the mind-brain relationship, the impact of developmental difference on moral responsibility and belief in a biological limit to achievement.

	Response as percentage % of sample			
	Agree	Don't know	Disagree	No response
The mind is the result of the action of the spirit, or of the soul, on the brain	72	16	11	1
State of mind is a reflection of the brain state in a given moment	41	51	7	1
If there are ways to study brain activity, the mind can be studied through them	58	35	6	1
The mind is a product of the working of the brain	56	27	15	2
Without a brain, consciousness is not possible	71	18	11	0
Intuition is a "special sense" that can't be explained by the brain	46	24	28	2
Individuals are not responsible for behavior associated with a developmental difference in brain function	44	36	19	1
There is a biological limit to what some individuals can achieve in their education	13	22	63	2
There is no biological limit to what any individual can achieve in their education	19	20	55	6

Table 2. Responses of our sample of Greek teachers to general assertions regarding the brain (C = correct statement, I = incorrect statement). It should be noted that some scientific evidence supporting one statement (marked C\*) has recently been found, raising questions about the correctness, or otherwise, of this statement.

	Response as percentage % of sample			
	Agree	Don't know	Disagree	No response

Brain activity depends entirely on the external environment: with no senses stimulated, we don't see, hear or feel anything (I)	25	11	61	3
Emotional brain processes interrupt those brain processes involved with reasoning (I)	44	36	19	1
Cognitive abilities are inherited and cannot be modified by the environment or by life experience (I)	4	2	94	0
Learning is not due to the addition of new cells to the brain (C*)	31	49	20	0
One's environment can influence hormone production and, in turn, personality (C)	79	18	2	1
We use our brains 24 hours a day (C)	76	12	12	0
To learn how to do something, it is necessary to pay attention to it (C).	76	3	20	1
Learning occurs through modification of the brain's neural connections (C)	59	38	3	0
Performance in activities such as playing the piano improves as a function of hours spent practicing (C)	90	3	7	0
It is with the brain, and not the heart, that we experience happiness, anger, and fear (C)	70	9	20	1
Hormones influence the body's internal state, and not their personality (I)	25	17	57	1
Memory is stored in the brain much like as in a computer. That is, each memory goes into a tiny piece of the brain (I)	59	29	11	1
We mostly only use 10% of our brain (I)	45	44	11	0
Memory is stored in networks of cells distributed throughout the brain (C)	51	44	5	0
Keeping a phone number in memory until dialing, recalling recent events & distant experiences, all use the same memory system (I)	12	47	41	0
When we sleep, the brain shuts down (I)	5	6	89	0

Table 3. Responses of our sample of Greek teachers to assertions regarding the brain that are related to educational practice (C = correct statement, I = incorrect statement).

	Response as percentage of sample			
	Agree	Don't Know	Disagree	No response
Children are less attentive after sugary drinks and snacks (I)	48	29	22	1
Omega 3 supplements do not enhance the mental capacity of children in the general population (C)	11	38	50	1

Extended rehearsal of some mental processes can change the shape and structure of some parts of the brain (C)	52	40	7	1
Environments that are rich in stimulus improve the brains of preschool children (I)	97	0	2	1
Individuals learn better when they receive information in their preferred learning style (e.g. visual, auditory, kinesthetic) (I)	97	3	0	0
Short bouts of co-ordination exercises can improve integration of left and right hemispheric brain function (I)	56	40	4	0
Regular drinking of caffeinated soft drinks reduces alertness (C)	39	25	36	0
Differences in hemispheric dominance (left brain, right brain) can help explain individual differences amongst learners (I)	71	24	5	0
Learning problems associated with developmental differences in brain function cannot be remediated by education (I)	29	13	57	1
There are no critical periods in childhood after which you can't learn some things, just sensitive periods when it's easier (C)	60	15	24	1
Vigorous exercise can improve mental function (C)	65	15	20	0
Individual learners show preferences for the mode in which they receive information (e.g. visual, auditory, kinesthetic) (C)	97	2	1	0
Drinking less than 6-8 glasses of water a day can cause the brain to shrink (I)	12	65	23	0
Exercises that rehearse co-ordination of motor-perception skills can improve literacy skills (I)	72	21	6	1
Production of new connections in the brain can continue into old age (C)	55	31	13	1

The mean percentage of educational outcome that participants attributed to genetics, home environment and school environment were 27 (SD= 13.2), 33 (SD=14.4) and 36 (SD=13.6) respectively. The mean percentage of educational outcome attributed to genetics that participants who agreed (N=131) and disagreed (N=29) with the statement “There is a biological limit to what some individuals can achieve in their education” was 29% (SD 12%) and 23% (SD 12%) respectively. An independent samples one-tailed t-test revealed this difference to be significant ( $t(158)=2.26$ ,  $p=0.012$ ). The mean percentage of educational outcome attributed to genetics that participants who agreed (N=41) and disagreed (N=161) with the statement “There is no biological limit to what any individual can achieve in their education” was 25% (SD 11%) and 29% (SD 13%) respectively. An independent samples one-tailed t-test revealed this difference to be significant ( $t(158)=1.79$ ,  $p=0.038$ ).

## Discussion

The research revealed that Greek participants held many neuromyths and misconceptions about the brain that have been recorded elsewhere in Europe. These include almost three-quarters (71%) of teachers believing that differences in hemispheric dominance (left brain, right brain) can help explain individual differences amongst learners, and the great majority (97%) believing in the effectiveness of teaching to learning styles.

However, as expected, most Greek teachers possessed a complex construction of the mind-brain relationship that included a more “mysterious” approach than recorded in the UK study of trainee teachers. High levels of religiosity characterize a large proportion of the Greek people (Hirschon, 2009) and the majority of this population are Christian

Orthodox. According to the Greek Orthodoxy ‘the man’s soul is in the image of God, the soul gives life to the attached body, the soul is all through the body, both the whole man and the body itself can be regarded as in the image of God’ (Hierotheos, 2006:118). The ontological aspect of the soul in Greek Orthodox tradition is considered a very important aspect of faith, and is very related to the concept of a human individual as a spiritual, biological and intellectual being reflecting the image of God. In addition, as described by Xrisostomos (1998:126), the soul is considered to be related to three interlinked cognitive abilities: the senses with which the external world can be perceived, and the biology and the spirituality of the mind. The perception of such an indissoluble relation of brain, mind, spirit and soul with God may explain some of the results we report here.

In summary, since many of the myths we report here are directly related to practice and to brain-based learning programmes with an unscientific basis, we conclude that the knowledge and practice of teachers in Greece would benefit from more accurate knowledge of the brain, as might be received from teacher training and in-service professional development. This may be an important first step for future efforts in Greece to enrich education with insights from neuroscience. Comparison of our results with international data sets suggests cultural factors influence teachers’ understanding of the brain, and better understanding of these factors would be a valuable target area for future research.

**The complete set of statements used in the questionnaire. Participants were asked to indicate their agreement with these statements as agree, don’t know or disagree.**

The mind is the result of the action of the spirit, or of the soul, on the brain  
 “State of mind” is a reflection of the brain state in a given moment  
 If there are ways to study brain activity, the mind can be studied through them  
 The mind is a product of the working of the brain  
 Without a brain, consciousness is not possible  
 Intuition is a “special sense” that cannot be explained by the brain  
 Individuals are not responsible for behavior associated with a developmental difference in brain function  
 There is a biological limit to what some individuals can achieve in their education  
 There is no biological limit to what any individual can achieve in their education  
 Brain activity depends entirely on the external environment: with no senses stimulated, we don’t see, hear or feel anything (I)  
 Emotional brain processes interrupt those brain processes involved with reasoning (I)  
 Cognitive abilities are inherited and cannot be modified by the environment or by life experience (I)  
 Learning is not due to the addition of new cells to the brain (C\*)  
 One’s environment can influence hormone production and, in turn, personality (C)  
 We use our brains 24 hours a day (C)  
 To learn how to do something, it is necessary to pay attention to it (C).  
 Learning occurs through modification of the brain’s neural connections (C)  
 Performance in activities such as playing the piano improves as a function of hours spent practicing (C)  
 It is with the brain, and not the heart, that we experience happiness, anger, and fear (C)  
 Hormones influence the body’s internal state, and not their personality (I)  
 Memory is stored in the brain much like as in a computer. That is, each memory goes into a tiny piece of the brain (I)  
 We mostly only use 10% of our brains (I)  
 Memory is stored in networks of cells distributed throughout the brain (C)  
 Keeping a phone number in memory until dialing, recalling recent events & distant experiences, all use the same memory system (I)  
 When we sleep, the brain shuts down (I)  
 Children are less attentive after sugary drinks and snacks (I)  
 Omega 3 supplements do not enhance children’s mental capacity in the general population (C)  
 Extended rehearsal of some mental processes can change the shape and structure of some parts of the brain (C)  
 Environments that are rich in stimulus improve the brains of preschool children (I)  
 Individuals learn better when they receive information in their preferred learning style (e.g. visual, auditory, kinesthetic) (I)  
 Short bouts of co-ordination exercises can improve integration of left and right hemispheric brain function (I)  
 Regular drinking of caffeinated soft drinks reduces alertness (C)  
 Differences in hemispheric dominance (left brain, right brain) can help explain individual differences amongst learners (I)  
 Learning problems associated with developmental differences in brain function cannot be remediated by education (I)  
 There are no critical periods in childhood after which you can’t learn some things, just sensitive periods when it’s easier (C)  
 Vigorous exercise can improve mental function (C)

Individual learners show preferences for the mode in which they receive information (e.g. visual, auditory, kinesthetic) (C)  
 Drinking less than 6-8 glasses of water a day can cause the brain to shrink (I)  
 Exercises that rehearse co-ordination of motor-perception skills can improve literacy skills (I)  
 Production of new connections in the brain can continue into old age (C)

## Abstract

This research was conducted in Spain. We used the ethnographic method and have interviewed more than 20 teachers. We wanted to know the opinion of teachers on the participation of immigrant associations in schools. The teachers say that these associations can participate in the school curriculum through parent associations, tutoring and guidance, department, transversal axes and curricular documents. They can also participate with the actors of the educational community (teachers, students and immigrants natives and immigrants and native families). For example with immigrant children, immigrant associations can design activities mediation between immigrant students and teachers, school guidance and school integration.

## 1. The Socio-cultural perspective of Education

Education should be understood as a collective project, within a reflexive and intentional social framework aiming at a better future for the different ethnic and cultural groups that form society. Therefore, it is urgent to broaden the concept of education currently held and to seek solutions to satisfy the educational needs of the population from different ethnic groups and cultures (Banks, 1988 and Soriano-Ayala, 2005). It has to be said that a certain resistance to change is perceived in the educational system. It has undergone reforms that have avoided social theories of great relevance, such as the Habermas' dialogical focus, to a certain extent. What is really necessary within the present context of an information society, marked by globalization and new migrating movements, is for learning to become an intrinsically social process and we agree with Vila's (2004) opinion who states that for learning to take place in schools, they should carry out their work in continuity with other educational agents. Not only that, it should be the school that plays a backbone role to become the centre of such educational agents as the family, the media, the neighbourhood, the district, associations, places for leisure, etc.

We must reflect on the impossibility of maintaining an individual school where only the teachers who favour learning and the students who learn with a mono-cultural focus exist. An educational egalitarian response must be given to the current changes occurring in society (Moom, 2011 and Mo and Lin, 2013). Schools in a plural society must open their gates to the members of the community, thus, not only is the participation of families important and necessary in this multicultural society, but also the participation of immigrants' associations in the schools of Southern Spain to achieve the school integration of children with different cultural referents.

It is, therefore, desirable that schools should become actual learning communities in multicultural contexts where a genuine correlation is established between what happens in the classroom, at home, in the neighbourhood and the

information acquired through the Internet and mass communication media (Gay, 2010). Schools should cease to be monolithic and anchored in the past and start to be coherent with the reality it exists in.

## 2. Methodology

This qualitative research is based on the ethnographic method. Ethnography is a method of study in which a researcher lives with the subjects being studied and participates as a member of that group. Researchers use ethnographic techniques of observation and qualitative analysis to study distinctive social, cultural and ethnic groups, but these techniques also are applicable in studies of schools, various types of organizations and urban and rural communities. With these techniques, researchers produce descriptive, richly detailed studies. This investigation, we need to know the opinion of teachers about new forms of collaboration in schools. Exactly how could participate immigrant associations in schools. This research was carried out in Spain. We have interviewed over 20 teachers. The selection was made through an intentional sampling according to the following criteria:

- One head teacher and one teacher from each Secondary School and Infant and Primary School located in geographical areas with the highest immigration rate in Southern Spain. There had to be at least one immigrants' association in the neighbourhood.

The drafted interviews were categorized and codified to be computerized at a later stage using the programme AQUAD version 5.7. The final category template drawn inductively from the interviews is as follows:

Table 2. System of categories of the participation proposals of the Immigrant Associations in education centers.

	Teachers	<ul style="list-style-type: none"> <li>- Availability of cultural resources</li> <li>- Education of the other cultures</li> <li>- Mediation with immigrant parents</li> </ul>

## 3. Results

The most frequent obstacles presented by the teaching collective are the lack of time to search for materials and resources from the culture of the immigrant students, the lack of knowledge of the cultures coexisting in the classroom, the lack of participation and connection of immigrant parents with teachers and the lack of information regarding the personal circumstances (economic, social, family) of the immigrant pupil. In the words of a teacher:

*"Teachers often do not know the other cultures and do not have the time to search for materials. It is also difficult because teachers are not familiar with the customs and culture of their pupils, which hinders their awareness. For example, I remember how in the beginning the feast of the lamb and the fact that some children would miss school during this feast came as a surprise to us, some types of behaviour seemed strange to us. Today it seems like a normal event".*

### 3.1 Proposals for the participation of immigrants' associations in schools according to the teachers interviewed.

The present proposals or ways of participating have been organized according to a potential participation in the curriculum and with members of the educational community.

#### *Areas of participation within the curriculum*

There are no unanimous opinions on the curriculum areas in which immigrants' associations could participate. Some proposals with regard to participation through the curriculum are as follows:

- Parents' associations. They point out that immigrants' associations could participate in these associations through the proposal of various intercultural activities or start their own immigrant parents association, which from our point of view would encourage segregation amongst the parents.
- Tutoring and Guidance Department. The teachers we interviewed indicated to us that the participation of immigrants' associations would be an invaluable instrument to propose intercultural activities to the tutors and to the Guidance Department.
- Transversal Axes. Teachers suggest that immigrants' associations could collaborate in transversal axes, specifically in Education for Peace and Friendly Coexistence designing and developing activities.
- Curricular Documents. Another possibility for the participation of these associations would be, according to the teachers, in the design of friendly coexistence commissions, within the Centre Educational Projects and Guidance Projects and in Tutorial Action.

#### *Participation with the agents of the education community*

##### *Immigrant students*

Teachers agree on a series of proposals for the participation of associations with immigrant students. These intervention proposals have been grouped in four areas:

- School guidance. They suggest that associations should collaborate in reception activities as immigrant students arrive at the beginning of term in order to explain to them how the school works.
- Mediation between immigrant students and teachers. The teachers propose that immigrants' associations should work as mediators with regard to the variety of obstacles teachers encounter in teaching immigrant students.
- School integration. Teachers suggest that immigrants' associations design activities to encourage the integration of boys and girls from immigrant families, such as:

1. Spanish language courses. One teacher specifies the following guidelines that are relevant to learning Spanish:

*"Many children cannot speak Spanish when they arrive and the associations should try to help us to teach them. The sooner the child learns Spanish, the sooner he/she will be able to integrate in society and in the school. An example would be revision lessons, Spanish lessons... Immigrants who are not enrolled in the school could come here to teach Spanish."*

2. Activities to encourage self-esteem and a change in the attitude of immigrant pupils. This type of activities caught our attention due to its aims. Teachers support the idea that the activities organised and implemented by the associations would increase the self-esteem of the students and change their attitudes because they would feel that their collective is valued and can make relevant contributions to the school, that is, they would not view themselves as an ethnic minority subjected to the rulings of the autochthonous collective. The relevance of self-esteem and a change in the attitude of immigrant students is explained by a teacher along these lines:

*"It is important for students to see that their culture is valued, for example, the association could come to the school and carry out some activities on their culture, then the immigrant student would see that his/her culture is valued because the local students ask about, participate and are interested in it. In fact, if we make this sector the protagonist, the predominance of the Spanish culture takes second place. It is a referent because*

*immigrant students will realize that they are people who come to school not only to receive but also to give. Thus, they will not regard themselves as intruders who come here to take, who know nothing and just obey rules, they will see themselves as people who can make a contribution”*

3. Friendly coexistence activities among the various immigrant collectives and the local students. Thus, is this type of participation based on friendly coexistence described by two teachers:

*“The greater the participation of associations in schools, the higher the level of integration of immigrant students will be. Contact between “different” people is very important, it changes our stereotypes and behaviours, it also teaches us to speak well of immigrants to other people in our group.*

*...the participation of associations will encourage a change in the attitudes of local children to immigrants. I think that knowledge and an approach to alien cultures is a powerful tool to change attitudes. Moreover, immigrant students would also change their attitudes to Spaniards because they would see that their culture is appreciated by teachers and classmates.”*

4. Remedial education activities. The associations should organize remedial tuition for students with remarkable learning gaps.

#### Autochthonous students

Teachers agree on the idea that immigrants’ associations must organize activities aimed at local students so that they come to accept immigrants as ordinary citizens, learn about their culture and customs. A friendly coexistence is encouraged as well as the knowledge of each others’ cultures and a change in attitudes and prejudices can be brought about in both parties for a better relationship between them... Two teachers manifest this participation proposal in the following words:

*“Of course they need to participate in schools so that the local students will look upon immigrants as ordinary people and not as aliens. An immigrant may have lived in Spain for 15 years and still be regarded as an alien; I think this is a problem that exists in the Spanish society. Associations have to collaborate so that autochthonous students can regard immigrants as people like themselves with the same feelings and not just as immigrants, that is, they should be regarded as individuals and not as immigrants...”*

*“Associations can participate in schools and this will make Spanish students understand their culture and respect it. This will help immigrant students to integrate to the extent in which local students understand them and regard them as closer to them. What is always repeated is that when alien students have just arrived they are all rejected and when local students get to know them, they begin to accept them. Rejection generally means lack of familiarity”*

Some of the proposals of the teachers to be put into practice by the associations with regard to local students are as follows: 1) Oral expositions by the managers of some associations to explain their life stories as immigrants, i.e., why they emigrated, the economic, the social and work characteristics in their countries, their first years in Spain... Teachers defend the idea that this type of activity in which an immigrant narrates the circumstances of his/her emigrating process helps to bring about a change in the attitude and prejudices of local students with regard to immigrants. 2) Activities which encourage integration and friendly coexistence amongst students from various cultural groups, local ones included. 3) Activities that explain and disseminate the main features of their culture.

#### The Families of Immigrant Students

According to the teachers, the participation they offer the associations with regard to immigrant families focuses on two fundamental aspects:

1. A change in the attitude of the families to the Education System. Some of the tasks established by the collective to achieve this objective are the following:

- To explain to parents how important it is for their children to finish their mandatory studies, and in their case, to continue studying.
- To inform parents of those aspects related to the education that their children are receiving.
- To teach parents to instil in their children study habits and responsibility for their learning.
- To explain to the families aspects related to the culture of the host country.
- To advise parents on the importance of their attendance to tutorials to inform the teachers of the problems affecting their children and to obtain information on their progress at school.

2. A bridge linking the schools and the families of immigrant children.

Teachers stress that a change in the attitude of immigrant families for them to take an interest in their children's education should be accompanied by an increase in their participation in the schools. Some of the proposals for this purpose are listed below:

- Parents can participate in the schools giving talks to local students on aspects related to their countries.
- Families can acquaint local children with their mother tongue.

#### Autochthonous Students' families

The intervention proposals devised by the teachers to be put into practice by the associations have been grouped under two aspects:

- A change in attitudes. Teachers point out that immigrants' associations should carry out awareness raising activities to eradicate the attitudes and prejudices that local families have to the presence of immigrant pupils in schools.
- Encouraging friendly coexistence and bringing local and immigrant families closer. Some of the activities they propose should be carried out by immigrants' associations to aid friendly coexistence and a closer relationship between immigrant families and local ones. In the words of one of the teachers interviewed:

*"It would be desirable to build a link between the parents. It is important that they should know and respect their different cultures. I believe this is the most relevant problem. The different customs, religions, views on life should become familiar to the locals and then they will be able to embrace what is good about them and reject those aspects that are negative"*

#### The teaching collective

Teachers appreciate that immigrants' associations can do much to support their teaching. The proposals for different areas are exposed below:

- Providers of intercultural resources. Teachers suggest that the associations should be in charge of providing typical materials from the pupils' countries. In the words of a teacher:

*"The associations could bring literature from their countries for the teachers to use, also writers and things they make. If we have Moroccan pupils, we could work with Moroccan associations so that they can bring in items. Romania has this periodical I have told you about and in the latest one they enclosed a book by Romanian poets in Spain that we can use"*

- Teaching the different cultures. This collective also supports the idea that associations should teach the main aspects of the culture of immigrant students. One teacher explains the cultural benefits that can be reaped from the participation of associations:

*“We would be interested in the participation of associations to learn about the culture of immigrant pupils. In teaching we have to start from the knowledge and experiences of the children so that their education can advance in a positive way, therefore we are interested in learning about their culture”*

- Mediators between teachers and immigrant parents. A fundamental aspect that all teachers stressed throughout the interviews is the urgent necessity for the associations to develop functions to encourage a closer link between immigrant parents and school life.
- Advice about the characteristics of immigrant students. In this aspect, they point out that once immigrants' associations have developed a closer link with the families of immigrant pupils, it should be them who inform the teachers of the circumstances surrounding the children.

#### **4. Discussion**

The results of this investigation show that to maximize an inclusive school that encourages interculturalism and integration between immigrant and local children and young people, it is necessary to open the schools to allow in and involve new educational agents: immigrants' associations which will contribute to the present academically monocultural schools the entry of other cultures, and their curricular involvement in a scenario that welcomes culturally diverse pupils (Picower, 2011 and Mo and Lin, 2013).

Teachers express their reasons and coincide with immigrants' association in pointing out that the latter must attend to local and immigrant families. To local families because they appreciate that these families present negative attitudes to their children sharing a school with immigrant boys and girls, and to immigrant families because they lack motivation towards and interest in the education of their children.

Teachers, who so far in the Spanish context, have not worked with or approached immigrants' associations to request their participation in schools, perceive how this participation should be (Soriano-Ayala, González-Jiménez y Cabellero Cala, 2014). They understand that associations could make relevant contributions to the curriculum, proposing and jointly designing curricular documents, intervening in specific education contexts for a peaceful coexistence and in tutorial activities Teachers state, as immigrants have done, that associations can intervene with immigrant students in welcoming activities, as mediators between them and the teachers, helping them to integrate in the school, increasing their self-esteem and improving their self-concept, reinforcing their learning and facilitating friendly coexistence. Teachers and immigrants believe, moreover, that they can work with local students towards a change in their attitude. This also applies to their families. With immigrant families, they would play a significant role showing them the relevance of the school and their children's education.

#### **5. Conclusions**

We understand that education is above all a collective project, a collaboration between all those involved in the life of a child or a young person: teachers, families, cultural centres, cultural associations, and according to our investigation, immigrants' associations in the local area. Education is an eminently social process and we agree with Vila (2004) when he says that for this process to be complete there should be continuity, communication and action between educational agents and schools so that the whole responsibility should not fall entirely on schools and one of these agents within a multicultural context are immigrants' associations. On the other hand, coinciding with Flecha and Puigvert (2008), we appreciate that existing resources should be utilized and an open attitude to negotiation and collaboration with others is fundamental in the classroom. The collaboration of immigrants' association in the classroom and in the school would aid dialogical learning which would transform the school and its environment. It would be ideal to establish learning communities with the collaboration of immigrants' associations in these multicultural education environments, to fight situations of inequality that can affect children and young people facing the risk of being excluded (Sleeter, 2013, 2014).

## Abstract

The aim of this study is to determine the opinions of school counselors about the Counseling and Guidance Program implemented at vocational high schools in Turkey. The sample group of the study consists of eight school counselors working in five vocational high schools in Kırşehir, Turkey. They were chosen by "Simple Random Sampling" method. The data is collected by a semi structured interview form prepared by researchers. Qualitative research method is used in the study and the data obtained is analyzed through content analysis method. As a result, opinions of school counselors about the positive and negative sides of counseling and guidance program implemented at vocational high schools are revealed and school counselors give suggestions for negative sides of the program. Also school counselors' opinions about a counseling and guidance program specific to vocational high schools are presented.

## Introduction

As the needs and developmental features of preschool education, elementary education, secondary education and university students differ from each other, the counseling and guidance services offered vary accordingly (Yüksel-Şahin, 2012). Considering adolescence, it is a tumultuous stage in human development. As teenagers enter high school, they face the emotional changes that come with the challenges and pressures of approaching adulthood (DaGiau, 1997). High school years are full of growth, promise, excitement, frustration, disappointment and hope. It is the time when students begin to discover what the future holds for them (ASCA, 2013). Therefore, the students' academic, vocational, emotional, social and personal development and harmony should be attended to considering their age and developmental tasks (Ersever, 1992).

As students begin separating from parents and exploring and defining their independence, high school is the final transition into adulthood and the world of work. Students are deciding who they are, what they do well, and what they will do when they graduate (ASCA, 2013). In Turkey, secondary education lasts for four years and it is composed of general and vocational and technical high schools. Vocational high schools offer a program to students aiming to prepare them for future life, business spaces and higher education (Alkan, Doğan & Sezgin, 1994). According to the Ministry of Education Statistics in 2011-2012, as vocational and technical, there are totally 5501 high schools and 2.090.220 students attend to these schools (MEB, 2012). These schools need counseling and guidance at most because they are outnumbering and different from the other schools in terms of their structural properties. Their program consists of both general and vocational lessons. In contrast with general high schools, they have to attend to all general lessons as

---

\* Corresponding author. Tel.: +90-544-761-1407.

E-mail address: hayriyeturunoglu@gmail.com

well as vocational lessons. Like the other general high schools, counseling and guidance has a crucial need in vocational high schools.

This study is carried out with school counselors because in high schools counseling and guidance programs coordinators are school counselors. School counselors are individuals with undergraduate or graduate degrees in psychological counseling and guidance (PCG) (Ergene, 2011). They help all students in the areas of academic achievement, personal/social development and career development, ensuring today's students become the productive, well-adjusted adults of tomorrow. Secondary school counselors are professional educators with a mental health perspective who understand and respond to the challenges presented by today's diverse student population. They do not work in isolation; rather they are integral to the total educational program (ASCA, 2013). In collaboration with principals, teachers, other school professionals and parents, school counselors share the challenge of preparing students to meet the expectations of higher academic standards and become productive and contributing members of society (Dahir and Stone, 2012). Secondary school counselors enhance the learning process and promote academic achievement.

The study aims for school counselors to assess the counseling and guidance programs they offer at their schools in every respect. It also focuses on the suggestions of counselors about the drawbacks. It is considered important to determine the opinions of implementers about the program of vocational high schools. By this way, it is thought that the difficulties which implementers face can be found out and enhancing the effectiveness of studies can make a contribution to this subject. The results of the study will be guiding for the implementers and preparers of the program and this study will shed light on literature.

The following questions were investigated on the basis of these purposes:

1. What are the positive features of the program you offer at your school?
2. What are the negative features of the program you offer at your school?
3. If you have stated any negative features, what are your suggestions for them?
4. How do you find the program in terms of vocational, personal and educational domains of counseling and guidance?
5. If you have an opportunity of developing a program specific to vocational high schools, how would it be?

## Method

Qualitative research method is used in this study which aims to evaluate guidance program applied at vocational high schools through evaluations of school counselors working at these schools. Qualitative research method is an approach that allows you to examine people's experiences in detail, by using a set of research methods, such as in depth interviews, focus group discussions, observation, content analysis, visual methods, life histories and biographies (Hennink & Bailey, 2010). In this sense, in this study, it is aimed to determine whether the guidance program applied at vocational high schools is appropriate for the structure of vocational high schools or not. Within this scope, the study is conducted through taking the opinions of school counselors.

### *Sample Group*

The sample group of this research consists of eight school counselors working at vocational high schools in Kırşehir during 2013-2014 academic year. They are voluntary for the interviews and chosen by purposeful sampling method. When the school counselors' period of services is in question; four counselors have 5-10 years of job experience; three counselors have between 10-20 years of job experience and one counselor has a job experience more than 20 years. When the counselors period of services at vocational high school is considered; three school counselors have 1-5 year of experience; four counselors have 5-10 years of experience; one counselor has more than 15 years of experience at vocational high school. One of the counselors is female and seven of them are males.

### *Data Collection Instrument*

A semi-structured interview form is developed by researchers. There are five open-ended questions regarding counseling program applied at vocational high schools in this form. In the process of the preparation of the interview form, questions based on literature are written at first by researchers. These questions are submitted to five academicians from Educational Sciences for their opinions in terms of content validity and appropriateness. Questions are reorganized and put into their final form within the bounds of academicians' feedbacks. Before application, interview form is applied to 3 school counselors and one academician from Department of Turkish Language in order to test comprehensibility and application time of questions. As there are no difficulties faced during the pilot study, the questionnaire is used in its final version in the study.

### *Procedure*

Interview form is prepared and then necessary permissions for application of form are taken from Directorate of National Education in Kırşehir. After permission is received, researchers interviewed with the volunteer school counselors and these interviews with each person took nearly one hour. During interviews school counselors are not voluntary for voice recording so their answers are noted down. Data obtained from interviews are computerized and made ready for analysis.

### *Data Analysis*

In this research content analysis method, which is a type of qualitative research, is used. Content analysis has the aim of getting rid of subjective factors during understanding and evaluating a discourse. The powerful side of this method is to reveal latent and covered content of discourse, rather than what is expressed, captured easily at first glance and exhibited and easily detected content. In this context, the message, it is a "second reading" to determine the factors that affect the individual invisibly. The common side of content analysis techniques is that they are based on the principle of deduction-inference. In all, there is a purpose of making an interpretation with observed and described items in messages. There are generally two different approaches in the process of implementation of the categorization of content analysis. The first approach, which has a specific area of a category system, taking into frames accordingly resorts to grouping. However, in the second approach categories are not determined before. Categories are determined

after discussing and reviewing message items. The first of these approaches is called "close approach" while the second one is called "open approach" (Henry & Moscovici, 1968; Bilgin, 2006). Open approach is used for categorization in this study. The features observed in answers of counselors given to questions of the questionnaire are recorded one by one and by determining their differences and similarities to the other items, the categories are created. Then, criteria are put into final form. Samples about criteria given by participants are used as they stated, no changes are made on them.

## Results

The results of the study are presented in five main categories in line with the research questions.

Table 1. School counselors' opinions about positive sides of counseling and guidance program applied at vocational high schools.

Number	Criterion	Frequency	Percentage (%)
1	Functional guidance activities	5	62,5
2	Program's compatibility with students' development level	3	37,5
3	Sufficiency in three guidance domains	2	25
4	Flexibility of the program	1	12,5
5	Sufficiency for intervention of problems	1	12,5

Opinions of school counselors relating to the positive sides of guidance program are given in table 1. When the school counselors' opinions are analyzed, it is seen that 62,5% of participants stated activities in their programs as functional. When answers relating second criterion are considered, 37,5% of participants stated program is compatible with students' development levels. When the third criterion is evaluated, 25% of school counselors stated programs is sufficient for guidance domains. Flexibility of the program is stated by 12,5% of participants. Also, program's sufficiency for intervention of problems as last criterion in the table is stated by 12,5% of participants again.

Table 2. School counselors' opinions about the negative sides of counseling and guidance program.

Number	Criterion	Frequency	Percentage (%)
1	Inappropriateness of guidance activities for structure of school	4	50
2	Insufficiency of time for implementation	3	37,5
3	Not including personal and vocational guidance enough	2	25
4	Inappropriateness for students' level of development	2	25
5	Difficulty in implementing guidance activities in classrooms	1	12,5
6	No inspection concerning the implementation of the program	1	12,5

Opinions of school counselors relating the drawbacks of their program applied at vocational high school take part in the table 2. When the table is analyzed, it is seen that Inappropriateness of guidance activities for structure of school the first criterion is specified by 50% of school counselors. Second criterion Insufficiency of time for implementation is remarked by 37,5% of school counselors. Both not including personal and vocational guidance enough and inappropriateness for students' level of development are considered by 25% of school counselors as

negative side of program. The next criterion difficulty in implementing guidance activities in classrooms is specified by 12,5% participants. Last criterion in the table no inspection concerning the implementation of the program is remarked by 12, 5 % of school counselors.

Table 3. School counselors' suggestions for negative sides of counseling and guidance program.

of school for of their take part 3.	Number	Criterion	Frequency	Percentage (%)	Suggestions counselors drawbacks program in the table
	1	Implementers having full knowledge of program	2	25	
	2	Increasing programs' application time	3	37,5	
	3	Increasing number of school counselors	1	12,5	
	4	Development of a program peculiar to vocational high schools	3	37,5	
	5	Giving further coverage to vocational guidance	1	12,5	

Accordingly, when the table is analyzed, implementers' having full knowledge of program being placed on the first column is seen. This criterion is specified by 25 % of school counselors. Increasing programs' application hour second criterion is remarked by 37,5 % of school counselors. Another criterion increasing number of school counselors is indicated by 12,5 % school counselors. Development of a program peculiar to vocational high schools takes place on the forth column and statements regarding this criterion is indicated by 37,5 % of participants. Statements regarding last criterion giving further coverage to vocational guidance is remarked by 12,5 % of participants.

Table 4. Evaluation of program's adequacy in terms of personal, educational and vocational guidance.

Number	Criterion	Frequency	Percentage (%)
1	Program is inadequate in personal guidance	1	12,5
2	Program is adequate in personal guidance	2	25
3	Program is inadequate in vocational guidance	2	25
4	Program is adequate in educational guidance	2	25
5	Program is adequate in vocational guidance	1	12,5
6	Program is inadequate in educational guidance	1	12,5

School counselors' opinions about program's adequacy in personal, vocational and educational guidance take place in the table 4. Accordingly, it is seen that, program being inadequate in personal guidance is indicated by 12,5% of school counselors and proportion of participants thinking personal guidance as adequate is 25%. School counselors indicating vocational guidance as inadequate is 25%, whereas it is indicated as adequate by 12,5%. When we consider another criterion educational guidance, we see that 25% of school counselors remarked it as adequate, whereas, 12,5% of school counselors remarked it as inadequate.

Table 5: School counselors' opinions about program specific to vocational high schools.

Number	Criterion	Frequency	Percentage (%)
1	Increasing activities application time	1	12,5
2	Giving more place to guidance area	3	37,5
3	Programs offering students opportunity	3	37,5
4	Having a program special to vocational high schools	2	25
5	Providing students' active participation	3	37,5

School counselors are also asked for their suggestions about developing a counseling and guidance program specific to vocational high schools. Accordingly, 12, 5 % of school counselors are indicated necessity of increasing activities' application time. Another criterion giving wide coverage to guidance areas takes place and 37, 5 % of school counselors remarked this criterion. Also, programs' offering students opportunity is indicated by 37, 5% of school counselors. Forth criterion having a program special to vocational high schools is specified by 25 % of school counselors. Lastly, providing students' active participation is indicated by 37, 5 % of school counselors. Examples relating these criteria are as follows:

## Discussion and Suggestions

The study aims for school counselors to assess the counseling and guidance programs they offer at their schools in every respect. It also focuses on the suggestions of counselors about the drawbacks. On being analyzed with content analysis method, opinions of school counselors on counseling and guidance program is categorized in line with the research questions

As for the positive features of the program, within the scope of opinions of school counselors, it is found that the guidance program activities are functional (62,5 %), the program is compatible with students' development levels (37,5%), it is sufficient in educational, vocational and personal counseling and guidance domains (25%),, the program is flexible (12,5 %)and it is sufficient for intervention of problems (12,5%). The planning of guidance activities is based on the student-centered approach and it aims to make students active and individuals able to solve problems (MEB, 2011). Also the comprehensive guidance and counseling program reflects a strong developmental approach, systematically presenting activities appropriate to student developmental levels and including achievable and measurable outcomes in the area of personal, social, educational, and career domains (Gysbers&Henderson, 2000). So guidance activities should encourage students to improve themselves in all domains of guidance. These findings of the study are in common with other studies in literature. For instance Berber (2010) conducted her study on school counselors vocational schools and she stated in her study that the activities of the program is comprehensible and they make students active during lessons and the activities fit for the development levels of

students. Similarly, in other studies, activities are assessed to be functional in line with their purposes (Nazlı, 2008). To accomplish the purposes of counseling and guidance program, activities and procedures are necessary to assist students in understanding and periodically monitoring their growth and development. Students must come to terms with their goals, values, abilities, aptitudes, and interests (competencies) so they can continue to progress educationally and occupationally (Gysbers, 1990). Therefore, considering vocational high schools, activities should support students in vocational domain, as well as educational and personal domains. School counselors evaluated the program sufficient in three guidance domains. It is important to enhance the school guidance and counseling program by providing sequential, developmentally planned activities for all students to gain an understanding of their academic, social, cognitive, and emotional development; become knowledgeable about educational and occupational opportunities; and utilize this learning to craft their educational and career plans (Harewood-Jones&Foster, 1998). So these goals can be reached with effective guidance activities including three guidance domains.

When the drawbacks of the program according to the opinions of school counselors are investigated, they stated the guidance activities are inappropriate for the structure of vocational high schools (50%), there is a lack of time for implementation (37,5%), vocational and personal guidance domains are not included enough in the program (25%), the program is inappropriate for students' level of development (25%), guidance activities cannot be applied in classrooms (12, 5%) and there is not any inspection concerning the implementation of the program (12,5%). As vocational high schools train students for professional life, their needs of counseling and guidance may be different from other schools. Half of school counselors states that the guidance activities should be organized in accordance with students' fields and these guidance activities should be different from the activities of the other schools.

One of the main concerns expressed by counselors in the current study was the time required to adequately and effectively implement the program. This finding of the study supports the finding of Lehr (2002) as he states that with more time and resources, more students can be reached, and more guidance and counseling needs met. It should be allocated more time for counselors to implement the program and

Another drawback is that the guidance domains are not included in the program equally. Vocational guidance in secondary education includes services offered students to help them be aware of professions in the changing world and choose a profession in accordance with their abilities and interests and improve themselves in their profession (Yeşilyaprak, 2013; Bakırcıoğlu, 2005; Tan, 2013). By choosing vocational high schools, students also choose their profession. These schools present students the opportunity to choose their profession earlier than the other high schools and the students take mainly career training-oriented education. So their needs of vocational guidance domain are different from the needs of students in general high schools. Therefore, the program should include effective vocational guidance activities and strategies appropriate for vocational high schools.

School counselors find it difficult to carry out in classrooms this problem may derive from several reasons. One of them expresses that some activities are not proper to conduct in classroom environment. Terzi, Tekinalp and Leuwerke (2011) suggest that crowded classrooms make it difficult to conduct guidance activities. Also Nazlı (2003) states that crowded classrooms, having no suitable rooms for guidance activities and lack of necessary materials hinder the implementation of the program. It should be searched for solutions to these problems within the resources of this country.

As classroom guidance activities are implemented by classroom guidance teachers in collaboration with school counselors (MEB, 2001), counselors want an inspection mechanism to control this process. According to the findings of studies in literature on this subject (Nazlı 2003; Terzi, Tekinalp & Leuwerke, 2011) the school counselors stated that teachers neglect performing classroom guidance activities and they do not take proper care and interest in guidance activities and lack the necessary skills to perform guidance practices. So classroom guidance teachers should attend to in service trainings to gain some skills and knowledge about counseling and guidance.

In this study as well as negative sides of guidance program, it is received the suggestions of school counselor to drawbacks of the program they stated. They suggested that as implementers, classroom guidance teachers should have full knowledge about the program (25%), there should be sufficient time for implementation (37,5 %), there should be more school counselors in schools (12,5 %), a program specific to vocational high schools should be developed (37,5 %), vocational guidance domain should be included more in the program (12,5 %). As stated above, insufficient time and teachers' lack of information about counseling and guidance activities are problems school counselors meet during the implementation of the program. They also express the number of counselors at schools is

not adequate and this hinders the implementation of the program. Yüksel-Şahin (2012) reveals in her study that the number of school counselors should be sufficient and school counselors should not be employed at schools where they are not permanently staffed. An important reason behind the inadequate level of PCG services offered is the insufficient number of school psychological counselors. This study also aims to determine whether there is a need for a program specific to vocational high schools in terms of opinions of school counselors. In this context, school counselors stated that vocational high schools need a program for specific to their structures and the needs of students attend to them. Preparers of the counseling and guidance programs should take this suggestion into consideration and they should investigate this subject in detail.

School counselors are asked for evaluating the guidance program's adequacy in terms of personal, educational and vocational guidance domains. When the percentages are examined, it can be said that the guidance program is generally sufficient in personal and educational guidance domains but it is not sufficient in vocational guidance domain as stated before. So there is a lack of vocational guidance activities and practices specific to vocational high schools. This problem may be resolved by Guidance Research Centers, they may encourage counselors working in vocational high schools to prepare some activities for students' vocational development.

School counselors also give some suggestions on a guidance program specific to vocational high schools. They said that if they prepare a new program for vocational high schools, they would increase the period of application of activities. They also give more space for personal, educational and vocational guidance fields. The new program would also give more opportunities to students to improve themselves. For this reason, there may be activities that will open up students' horizons.

In conclusion, school counselors who are the implementers of guidance programs of vocational high schools find the program powerful in terms of the guidance program activities, the program's compatibility with students' development levels, educational, vocational and personal counseling and guidance domains, flexibility of the program and its sufficiency for intervention of problems. On the other hand, they find the guidance program weak in terms of inappropriateness of guidance activities for the structure of vocational high schools, insufficiency of time for implementation, not including vocational and personal guidance domains enough, inappropriateness for students' level of development, difficulty in implementing guidance activities in classrooms and no inspection concerning the implementation of the program. One of the important opinions of school counselors on this subject is that vocational high schools have hallmarks in education system of Turkey. For this reason vocational high schools need a program prioritizing their distinctive features. By means of this study, for the first time in Turkey, counseling and guidance program implemented in vocational high schools is investigated so, the findings of the study can be useful for school counselors working at vocational high schools, officials preparing education programs and also in organization of education policies and training of school counselors. Furthermore, different studies can be conducted for investigation and development of counseling and guidance programs implemented at vocational high schools.

## Abstract

The aim of this paper is to assess the transformation of the education system in Poland in the last 25 years, particularly with the discussion of the National Qualifications Framework. During this period there were introduced three bills on higher education in years 1990-2005-2011. The last two follow European standards of education. In the past three years, work of the Ministry of Higher Education has been accelerated. The legislator produced 101 further regulations and notices until the end of 2013. The Ministry's website contains 37 further projects about to change some regulations until now. However the nightmare of the Polish scientists is the National Qualifications Framework.

## 1.1 The power of tradition

The ideas of higher education, since its institutionalized foundation in the Middle Ages until now, have been based on cognitive and impractical values. Medieval Europe used these values to build ideas of teaching and learning aided by values like freedom, autonomy, truth, and mutual respect. These values were accompanied by one more value that is often forgotten – full

Peer-review under responsibility of the Sakarya University.

openness of every university. Such an approach enabled free development of the universities as well as exchange of findings and information resulting from the research carried out at individual schools.

These ideas put together brought success to schools and researchers, but it also meant selection of those who wished to study. As a result, a university was a research unit, but it offered its services only to a limited group of students. Consequently, certain methods of teaching and doing research were established. This specific relation, known today as a master – student relation, was a highly individualized cooperation relationship. This type of relations followed by the highest possible moral and work standards constituted a scientific and moral trademark of a university. Elitism of knowledge was paired with elitism of access.

### 1.2 The potential of modernity

Exclusiveness of education that gave a firm basis for self-development was based on principles of individualism. A student was guided by independent decisions in choices of subjects and teachers, being a consequence of individual interests. Such approach to studying should not be considered irrational. The educational system was organized in a way that even when a student joined a technical university in order to study in specialist, technical field, he could still broaden his or her interests directly in his/her own college, or at a university which made it possible for each student to acquire deeper human knowledge.

The early twentieth century brought along profound social changes caused by both world conflicts and military races. After the Second World War a technological race of the countries on both sides of the Iron Curtain took place. Economic and, in consequence, technical and military imbalance resulted in an educational majority of one of the sides. Knowledge kept its status, although its character changed. The elitism of humanistic knowledge was driven by the egalitarianism of technical abilities (in the West).

The geopolitical change imposed as a result of the Yalta arrangements pitched the so far homogeneous education system in Europe. That is why the Second World War constitutes an important dividing line in the approach to the obvious until now issues associated with the functioning of a university. One of the most important matters was autonomy. A considerable fragment of Europe became subordinated to the communist ideology, which meant serious changes in the status of universities and their staff. This resulted in an imposition of a direction for the conducted research and didactics. As a matter of fact, these changes were much wider and deeper since education became subordinated to the ideology of the communist party. In 1951 a new law on higher education institutions was enforced, which established a new institutional and organizational model in Poland. As a result, the learning was divided into four levels: higher education institutions, the Polish Academy of Sciences, departmental institutes, and science and technology associations (Hejnicka-Bezwińska, p. 36).

As a result of the dominance of the ideology of scientific work over the philosophy of such a work, many outstanding but non-conforming scientists lost their university positions. Not only people were eliminated, but "institutions and ideas as well. Crime could also be committed on the system of values. Such were the needs of the system. However, the crisis of arts and limitations of humanism was of help" (Hübner, p. 227). The crisis that was triggered, naturally, by the very dominating system of mass culture which "destroyed local values", caused "the family world to break up, faith was at the state of crisis. (...) On one hand, the system had a great destructive power but it was short of structural abilities not only in the economic sphere, but also in science".

Universities surrendered to having certain departments closed, which included theological departments. Others were transformed into new colleges. The Jagiellonian University may be taken as a typical example of the situation in those times. Its agricultural, medical and physical education departments were used to serve as a basis for creating new higher education institutions. Some other departments were closed while enrollment to others was canceled for a dozen of years. This happened to philosophy, pedagogy, psychology and sociology departments. Finally, the number of students who could be admitted was limited, and its increase or further reduction depended on the decision of the party executive committee. In other words, decisions on important, and often sensitive issues of higher education and broadly understood culture, were given an ideological character.

In the mid-fifties the situation got slightly better, although it never achieved full stability and autonomy available to colleges in Western Europe or the USA. The centralization of culture extended on higher education, too. As a result, during all those years higher education was subjected to party-political pressures and control. Therefore there were hopes that the political- economic turn of the late 80s of the 20<sup>th</sup> century would finally put an end to this type of guidance and make way for re-establishing of the university, basing on the well-known patterns and traditions of the pre-war system as well as answering the needs of the new century.

### 1.3 Mission or remission?

In the late 1980s, on the occasion of the nine-hundredth anniversary of the University of Bologna (1988),

rectors of European universities, including Warsaw University, signed the Bologna Charter (18.09.1988). This document links tradition with the present by emphasizing the importance of such academic values as tolerance, respect, openness and assigning universities the central role in the social and cultural life of European countries. Moreover, an obligation to create a common system of education in Europe, based on principles formulated in the Magna Charta Universitatum, was expressed there. In its "Fundamental Principles" we can find a confirmation of the role and place of the university in the culture of the "old" continent expressed by four principles: a) autonomy: "research and teaching must be morally and intellectually independent of political authority and economic power"; b) bond of science and didactics: "Teaching and research in universities must be inseparable"; c) tolerance: "a university is an ideal meeting-place for teachers capable of imparting their knowledge (...) and for students entitled, able and willing to enrich their minds with that knowledge"; d) trust: "a university is the trustee of the European humanist tradition; its constant care is to attain universal knowledge; to fulfill its vocation it transcends geographical and political frontiers, and affirms the vital need for different cultures to know and influence each other" ([http://www.magna-charta.org/library/userfiles/file/mc\\_english.pdf](http://www.magna-charta.org/library/userfiles/file/mc_english.pdf)). These principles expressed obvious beliefs as they had been carried out in Europe for the past thousand years, and yet, it was necessary to recall them since they had been repeatedly violated in the 20th century.

The declarations that followed confirmed this fact, broadening some of the issues. Eleven years later, in 1999, 29 ministers of higher education of European countries signed the Bologna Declaration (19.06.1999) which expresses the will to create the European Higher Education Area. All these declarations resulted in activities aimed at unifying the educational systems of individual countries. There were also a few communiques and declarations (Prague 2001, Berlin 2003, Bergen 2005, London 2007, Leuven/Louvain-la-Neuve 2009, Budapest-Vienna 2010) which stated that Europe needed strong universities that would help to build the "European science society" ([http://www.eua.be/eua/jsp/en/upload/GLASGOWdeclaration\\_FINAL\\_PO.1117550611801.pdf](http://www.eua.be/eua/jsp/en/upload/GLASGOWdeclaration_FINAL_PO.1117550611801.pdf)).

We can acknowledge that the Magna Charta Universitatum is the answer to the never asked question: why is the "knowledge society" important. "The future of the mankind (...) depends largely on the cultural, scientific and technical development, whereas this development is an effect of the action taken at community centers, the knowledge and researches, so as universities. A crowning of the work was the Budapest-Vienna Declaration, which announced the appointment of the "European Higher Education Area".

The Bologna process has created space for higher education, although probably we will have to wait longer for the building of a science society. Nevertheless, the Bolognese process has set out a general framework of action without interfering with detailed issues of education in individual countries. And thus the signature of the Declaration does not mean any loss of educational autonomy of each of the countries participating in the process, because it allows individual solutions.

All these principles and declarations concerning the institution of the university instil optimism. They draw a future in which restrictions of reforms of Napoleon and Humboldt will be overcome by including them in the structure of the education, applying needs of the present. It is a great challenge and it is possible to recognize the already implemented changes as an answer to the current needs. One might state that the Bolognese process combines the French and German models of education. A bachelor's degree course "through its one directionality" belongs to the first one, while an undergraduate course leading to a master's degree comprising of „theoretical part, methodological part and a part aimed at developing practical skills" belongs to the second model (K. Sauerland, 36). The Bologna process was commenced in the sphere of organizations and the European network of higher education institutions is a fact. Structural changes, which in themselves should be regarded as positive, were carried out too mechanically, and as a consequence they adversely affected the level of teaching. Analyzing the implemented changes in Poland will be particularly interesting.

The fundamental changes concerned the quality of teaching students, referring to the National Qualification Framework (NQF). In Poland, they were introduced on the 18<sup>th</sup> March 2011 and came into force as of 1<sup>st</sup> October 2011. The NQF program, while worthy in its assumptions, has caused and still is causing a headache to university teachers in Poland, gaining extremely varying opinions. The following remarks are supposed to present the "Polish way" of carrying out the program, which – for obvious organizational reasons (central management) – affects the entire system of higher education in our country. As exponents of the attitude towards the NQF we take the analyses of two scientists from the AGH-University of Science and Technology, who

analyzed the program from a theoretical and empirical point of view, in two aspects: negative and positive.

The authors, Ryszard Tadeusiewicz and Antoni Ligeza, state that from the very beginning the NQF was a "real nightmare that affected the entire higher education and caused (...) a huge disruption in the teaching process in all Polish colleges. The implementation of these rules cost a massive amount of work of highly qualified

academic teachers from universities given to an undertaking that proved to be as much ill-considered, as pointless" (Tadeusiewicz, Ligęza, 2).

In their report, the authors raise some valid questions: what was the reason for applying the NQF, what purpose it is supposed to serve, what are the potential profits and losses resulting from its implementation. In other words, they carry out an academic account. It is worthwhile adding that there has been no ministerial account of the reform to this day. The general evaluation falls out very badly, not to say crushingly - and what is more both in the technical, as well as financial aspect. Still, we cannot claim that the implementation of the NQF was the requirement of the European Union, since only two countries implemented it: Norway and Poland. Three other countries - France, Germany and Great Britain - had their own NQF. So what did the NQF basics mean?

The authors took into consideration only their own university, comprising of 16 departments. A digital curriculum has some statistics available: "For example, each department created from 189 to 1398 descriptions of modules of teaching. Every description of a module consists of 14 identification fields, descriptions of effects of educating (...), matrix of effects of teaching (...), description of contents of teaching, estimating the workload of the student and balance of ECTS points, description of the method of appointing the final evaluation, description of preliminary and additional requirements, list of recommended literature and resources, additional information" (Tadeusiewicz, Ligęza, p. 9). As it appears from these statistics 10 860 descriptions of modules have been prepared. Since writing up of each module took up to 20 hours, it sums up to a massive 200.000 man-hours total. Estimating the cost of one man-hour as PLN 40 (without substantial supplementary costs), it is PLN 8 million (approx. 2 million Euro) per one college.

The conclusion in the wider scale is indeed paralyzing: "at the national level it gives an estimated total (with reference to public colleges) of one billion Polish zloty" (Tadeusiewicz, Ligęza, p. 9).

And so question arises: has anything changed in the process of conducting classes or verifying students' knowledge? The answer regarding the evaluation of knowledge and skills is explicit: nothing. The teaching process and the process of examining remained unchanged. So have any changes taken place with reference to competencies? The reply is also negative. The ministry did not provide for any mechanisms of verification and evaluation of social competencies, and in fact the university cannot do it on its own. Consequently, costs may multiply. As the authors point out, a survey on the NQF identified various negative opinions and criticism from different sources. Until the moment of publication of their report, there had been no positive assessments. Let us also hope that the situation of KRK will not replicate the legal situation of the act on higher education.

After the political changes in 1989, on 12<sup>th</sup> September 1990 an act on higher education came into force. Fifteen years later it was replaced with a new statute "Law on higher education" (27<sup>th</sup> July 2005). Six years passed and there was another change of law. As can be seen, the time between introducing new laws has shortened. In the last three years the pace at which the Ministry of Science and Higher Education conducts legislative work has considerably accelerated: up till today 101 further regulations and announcements have been introduced, in which the legislator expressed the will of even more detailed regulation of different issues. Currently, on the Ministry's website there have been 37 further draft amendments published (Tadeusiewicz, Ligęza). It is worthy to note that the Polish Ministry of Higher Education is going to add further 150 regulations this year only).

All these facts demonstrate problems that administrative personnel and academic staff have to deal with at Polish universities. These facts rise anxieties regarding future actions of ministerial committees. Above all, however, these undesired developments also show the shaken relations and a total lack of balance between the NQF goals and the reality? On one hand, there is a lot of talk about the mission of the university in the contemporary world, and on the other - about the challenges of this world. The latter immediately undermine the ideal of a university and its mission because it implements an element of entrepreneurship at universities, which converts a higher education institution into a business venture. Thus, instead of the mission accepted by the ministry and carried out by a higher education institution we are dealing with a remission of the morbidity, triggered by the real socialism. This only means continuing the process of decay of traditional values associated with education, knowledge acquisition, research conduct - that is, all the elements that form the European humanistic tradition.

Three missions: knowledge, skill and competence express significant features of university education throughout its history, from the cognitive model of the Greeks to the enterprise model of the present. The theory, understood as a deep cognitive access, has been currently subordinated to the pragmatics of technologized and economized life. Finding a balanced model, in which none of the missions will be developed at the cost of another, seems unattainable at the moment. These three missions are similar to the three Greek Graces of European education. Let us not decide which is "Splendor" (Aglaia), which "Mirth" (Euphrosyne) and which "Good Cheer" (Thalia). However, we fear to ask whether, by any chance, there was some "local" grace that participated in the implementation of changes to Polish higher education. And if it did, which name should we call her?

## The popular education in Rio Grande do Norte (1948-1964)

Marlúcia Menezes de Paiva<sup>a</sup>

<sup>a</sup>UFRN, Campus Universitário, Natal, RN, Brazil

---

### Abstract

This paper studies movements of education and popular culture that occurred in the State of Rio Grande do Norte, between the years 1948-1964, a period of democratic validity. This context facilitated the expression of the Catholic Church, under the guidance of the Archdiocese of Natal and progressive sectors of the Catholic Action, created in 1958, an experience in education and popular culture literacy by radio to the rural environment, the radio schools, then Base Education Movement (MEB). Also in Natal in 1961, a movement of popular education, the responsibility of the Municipality, called "Campaign standing on the ground also learn to read" and meant an innovative experience in education, with great popular participation, facing the same poorest sections of the population. These two experiments have achieved a significant number of the population, developing, beyond literacy an awareness- pedagogical action, representing moments of liberation, progressive quest for a more just and humane society.

### Introduction

The movements of popular education and culture, which occurred in the State of Rio Grande do Norte in the 1950s and early 1960s, happened in a period of relative democratic opening in our country. The validity of the democratic state in Brazil (1945-1964) led to the growth and organization of civil society, leading to the emergence of mobilizations in favor of structural reforms for the country, denominated base reforms, necessary for the economic and social development.

This historical context facilitated the expression of the Catholic Church, under the guidance of the Archdiocese of Natal and of the progressive sectors of the Catholic Action, created, in 1958, an experience in education and popular culture of literacy by radio, focused on rural areas, denominated Radio Schools. The expansion and continuity of this experience led to the creation of the Movement of Basic Education (MEB), which pushed the boundaries of the State of Rio Grande do Norte, affecting much of the country in areas considered the poorest, with high illiteracy rates.

Within the civil society, secular, political factions, progressive and nationalist, elected during that democratic process in expansion, favored the emergence of other movements of popular education and culture. In Natal, for example, in 1961, a movement of popular education emerged under the responsibility of the Municipality, called "Campaign standing on the ground also learns to read" and meant an innovative experience in education, with a great popular participation, aimed for the poorest sections of the population of the city of Natal.

These two experiments have achieved a significant part of the population, developing, beyond literacy, an awareness-pedagogical action. Shortly thereafter, in 1963, occurred in the city of Angicos, in the backcountry of Rio Grande do Norte, promoted by the State Government, an experiment in popular education known as The 40 hours of Angicos. In this city, the educator Paulo Freire applied on a larger scale, for the first time, his educational system. Until then, the system was designed and implemented in small groups. At that moment, to apply it on a larger scale, the educator could consolidate it, resizing and adjusting it to the literacy needs of the poorest sectors of the population. These experiences lost, with the coup d'état of 1964, their strength, because they were severely repressed. The new government had imposed a new-old order.

In this research, we have worked with the first two movements: the Radio Schools/ MEB and Campaign "standing on the ground also learns to read". We have defined our study on these two movements because they consisted of a more lasting experience, covering a larger share of the state population. The experience of Angicos, despite the future developments, had a brief existence; its action was limited to the city of Angicos not generating greater impact on the literacy rate of the state. In both movements chosen, we decided to work the

process of teacher training, instructional materials for reading used in literacy, observing the book, booklet, among other educational materials, also highlighting the content transmitted in various reading activities, without forgetting that, for the poorest, the school is the only reading space. The study is limited by the post-war period until 1964, the year when the coup d'état occurred, because these movements were smitten, as said before, losing its power or even being canceled, as was the case of the Campaign "standing on the ground also learns to read".

### The Radio Schools

The radio schools emerged within a larger movement, developed by the Archdiocese of Natal, called Movement of Natal. This movement emerged as an unfolding of the problems caused by the Second World War and by the phenomenon of cyclical droughts in northeastern Brazil. With the outbreak of the war and especially because of the geographical position occupied by the city of Natal, on the way of troops in transit to Dakar (Africa), the Office of Anti-Air Defense was installed, in 1942, in the nearby town of Parnamirim, and thereafter, "... the city, in addition to receiving the troops in transit, hosts a large numbers of Americans, because Natal had come to constitute a field for the adaptation to the tropical climate" (Paiva et al, 2009, p. 25). There were times when the city hosted about 10,000 soldiers, a period in which it had about 50 million inhabitants. This fact demanded labor for domestic service, construction, bars, hotels, nightclubs, attracting people from across the region, for these new jobs, particularly in rural areas plagued by the drought.

The end of the war, which caused the withdrawal of U.S. troops, produced a severe social crisis in the city, marked by problems resulting from drought. People, who had been attracted by the possibility of employment, were unemployed in large part, generating a high level of panhandling and other typical problems of crisis moments. The Archdiocese of Natal, then, initiated a series of actions to combat these problems, occupying a place that would be up to federal, state and municipal governments. These actions initially limited to the city of Natal, extending soon after to rural areas, with the creation of the Office of Rural Assistance (SAR) in 1948. Among activities such as shelter to abandoned children, creation of social centers, rural missions, holiday weeks, cooperatives, among others, the Archdiocese of Natal, with the adjuvant action of the Catholic Action, introduced another activity that was the literacy for youth and adults.

Taking as parameter the activities of evangelization and education by radio observed by D. Eugenio de Araujo Sales, the Auxiliary Bishop of Natal, in Sutanteza (Colombia), it was initiated into the Movement of Natal, the education through the radio, with the creation called the Radio Schools. These schools, different from the movement of Sutanteza, had an organized reception. They were primarily intended for the people who lived in the countryside. Its constitution was under the guidance of local parishes and the infrastructure was responsibility of the communities where the schools were located. At the beginning, the Church supplied the radio and the electric battery, that could be rechargeable, and then the radios became more modern and started operating on batteries, so the students and the community people held parties, task forces and money for the small expenses such as batteries for the radio, kerosene for lamps, chalk.

There was a large participation of the entire community. The students also cooperated bringing objects from their homes to sit – such as benches, stools, because the classrooms functioned wherever possible, what could be the home of the monitor, the rectories, or any available room that existed in the community. Schools started in September 1958 with literacy classes for youth and adults.

In 1961, with the expansion of the schools, it was introduced a new series and so on until, in 1963, the first five grades of primary education. The classes had the duration of 45 minutes and were broadcast daily by the Issuer for Rural Education, radio that belongs to the Archdiocese of Natal. The movement initially reached 69 schools and, in 1963, the year that a further expansion occurred, these schools were expanded and reached a total of 1,414 and 26,863 students.

Until 1961, the experience of the Radio Schools was the responsibility of the Archdiocese of Natal, through the SAR, and was restricted to the Rio Grande do Norte. After the Second Meeting of Bishops of the Northeast (1959) held in Natal, the bishops present suggested, in the Declaration of the Bishops of the Northeast, result of the meeting, to the then president, Juscelino Kubitschek, the expansion of the Radio Schools to the entire Northeast. That fact was realized later, on the occasion of the first meeting of the Basic Education, in Aracaju (SE), in December of 1960. In this meeting, the CNBB initiated talks with the elected president - although not yet sworn in, Jânio Quadros to expand these schools. In contrast, "[...] the CNBB proposed itself to structure the existing efforts through a Movement to coordinate the common action. The activities of the Radio Schools of the Diocese, along with the sector of Basic Education of RENECE, would become a new organism: the Movement of Basic Education (MEB)." (SPEYER, 1976, p. 6).

Yet in 1961 the Movement of Basic Education (MEB), was established by Decree No. 50,370, of March of 1961, signed by the President Quadros, which provided, through an agreement between the Ministry of Education and Culture (MEC) and CNBB, the funding of this project for five years of basic education. The agreement assumed the installation of 15,000 radio schools in the north, northeast and center-west of the country, considered underdeveloped regions. With the signing of this agreement, the MEB started. After the MEB, the radio schools of Natal took a new direction and became part of this new organism, which was linked to CNBB, although it was still organically linked to the Archdiocese of Natal. The national coordination of the MEB was subordinate to the Church/CNBB, but had the active participation of lay people, particularly those linked to the Catholic university youth (JUC), Section of the Catholic Action.

The radio schools were based on a tripod: speaker-teachers, monitors and radio.

The speaker-teachers were arrayed among youth who had a teacher training and participated, almost always, of the social activities of the Archdiocese of Natal. The first speaker-teacher was also a teacher of the Normal School of Natal and had some knowledge on radio technics for education by radio. The inaugural class, taught by the mentioned teacher, aired on September 20th, of 1958. Later, in February 1961 and in December of the same year, with the expansion of the schools, this teacher invited two students of the Normal School to participate as speaker-teachers of the educational experiment.

These three teachers led the work of the radio broadcast of classes throughout the time limits of this study. The last two teachers received in-service training, because there was no time to conduct more appropriate training, the activities were happening while the speaker-teachers learned how to deal with the new situation.

With the entry of the MEB, the training of the pedagogical staff became a target of greater importance. The National Team of the MEB performed supervisory visits and, at that time, there were discussions, debates, readings of texts with theoretical-philosophical deepening and planning of activities, with review and exchange of experiences. The speaker- teachers were also responsible for the preparation and transmission of the classes that had the form of script, because of the language of radio.

The monitors were set up in the large motor movement. Many were just literate and, in general, participants of the Catholic Action and other movements of the Church. They played a volunteer work, without pay. These young people lived in the parishes where the school was, or would be installed. They were usually chosen by the local priest, who took into account their leadership skills and the requirement to have a minimum of literacy. So they could take this educational function, the monitors participated of trainings, or other activities such as study days, courses. These educational activities were held under the coordination of the Central Staff, sort of techno-pedagogical staff who coordinated all the activities of teaching and schools running, and were held in conjunction with members of other sectors of the SAR in Natal.

The monitors were responsible for boosting the lessons provided by the speaker-teachers, by the Issuer of Rural Education, and were also responsible for handling the radio in the schools. In remote locations, wilderness, there was a monitor stimulating classes of the radio schools. The training received, was initially a conversation to know the daily life of the community where he resided, from that information, the knowledge was broadened to a more general information about the state, country, other countries, placing him in this reality; then the speaker-teachers taught classes with didactic-pedagogic content and information on the operational functioning of the school, such as the handling of the radio, license, frequency control, among others (PAIVA, 2009).

The reading book, "Educate to build" (1964), created by the teaching staff of the movement itself, brings in one of its lessons, called, "The mission of the monitor", the following assertion:

January 20th, the day of the monitor, the day of those who fight for a better tomorrow, and want to turn darkness into light, loneliness in friendship, and sadness into joy. The monitor is someone who will make the field a land of free men, because to be free we have to educate ourselves. [...] I, monitor, must be the light which will lighten the illiterate. I will be someone who works for a strong and true Christianity to come to the world. We must follow this motto: All for God and for our brothers (PEREIRA, 1964, p. 4.).

This lesson was written by a monitor of a small town. It shows the importance that the monitor was in the movement, as it is the one that "will make the field a land of free men" and is also "the light that will lighten the illiterate".

The movements of education and popular culture of the decades of 1950/1960, according to Germano (2004) present typical features of the political romanticism: "refusal of this social reality, sense of loss, nostalgia and search for what was lost". "Thus, the present would be denied, and the future would be object of interrogation, and, somehow, a reference to the past" (2004, p.5). All the text of the lesson in question is redolent of that romantic spirit, almost heroic.

The radio was the big star in the radio schools. It represented an extraordinary technological novelty for that needy and so devoid of everything place. We shall not forget that we are talking about the interior of the northeastern region, Brazil, in 1958, the beginning of this educational movement. A letter from a monitoring well exemplifies this dimension: "At my school what is grandest is the Radio. In the room where settles the

class, it was reserved a place with all zeal and affection. This radio is music, teacher and church, teaching and instructing the people in our rural areas.” (MORAIS, s/d. In: PAIVA, p. 55).

The radios, of the Phillips brand, came from Holland, donated by Catholic institutions. At the time Catholic institutions, such as the Adveniat, Misereor, among others, helped a lot the Catholic social works in the Northeast. The radios were equipped with a device that did tuned only the Issuer for Rural Education. Because of the lack of electricity in rural areas, the radios worked with electric battery. As a teaching-learning tool it was invaluable. The vehicle, itself, already pointed out, the speech of the monitor reflects the dimension of this importance. The isolation of the rural areas was broken. Without leaving their community, the workers and the rural communities could tune into the world.

Backed in this tripod, the didactic and pedagogical activities were being built. For the best achievement in the teaching-learning process, quite varied materials were employed, such as “cordel” literature, viola singings, folkloric events, plays, politicization books, newspapers, brochures and reading books.

The manifestations of the popular culture, such as viola singing, “cordel” verses, facilitated the transmission of content, as they talked about the day-to-day of the peasant population. The reading book, “Educate to Build” prepared by the core team of the MEB Natal itself, as already mentioned, had the collaboration of texts written by the monitors. The book approaches questions close to the interests of the workers, such as work, conscious vote, the importance of education and health, value of foods, cooperatives, culture, folklore, popular festivals, but also Christian messages such as “God the creator of all things”, “love of neighbor”, “and the gospel as good news”. The texts in the book bring messages that seek to educate, and as was said at the time, aware. There is clear guidance so that workers know and seek for their rights, their freedom, and their importance as beings responsible for their story. In the text entitled “the value of the vote”, without authorship declaration, reads:

Brazil needs the conscious vote for each of us to develop it. The conscious man knows that his vote is a weapon. He knows that this weapon must be used for the behalf of the people. He knows that this weapon should be used to choose leaders for all the people. The true vote is conscious. The true vote is free. (VALOR..., 1964, p. 27).

There can also be observed the “romantic affinities of the popular education”, exposed by Germano (2004). But, despite this particular, this educational experiment was of great importance in the struggles of workers, in asserting their rights and also literacy them. Besides reading the book “Educating to Build” MEB used in the literacy primer “Effort” and arrived to prepare a book reading “To live is to fight”. The latter was seized by conservative forces of the Lacerda government, in Rio de Janeiro, and has almost not been used; the “Effort” textbook, widely used in the educational action of MEB, was the responsibility of the National Team. It was directed to the rural population and presented a critical content, transformative and, as said at the time, conscientizing, as in general the publications of the national MEB were presented. The Lesson 2, of the 2nd reading book, in verse form, says “In Brazil there is a lot of land waiting for planting, all land without use prejudice gives to the nation. If the land is undivided there is no solution. But the Land Statute can help the matter, because some of the people, who plant corn and beans, want a little land to plant with more passion.” (1965, p. 6).

For the ruling elites of the country, at the time, land and agrarian reform were true taboos, work on this theme on the literacy of peasants meant subversion of the established order, with serious consequences for their authors. This educational activity was severely repressed by the dominant forces of the country in the post-coup of 1964. It was one more experiment in popular education pruned by the blow. The MEB continued its activities, but quite mischaracterized of its initial proposal.

### **The campaign “standing on the ground also learns to read”**

Unlike the previous experiment, which was initiated by the Church, this educational experiment was born in the popular struggles for more education. The first elected mayor of Natal, in 1960, was Djalma Maranhão, elected by a coalition of opposition, mainly sustained by popular participation, incorporated of Popular Commands, consisting of politicians, intellectuals, trade unionists, students, leaders of neighborhoods. These commands prepared the campaign of the mayor and created other levels of organization, such as the Nationalist Camps, which served as guidance for voters and also to raise funds for the campaign. The most representative organizations were called Nationalists Committees, which rallied people through streets and neighborhoods, creating a capillary network that politically mobilized the entire city of Natal (GERMANO, 1982).

After the possession, the mayor fulfilling the commitments of the campaign and accepting popular demands, particularly of the nationalist 240 Nationalists Committees, elected education and culture as a priority for his government. The public education system was in clear decline. There was a lack of schools. The number of

public schools had declined in the past years. However, due to the lack of resources, the mayor struggled to implement reforms and improve the education, for example, to build new schools without the resources.

In the beginning of the administration, the city, to start the Literacy Campaign, expanded the called small schools, literacy classes, in emergency system when all the rooms available, donated by the community, where could run a literacy class were used: unions, churches, clubs, private residences and even a cinema. The teaching materials and meals were donated to students by the public authorities, the teacher, who was trained in emergency courses, received a small pro-labor, but water and electricity were under the responsibility of the entities responsible for the assignment of the room. In two years, these small schools had reached the number of 271 classrooms; however, this number was not sufficient to meet the demand for literacy. That was when the discussions and debates in the Committee of the Nationalist of the Rocas neighborhood came up with the idea of building schools using coconut straws. Moacyr de Goês, then Secretary of Education of the city, in his book "Standing on the ground also learns to read (1961-1964): a democratic school", he reports this time of the birth of the Campaign: "The discussion was long. For over two hours we were around the same issues: it was necessary to eradicate the illiteracy - the people wanted, the mayor too. But, how to end the illiteracy without money to build schools? I do not know, really, from whom came the proposal at that meeting of 40-50 men and women: - Make a school of straw!" (1980, p. 35).

At the end of the meeting a proposal was submitted to the mayor who approved it. There initiated the educational movement that was named "Standing on the Ground Also Learns to Read", name taken from a newspaper article written about the educational movement of the prefecture of Natal. The implementation of the measures necessary for its development was under the responsibility of the Secretary of Education, Culture and Health, of the Municipality, which, for this purpose, created the Working Group on Popular Education. The neighborhood of Rocas was then selected to be the experiment area and construction of the first school of straw. The Nationalist Committee of the neighborhood was one of the most important participants in the struggles and popular demands.

The first school built was named Camp School of Rocas and in the same year, 1961, the city built another School Camp in Carrasco. Soon, it was made the calls to the school for admission of students to begin classes. In 1962, seven more Camps were built in neighborhoods of Nordeste, Igapó, Aparecida, Quintas, Conceição, Granja and Nova Descoberta. It is important to highlight that they were all neighborhoods on the periphery of Natal. There were schools built for the poor people. The enrollment has evolved rapidly in 1960, the Little Schools catered to 2,974 students, in 1961, the total number of students served was 5,249. Regarding the registration of the Schools/Camps, according to Germano (1982), it is difficult to compute the lack of registration. Goês, states that in April of 1964, the overall enrollment exceeded 17,000 students. (1980, p. 79)

The camps had a different architecture from the traditional schools. They were composed of rectangular sheds, where the classrooms happened, with 30 X 8 meters, with thatched roof and floor of beaten clay, without sides; a circular shed, with the same features as the other, for the recreation of the students, parties and folkloric presentations and, also, for meetings of parents and teachers. Internally, the rectangular sheds were divided into four rooms, divided by thick and wide boards used as chalkboards and bulletin board and also as partitions between the rooms; they did not reach the ceiling, neither the floor, they did not have the goal of closing the classes because, as we said before, the sheds had no side walls. It was a literally open school closed in the ceiling by the coverage of straw. Masonry construction, there was only one room where the board functioned, secretary, warehouse, among others, and restrooms. (Goes, 1980).

All camps were equipped with the same infrastructure. The classes were held at regular times, in three shifts, similar to the education of the public school system form. At night worked as a school for adult education.

The teachers who participated in this experiment received varied training, comprised of volunteers, the community, and partly by city officials. Initially, the teachers were trained in emergency courses; until 1962, the city held two of such courses: the first, in 1961, 250 candidates participated in the campaign, who were admitted as lay teachers; in the second, as there was a large number of people, there was a previous selection, with the requirement of complete primary to the candidates; 300 people attended the course, which lasted two months, but only 250 were seized in the Campaign as monitors, or lay teachers. This course gave a greater emphasis on the first three grades of school, called primary course, larger field of action of the campaign.

With the expansion of student enrollment, arose the need for more teachers with better qualifications, it was, then, created the Center for Teacher Education (CFP) in 1962, an institution that became responsible for the teaching coordination of the campaign, or as Goês reports, the Center for Teacher Education has become the "brain of the campaign" (1980, p.72). It offered three modes of courses: a) Emergency Courses, for training of lay teachers, lasting for three or four months, to meet the interior municipalities that had agreement with the city of Natal; Normal gym, lasting four years, which served the Campaign teachers who had previously attended the courses Emergency; and Normal College, high school level, improving the training of the Campaign teachers and also open to other interested people. (CORTEZ, 2005)

The Training Centre gave a greater dynamism and organicism to the Campaign. In addition to the training courses for teachers, it was also responsible for supervising and for all technical and pedagogical orientation, which was held weekly through meetings and visits. It also had an Audio-Visual Resource Center, which prepared the didactic-pedagogic material, and a Demonstration School, which served as a laboratory for teachers and students of the CFP.

The teaching-learning materials used in the campaign, as in MEB, were quite diverse. At first, the process of teaching-learning was not different from the one that existed in the public school system, little by little, with the maturing of the Campaign; the teaching process was being renovated, modified. Widely used was the "Book Reading 'standing on the ground also Learns to Read'", an adaptation of the book "Reading for Adults of the Popular Culture Movement of Recife", as written on the cover of the book, or how the Secretary of Education at the time, Moacyr de Goés, said on the presentation of the book: "This 'Textbook for the reading of Adults of the Campaign Feet on the Ground Also Learns to Read' is not an original work; it is an adaptation to the local conditions of Rio G. do Norte of the 'Textbook for Adults Movement of Popular Culture of Recife'. If the 'Textbook' of the MCP is valid, as we believe, then, it is certain that we seize this valuable experience and I apply it between us." (1963)

There was a great integration between the educational movements of Natal and Recife. Miguel Arraes, governor of the state of Pernambuco and Djalma Maranhão, Mayor of Natal, were very close politically, communed the same struggles and ideals. This book, as the reading book of MEB, also brings a rather critical, conscientizing and also of appreciation of the popular culture in its many interpretations. Some of the lessons are quite enlightening on how these expressions were used, like: "It is necessary to be formed, in Brazil, a broad front, bringing together all those who work to eliminate the causes of the misery of the people. The suffering of our people is just a consequence. The causes that produce these sufferings are deeper. It can only be eliminated with planning and basic reform". Or, "The folklore is all the traditions of a people. The most popular dances of the Northeast are: quadrilha, araruna, bambelô, chegança, bumba-meu-boi and pastoril."

The use of the popular culture, in various expressions, was present at all the times. The shed of circular form, that every camp had, was the scene of varied artistic statements, including the folk performances of each district, which were fully explored: in the Rocas neighborhood, the "Araruna Society of Ancient Dances"; in the Conception neighborhood, the "Bambelô Asa Branca"; in Carrasco neighborhood, the "Congos" and "Boi Calemba", among others.

As Germano says, "it is important to state, at the outset, that the Campaign meant, apart from small schools and School Camps, the creation of popular libraries, cultural squares, the Center for Teacher Education, the People's "Tetrinho", the Art Gallery; meant the formation of reading circles, the conducting of cultural encounters, the reactivation of groups of folk dances, the promoting of art exhibition, the presentation of plays, in other words, resulted in a cultural organization in the city, where people participated effectively and not just watched as a spectator" (1982, p.102,103).

The movement of the campaign Feet on the ground also Learns to Read represented a general change in the culture of the city. The campaign went beyond the traditional limits of action of our schools, mobilized the entire city, the popular culture received a great encouragement and appreciation, folk groups that were disappearing resurfaced and, especially the poorest strata of the population initiated a process of apprehension and worship of the cult knowledge, so distant until that. As the MEB, this was another experiment in popular education finished by the coup of 1964.

## Final considerations

The two educational experiments studied represent popular social movements, with nationalist trend, with proposals for social reforms that, maybe if they had not been pruned, they could have gone further in their accomplishments. There were movements led by intellectuals of the middle classes, Catholics and non-Catholics, socialists and non-socialists. They present a romantic aspect, often assigning education a wrong paper of processing, remnants of the Enlightenment belief in the regenerative potential of education (Beisiegel, 2004), but also represented moments of liberation, of progressive quest for a more fair and humane society.

## Abstract

“B-on” is the electronic resources platform acknowledged by the Portuguese scientific community, providing a high number of scientific resources and electronic services. Portucalense University adhered to B-on in 2013. After a year, a study of use and evaluation of the professors’ satisfaction was conducted. This paper presents the results obtained through the application of a questionnaire and the analysis of statistical data supplied by the platform. Results reveal a medium level of compliance, although with high intensity and users’ satisfaction. More information literacy instruction is required in order to amplify and diversify the use of the tool.

---

## 1. Introduction

The Online Knowledge Library, usually known as *B-on*, is an electronic resources platform developed by the Portuguese Foundation of Science and Technology since March 2004. It provides the universities, scientific laboratories and higher education organizations in general with an unlimited and permanent access to several of the main national and international sources of knowledge, as online scientific journals and e-books.

The mission of *B-on* is to ensure the access to a high number of scientific publications, providing related electronic services to the Portuguese academic and scientific community. The platform works as a consortium, and the access to this range of services is only allowed to the adherent institutions, through their IP addresses. Up to now, 41 research and higher education institutions are members of this consortium.

*B-on* presents the following main goals:

- To promote electronic access to some of the major international knowledge sources;
- To play an active and participatory role in building a Knowledge Society;
- To encourage the consumption and production of scientific contents by the community;
- To encourage cooperation between national academic and scientific institutions;
- To facilitate the management of information of the national scientific output;
- To develop key skills in managing information and knowledge;
- To rationalize costs through a centralized negotiation with publishers and other content providers;
- To increase visibility, accessibility and dissemination of Portuguese scientific research and academic activity, enhancing their use and impact among the national and international scientific communities;
- To become a reference in the provision of electronic services and products that meets the needs of the various user groups;

To develop and provide a preservation policy in order to ensure perpetual access to the publications available to its members. (B-on, n.d.)

In fact, *B-on*

made possible to all the national academic and scientific community – teachers, researchers and students – an easy access to the full papers of a relevant set of scientific journals published online by some of the most reputed scientific international publishers and database owners, in a scale economy made possible by the centralized purchase of contents. (Costa, 2007, p.1, translation by the authors)

By allowing the access to a high set of online full text papers and e-books, covering different areas of knowledge, this platform looks not only for the improving of the conditions of access to knowledge, but also to stimulate and increase the Portuguese scientific production (Costa, 2007). Besides being a content provider, the platform offers several advanced services to support learning and research, such as training, tutorials, preservation, special support for researchers, librarians, students, health professionals and publishers, access to the Journal Citation Reports, bibliographical analysis and other features of Thompson Reuters' Web of Science, such as the bibliographic manager (EndNote Web) and also administration features, including statistical data.

As Costa (2008), we also believe that *B-on* represents one of the most meaningful accomplishments in favor of the Portuguese scientific and academic community, offering as its main advantages the democratization and flexibility in the access and organization of scientific knowledge.

This paper pretends to disseminate and analyze the results of an evidence-based research centered within the academic community of the Portucalense University, a year after the introduction of *B-on* in its routines of information search and retrieval. The use of the resources and services provided by this platform was therefore subject to a descriptive and interpretative analysis. The results of the study, operated as evidences, will provide management indicators related to the return of the investment in contribution for the scientific production and learning, as well as capital information for the development of more adequate strategies of information literacy and divulging, in order to make the best use possible of the tool.

## 2. Context

Portucalense University is a small private university located in the second town of Portugal, the city of Oporto, in the northern part of the country. It has around 2.000 students and 140 teachers and researchers, and is divided into four Departments: Law Studies; Tourism, Culture and Patrimony; Psychology and Education; and Economy, Management and Innovation. It offers ten graduation courses and 13 masters, giving its students the opportunity of specialization and lifelong learning through a wide range of post-graduations and short masters.

The Library is an important part of the university, and it supports the processes of learning and research of the academic community not only by providing the access to collections and traditional services, both in physical and virtual environments, but also managing the institutional repository and the access to the subscribed databases – *B-on* being the most important of them – and developing formal and informal sessions of information and digital literacy, including the production of guidelines for bibliographic styles and scientific publication.

To ensure the return of the investment made by the administration of the university in the subscription of *B-on*, corresponding to 34.000 euros, and to incite the academic community to use the platform, the library developed several information literacy training sessions, for teachers and students, besides numerous announcements and publicity through e-mail, advertisements, the university institutional newsletter and site, and also social networks such as Facebook.

The close collaboration with the academic community and the application of evidence-based principles in the library management led to a study that intends to start the evaluation of the use and impact of *B-on* and the importance of literacy sessions for the faculty members, looking for evidences that will help the making of informed decisions within the use of scientific information for learning and research purposes.

Evidence-based decision making is a rational model based on the use of research through scientific methods to gather quantitative and qualitative evidences. The evidences gathered should have consequences *for* the practice (identifying best practices and proposing new practices), *in* the practice (identification of problems and contradictions through the contextualization of professional experience and research results), and *from* the practice (measuring the results of the phenomena studied through the identification of the changes that resulted from the actions taken) (Todd, 2008). Such evidences will be shown in this paper, though the results reported relate to a larger study from which we present only the most significant findings.

### 3. Methodology

The methodological approach for this study thus follows the evidence-based research principles, supported by both background and foreground questions, as suggested by Booth (2004). Research looked for answers to background questions, whose results were found through statistical data provided by the platform reports and the answers to a questionnaire survey, such as: “Is *B-on* really having an impact in the search practices of teachers and researchers?”, “How many well succeeded searches were achieved during the first year of use?”, “Which knowledge area is using more the platform facilities?”. A range of foreground questions, whose answers were found through the survey, with both closed and open questions, and the crossing of data, were designed as follows: “How do teachers and researchers use the platform facilities?”, “Is the participation in information literacy sessions related to the intensity of their use of *B-on*?”, “For what purposes is the platform being used?”.

As pointed above, the techniques used for data collection were statistical reports provided by the platform and a survey with both open and closed questions; the survey was sent to all the universe of 141 teachers and the sample obtained corresponds to thirty-four ( $n=34$ ) of them, that is, 25% of the population. All data were subject to interpretation, and some of the open questions gave place to the definition of qualitative categories to help the comprehension of the motivations lying under the answers. Also, some data were crossed in order to better understand their significance.

As this is the first phase of an evidence-based research on the impact of a big content aggregator and scientific research services provider, the analysis of the results is intended to be both descriptive and interpretative, providing evidences that will guide future researches and lead to better practices in the immediate future.

### 4. Results

#### 4.1. Statistical reports

Statistical data collected from the *B-on* reports incurred in the number of downloads and its distribution through the months of the year, the most requested publishers and the most rated journals between January and November 2013.

Being the total number of downloads 4.257, the first graph shows its monthly distribution. We can see that the months that correspond to a larger number of downloads were January, with 600, followed by February, with around 530, April (480), then July (460) and October and November, around 500. The months when the platform was less used correspond to June, August and September, all of them below 200 downloads.

Graph 1: Number of downloads and monthly distribution

This distribution can be better understood if it's noticed that the first two months correspond to the first literacy sessions and to a heavier effort of publicity related to the launch of the platform at the university. April corresponds to another training session, such as October. As July is the month before vacations in Portugal, maybe the high rate of downloads during this month can be justified by the preparation of the new academic year, but that is yet to be proved by findings that this study wasn't able to show.

What are the predominant knowledge areas of the most searched journals? Graph number 2 shows the knowledge areas, that were defined through the keywords and title information of the journals from where the downloads were obtained:

Graph 2: Knowledge areas of the most requested journals

Data shows that Psychology is by far the most requested area, followed by multidisciplinary journals (other areas) and, by far, by Management, Social Education, Education and Tourism. These knowledge areas are a reflection of the contents that are covered by the faculty courses and lines of research. The most important courses of the university are, by number of students, first Law, than Economy and only then Psychology. Nevertheless, neither Law, nor Economy are so well succeeded in their research sessions. Further in this paper, in the analysis of the questionnaire results, the reason of these outcomes will be better understood.

#### 4.2. Survey results

The survey was applied to thirty-four teachers (N=34). From these, twenty-nine (N=29) use the resource regularly, while five never used it. Questioned about the reasons why they didn't use it, two said that they had never heard about it, and the other three presented the following reasons: "I never needed it", "I don't have much time for research, and when I do I prefer to search through Google scholar" and "I work at home and I can't access *B-on* from home". These responses show that, although a minority, there are still some teachers that don't use or care to use reliable and actual scientific resources, and lack computer and literacy skills to help them search through Internet using, for instance, the VPN service provided by the university; further research will help us understand some demographic and sociological characteristics of this group, which were not surveyed through the present questionnaire.

The research interests of the twenty-nine teachers that use regularly *B-on* are shown in Graph 3:

Graph 3: Research interests

Respondents that confirmed an effective use of *B-on* are mostly interested in the areas of Psychology (N=6) and Information Science (N=5), followed by Law and Economy/Finances (N=4 to each of them). When we cross these data with the statistical reports on the most requested knowledge areas, we can see that there is a coincidence, for respondents come mostly from the area of Psychology, which is in fact the most requested area in the platform. We can interpret that if all the Information Science researchers of the University answered the survey (N=5), that doesn't coincide with the most successful searches for the simple reason that this is a small area at the university, showing only the special concern of these researchers in participating in a survey that has to do with their own research interests. There is also a special interest revealed by teachers of Law and Economy/Finances, which doesn't result in equivalent well succeeded searches for reasons that will be pointed out further in this report.

Graph 4 shows how often these individuals use the platform:

Graph 4: Regularity of use

Most respondents (N=13) use it only occasionally, although a significant number (N=9) recurs to the platform once or twice a week.

Trying to understand how systematically some of *B-on* facilities, such as the personal profile are being profited by the respondents, they then were asked if they had opened one. Graph 5 tells us that this feature is not yet used by all the respondents, but nevertheless conquered almost half of them (N=13 for yes, and N=14 for no):

Graph 5: Personal profile

Respondents that didn't register for a personal profile justified their answer in the following two categories: (1) lack of use and (2) ignorance; "I don't use *B-on* very often", or "I use *B-on* occasionally and it doesn't justify the opening of a profile" were inserted into category one (lack of use); "I don't understand what the advantages

are”, “I don’t think I need one”, “I don’t know how to do it”, “I had never thought about it”, “I save everything in my PC” or “I don’t feel at ease with this technology” belong to category two (ignorance). Crossing data with the regularity of use, and although some of those who use *B-on* more often didn’t create a profile (N=5 for daily and weekly use answered No, from a total of 12) these answers can be interpreted as showing that those who don’t use very often the search platform don’t feel the need of exploring it more for, for instance, purposes of saving searches for further use within the platform (N=11 for those who use *B-on* Occasionally or Monthly, from a total of 17); a lack of experience with scientific databases that are being now explored for the first time is another possible explanation. The respondents included in category two also said that they would ask for instructions at the library, which means that they rely on the librarians to help with their search difficulties.

The survey also intended to understand for what purposes the respondents use the resources retrieved from *B-on*. The data shown in Graph 6 demonstrates that scientific resources are mostly used as research sources (N=9), but also for the preparation and teaching of classes (N=4) and, in a significant dimension, for both objectives (N=9). Seven (N=7) of the respondents didn’t answer to this question, having five of them justified with the lack of interest of the platform resources for their area of knowledge.

Graph 6: Use of the resources

Crossing these findings with research interests, it is verifiable that the less satisfied responders are those from the areas of Law and Finances, who use other databases for their work, which are not included in *B-on*, such as Heinonline, JStor and national databases regarding jurisprudence and national legal matters, for the first, and ProQuest and SARI (national) for the second. From these, the university subscribes two national databases, respectively BDJUR and SARI.

Finally, it was intended to know whether respondents had participated in any of the Information Literacy sessions provided by the university library. Results show that nineteen (N=19) of them participated in those training sessions, with six (N=6) having assisted to more than one session, as can be seen in Graph 7:

Graph 7: Assistance to Information Literacy training sessions

There appears to be a direct relationship with the assistance to training sessions and the regularity and intensity of use of the platform, while the results also show that respondents within the Law Studies area,

although attending to the training sessions and having regular search practices, can't find the contents they need within *B-on*.

## 5. Conclusion

*B-on*, as a major database's and scientific research service's platform, is a new reality in Portucalense University. During the first year of subscription almost 5.500 requests were made, mainly from individuals whose research interests rest on the area of Psychology. It appeared as an innovation on the research practices of the university members, as shown by the initial enthusiasm that led to a great number of requests during the first months, aided by the assistance to its first information literacy training sessions. As an innovation, not all teachers and researchers have yet become aware of its importance, or even existence, but those who did have started to integrate it in their habits and practices, both for learning and research activities. Some of the university members don't seem to find in the platform the kind of resources they need, and this applies mainly to those whose research interests lie on Law and Economic Studies, areas where the platform is not so strong, mainly when referred to national publications.

This study brought up to light three main evidences:

Evidence 1: the use of *B-on* is not yet sufficiently widespread within the faculty members, but satisfies those who use it and must be more divulged; The spread implies more publicity and more training sessions, not only deepening but introductory;

Evidence 2: not all areas taught and researched at the university are duly covered by *B-on*: Law Studies, but also the area of Economics/Finance don't find in *B-on* a satisfactory response to their specific needs. The solution to this lack of resources must be found by the managers of *B-on*, but meanwhile obliges the university to subscribe specialized databases, so that the needs for learning and researching in these fields are granted.

Evidence 3: university members rely on the university library and its librarians to help them with their research problems; still, the library needs to offer the researchers more information literacy training sessions and other types of support.

Evidence 4: further research is needed to deepen the findings of this first survey, as well as a continued monitoring of the statistical reports provided by the database; another survey should be applied by the beginning of the academic year of 2014/2015, with questions leading to a qualitative analysis of the results.

As an evidence-based research applied for the purposes of decision making, this is the first step of a continued process, intending to improve the research and learning process at Portucalense University and insure an effective return of the investment implied in the subscription of a major platform like *B-on*. The search for good practices as a way of increasing the use of the platform and the development of more Information Literacy sessions will be the next step, as well as the continued analysis and evaluation of the use of the tool, namely to understand the real impact of the platform in the research and learning practices of the university members; that includes students, who were not inquired through this survey. The alert provided by the less satisfied researchers with the platform contents must as well be considered by attempts of influencing the policies of *B-on* consortium managers and, meanwhile, by continuing to subscribe smaller databases on those less contemplated contents.

# The power in digital literacy and algorithmic skill

Mária Csernoch<sup>a</sup>, Piroska Biró<sup>b</sup>

<sup>a,b</sup>University of Debrecen, Kassai út 26. Debrecen 4028, Hungary

## Abstract

We argue that in educational contexts ICT (Information and Communications Technology) and CS (Computer Sciences) should not be separated. To support our ideas, we present methods related to the minimalist principle with which students with different interests would develop algorithmic skills even in an ICT environment, and this introductory phase would lead the students on to more serious CS studies. The core of these methods is that from the very beginning of CSI education algorithms should be looked for in every computer-related problem. Deep-approach metacognitive methods should be applied, instead of uncontrolled sequences of surface-approach metacognitive activities such as aimless clicking, unplanned wandering, and relying on the newest features in graphical user interfaces (GUI). Our team has developed a deep-approach metacognitive method for teaching spreadsheet to novices, which is in accordance with the concept of building algorithms to solve computer-related problems. The three cornerstones of the method are (1) introducing as simple and as few functions as possible, (2) building multilevel formulas based on these functions, and (3) focusing on the problem instead of the features of the software. As the students make progress, the number of functions would be increased, but general purpose functions would still be focused on. Testing our deep-approach method has proved that it is a lot more effective in teaching spreadsheet than the classical surface-approach, wizard-based metacognitive methods, since all the basic elements are in accordance with the minimalist theory, which advises teaching as simple a language as possible for beginners to develop basic algorithmic skills. Beyond the direct advantages of the method, spreadsheet would serve as an introductory language to high level programming languages, which is our ultimate goal.

## 1. Introduction

Digital competency and digital literacy have been among the most popular expressions featuring in the curricula of the last few years, and the effect of both of these on different generations – the Y and Z generations of digital natives (the bit-generations) and the X generation of digital immigrants (Dani, 2013; Jukes, McCain & Crockett, 2010) – is one of societies' main concerns. We must give some consideration to these newly coined expressions and some background information related to them. First of all, the most important point is to emphasize that in order to develop digital competency effectively and efficiently, and to achieve digital literacy, formal education is needed. For formal education, teachers are needed, and for teachers, teacher education is needed. At this point the loop is closed, and we face the chicken and the egg problem: who teaches the teachers if there are no teachers? In Computer Science/Informatics (CSI) education this is one of the most crucial questions and for an answer we have to look back in time to the emergence of the subject. The contradictions, both of the science itself, and of the developing commercialized world as it interacted with the science, have affected both teachers and teacher education and consequently the development of digital literacy.

The pioneer teachers were self-educated, in most cases not supervised, and if so, certainly not by experts in the methodology of the subject, because it did not exist. These first teachers mainly taught programming languages, algorithms, binary arithmetic, and computer architecture. Over time they became accepted in their local environment, whether they were qualified or not; they used methods they had developed themselves, without proving their efficiency or effectiveness, due to a lack of time and methods.

In the meantime, computer science developed at an incredible speed, and the new mouse-based graphical user interfaces (GUI) increased the number of users and changed the approach and attitude towards computers. Everyone started to use computers regardless of whether they had any background knowledge, and software developers encouraged them to do so. These companies claimed that by using the GUI and its accompanying wizards the users would be able to solve problems. Users need do nothing more than click here and there and they will find the solution.

E-mail address: csernoch.maria@inf.unideb.hu

Even teachers fell for this, and giving up the teaching of algorithms, switched to aimless clicking, not looking for the algorithms in these new programs; consequently they stopped developing their own and the students' algorithmic skills.

### *1.1.Fiasco*

#### *1.1.1.Facts and results*

Recent studies have found that more than 90% of e-documents have errors (Panko & Aurigemma, 2010; Tort, Blondel & Bruillard, 2008; Tort, 2010, Csernoch & Bujdosó, 2009; Csernoch 2010), and uneducated computer users cause serious financial losses by providing unreliable data and by taking much more time than problems require (van Deursen & van Dijk, 2012). Along with these findings, other publications have provided evidence that these mistakes are due to a lack of algorithmic skills and thinking (Angeli 2013; Panko & Aurigemma, 2010; Biró & Csernoch, 2013a, 2013b). However, the Students On Line session of the PISA 2009 survey proved that computer usage in schools does not necessarily increase the level of digital competency (OECD, 2011). This ambiguity clearly indicates that we have serious problems with the methods employed to teach CSI in most countries. Faced with these problems, countries have reacted in different ways. In the United Kingdom in 2012 the number of computer classes was increased, in order to focus on the development of the algorithmic skill, while in Hungary the number of CSI classes was reduced in the 2013 Core Curricula. In 2012 France introduced Informatique et sciences du numerique (ISN) as an optional subject in the science track for the 12th grade. Despite this, no more than one sixth of French students study CSI only for one year. Who is right? Which path should be followed? Which are the most effective and efficient ways to improve?

The answer lies mainly in the characteristics of the science. The problems of CSI education emerge from the particularities and contradictions of the science, namely that it is:

- a new science without any direct predecessors,
- a science developing at a speed previously unknown in any other science,
- a science with its own commercialized word developing around it, and
- a science operating in the context of the pressures and the needs for computer usage and for information.

In this heavily industrialized science, researches and teachers have to find methods to develop basic algorithmic skills which are effective, efficient, and last but not least, acceptable to the different generations of computer users.

#### *1.1.2.ICT is blamed*

Recent reports indicate that office packages are to blame for this fiasco, and they should be banished from CSI courses. One of the most extreme views is Gove's, who states that "Instead of children bored out of their minds being taught how to use Word and Excel by bored teachers, we could have 11 year-olds able to write simple 2D computer animations using an MIT tool called Scratch. By 16, they could have an understanding of formal logic previously covered only in University courses and be writing their own Apps for smartphones." (Gove, 2012).

In our opinion, even these 11 and 16 year-olds should be able to create error-free e-documents. Gove is mistaken when he thinks that CSI classes should not teach how word processing and spreadsheet. These classes should teach the structure of documents and formulas, and the algorithms behind them. Actually, these programs are quite challenging. Typing and aimlessly clicking on the surface should be banished, not the programs themselves. In general, office packages are harmless. They are programs which operate on algorithms, and we have to find and teach the algorithms behind these programs. Those teachers who find these programs boring and make their students think the same are effectively saying that they themselves never have looked for these algorithms.

### *1.1.3. Surface-approach metacognitive processes – reasons*

Our team has launched the Testing Algorithmic and Application Skills (TAaAS) project in the 2011/2012 academic year. In the TAaAS project we tested the Informatics knowledge and the usage of terminology of freshmen students at the Faculty of Informatics of the University of Debrecen, Hungary on the first week of their arrival.

In the TAaAS project it has been proved that most of the computer related activities are metacognitive processes (Biró & Csernoch, 2013a), because users are supposed to read and understand the signs and messages of the GUI and the wizards, and they must make their decisions on the basis of the information offered. However, the results of the TAaAS project clearly indicate that in most cases users adopt trial-and-error driven solutions (TAEW, Trial-and-error wizard-based) (Csernoch & Biró, 2013a), mainly because they do not understand and are not interested in the messages provided by the software. Consequently, these methods of creating e-documents can be categorized as surface approach methods, and such as they are not sufficient for problem solving, and consequently, developing digital competency, digital literacy, and algorithmic skills.

Several other consequences of the teachers' choice of the TAEW-approach could be reported, but we must emphasize one which has far-reaching consequences: the method is not suitable for measuring the students' knowledge (Csernoch & Biró, 2013b). The tests of the TAaAS project have also revealed that the teachers hardly know any more than the students, and more disconcertingly, they are not able to judge the students' knowledge (Csernoch & Biró, 2013b).

Similar results were found by testing the students' and the teachers' programming skills (Biró & Csernoch 2013a). The results of the test clearly show that both the students, and more unfortunately, the teachers, have problems with tracking codes both in programming and spreadsheet. After seeing the teachers' results it is no wonder that in general they are not able to develop the algorithmic skills of the students. The other surprising and disappointing result of the test is that those who passed the middle level graduation exam – where knowledge of office packages is tested on computer – have not been helped in developing their algorithmic skills. The results of the test are in accordance with our findings, considering the different metacognitive approaches in teaching computer applications and programming (Csernoch & Biró, 2013a, 2013b). Based on these tests, it is clear that in order to develop algorithm skills, digital thinking programming and applications should not be separated from each other, because computer related problems – the problems of the digital world – are based on algorithms.

## **2. Results**

### *2.1. Deep-approach metacognitive processes*

To solve the problems of the digital world algorithms have to be built and these algorithms have to be coded. The methods which support this approach are entitled Computer-algorithmic And Debugging-based methods (CAAD) (Csernoch & Biró, 2013a, 2013b), and are classified as deep-approach metacognitive processes (Case & Gunstone, 2002, 2003; Case, Gunstone & Lewis, 2001). The CAAD approach can be applied to any computer related problem. We have developed and tested CAAD-based methods for solving spreadsheet (Csernoch, 2012; Csernoch & Biró 2013a) and word processing problems (Csernoch, 2009). In both cases the primary aims of the methods are that in advance of the actualization of the problem the algorithms have to be created, and, based on the algorithm, the coding process follows (Biró & Csernoch, 2013a, 2013b, 2014). With spreadsheet, since it is classed as a functional language the coding process is more closely related to other programming languages, while in word processing the coding in the planned order is carried out by clicking on the command buttons, filling in the fields in GUI.

### *2.2. Theoretical background to the CAAD-based approach*

The core of our CAAD-based method is based on the following theories:

- the Minimalist theory (Carroll, 1990; Nielsen, 1993; Warren, 2004),
- the Guided-instructions theory (Kirschner, Sweller & Clark, 2006),
- Phenomenography (Booth, 2001),
- Constructionism (Papert & Harel, 1991).

In the following chapters the implementation of these four theories are discussed in detail in the context of the spreadsheet environment. We argue that based on these theories efficient and effective methods for developing algorithmic skills would be created in the ICT environment.

#### *1.1.4. Minimalist theory in the spreadsheet environment*

From time to time, the most popular software publishers release new packages on the market boasting new features, which are of course more powerful than their predecessors. Spreadsheet programs, in addition to these new features, introduce new functions, specialized to solve specific problems. However, on one hand, these new functions make the program more difficult to use and understand for novices, while on the other hand, there is no way to prepare a general purpose spreadsheet program to solve all the world's problems, so there can never be enough upgrades. All these efforts are in vain.

According to the minimalist theory, we can teach spreadsheet to novices with as few and as simple functions as possible (Table 1, Group 1), and along with these functions we can teach how to build algorithms to solve more demanding problems, focusing on the problem, not on the software. Simple functions have two characteristics; (1) they are general purpose functions, and (2) they have only a few arguments. The other tool to solve problems using these simple general purpose functions is the creation of multilevel functions. Building multilevel functions can be well demonstrated by the popular Russian (matrjoska) dolls (Fig. 1). The encapsulated functions behave in exactly the same way as the encapsulated dolls do:

we start building the multilevel function with the innermost function, outside it comes its hypernym, whose one argument – the input – is the output of the innermost function, this relationship between hyponyms and hypernyms continues until we reach the outermost function, the output of the outermost function is the output of the multilevel function.

Table 1. Three steps of introducing general purpose spreadsheet functions

Step 1	Step 2	Step 3
SUM()	MATCH()	SMALL()
AVERAGE()	INDEX()	LARGE()
MIN()	ISERROR()	AND()
MAX()		OR()
LEFT()		NOT()
RIGHT()		ROW()
LEN()		COLUMN()
SEARCH()		OFFSET()
IF()		TRANSPOSE()
		ROUND()

Fig. 1. Russian (matrojska) dolls simulating the encapsulation of functions in a multilevel function

Nielsen in 1991 and Warren in 2004, claimed that spreadsheet programs fulfill the expectations of the minimalist theory but neither of them provided further details or methods. As has been mentioned in section 1.1.3, the mere existence of a spreadsheet program does not in itself fulfill the requirements of the minimalist theory. However, a CAAD-based approach to spreadsheet, as outlined in this chapter, would be the right tool to do this.

### 2.2.1. Guided-instructions theory

Kirschner, Sweller & Clark's (2006) paper gives details regarding why it is that minimal guidance during instruction does not work. The reason is simple: very little is stored in long term memory. This finding is in accordance with our CAAD-based approach.

With spreadsheet the CAAD-based approach means that algorithms have to be built both at workbook and formula levels. For novices we focus on the formula level. At this level we teach a small number of general purpose functions (Table 1) and how to create multilevel functions to solve problems (Fig. 1). Again, with these two tools and heavily guided instructions at the beginning we can develop the basic algorithmic skills of the students, and later on, based on this knowledge the students will be able to free themselves from the teachers' strict guidelines and solve problems on their own. However, we have to emphasize here that creating spreadsheet formulas requires algorithms and the methods for creating formulas have to be learned. Clicking and wandering

aimlessly in a huge program will result not in any knowledge entering long term memory but rather frustration, boredom, and error-filled documents. With guided instructions for novice spreadsheet end-user programmers, beyond the direct advantages of developing algorithmic and debugging skills, we can teach our students how to reduce the tendency to produce errors in spreadsheet documents.

The other importance of guided instructions at the beginning is that spreadsheet languages, since they belong to the group of functional languages, would serve as introductory programming languages which lead on to high level programming languages. This is one of the reasons that in teaching spreadsheet we have to use the same already proven methods of teaching programming languages.

### *2.2.2. Phenomenography*

Marton and Booth (1998) proved that learning has two aspects that are inextricably intertwined: (1) the “what” aspect, which refers to the content of learning, and (2) the “how” aspect, which refers to the way in which learning takes place. It has been empirically established that whatever it is that learners learn (the “what” aspect), a qualitative variation is to be found in the outcome, and, correspondingly, whatever learning tasks are undertaken (the “how” aspect), there is a qualitative variation in the ways the learners approach them, or go about them. There is a degree of consistency in the nature of the variation in the “how” aspect in that there is an overall pattern of deep and surface approaches. A deep approach to a learning task is characterized by the learner's intention of finding meaning in the content through tackling the task, whereas in a surface approach focus is rather on meeting the demands of the task as such.

The learner's experience is always one of learning something, in some way, and in some context; by holding the learner's experience of learning as the focus of study throughout – and not studying the learning of the content and the acts and the context as separate and distinct focuses – the content, the act, and the context remain united as constituents of the learner's experience.

In 2001 Booth detailed and provided examples of their phenomenon. She claims that the first form of learning might be exemplified, in computer related activities, by acquiring further aspects of a partly-known programming language, or learning to write programs in yet another imperative programming language, or by learning to work in another new operating environment, or acquiring mastery of a particular set of techniques. The second form of learning, characterized rather by seeing things in a new way and bringing new perspectives to bear on things, is more like learning functional programming or object-oriented programming when hitherto only imperative programming has been encountered, and having to approach problems in quite a new way, having to consider new structures, and to develop new ways of understanding.

In a simplified way, we can say that Marton and Booth found that those methods which focus only on content and in which students cannot see the outcome of the learning experience are not effective enough. It is like not seeing the wood for the trees. Students are lost in the technical details and cannot grab the main idea. In Warren's wording (2004) this concept is expressed in the following form: “There is a need for an approach that allows the Computer Science issues to be in the foreground and the language issues in the background.” In a human computer interaction (HCI) the problem, the programmer should be the focus of the activity, not the language, the software, the environment, or the hardware.

Marton and Booth's theory can easily be adapted to spreadsheet environment. However, using TAEW-based surface approach methods in spreadsheets the primary aim of the processes is to find a suitable function. But it should not work this way: first the algorithm has to be built and then we have to apply tools to code our algorithm. The tool is already provided in section 2.2.1. This method is in accordance with Booth's second form of learning: students gain experience in a functional language with a perspective towards other high level programming languages.

Booth's first form of learning is present in at least two different forms in spreadsheet. First of all, in the direct environment, where despite being familiar with only a few functions, demanding problems could be solved. Furthermore, the ability to solve problems in a spreadsheet environment might lead to similar problem-solving abilities in other programming languages.

In general, we state that the goal of learning spreadsheet is not to learn functions but to solve problems. The functions are only tools which are needed for coding; consequently, they should not be the primary target of the learning process. In most Informatics course books long lists of spreadsheet functions are presented, like in a reference book, suggesting that students have to learn these functions. The whole process should be the other way around: problems should be presented in these course books and the functions should only play a minor role.

If we teach only a few simple and general purpose functions along with the methods needed to build multilevel functions

the functions can be easily remembered and

both the functions and the building of multilevel functions can be adapted to other programming languages.

In this concept both spreadsheet course books and spreadsheet classes should use authentic tables instead of typing and creating artificial tables during the class. The hindrance caused by typing tables in a learning spreadsheet environment has far reaching consequences. Here, we find the connection to the next theory: artificial tables will not provide data and consequently there will be no need to construct them. Again, interest is lost. In a spreadsheet environment we have to convince the students that they “desperately” need this piece of software; they have to see the power in this program from the very beginning.

### 2.2.3. Constructionism

Neither phenomenography nor constructionism support typing data sources in introductory application classes. The unexpected consequences of typing tables in introductory spreadsheet classes are listed below.

- Typing is boring. Students get bored at the very beginning.
- Typing is not Informatics. Consequently, typing steals time from real Informatics.
- Typed data is uncontrollable. Students type at different speeds and with different abilities. Consequently, the results are hard to use in a classroom environment.
- The amount of data is not sufficient. Consequently, students will find that creating spreadsheet for such a small amount of data is a waste of time.
- Manually typed tables are not challenging enough. No one is interested in information retrieval in a short and boring table.
- Students cannot see the power of a spreadsheet through typing. Consequently, they lose interest in it before they become familiar with it.

Learning and using applications should be a creative occupation. That is where the constructionism theory has its role. If we use authentic source documents for information retrieval and if we create documents which would communicate the desired content, these processes are nothing else but a construction of information or sources of information. Although these documents do not necessarily reach the wide public, the students in their micro community – even in a class – do construct something which has a value, the value of information.

### 2.2.4. The actualization of CAAD in spreadsheet

Based on the theories outlined in the previous chapters we have developed a deep-approach CAAD-based metacognitive method on the formula-level of spreadsheet programs. The method is applied to a rarely used but powerful feature of spreadsheet, namely the Conditional Single Result Array Formula (CSRAF). This feature of spreadsheet programs requires

knowledge of a few simple and general purpose functions – minimalism,  
 knowledge of how to build multilevel formulas – constructionism,  
 complete guidelines from teachers at the beginning – guided instructions,  
 meaningful, usually authentic tables with a huge amount of data – phenomenography,  
 the teachers’ choice of demanding problems at the students’ level – constructionism, phenomenography,  
 students’ awareness of problems – constructionism, phenomenography.

Through the course of the application of CSRAFs, spreadsheet programs

- serve as a tool for building algorithmic skills – phenomenography,
- serve as an introductory language to high level programming languages – phenomenography,
- serve as an environment for solving demanding data retrieval problems – constructionism, phenomenography,
- serve as an environment for debugging formulas – guided instructions, constructionism, phenomenography,
- serve as a tool for lowering the number of error-filled documents – guided instructions, constructionism, phenomenography,
- increase students’ confidence – constructionism, phenomenography,
- increase students’ skills in handling problems – constructionism, phenomenography.

It has been proved with the tests conducted on the TAaAS project that one of the main reasons for error prone documents is the almost exclusive usage of TAEW-based methods, especially in the learning stage. Based on these theories we switched to a CAAD-based method whose focus is the building of CSRAFs. The method was first applied to gifted high schools students participating in application competitions. The students’ results in these competitions improved a great deal. Encouraged by the results of the competitions we applied the method to a couple of normal Informatics classes, and it also worked.

### 2.2.5. Students’ development in a CAAD-based environment

The first tests of the method were carried out with university students in the academic year 2011/2012 and were repeated in the following two years. The students were tested three times.

- The first stage of the test was carried out at the beginning of the students’ tertiary studies, with students who

had previously studied spreadsheet with TAEW-based methods in elementary and high schools.

Consequently, in terms of the methods with which the students were familiar, at this stage there was no difference between Group1 and Group2.

- The second stage of the test took place immediately after students had covered spreadsheet with a CAAD-based method (Group1).
- The third test was applied one year later, testing students who had covered spreadsheets with CAAD-based (Group1) or TAEW-based methods (Group2).

In all three tests we were focusing on the methods the students used to create spreadsheet formulas. In the first test the students' results were extremely low, below 5% on average (Fig. 2.). In the second test the results of those students who covered spreadsheet with the CAAD-based method increased to above 60% (Fig. 3, left). In the third test the question was what knowledge is stored in long term memory. It was found that those students who learned with the CAAD-based method had results around 40%, while those who used the TAEW-based method were still unable to solve these problems (Fig. 3, right).

Fig. 2. The students' results in the first TaaAS test in September, after covering spreadsheet with TAEW-based methods in elementary and high schools

Fig. 3. The students' results in the second test, after covering spreadsheet with the CAAD-based method (left), and in the third test, in next November, one year after covering spreadsheet with CAAD- or TAEW-based methods (right)

The other goal of the test was to detect whether the CAAD-based method made the students switch to the multilevel formulas instead of using the error prone built-in functions or, based on their previous 6–8 years of studies, they still stuck to the built-in functions.

It was found that the students using the CAAD-based method almost exclusively switched to the multilevel CSRAFs, while in the other group some students preferred the CSRAFs formulas. Their solutions, due to the lack of guided instructions, were not correct, but the traces of multilevel formulas were recognizable.

As was mentioned in section 2.2.5, the method was first introduced to high school students, and their ability to solve spreadsheet problems improved significantly; however, their improvement was not tested directly, but observed through their results in competitions.

Similar improvements were registered by testing 8<sup>th</sup> grade students studying spreadsheet with a CAAD-based approach, in comparison with 8<sup>th</sup> grade students studying with the popular TAEW-based method (Majláth, 2013). All these findings mean that the method can be applied to the different levels of the education system.

### 3.Summary

It has been proved in the last couple of years that more than 90% of spreadsheet documents carry mistakes, and uneducated computer users cause serious financial losses by providing unreliable data and by taking much more time than problems require. It has also been proved that surface approach metacognitive methods are not effective and efficient enough to develop the skills required to solve spreadsheet problems. Even though the minimalist theory claimed in 1993 that spreadsheet languages would be perfect introductory languages, methods have not been developed. The reason was that the minimalist theory on its own was not enough to develop a method which would be used in education; three additional theories – guided instructions, phenomenography, and constructionism – had to emerge.

Based on this theoretical background we have developed a deep approach metacognitive method – the computer-algorithmic and debugging (CAAD) based method – for solving computer related problems, especially those within computer applications. In spreadsheet programs the tool which fulfills all the requirements of the CAAD-based method is the conditional single result array formula (CSRAF). The core of this method is that we use as few and as simple general purpose functions as possible, and develop the technique necessary to create multilevel functions.

By testing the method it was found that it is much more effective and efficient than the widely used and commercialized TAEW-based methods. The students using the CAAD-based method prove to be more confident and safer in creating spreadsheet formulas. Beyond this primary result, our tests also proved that with the CAAD-based method the students' algorithmic skills have developed, and that knowledge is stored in long term memory. Nielsen's prediction of the power hidden in spreadsheet and his suggestion to use spreadsheet as an introductory programming language has been proved with our CAAD-based method.

---

## Abstract

The Higher Education in Brazil from 1990 was marked by reforms that attended to the imperatives of the international agencies, in particular the World Bank that had a fundamental part in the dissemination of the neoliberal guidelines. This article raises questions in the current reform of the Higher Education in the country, emphasizing the expansion of private education, the investments in long distance courses, and the precarious situation of the teaching work. The results point to production-driven and meritocratic tendencies which reign in the education in detriment of research, demonstrating that the demeaning work conditions that demand an excessive workload of bureaucratic and administrative tasks, distancing themselves from the first function which is to build and disseminate critical knowledge.

*Keywords:* Higher Education; teaching work, mercantilization, private education, reforms

---

The data show the expansion process of the Higher Education and in neoliberal context, earn new rationality, established through the extension of the private sector and the internal privatization of the Higher Education state institutions. The teaching work suffers directly from the consequences of this expansion and mercantilization of the Higher Education through the incorporation of the managerial logic in work conditions, differentiating from public and private institutions. It states that while in public institutions of Higher Education the faculty work full time and have a doctorate title, in the private institutions they are generally hired by the hour and have a master's degree.

## *The paths of Brazilian higher education*

Higher Education in Brazil was marked in the 1990's by reforms that attended to the demands of international agencies, specifically the World Bank which had a fundamental part in the dissemination of many guidelines that founded the neoliberal hegemony. With the proposal of the state reform elaborated by the Ministry of Administration and Reform, it was sought to put into practice the redefinition of public and private spheres through the appearance of a new concept, the "non-state-owned public". The minister Bresser Pereira defended the trick alleging that it would be necessary to modernize public administration making it more efficient under market criteria.

This way, in the MARE Director Plan (1995), education, in all of its levels, basic, grade, high, or higher was placed in scope of the non-exclusive State activities; in other words, it could be transferred and better executed by the economic point of view through the "non-state-owned public". This process is erroneously called "publicity", where traditional teaching institutions organize themselves under a new legal form, the social

---

## Introduction

This article means to analyze the Higher Education in Brazil during the last years, pointing to the paths taken, the present tendencies, and the changes that interfere in the teaching work. This is a bibliographic research complemented through the analysis of data through the Higher Education Census published in 2012.

\*Corresponding author. Tel.: +0-000-000-0000  
Email address: lorenafportes@gmail.com

organizations that would celebrate the management contracts with the State who would reduce their part as direct service providers, maintaining themselves regulator, provider and promoter.

In this scenario, the private institutions started to “negotiate” education transforming the right to education in a service that should be “bought” on the Market. This denounces Chauí (1999, p 01) for “ the Reform shrunk the democratic, public space of rights and increased the private space, not just where it would be predictable- in the activities connected to economic production, but also where it is not admissible- in the field of conquered social rights”. The historic struggles of the Brazilian society made the guarantee to the right of education as a State duty, as specified in the Federal Constitution of 1988. In Higher Education, the classic universities transform themselves into functional universities, as highlighted by the author, aimed to the fast training of professionals requested with highly qualified labor for the job market.

Adapting themselves to market demands, the university changed its curriculum, programs, and activities to guarantee the professional insertion of students on the job Market, each time further separating instruction and research. While the classic university was aimed to knowledge, the functional university was aimed directly to the job market. (CHAUÍ, 1999, p. 04).

From functional it started being operational, governed by management contracts evaluated by productivity indices, calculated to be flexible, with an emptying formation process, reducing training to recycling, annulling the possibility of criticism to the *status quo*.

The reform process in the Higher Education in Brazil presents a managerial culture, especially in federal universities. According to Netto (2000) one of the greatest traits of this culture is the logic in rationalizing resources, from which the State ceases being the main provider in social politics specifically in Higher Education, turning over the responsibility to the market with the intent of saving expenses from state machinery. This perspective makes financing through public-private partnerships possible and places graduate school and research in the interest of private organizations.

Another outstanding factor is the management’s direction towards results from which the evaluation plays an important part in the accreditation in Higher Education Institutes for the realization of its autonomy and resources received. In the same line of efficiency and optimization of financial resources, it acts as a limit to flexibility. From the elimination of the single legal system, public contest, and exclusive dedication to teaching, shorter and more economic contracts are preferred. The results are the “temporary” faculty contras in a precarious work condition. In managerial logic, quality is built and founded in competition and meritocracy; quality cannot be restricted by all universities, concentrating itself in a few centers of excellence.

In Brazil, the configured option in the Bresser Plan, in establishing the expansion of Higher Education for private education institutions, presented in public universities the tendency to commercialize teaching. As an example we can observe the growth in paid graduate *lato sensu* courses. Maroneze and Lara, in their studies about the challenges of political and personal education, explain that teaching has not become immune to the transformation in social relations of production that characterized the last few decades in the XX century.

It can be affirmed that the new social relations assumed in the capital’s financial globalization context established changes in the field of education shaping a visible devalued and precarious work frame which is manifested in compliance with the current restructuring of the productive sector and redefinition of State intervention. (MARONEZE E LARRA In LARA E DEITOS, 2012, p. 119)

Bosi (2007) conducted a survey about the precarious teaching work in the IES (Higher Education Institute) from ample research from different bibliographies about the mercantiliBzation of Higher Education (Pinto, 2002; Amaral, 2003; Chaves, 2005; Silva, 2005) and a generalized view from the professors. He considered precarious teaching work to be the teaching routine activities, research, and extension that composes the academic activities in Brazil, articulating data related to the IES of the public sectors (federal, state, and municipal) and private (community, religious, and private)

According to the author, the main changes happening on the job market that involve the faculty activities are situated in a crisis of accumulated capital occurred on international scope, in the beginning of the 1970’s (BOSI, 2007). The 1990’s inaugurated an educational model encouraged by the reduction of state functions through the minimization of economic, social, and educational investments and the opening of a vast and promising field of private initiative.

The successful Brazilian governments of Itamar Franco and Dilma Rousseff adopted as a principal of their neoconservative politics, for financing education, the strategy of financial funds, aiming to minimize the negative social impacts on the supply of education, giving the impression that from there it would reach by itself the condition of redeemer of problems derived from poverty. (COUTINHO, 2012 p 148.) It was from that

moment that the modality of public spending in education in the country began idealized under the acquiescence of national and international governments.

The process of privatizing, especially on the educational scope, opened precedents of the lack of responsibility of the State, resignifying the public, private and state concepts. In this sense, the Higher Education represented a great possibility of investments and financial success for the capital. Proof of this was the immense growth and mercantilization in Higher Education. One of the strategies of this expansion is long distance courses.

The delivery of Higher Education to the private sphere demonstrates the integration of the educational politics to the management of international agencies, making itself a more promising field on the market. According to Sousa Santos (2004, p. 27) “more profitable than the London Stock Exchange (...) more than double the world automobile market”, Higher Education has been very promising for profit. Data from ILAEE (2004), cited by Koike (2009, p. 205) show that the financial investments in Higher Education, in 2003, were of R\$45 billion and for the companies that negotiate in the profits sector, it was of R\$15 billion.

Analyzing the reform of the Brazilian State is a managerial logic that interferes with the politics of Brazilian Higher Education. Netto (2000) presented five traits of this interference that are not only projective, but are evidenced in the current reality.

The first trait is the shameless preference towards the expansion of privatism, a movement that installed itself in a period of military dictatorship, transforming Higher Education into a field of capital investment. The second trait is the liquidation in the academy of the teaching/research/extension relation being made evident in the separation of this trivet. LDB (Law of Guidelines and Basis of National Education) even makes way for this disjunction, as long as it is clear that not all Higher Education is responsible for research. The third trait is the suppression of the universalistic character of the university. As the fourth trait is the suppression of the university's goals towards market demand, making this one of the references for academic life because it starts to legitimize the university effectiveness. Lastly, the fifth trait is the fall in the degree of university autonomy to the rise in financial autonomy. It's transformation in organization also represents suppression of faculty autonomy making a faculty career more flexible.

It should be mentioned that the expansion and growth of Higher Education, disguised by the “democratization and access to education” speech, has deconstructed the public Brazilian education as a social right. The reforms in Higher Education and the measures taken by the Cardoso government and strengthened by the Lula government demonstrated this deconstruction. Since 2003, the Lula government implemented Interim Measures, Law Projects, Decrees indicating that a renewal in Higher Education was a priority on his political action agenda, says Lima (2012). Some of these programs include: The University for Everyone Program – PROUNI (Programa Universidade para Todos), The Restructuring of Federal Universities Program- REUNI (Programa de Reestruturação das Universidades Federais), the Financing Fund for the Higher Education Student- FIES (Fundo de Financiamento ao Estudante do Ensino Superior), and Distance Learning- EAD (Ensino a Distância)

These measures made the entrepreneurship of education evident in three ways, as Lima points out (2012): a) the rise of the IES number with the expansion of private schools, remaining in the tendency of privatism to Higher Education; b) the privatization in public universities, expressed by the sale of “educational services”, such as paid courses and partnerships between companies and public universities; c) the productivism that crosses and conditions the politic of research and postgraduate studies: this process makes evident the subordination of science towards mercantile logic, motivating competition and pragmatic entrepreneurship where the process of producing new knowledge is linked to company competition.

On these terms, education ceases being public politics and the institutions of Higher Education, particularly universities, start playing another part of not constituting as a space of knowledge production, debate, training of professional critics with a theoretical and competent technical base (PINTO, 2012.).

The unfolding of this movement to Pinto (2012) is a profound change in the teaching work, identifying three main components of this change a) fragmentation of the classification among faculty, distinguishing themselves among those who research and those who teach; b) precarious work due to the increase of the class load, number of students, integration of tasks as criteria for compensation and the absence of wage policy; c) wage compensation related to productivity, whose criteria is defined by external demands.

This State reform and privatism of social rights movement, transforming them into goods is disguised by speeches of democratizing access to Higher Education, elevating the educational level for the Brazilian population and strengthening democracy. However, in what conditions is this access being made available? To whom? With what quality? With what resources?

This opens to an extremely profitable field which is long distance learning and private, live classes. What is the State's part in this expansion? The private sector to maintain and be able to get this expansion needs state intervention through public resources to finance directly or indirectly the private institutions. As Davies (2012) points out the “tendency is create a “captive” bourgeoisie in the reception of the most meaningful volume of

resources”. Proof of this is the disguise of the private institutions under the veil of philanthropy, since most of the greatest private IES in the country do not declare profit.

It should also be mentioned that the impacts of this commercialization for training professionals: downplayed formation voted towards market interests, providing tools for Higher Education, stepping away from solid and critic formation, and the tendencies that outline the functionality of Higher Education in Brazil.

This way we watch Higher Education dissemble by means as it tends to follow the doctrine of loosening activities, the faculty career, the lack of necessity of scientific research, fragmentation of fields of knowledge. This university, says Chauí (1999 p. 07) “does not make nor create the curiosity and admiration that leads to discovery again, it annuls all pretenses of historic transformation as a conscious action of human beings in materialist determined conditions”.

This process brings consequences in the faculty’s work in Brazilian Higher Education. The proposal of management flexibility in Higher Education institutes have favored more agile and economic work contracts, such as “temporary”, “precarious”, and “substitutes”; the teaching is made flexible through shorter courses, a quickening in formation and in curriculums, the growth of long distance learning; new attributes are aggregated to the teaching work, with the responsibility of fundraising, creating an excessive workload, the evaluation practices are developed more and more on a productive-driven path, adding to the teaching work an undetermined number of procedures, such as reports, filling out forms, providing data for information systems, emitting opinions; a competition is created among the professors, by the institution of managerial quality at work, founding itself in competence and merit, therefore dismantling the collective dimension of work. (MANCEBO and FRANCO, 2003)

#### *The teaching work in higher education in Brazil*

It has been noted in the most recent periods in Brazil through analyzing data from the Higher Education Census in the last few years that is it a growing tendency related to faculty who establish a capitalist relation when compared to those who are State Workers. In relation to the degree of training, data shows that 362,732 current teaching posts, 93 are carried out by teachers without a university degree, 10,745 with a university degree, 95,589 with a specialization, 141,218 with a master’s degree, and 115,087 with a doctorate degree. In comparing with the 2011 Census there was a growth in the masters and doctorate degrees.

However, when compared to the data between the public and private institution, the reality is quite different. In public schools, 19,838 teaching posts are carried out by faculty with a specialized degree, these numbers rise significantly in private schools with a total of 75,751. In relation to the master’s title, in public institutions, the total is 44,536 while in private institutions it is 96,682. Teaching posts carried out by doctorate faculty in public institutions symbolizes 77,298 and in private institutions 37,789.

It can be affirmed through this data that the professors of Higher Education in public institutions have a more representative title of masters and doctorate degrees, while in private schools their titles are specialists and masters. In the work regime of the 150,338 current teaching posts in public institutions, 120,443 are characterized by a full-time workload, 19,501 by a part-time workload, and 10,395 by an hourly wage workload. In private institutions, of the 212,394 current teaching posts, 51,372 are a full-time regime, 72,512 are a part-time regime, and 88,510 are an hourly wage regime.

The data reveals that while in private IES the “typical faculty member” has a master’s degree and an hourly wage regime. In public IES the “typical faculty member” has a doctorate degree and a full-time workload. It is clear that the faculty work conditions are differentiated between the public and private sector, indicating that the faculty in the private institutions does not have conditions to dedicate themselves in research and extension since they are on an hourly wage regime and are therefore restricted to teaching.

These discrepancies end up being legitimized by the legislation that governs the education in Brazil. The Law of Guidelines and Basis of National Education –LGBNE explains that only university institutions are legally obligated to scientific research and only in them is it mandatory the existence of “(...) at least a third of the faculty members with an academic title of masters or doctorate” and (...) a third of the faculty members with a full-time workload” (BRASIL, 1996, art. 52, I and II).

Supported by the legislation, the institutions, especially the private ones, end up neglecting the qualification of their own staff, hiring them for their titles, to attend to the minimum criteria demanded. Once they have assured the minimum required they do not try to expand their teaching staff with Master’s and especially, Doctorate degrees, conditions are not created for the faculty member to qualify and seek to improve their titles, which is up to the individual effort of each faculty member. The teacher training policies are fewer and fewer, being neglected by the private realm where the professors have little incentive and concrete conditions in which to qualify themselves.

The characteristics of Higher Education in Brazil clarify that the education institutions transit between the new Napoleonic and Neo-Humboldtian models. According to Sguissardi, (2004), in the first model, criteria and indicators predominate, such as a lack of structure from consolidated and recognized research and graduate *scripto sensu* studies; majority presence of faculty in part-time or hourly wage regime and without postgraduate studies qualification that qualifies them for research; isolation from units, almost exclusive dedication to teaching activities, administrative-academic structure directed towards teacher training. In the second model, on the contrary, criteria and indicators predominate such as, the presence of structures of scientific production and consolidated, recognized, *stricto sensu*, postgraduate studies; majority presence of faculty in full-time regime, and postgraduate studies qualification that qualifies them for research; integration of units around common educational and research projects; learning association, research and extension in different levels, administrative-academic structure directed towards teacher training and research training in most of the knowledge areas. (SGUISSARDI, 2004).

With this classification we could claim that it is not possible to think of just the Higher Education model in the Brazilian reality. What we can attest to and easily demonstrate is in the “presence of duality or suppositions of models” (p. 42). The new Napoleonic model predominates in private colleges, without any obligation of doing research or associating education, research, and extension. However, would the public institutions, the universities, be attending the criteria of the Neo-Humboldtian model? The author questions: how many of these institutions have consolidated structures for research and postgraduate studies? How many have faculty that work predominantly full-time and are qualified for research? How many implement to the association teaching, research, and extension in addition to the programs and *scripto sensu* graduate courses?

This way, Sguissardi (2004) affirms that from 1990 on Higher Education acquired more and more the content of a public and private model- *neoprofessional, heteronomous, and competitive*. Indicators of this model are evidenced by the expansion of the number of private IES, much more than that of public institutions; the evolution of the amount of enrollments in the private sector in relation to the public; the reduction of public financing; the insertion of competitive criteria between faculty/researchers in relation to a bonus for teaching motivation; the strengthening of economic competitiveness which would imply the innovation of products and processes linked to market necessities; the incentive towards creation of private foundations on campuses in public sectors; the lack of autonomy of universities, where the market and state have expanded their capacity to enforce their own logic and interests; the decline of the Neo-Humboldtian model, that is, in research universities or universities related to research, education, or extension.

Before these considerations, it is not possible to generalize faculty linking them only to universities. The institutional diversity of Brazilian Higher Education implies the existence of teaching models which are established from the kind of institution where the professors work. The teaching, in a university institution, sustained by the tripod of education, research, and extension, imposes distinctive characteristics in relation to the teaching in non-university institutions, in which the central axis is the teaching. Considering that the highest number of institutions of Higher Education today is constituted by non-university institutions and private institutions, the teaching in non-university institutions deserves some attention (DOTTA, 2011).

Nevertheless, it is necessary to be careful to not make any anticipated analysis restricting criticism to private IES, especially private colleges, given to the expansion and being the highest number of Higher Education institutions in Brazil. On a public realm, we have seen in a differentiated way, sometimes even camouflaged, the rebuttal of the productive reconstruction in the teaching work. This implies to affirm that, even the faculty who work in public institutions have suffered with precarious work conditions, the invasion of productivist logic, the differentiation among faculty who research and teach, the valorization for individual merit, the temporary work contracts; there is an invasion of the managerial model in public administration, and therefore, the teaching work suffers its rebuttals.

From the mercantilist point of view of education, educational workers cannot be separated from the others, being that they are equally overexploited. Hence, we are experiencing an intensification in teaching work that expresses itself with determined characteristics, as explained by Del Pino; Viera; Hypolito (2009, p. 123):

- 1) Leads to the reduction of rest time in the workload; 2) implies lack of time for updating and requalification in necessary abilities; 3) implies a chronic feeling of an excessive workload; 4) reduces the quality of time, which increases isolation, reduces interaction, and limits joint reflection; 5) the collective work abilities are lost or reduced and managerial activities are increased; 6) imposes and increases specialist's work to cover personal “deficiencies”; 7) introduces simplified, technical solutions (technology) for curricular changes, in order to compensate the reduced preparation time; 8) the ways of intensification are many times interpreted as professionalization and this starts being voluntarily approved of by teaching.

These characteristics are not manifested in a homogenous and linear way, for they stand out among faculty, depending on the level of education in which they work and the relations which are established in the education and institutional contexts.

## Conclusion

The apparent expansion of access to Higher Education meant an internal privatization of public universities and the entrepreneurship of Higher Education, through the growth in number of private courses and by the imposition of entrepreneurial logic towards professional training. As Dahmer (2008, p. 42) says, “Higher Education has formed a very lucrative vein for capital and, at the same time, stands out in its part of ideological dissemination of collaborative sociability, by means of training intellectuals, collaborators, and entrepreneurs about optic capital”.

It is important to emphasize that the counter reform of Higher Education, initiated by the FHC government, extends itself to the Lula Government and continues during the Dilma Rousseff Government, through intense reforms, from the materialization of the non-state public concept of partnerships between public and private institutions. This reform, in the Lula government is evidenced by the immense expansion of Higher Education at a distance which focuses on streamlining and disqualifying professional training.

With the speech of democratizing Higher Education with access to the right of education, the interests and finalities end up disguising the tendencies that currently orient Higher Education in Brazil. These tendencies show that the Brazilian reality is on the path towards to astronomic privatization of Higher Education, be it by the expansion of private institutes or by the attack to university autonomy in public institutions and by the managerial logic that invades university areas, and also, teaching work. As Sevcenko (2000, p. 7) denounced, “The ideal professor now is a hybrid of a scientist and a broker”.

# The problems of assessing the competitiveness of Russian graduates

Tatyana Selevich<sup>a</sup>, Olga Selevich<sup>a</sup>, Vera Golubeva<sup>a</sup>

<sup>a</sup> Tomsk Polytechnic University, Lenin st., 30, Tomsk, 634050, Russian Federation

## Abstract

In recent times the largest Russian Higher Education Institutions have been aimed at enhancing the quality of educational services and increasing the graduates' competitive advantage in the world educational market. Meeting this challenge Russian Higher Education Institutions have faced with a specific issue: the traditional assessment system makes it possible to analyse only graduates' educational achievements while the employers in their turn specify a wide range of requirements concerning the competences and personal traits of the prospective employees.

Thereby, the authors of the paper suggested their own methodology of assessing the graduates' competitiveness, i.e. their ability to be in demand in the competitive labour market. The paper contains the research results of the key requirements which the employers specify for a graduate and the methodology of assessing these requirements.

## 1. The Transformation of Higher Education in Russia

Recently there have been some substantial transformational processes in the system of Russian higher education. The number of students studying in different types of universities tends to reduce; this situation is caused by demographical reasons.

A sharp decline in the birth rate during 1990s influences the field of professional education. In three coming years the number of students in Russian higher educational institutions is predicted to be reduced by 2 million people. According to the estimations of the Ministry of Education, the demographical crisis will last till 2020, see Fig. 1 [Fursenko, 2010].

Fig. 1. The time history of the number of students in state and private higher educational institutions, 1000 people.

This leads to a range of challenges for the system of Russian higher education. Firstly, according to the Concept of the Federal Target Program for Education Development in 2011-2015 the number of academic staff in professional education is predicted to be reduced by 20-30% [the Concept of the Federal Target Program for Education Development]. Secondly, the demand for getting higher education remains pressing; the fact is proved by the results of the research conducted by Russian Public Opinion Research Center, see Fig. 2 [WCIOM, 2011].

E-mail address: golubeva@tpu.ru

Fig. 2. Higher education as a life goal.

Russia is among leaders by the number of people with higher education; the number of people who want to get a higher education increases worldwide, see Fig. 3. [CITI, 2012].

Fig. 3. Countries-leaders by the number of people with higher education.

However, the increase in the number of people who want to get a higher education is accompanied by a sharp decline in the quality of educational services, that is the demand for the diplomas of higher education is greater than the demand for knowledge. Russian higher educational institutions have become an element of socialization rather than a place for getting an education.

These internal contradiction in the system of higher education has led to the necessity of enhancing state monitoring. Reacting to a low quality of training and a large number of ineffective higher educational institutions the government implemented the system of assessing the effectiveness of higher educational institutions. You can see the results for the year 2013 on the Fig. 4 [Ministry of Education of the Russian Federation, 2013].

Fig. 4. Ineffective higher educational institutions in Russian regions.

A list of ineffective higher educational institutions and those higher educational institutions which show signs of ineffectiveness emerges every year as a result of annual state monitoring. Eventually not only the administration of ineffective universities are made to take action. The leaders in the field also try to achieve better results; this has led to a national campaign for enhancing the quality of training.

We suppose that the key task of a higher educational institution is not only to enhance the quality of educational services but also to increase the competitiveness of its final products – the graduates. There are two reasons: a systematic one (the strengthening of the state requirements for the quality of educational services) and a market one (the decrease in sales, the improvement of domestic competition and employers' intention to hire graduates with greatest number of competences and best personal traits). Employers are interested not in the organization of the educational process but in the final product.

Since 2010 the most ambitious Russian higher educational institutions (Federal universities, National Research universities as well as the universities participating in the project of becoming a part of 100 world top universities in QS by 2020) have made the first changes and showed responsible attitude.

While assessing graduates' qualities Russian higher educational institutions faced with a specific issue: the traditional (grade-rating) system makes it possible to analyze only graduates' educational achievements while the employers in their turn specify a wide range of requirements concerning the competences and personal traits of prospective employees.

Hence, we took the marketing approach to assessing a graduate's competitiveness, that is his/her ability to be in demand in the competitive labor market.

## 2. Assessing Graduates' Competitiveness

To assess the competitiveness we have chosen 3 subjects – 3 graduates from the Department of Engineering Entrepreneurship of Tomsk Polytechnic University (market research consultants), we will term them Graduate 1, 2 and 3. We determined the graduate's value which employers and the society expect. It is the ability to do a job to a high standard which is guaranteed by the presence of competences, both professional and universal. Professional competences are more important for business; universal competences – for the society.

By the target group we mean business, a university should adapt to the needs of the target group. The employer's requirement is to employ a competitive graduate with a high level of professional competences. We implemented the segmentations of the business and found out that the requirements of employers working in different segments vary:

- Manufacturing companies appreciate analytical competences
- Trade organizations expect communicative competences in the first place
- Large companies appreciate competences in the project management field

Our next step was to choose priority competitors. As the assessing of competitiveness is a relative value we should determine who we will compare. There are two approaches: the first approach is to compare to similar subjects, the second – to the standard. We took the first approach – compared our subjects to the graduates from the same educational program of the department. We could have compared to the graduates from the same educational program of the department but this would have raised the issue of searching for an information source.

Then we defined the graduate's competitive differentiators, which you can see on the slide. They are the following:

- Graduate's academic achievements
- Graduate's nonacademic achievements (competitions, conferences)
- Graduate's competences (knowledge and skills)
- Graduates' employment (practical experience)
- Graduate's personal contacts (whether a graduate knows influential people or has influential relatives or friends who lobby his/her interests)
- Graduate's individuality (personal traits)

To collect the data we used the methods of competitive intelligence, social research and psychological assessment (testing). An important source is the review of secondary data (exam and academic results, R&D reports, portfolio analysis). While interviewing employers, we singled out key criteria for a graduate they would like to employ. We termed these criteria as graduates' competitive differentiators. They have different weight

which was estimated while conducting a survey among employers (entrepreneurs), experts and graduates. You can see weighting coefficients on the Fig. 5.

Fig. 5. The distribution of weighting competitiveness coefficients.

Our next step was to decompose the indicators. Thus we decided to assess academic achievements on the basis of the graduate's academic progress (average grade), state exam results and thesis defense results. We also took into account if a graduate was getting any further education.

Nonacademic achievements implied the number of victories in competitions, especially the number of victories in municipal, federal and state academic competitions.

The level of professional competences (graduate's knowledge and skills) was assessed by a special commission; the level of universal competences – by mentors and tutors.

Psychologists assessed graduate's personal traits: motivation, ambitions and talent.

Employment assessment implied working experience, position held and whether the graduate applied to an employment office.

Then we compared micro-indicators by transforming the quantitative and qualitative assessment into points (using the 5-point scale), see table 1.

Table 1. The comparison of graduates' competitive positions.

Differentiators / Competitors	Graduate 1	Graduate 2	Graduate 3	Leader
1 Academic achievements:	4,88	2,7	3,1	
Coeff. = 0,17	0,83	0,46	0,53	
State exam results	5	4	5	Graduate 1
Average grade	4,65	4,1	4,3	
Further education	5	0	0	
2 Nonacademic achievements:	3,66	4,33	4,33	
Coeff. = 0,18	0,66	0,78	0,78	
Competition winners	4	5	5	Graduate2, Graduate 3
Academic competition winners	4	3	5	
Hobbies	3	5	3	
3 Level of Competences	5	4	4	
Coeff. = 0,26	1,3	1,04	1,04	Graduate 1
Professional Competences	5	3	4	
Universal Competences	5	5	4	
4 Employment:	4,5	4	4,5	
Coeff. = 0,09	0,41	0,36	0,41	Graduate 1, Graduate 3
Occupational Work	4	3	4	
Employment term	5	5	5	
5 Personal contacts	5	3	5	Graduate 1, Graduate 3
K = 0,11	0,55	0,33	0,55	
6 Personal Traits:	4,38	4,08	3,1	Graduate 1
Coeff. = 0,17	0,83	0,78	0,59	

Academic and career motivation	4,8	4	3	
Incentive motivation	4,33	4,33	4	
The ability to apply knowledge in uncommon situations	5	4	3	
Research skills	4	4	2	
Skills that ensure personal enhancement and professional growth	4,4	4	3,4	
Results (market standing)	4,57	3,68	4,00	Graduate 1
With weighting coefficient	4,57	3,74	3,89	Graduate 1

The leader by “Academic achievements” was Graduate 1. The leaders by “Nonacademic achievements” were Graduate 2 and Graduate 3. Graduate 1 took the first place in «Level of competences».

Graduate 1 and Graduate 3 shared the leadership in “Employment”. As for “Personal contacts”, here we have 2 leaders: Graduate 1 and Graduate 3. The assessment of personal traits was conducted in detail; the leader by this indicator was Graduate 1. Finally, after summing up all the points, the leadership position was held by Graduate 1.

Then we counted the competitiveness of Graduate 1. If the competitiveness is more than 1, the subject is more competitive.

The competitiveness of Graduate 1 referred to the competitiveness of Graduate 2 is 4,57 divided by 3,74 equaling 1,22; the competitiveness of Graduate 1 referred to the competitiveness of Graduate 3 is 4,57 divided by 3,89 equaling 1,17. Thus Graduate 1 is more competitive in the market.

We visualized the result as a competitiveness polygon; here the advantages of each graduate are visually presented, see Fig. 6.

Fig. 6. A competitiveness polygon.

It's possible to present the polygon adjusted to the weighting coefficient. It is presented here. As you can see at Fig. 7, the results are clearer.

Fig. 7. The polygon adjusted to the weighting coefficient.

We conducted the SNW analysis (the table of graduates' strong and weak points), the results are presented on the slide. This data were received without taking into account the weighting coefficients. As you can see at Fig. 8, none of the graduates is below the threshold.

Fig. 8. The SNW analysis.

The data with the weighting coefficients are presented at Fig. 9.

Fig. 9. The SNW analysis with the weighting coefficients.

Having conducted the research we have come to the following conclusion:

Firstly, by investigating the annual dynamics of the graduate's competitiveness it's possible to assess the growth rate of the graduate's qualities and draw a conclusion about the efficiency of applied academic approaches.

Secondly, it's necessary to single out the most significant competitiveness indicators for an employer. By doing this we can find a graduate who meets the employer's requirements.

Thirdly, by comparing the competitiveness of the graduates from different groups, educational programs, higher educational institutions and nationalities we can determine target segments with the maximal competitiveness growth, find the factors and reasons for it and hold the growth.

The results of the research may be useful for higher educational institutions' academic and administrative staff who are concerned with the challenge of finding an assessment system which will, on the one hand, be universal and easy to use and, on the other hand, would allow to meet employers' requirements.

# The reactions of universities to imposing new a institutional pattern: the case of higher education in Serbia

Nebojša Janićijević\*

*University of Belgrade, Faculty of Economics, Kamenicka 6, 11000 Belgrade, Serbia*

## Abstract

The paper is aiming to discover the shape of universities' reactions to imposing a new institutional pattern of structure and functioning. The answer to this question is sought through analyzing of the accreditation process in higher education in Serbia. This paper analyzes the way in which universities and faculties reacted to the requirements for implementation of the accreditation standards. Research findings have shown that the universities reacted in four basic ways: full implementation; modified implementation; partial implementation by elements, time, space, and level; and rejection of implementation.

## Introduction

In the second half of the 20<sup>th</sup> century, the institutional theory emerged in the field of organization, offering a completely different explanation of organizations' structuring in comparison with the then dominant rationalistic and objectivistic explanations of organizational theory (Kondra and Hurst 2009; Pedersen and Dobbin 1997, 2006). Organizational institutional theory is based on the argument that the structuring and functioning of organization in a certain sector is determined by institutions, and not by criteria of technical or economic rationality and efficiency (Meyer and Rowan 1977; Di Maggio and Powell 1983; Scot 1987, 2008). Institutions in every sector prescribe the institutional pattern of organizing and functioning, and impose it on all organizations within the sector. The basic assumption that underlies this argument is that organizations prove their legitimacy in society by obeying institutionally imposed pattern of structure and processes, and not by technical or economic efficiency.

According to Scott (1987), institutionalization is basically the process of creating and stabilizing of the meaning of reality, and institutions are stable systems of social beliefs and rules that govern defining of practices in many functional spheres of life. Berger and Luckman (1966) had long ago asserted that behavior of social actors is determined by their interpretation of reality that surrounds them, and that they construct that reality in social interactions with other social actors. In the process of social constructing of reality, actions of social actors are being "infused with value" in order to be imposed as such on other social actors (DiMaggio and Powell 1983). Value of a certain pattern of behavior does not at all have to originate from the fact that this pattern constitutes a technically rational or economically efficient way of spending of social resources. The institutionalized pattern of behavior is valuable because it is generally accepted and because it complies with the shared understandings of reality, and not because it is objectively proven to be rational. When a certain rule, structure or process is being institutionalized, it is marked by social actors as valuable and legitimate, and therefore all other actors within the sector, in order to prove their legitimacy and value, must accept and implement it. The institutionalized patterns of structuring and functioning of organizations often have the form of contemporary myths (Meyer and Rowan 1977). There are the three basic types of institution that constitute institutional patterns of structure in organizations: regulative, normative, and cultural-cognitive (Scott 2008), as well as three mechanisms through which each is imposed on organizations: coercive, normative, and mimetic (DiMaggio and Powell 1983). Institutionalized practices are seen as natural, the only possible, and therefore legitimate (Oliver 1992). Institutionalized organizational behavior includes stable, repetitive, and permanent activities which have meaning and values that surpass their technical goals (Jepperson 1991). The consequence of institutionalization in a sector is, therefore, that organizations within it become increasingly isomorphic, that

is, their structures and way of functioning resemble each other's more (Ashworth, Boyne, Delbridge 2007; Frumkin, Galaskiewicz 2004; DiMaggio and Powell 1983).

It is intriguing that so far, the institutional theory has not dealt much with the issue of the reaction of organizations to an imposed institutional pattern (Scott 2008; Edelman 1992; Oliver 1991). The institutional theory has offered explanations of the nature, the way of creation, and the way of imposing of the structure and processes' patterns on organizations, but it has not offered much in the explanation of organizations' reactions to these patterns. Still, there are some notable exceptions, starting from Meyer and Rowan's (1977) concept of decoupling, through the works of Oliver (1991, 1992), Edelman (1992), Greenwood and Higgs (1996), and Casile and Davis-Blake (2005), to the work of Pedersen and Dobbin (2006). In a number of these works, the focus is on factors that direct the behavior of organizations faced with the imposed institutionalized pattern, while other works explore precisely how organization react to these patterns. This other group of works will be our primary focus of interest.

Using the stated works as a theoretical framework, this paper will explore the reactions of universities and faculties in Serbia to the implementation of accreditation standards which have shaped the new institutional pattern of structuring and functioning of the Serbian universities and faculties. The key research question of this paper is: how do the universities react to the pressures from the institutional environment to accept and implement the new institutional pattern of structuring and functioning? The integral part of this question is also the question of the available options that the universities and faculties faced with institutional pressure have in accepting this new institutional pattern? The aim of this paper is to identify typical reactions of universities and faculties to the pressure from institutional environment to implement the institutionalized rules of their structuring and functioning. The answer to the research question is obtained by means of empirical analysis of the accreditation process in the higher education sector in Serbia in the period from 2006 to 2010.

The paper is organized as follows: first, the theoretical framework, comprising the existing papers focused on organizations' behavior during institutionalized patterns implementation, is presented. Next, the research methodology is explained, including the description of the accreditation process in Serbia which served as the empiric research framework. This is followed by the research results and discussion. And finally, conclusions are made, and directions for further research are defined.

## **The literature review**

The idea that organizations do not have to accept and implement the imposed institutional pattern of structure and functioning first came from Meyer and Rowan (1977). They noticed that standardized rules of organizations' structuring and functioning can be inconsistent with technical criteria of efficiency, and also too general and contradictory, so therefore unacceptable for an organization. In this case, the solution for organizations is decoupling, that is, separating the operative, real structure from the formal, institutionalized structure. Formal structure proves legitimacy, because it is in conformity with the institutionalized rules, and in reality the practice and functioning of organization are in conformity with technical criteria of efficiency. Formal structure is accompanied by ceremonies that manifest loyalty to the institutionalized rules, while in reality these rules are not applied, because in practice technically effective solutions are being used.

Probably the most comprehensive summary of organizations' possible reactions to the imposition of institutional structures and practices was presented by Oliver (1991). In her view, organizations may react to pressures from the institutional environment in five basic ways that vary according to the degree of an organization's activism: 1) conforming, or accepting the requirements and implementing the institutionalized rules, practices, and structures; 2) compromise, or obey the institutional requirements but adjusting them to the organization's own capacities; 3) avoidance, or only symbolically accepting and implementing practices and structures, while in reality continuing with the existing practices (this corresponds with decoupling); 4) defiance, or publicly refusing to implement the institutional patterns of structures and functioning and; 5) manipulation, or trying to influence the institutional environment, that is, negotiate and acquire special treatment for the organization that would enable it to not implement the institutionalized rules. Which reaction the organization will choose depends on several factors that Oliver identified: institutional pattern legitimacy, organization's dependence of the institution that designs the pattern, consistency of the pattern itself with the existing way of structuring and functioning of organization, efficiency of control of institutional pattern implementation, and interconnectedness of organizations within a sector.

Pedersen and Dobbin (2006) have analyzed the reactions of business schools to the institutional environment by analyzing MBA programs in Europe. Authors have identified four processes that shape those reactions. The first process is imitation, and it emerges when one school imitates those that are successful and applies their way of organizing. Hybridization is the second process through which school combines the global, accepted model with some local elements, thus making a hybrid. Transmutation happens when new meanings are assigned to the existing forms and shapes of structure and processes in the school, while the said structure and processes change little or not at all. Practically, it is “proclaimed” that the existing structure and processes are harmonized with the institutional pattern, which is specifically done through redefining of their meanings, regardless of the reality. Immunization emerges when the school’s leaders refuse to implement the institutional model, invoking the tradition and their own experiences.

In their research of higher education organizations’ reaction to the accreditation process, which is highly relevant for this paper, Casile and Davis-Blake (2002) have shown that, other than acceptance, there are other reactions of organizations to institutional requirements. Accreditation is a kind of “rationalized myth” that provides legitimacy to business administration schools under investigation. The authors explored how US collegiate business schools reacted to accreditation standards. The schools were dissatisfied with both the accreditation standards and the body implementing them, since half of them did not manage to get accredited. Due to this, the schools put pressure on the accreditation institution by founding a new accreditation body. In response to this, the original accreditation body lowered the criteria and paid special attention to loosening the teachers’ academic qualifications requirements. Although the factors directing organizations’ response were actually the focus of the authors, their results imply that organizations can also impact institutions, and that this is actually one of the possible responses to institutional pressures. The key factor that directed the schools’ behavior in the accreditation process was ownership, because private and public schools have different sources of financing, they are dependent on the state or market in different degree, they also have different degree of power and influence, etc.

Edelman (1992) determined that organizations faced with the necessity of implementation certain regulatory norms (laws) react by first elaborating their own formal structural arrangements for enforcing laws. They do this even when it is not requested by the institutionalized norm. Elaboration of formal structures is, however, useful for an organization because the organization in this way symbolically shows that it obeys the law and enforces it. On the other hand, elaboration of formal structures enables organization management to construct the meaning of obeying and enforcing laws in the way it suits the organization management. The second step is institutionalization of structures by means of developing routines in organization’s functioning. The impact of laws on organization’s functioning is in this step indeed realized, at least in the smallest possible degree. When structures are once developed and when they develop their routines, one part of the law is still enforced and it changes the functioning of organization. But this enforcement of the law is modified in such a way that it jeopardizes the interests of organization and its management in the least possible degree.

Ashworth, Boyne and Delbridge (2007) have developed a hypothesis that conforming of the organization with the institutional pattern requirements can have two possible forms: compliance and convergence. Compliance is the process through which organizational characteristics are modified in the direction of increasing compatibility with institutionalized pattern. Convergence is a constraining process that forces one unit in a population to resemble other units that face the same set of institutionalized rules. Therefore, through the process of compliance, organizations directly accept the model of structure and functioning created in the environment, while through convergence they indirectly implement the institutionalized pattern following the example of other organizations that have already done it through obeying. In both cases, the result is implementation of institutionalized pattern.

In several of their works, done both individually and with their associates, Greenwood and Hinings have analyzed the process, factors and results of the implementation of institutional patterns of structures within organizations (Hinings, Greenwood 1988; Greenwood, Hinings 1996; Hinings, Greenwood, Reay, Suddabay 2004). These institutional patterns are what they call archetypes. When a new archetype is created in a field of organization, it is imposed on the organizations in the field. Reactions of organizations may be: (1) acceptance of the new archetype through linear transformation or oscillating dynamics; (2) refusing the new archetype through inertness or “aborted excursion” ; (3) partial implementation of the new archetype through “unfinished journey”.

The review of literature shows that organizations faced with the pressure to apply the institutional pattern of structure and functioning can react in several ways. They can obey the institutional environment requirements and completely accept and implement the institutionalized rules of structuring and functioning. This kind of organization's reaction is primarily expected and it is in accordance with the institutional theory postulates (Ashworth, Boyne, and Delbridge 2007). However, other than acceptance, organizations have other options available when reactions to institutional pressures are concerned. First, they can adapt the institutional pattern to their own needs and resources, values or interests, and implement thus adjusted pattern. While Oliver (1991) called it compromise, this type of organizations' reaction was named hybridization by Pedersen and Dobbin (2006). Second, organizations can pretend to implement the institutional pattern, while in reality they are actually not implementing it. This fiction is achieved through symbols, such as rituals, language phrases or material symbols. Meyers and Rowan (1977), as well as Edelman (1992) have described this process, while Oliver (1991) called it avoidance and Pedersen and Dobbin (2006) named it transmutation. Finally, in certain circumstances, organizations can even, openly or covertly and more or less aggressively, refuse to implement the institutional pattern. The consequence of this refusal is inertness of the organization (Hinings, Greenwood 1988). Casile and Davis-Blake (2002) have also described this scenario, while Pedersen and Dobbin (2006) named it immunization. Oliver (1991) has even distinguished two types of refusal: the one accompanied by attempts to impact institutions and the one without these attempts.

### The Research Methodology

The accreditation process in higher education in Serbia represented an excellent research framework for exploring the reactions of universities to imposition of a new institutional pattern of structure and functioning in the said sector. The higher education sector is one of those sectors in which the influence of institutional environment on organizational structure and functioning is very strong (Casile & Davis-Blake 2002). In this sector it is not possible to clearly define technical criteria for performance evaluation, so performance of universities is evaluated according to the degree in which the institutionalized rules and standards are followed (Frumkin & Galaskiewicz 2004). The accreditation process is *par excellence* a process of putting institutional pressure on universities as basic units in the higher education sector. Through the accreditation process, one model of functioning of university is actually being shaped and institutionalized, and then imposed on all universities.

Accreditation in higher education organizations and study programs in Serbia was first conducted between 2006 and 2010. Accreditation in higher education in Serbia started in 2006, when the National Council for Higher Education (NCHE) and the Commission for Accreditation and Quality Assurance (CAQA) were formed in compliance with the Higher Education Act (<http://www.parlament.gov.rs>). CAQA was formed as an independent regulatory body and was comprised of fifteen university professors from all scientific fields. CAQA proposed two sets of accreditation standards: one for universities and faculties as higher education organizations, and the other for study programs. Both sets of accreditation standards were then adopted by NCHE. According to the Higher Education Act these standards are given the power of the law. A positive accreditation decision was the precondition for issuing of operating license to a higher education organization by the Serbian Ministry of Education.

Accreditation was conducted at both levels: organizational level and at the level of a particular study program. Organizational level of accreditation comprised faculties and integrated universities. The majority of Serbian universities are not integrated, which means that they function as loose confederations of independent faculties. Although faculties cannot exist outside of university, they are almost completely independent within themselves. Therefore, faculty was the basic organizational unit in accreditation. Along with faculties, integrated universities, which include no independent faculties but have departments in their structure instead, also constitute organizational units subjected to accreditation. They are a recent occurrence in Serbia and they are all private. Accreditation standards for faculties and integrated universities consist of 13 sections: the mission and the goals, planning and control, organization and management, qualifications of graduated students, scientific research, number and competence of teaching staff, number and competence of support personnel, student admission, space and equipment, library and informational support, financial resources, quality assurance system, and public relations.

Undergraduate programs, as well as master and PhD programs, have also been accredited in Serbia along with universities and faculties and their individual study programs. Therefore, every faculty first had to gain

accreditation as an institution and then to accredit every of its study programs. Standards for accreditation of study programs prescribe the existence of the minimum level of quality of the following: the purpose, the goals, education results and students' competences, curriculum, number and competences of lecturers, evaluation of students, spatial and library resources, and the system of quality assurance.

In the period from 2006 to 2010, 220 faculties and universities in Serbia were accredited. In addition, 509 study programs for the first level of education, 459 study programs for master studies, as well as 223 study programs for PhD studies were accredited. Out of all the institutions that applied for accreditation, 78% were accredited, while out of all the study programs that applied, 73% were accredited. The analysis in this paper encompassed only the accredited faculties and universities and their accredited study programs.

In Serbia, accreditation standards are formulated so that they ensure two basic goals. The first goal was to ensure the quality of the educational process at universities and faculties in Serbia. That is the reason for having prescribed standards concerning the minimum number of lecturers, their competences, space, equipment, librarian and IT resources that a faculty or university must have. The second objective of the standards was no less important: ensuring that faculties and universities meet demands in higher education set by the Bologna process ([www.ec.europa.eu/education/higher-education/doc1290\\_en.htm](http://www.ec.europa.eu/education/higher-education/doc1290_en.htm)). Standards for accreditation in Serbia are written in a way that mirrors the key elements of higher education defined within the Bologna process. Implementation of these elements is designated to develop a model of higher education that can be called "the Bologna model". For instance, there are standards prescribing self-evaluation, students' mobility, mandatory interactive teaching, evaluation of students during classes, number of elective subjects in the curriculum, etc. All 25 standards were mutually consistent, and although overlapping, bore the same basic idea. In Serbia, accreditation standards were the rules by whose adoption universities and faculties were compelled to accept and implement the Bologna model of higher education. Since the universities in Serbia had operated in a traditional way until the beginning of the accreditation period, the accreditation standards, focused on implementing the Bologna model of higher education, were quite new for universities in the country. By adopting the standards for accreditation as they were formulated, universities and faculties in Serbia were supposed to accept and implement a pattern of structure and functioning very different than those they had had before. Therefore, in the process of accreditation, universities and faculties in Serbia faced the institutional environment requirement to accept a completely new model of structure and functioning. It is very important to identify how the higher education organizations reacted to this requirement.

The process of the research contained three steps. First, a detailed analysis of accreditation standards in Serbia, which shaped a new institutional pattern of functioning of the universities, was performed. This was accomplished by reviewing the accreditation standards published as a public document (<http://www.kap.kg.org>). The objective of the analysis was to determine the standards whose application would be monitored at faculties and universities in Serbia. Reducing the number of the standards to be monitored was necessary, since it would be very difficult to monitor the implementation of all 13 standards for faculties and all 12 for study programs. It was therefore necessary to select a manageable number of standards of accreditation whose implementation on faculties would be analyzable. The criterion for selection of the standards was twofold. On one hand, they had to be the standards which bring the key elements of Bologna higher education model to universities in Serbia. On the other hand, they had to be the standards whose implementation could be monitored at faculties in Serbia. After a detailed analysis, five out of 25 standards were selected to be included in the analysis. Out of those five, two refer to faculties as institutions, while three of them concern study programs. This is the list of selected standards:

Curriculum: Minimal elements of study program's curriculum and its compatibility with students' goals and competences are prescribed.

Number and competences of lecturers: Number of lecturers in relation to the number of students and the number of active classes are prescribed; minimal competency of a lecturer measured in number of relevant references is also prescribed.

Student assessment: Monitoring and evaluation of students' work during classes and in the final examination is prescribed.

Quality assurance system: Necessary elements of self-evaluation system and quality assurance in an institution are prescribed.

Facilities and technical resources: Minimum space according to number of students and minimum library and IT resources are prescribed.

The second step in methodology of this research consisted of choosing samples, or, in other words, selecting the faculties and universities where the implementation of the accreditation standards would be monitored. The selected faculties and universities were within the field of humanities, particularly from the domain of economics and management. There were several reasons for this. Firstly, the author was a member of CAQA, in charge precisely of the accreditation process in the domain of economics and management; therefore he had the experience and the knowledge about the faculties in this domain. Secondly, the majority of faculties and universities, especially private ones, are within this particular domain. Thirdly, it was a commonly held belief that the faculties from this domain have the lowest teaching quality; so the most distinctive changes were to be expected there. Twenty faculties and integrated universities from different parts of Serbia were selected, and their implementation of the accreditation standards was monitored. Among these, 5 were public faculties and 15 were privately held. Seventeen out of 20 selected organizations were faculties and the remaining 3 were integrated universities, all 3 of them privately held. From each of these 20 schools, a study program in management and economics was chosen. Almost all of the selected schools even had several programs in management and economics, but in order to keep the monitoring process simple, only one program from each school could be selected. Besides, while implementing the standards of accreditation, the schools behaved quite evenly within all the programs. All selected programs were undergraduate ones.

Collecting and analysis of data on implementation of the selected accreditation standards within the selected higher education institutions constituted the third step in research methodology. Data collecting was conducted through two basic methods. In-depth interviews with managers, lecturers and students at the selected faculties constituted the first method. Interviews with the dean, the vice-dean of academic affairs, three lecturers and five students were performed at every faculty. That meant 220 interviews in total. The interview questions were focused on finding whether elements of the selected standards existed at faculties after the accreditation, and also, whether they initiated specific changes within the course of the education process and its outcomes. The second method of data collecting involved content analysis of the faculties' documentation. Documents from before and after accreditation were analyzed in order to identify the differences. The list of the analyzed documentation included: study program curricula, students' brochures, self-evaluation and quality assurance policies, statutes, documentation on facilities, lists concerning the number of lecturers and their references. Some of the aforementioned documents were available on the Internet, and the rest were provided by the faculties themselves.

The research was conducted from October 2010 to October 2012. The implementation of the accreditation standards and all the changes that took place within the faculties were monitored in that period. The research results consist of findings about real changes brought about by the implementation of the accreditation standards at the selected faculties and universities.

### The Research Results and Discussion

The research has shown that the universities and faculties in Serbia have exhibited four different reactions to the attempt of imposing new institutional pattern through accreditation standards. These reactions mostly match those described in the literature (Oliver 1991; Pedersen, Dobbin 2006), although there are some specific qualities that will be elaborated. The first type of faculties' reactions was the acceptance and full implementation of the accreditation standards. Some universities and faculties fully accepted and implemented some accreditation standards. The second reaction of the universities and faculties was to modify some accreditation standards and then to apply them. The third reaction was partial implementation of the accreditation standards. The fourth reaction of universities was rejection of the accreditation standards. Universities and faculties in Serbia were selective in the process of accreditation. They chose which accreditation standards they would accept and implement, which accreditation standards they would implement in a modified version and which only partially, and, finally, which accreditation standards they would completely refuse to implement. The consequence of this is that no accreditation standard was implemented by all the universities and faculties. On the other hand, no university or faculty had implemented all the accreditation standards. Summary overview of 20 faculties' and universities' reactions to implementation of 5 accreditation standards is presented in the following table:

Table 1. Universities' reactions to implementation of selected accreditation standards

Reactions Standards	Full implementation	Modified implementation	Partial implementation	Rejection of implementation	Total
------------------------	---------------------	----------------------------	---------------------------	--------------------------------	-------

Curriculum	5	10	4	1	20
Lecturers	3	12	2	3	20
Student assessments	7	5	4	4	20
Quality assurance	2	7	9	2	20
Spatial and technical resources	6	8	4	2	20
Total	23	42	23	12	100
Percent	23%	42%	23%	12%	100%

Full implementation of the accreditation standards means that faculties have implemented requirements contained in the standards in practice. In such cases, universities and faculties did not merely meet the accreditation standards on paper at the time of application for accreditation, but proceeded to meet them by implementing the requirements contained in the standards in a longer period after gaining the accreditation. This type of reaction of higher education organizations in Serbia is in compliance with the basic postulates of the institutional organizational theory, and it is completely expected. Oliver (1991) describes it as conforming. Full implementation of the accreditation standards induces significant reforms on faculties and universities. However, the analysis has shown the full implementation of the accreditation standards on faculties and universities in Serbia to be relatively rare. The curricula were genuinely and permanently changed to adapt to accreditation standards in only 5 out of 20 study programs at the same number of universities or faculties. In two years after the accreditation, the number of lecturers and their competences was found to be in full accordance with the standards at only 3 out of 20 faculties or universities. Among higher education organizations in Serbia, among all the standards, student evaluation standards were the ones that were most widely met to full extent. It was found that the evaluation method had been thoroughly adapted according to accreditation standards and their demands in 7 out of 20 study programs. However, in only 2 out of 20 higher education organizations in Serbia, the development of quality assurance system was entirely carried out by the accreditation standards. Finally, 6 out of 20 faculties or universities were managing their facilities and equipment in accordance with the accreditation standards. The analysis resulted in the conclusion that 23% of 5 standards at 20 faculties and universities were fully implemented.

Modified implementation of institutionalized standards indicates that, prior to implementing them, a university modifies them to a certain degree and adjusts them to its own resources, its existing structures and processes, its perception of technical rationality and, finally, to the interests of the ruling coalition. It is this type of reaction that Oliver (1991) calls compromise, while Pedersen and Dobbin (2006) call it hybridisation. Edelman's (1992) description of an organization's behaviour during law enforcement also matches this type of reaction. Modification of the accreditation standards happened, for example, at the University of Belgrade when it comes to standards of defining the competence of the faculty members who teach PhD courses or who can be mentors for PhD dissertations. This particular competence is, for the first time in Serbia, being defined by accreditation standards based on the number of articles published in journals from SCI list. However, University of Belgrade has simply decreased the number of published articles required as a minimum condition for teaching staff and mentors from 5 to 3, and applied the standard modified in such a way in practice. After the accreditation process, 10 out of 20 researched study programs had their curriculum in accordance with new standards, but those standards were not original but modified ones. As for the lecturers, before the implementation, standards concerning their number and competences were modified at 12 out of 20 faculties and universities monitored. Seven out of 20 institutions had the standards of quality assurance system implemented, but modified according to their own perception of the optimum. A similar occurrence took place with the facilities and equipment standards, since 8 out of 20 faculties or universities implemented "their own" standard, which differed from the original.

Partial implementation of institutionalized standards, structures and processes means that a university does accept and implement institutional demands coming from the organizational field it is a part of, but does so only partially, not completely. This type of organization's reaction to institutional pattern is, in large part, new and so far it has not been recorded in the literature. Namely, there are several modalities of partial implementation of institutionalized standards: a) by elements: some elements of the standards are implemented, while others are not; b) by time: a standard is applied for some time, and then its application gradually decreases, and in the end the standard is completely abandoned; c) by organizational parts: the university, more or less, fully implements

the institutionalized model in some of its departments, while avoiding its implementation in other departments, especially if they are territorially separated from the headquarters; d) by levels – symbolic implementation: the standards are not in fact being implemented, but universities deliberately design and present symbols like rituals, terms, artefacts, which serve the purpose of convincing the external institutions that the university has indeed accepted and implemented the required structures and processes even though there have been no changes in the way of structuring and functioning of the university. Good examples for the symbolic implementation of standards are ritualized student polls at some universities, which only serve to fake the process of teaching staff evaluation without a real effect. The first three types of partial implementation, by elements, by time and by parts, are new in the literature. The last type of partial implementation of institutional pattern, symbolic implementation, has already been described in the literature. This reaction of organizations to institutional pressure is what Meyer and Rowan (1977) called decoupling. Also, Oliver (1991) has identified this type of reaction as avoidance, and Pedersen and Dobbin (2006) have recognized it as transmutation. Partial implementation usually implied significantly reduced implementation of accreditation standards and induced even lesser changes than the previous modification of standards. When it comes to the quality assurance system, partial implementation of standards was the most common case. Quality assurance standards were implemented partially and in a different manner at almost half of the institutions. For instance, particular system elements have been developed at some universities and faculties, while other elements, also requested by the standards, simply were not developed; for example, a teacher evaluation survey for students took place, but no self-evaluation report needed to be made. Some of the universities and faculties implemented this standard only symbolically – by performing the ritual of preparing and publishing self-evaluation reports with no actual consequences or results of any kind. Some faculties conducted the process of self-evaluation reporting only in the year of their application for accreditation, and ceased to do so since. Finally, at some universities, quality assurance system is implemented only at headquarters, and not at their dislocated departments.

The final type of the universities' reactions to the pressure from institutional environment to accept the accreditation standards is rejection of their implementation. As it is described in the literature, rejection had, more or less, passive or active form which manifested as: ignoring, passive rejection, active rejection or attack, and it was even manifested as an attempt to control the CAQA as an institution which implements the standards (Oliver 1991; Casile Davis-Blake 2005). Some universities in Serbia have simply decided to enroll students above the quota allowed by accreditation, or have simply to enroll students whose applications were denied to study programs. Rejection, as a reaction of a university or a faculty, is only possible in the case when the university has gained the greatest autonomy with respect to institutional environment. As a rule, universities use this autonomy in order to block the changes that are being imposed on them by the institutional environment. Among the standards, student evaluation standards are the ones that are most often entirely rejected, as is the case with 4 universities and faculties. Student evaluation during classes is the most rejected element – instead of its implementation, the former practices of evaluating students with only one final exam (usually oral) is still the case.

### **Conclusions, Limitations and Directions for Further Research**

The research of reactions of universities and faculties in Serbia to imposing of institutional pattern of structure and functioning through accreditation process has confirmed the so far identified patterns of organizations' behavior when faced with institutional environment requirements. Faced with the institutional accreditation standards, the faculties and universities in Serbia have reacted in four ways that have mainly been already described in the literature (Meyer, Rowan 1977; Oliver 1991; Edelman 1992; Casile, Davis-Blake, 2002; Pedersen and Dobbin 2006). The reactions of higher education organizations in Serbia that could have been assumed based on the findings of the institutional organization theory are full implementation, modified implementation, rejection of implementation, as well as symbolic partial implementation. Partial implementation by elements of content, by time and by parts was also the universities and faculties' reaction to imposition of the accreditation standards, but it has not been described in the literature so far. The general conclusion is that organizations are everything but helpless and forced to accept and implement the institutionalized patterns of structure and functioning imposed by the institutional environment.

This paper has a number of limitations, especially with respect to the methodology. It is basically a multiple case study analysis, and there are significant limitations with regard to generalization of the conclusions. Also, the collecting of data on reactions of Serbian universities to accreditation standards and their implementation was

mostly based on interviews, which in itself has certain limitations with regard to subjectivity of both the interviewer and the interviewee.

The important issue which has been dealt with in the literature, but which was not a part of this research and remains open for some new researches, is the following: Which factors determine the reactions of organizations to imposing of institutionalized patterns from the environment? What does it depend on whether the organization will fully implement the pattern, or it will implement it in the modified form, or it will partially implement it or it will not implement it at all? In the case of accreditation process in higher education in Serbia, the question is: which factors determine universities and faculties' reactions to accreditation standards?

## Abstract

The aim of this research is to investigate the reflections on operational chemistry and physics problems solving critical thinking dispositions of engineering faculty students. This research is designed as relational scanning model. The sample of this study, Chemistry, Chemical Engineering, Electrical-Electronics Engineering last year students taking “General Chemistry” and “General Physics” course has formed. In the study; The California Critical Thinking Disposition Inventory (CCTDI-R), which is improved by Facione, Facione and Giancarlo (1998) and adapted to Turkish by Kökdemir (2003).and “Mathematics usage scale in Operational Chemistry and Physics Problems” (MUSOPCP) with two factors which is developed by Özsoy-Güneş, Derelioğlu, Kırbaşlar (2011) are used as tool of data collection. In order to analyze the data, SPSS 16.00, ANOVA, independent T-Test, Pearson correlation coefficient techniques are used. As a result, between CCTDI-R scale with mathematics anxiety in chemistry and physics problems factor of MUSOPCP has a negative relation and with mathematics knowledge factor of MUSOPCP has a positive relation. The significant differences were found between the departments with mathematics anxiety factor score of MUSOPCP and between the gender with mathematics knowledge factor score of MUSOPCP. The significant differences weren't found between gender and department with CCTDI-R scale; but according to graduated secondary school, significant differences were found between with CCTDI-R scale.

## 1.Introduction

Critical Thinking can be defined as an effective, organized and operative cognitive period enabling us to improve understanding our own thoughts and others ideas and our skill to explain the opinions (Chaffee, 1994). Critical thinking is a positive analysis enabling us to comprehend the events happening around us. This system of analysis is a system that can be used for defining the problems, starting the studies of any aimed subject, deciding and making evaluations retrospectively (Chaffee, 1994).

Nowadays, it is crucial that active individuals with critical thinking and problem solving skills, with ability to create information, to question, search and contribute to information, to adopt change and to apply their thoughts must be brought up. This situation causes new expectations to be raised in education. Today, the most important aim of education is to bring up individuals who can adapt to different conditions, who can think in different, flexible and original ways. This general change in the whole world, effects education systems and causes them to be developed to meet the requirements of the age (Kirişcioğlu, Başdaş & Başöncül, 2007; Koray & Çil, 2006; Seferoğlu & Akbıyık, 2006; Zayıf, 2008; Gök & Erdoğan, 2011).

The main objectives of university education; give a good basic education, develop analysis, thinking, research and inquiry skills, generate ideas, develop teamwork and communication skills, Thinking on a global level, be able to organize information in a particular field and develop the ability to solve problems in that area can be listed. In this sense, in terms of positive science, higher education will be based on a strong science and mathematics education is often emphasized (Gençoğlu & Gençoğlu, 2005). The most important reasons of the students' difficulties in science (chemistry and physics) problems solving are the lack of information in domain and lack of the basic operational processes.

Problem solving is an action has a wide range of mental processes and skills when reached the correct conclusion (Altun, 2002). An individual with advanced problem solving skills can effectively use knowledge and can easily solve the problems encountered (Altun, 2010).

General Chemistry and General Physics courses were taught in the first classes of the Engineering Faculties' all departments. Development of professional and mathematical information and skills used by engineering faculty students in solving operational problems plays a crucial role in the educational process. Much of the problem solving is quantitative, involving formulae and the application of mathematics, and is a source of great difficulty for many students. Many studies have been conducted on the problem solving models, the types of problems and successful problem solving (Bodner & Domin, 2000; Bennett, 2008; Cooper, Cox, Nammouz & Case, 2008; Lee, Tang, Goh & Chia, 2001).

## **2. Aim of the Research**

The aim of this research is to investigate the reflections on operational chemistry and physics problems solving critical thinking dispositions of engineering faculty students.

Is there a connection between critical thinking dispositions and operational chemistry and physics problems solving skills of Engineering Faculty students?

Sub Problems:

1. What are the levels of critical thinking dispositions and operational chemistry and physics problems solving of students?
2. How do students' levels of critical thinking dispositions and operational chemistry and physics problems solving vary according to the varieties of gender, department and graduated secondary school?
3. Is there a connection between critical thinking dispositions and operational chemistry and physics problems solving skills of Engineering Faculty students?

## **3. Methods of the Research**

In this study, quantitative research method and relational screening model has been used.

### *3.1. Sample of the Research*

The sample of this study is formed by 214 senior students taking "General Chemistry" and "General Physics" course from departments of Chemistry, Chemical Engineering and Electrical-Electronics Engineering at Engineering Faculty. 58 of Students (27.1%) are from the department of Chemistry, 99 of them (46.3%) are from the department of Chemical Engineering, and of 57 them (26.6%) are from the department of Electrical-Electronics Engineering, 119 of students (55.6%) are female and 95 of them (44.4%) are male.

### 3.2. Data Collection Instruments

For research a three fold form has been created. In the first part personal data like the gender, department and graduated secondary school have been collected. Second part includes “The California Critical Thinking Disposition Inventory” (CCTDI-R), which is improved by Facione, Facione and Giancarlo (1998) and adapted to Turkish by Kökdemir (2003). Third part includes Mathematics usage scale in Operational Chemistry and Physics Problems” (MUSOPCP) scale which is developed by Özsoy-Güneş, Derelioğlu, Kırbaşlar (2011) for define mathematics usage inclinations in operational chemistry and physics problems of students.

The California Critical Thinking Disposition Inventory (CCTDI-R): As a data collection tool, The California Critical Thinking Disposition Inventory (CCTDI-R) was developed by Facione, Facione and Giancarlo (1998) and was translated and validated in Turkish by Kökdemir (2003) has been employed. Cronbach’s alpha coefficient, which shows internal consistency for the dimensions of the CCTDI-R were calculated as .75 in analyticity dimension, .75 in open-mindedness dimension, .78 in inquisitiveness dimension, .77 in self-confidence dimension, .61 in truth-seeking dimension, and .63 in systematicity dimension. Cronbach’s alpha coefficient of the latest scale which was translated in Turkish by Kökdemir (2003) and has six dimensions and 51 items was calculated as .88. The scale was prepared as six – point Likert scale. A total score above 240 reflects a positive overall disposition toward critical thinking (Kokdemir, 2003). Six-point Likert type scale shows “totally agree” option 6, “disagree” option 1 point. Six-point Likert type scale responses were collected. Raw scores were calculated for each factor. The raw scores were divided by the number of questions and then were multiplied by 10. In this way, the lowest value 6, and the highest value 60 standard points are obtained for factors.

Mathematics usage scale in Operational Physics and Chemistry Problems (MUSOPCP): MUSOPCP formed by 10 statements requiring “yes”, “no” and “neutral” as choice of answers is a three-points likert scale. Following the factor analysis, it is noticeable that the scale is in two factor structure and disclosed total variance is 46.864 %. These factors are defined as: 1. Mathematics anxiety in Operational Physics and Chemistry Problems, 2. Conceptual knowledge and Mathematics knowledge relation in Operational Physics and Chemistry Problems. First factor consists of the statement numbers 2, 4, 5, 7, 9, 10; second factor consists of the statement numbers 1, 3, 6, 8. Total cronbach of the scale is  $\alpha=.713$  and cronbach for the first factor “Mathematics Anxiety in Operational Physics and Chemistry Problems” is  $\alpha=.720$ ; cronbach for the second factor “Concept knowledge and mathematics knowledge connection in Operational Physics and Chemistry Problems” is  $\alpha=.675$ . Students’ responses to substances, “yes” option 3, “neutral” option 2, “no” option is given 1 point. The minimum and the maximum score that can be taken from the scale are between 6-18 for the first factor, 4-12 for the second.

### 3.3. Analyzing Data

SPSS 16.00 is used to analyze the data. ANOVA, independent t-test and Post-Hoc test techniques have been conducted to monitor the scores taken from the scales in terms of demographic varieties. PEARSON correlation coefficient analysis technique is applied in order to observe the relations between scales. In all statistical processes significance at a level of .05 has been sought.

## 4. Findings

The research findings are evaluated in the context of sub-problems.

Sub-Problem 1. What are the levels of critical thinking dispositions and operational chemistry and physics problems solving of students?

The sample of this study is formed by 214 students from Engineering Faculty. In this study, the taken total The California Critical Thinking Disposition Inventory (CCTDI-R) scale score was calculated as 222.93. In this study, Students’ average score for the first factor which is Mathematics Anxiety in Operational Physics and Chemistry Problems is found as 9.1028; and average score for the second factor which is Concept Knowledge and Mathematics Knowledge Relation in Operational Physics and Chemistry problems is found as 11.5888. (Table 1).

Table 1. Distribution of scores of students taken from CCTDI-R scale according to the factors and MUSOPCP according to the factors.

Scales		X	SD	SE
CCTDI-R Scale	Analyticity	45.1449	5.63878	.38546
	Open-Mindedness	40.7671	5.26478	.35989
	Inquisitiveness	45.2544	5.75605	.39348
	Self-Confidence	44.3792	5.93236	.40553
	Truth-Seeking	44.2190	5.99698	.40994

	<b>Systemacity</b>	43.5280	5.28785	.36147
	<b>CCTDI-R Scale Total</b>	222.9299	22.44785	1.53450
<b>MUSOPCP Scale</b>	<b>1st Factor</b>	9.1028	2.74737	.18781
	<b>2nd Factor</b>	11.5888	1.06108	.07253

Sub-Problem 2. How do students' levels of critical thinking dispositions and operational chemistry and physics problems solving vary according to the varieties of gender, department and graduated secondary school?

As in table 2, as a result of independent group T-test applied to define whether the scores taken from the CCTDI-R scale and factors differentiate according to the gender variable; for the CCTDI-R scale Analyticity, Self-Confidence, Truth-Seeking factor scores the difference between the arithmetic average of the groups have been found statistically significant. Female students' score average is significantly higher than the Male students ( $p < .05$ ). As a result of independent group T-test applied to define whether the scores taken from the MUSOPCP factors differentiate according to the gender variable; for the second factor score the difference between the arithmetic average of the groups have been found statistically significant. Female students' score average is significantly higher than the Male students ( $p < .05$ ).

The result of independent group t-test applied to define whether the scores taken from the MLSS Scale differentiate according to the gender variable; for the MLSS Scale total score the difference between the arithmetic average of the groups have not been found statistically significant ( $p > .05$ ).

Table 2. The results of Independent group T-test of the scores taken from CCTDI-R scale and factors and MUSOPCP factors according to the gender variable of students.

	Scales	Group	N	X	SD	SE	T test		
							t	df	p
CCTDI-R Scale	Analyticity	Female	119	45.8487	5.14475	.47162	2.059	212	.041
		Male	95	44.2632	6.11627	.62752			
	Open-Mindedness	Female	119	40.9664	5.28048	.48406	.619	212	.537
		Male	95	40.5175	5.26230	.53990			
	Inquisitiveness	Female	119	45.3968	5.54101	.50794	.404	212	.686
		Male	95	45.0760	6.03956	.61965			
	Self-Confidence	Female	119	45.1501	5.65410	.51831	2.145	212	.033
		Male	95	43.4135	6.15791	.63179			
	Truth-Seeking	Female	119	44.9580	5.73490	.52572	2.032	212	.043
		Male	95	43.2932	6.21679	.63783			
	Systemacity	Female	119	44.1597	5.02758	.46088	1.969	212	.050
		Male	95	42.7368	5.52191	.56654			
	CCTDI-R Scale Total	Female	119	225.4370	21.65901	1.98548	1.839	212	.067
		Male	95	219.7895	23.13048	2.37314			
MUSOPCP Scale	1 <sup>st</sup> Factor	Female	119	9.1008	2.85644	.26185	-.012	212	.991
		Male	95	9.1053	2.61938	.26874			
	2 <sup>nd</sup> Factor	Female	119	11.7395	.69456	.06367	2.198	132.026	.030
		Male	95	11.4000	1.37144	.14071			

As seen in table 3 as a result of one-way analysis of variance (ANOVA) which is done in order to determine whether the CCTDI-R scale and factors show a significant difference according to the department variable; for CCTDI-R scale Open-Mindedness factor scores the difference between the arithmetic average of the group has been found statistically significant. Following this process Post-Hoc analysis techniques are started to be applied.

After one-way analysis of variance (ANOVA); to determine how changed in CCTDI-R scale Open-Mindedness factor among sub-groups, considering the department variable, Tamhane test has been chosen from among the post-hoc analysis techniques; because of Open-Mindedness factor group variance are not homogeneity according to the Levene's test ( $L=3.333$ ,  $p < .05$ ). As a result of this test it has been stated that Chemistry Engineering students get a lower significant level of score for the Open-Mindedness factor than Electric-Electronics Engineering students.

Table 3. The results (ANOVA) of the scores taken from CCTDI-R scale and factors and MUSOPCP factors according to the academic department variable of students.

As a result of one-way analysis of variance (ANOVA) which is done in order to determine whether the scores taken from MUSOPCP first and second factors show a significant difference according to the academic department variable; for the first factor scores the difference between the arithmetic averages of the group has been found statistically significant. Following this process Post-Hoc analysis techniques are started to be applied.

After one-way analysis of variance (ANOVA), conducted to define how first factor score changes among sub-groups, considering the academic department variable; LSD test is chosen among the post-hoc analysis techniques upon seeing: group variance is found not homogeny for the first factor according to the Levene's test applied ( $L=4.010$ ,  $p<.05$ ). As a result of this test it has been stated that Chemistry Engineering students get a higher significant level of score for the first factor than Chemistry and Electric-Electronics Engineering students.

As seen in table 4 as a result of one-way analysis of variance (ANOVA) which is done in order to determine whether the CCTDI-R scale and factors show a significant difference according to the graduated secondary school variable; for scale total score and Analyticity, Inquisitiveness factors scores the difference between the arithmetic average of the group has been found statistically significant. Following this process Post-Hoc analysis techniques are started to be applied.

Table 4. The results of ANOVA of the scores taken from CCTDI-R scale and factors and MUSOPCP factors according to the graduated secondary school.

After one-way analysis of variance (ANOVA); to determine how changed in CCTDI-R scale and factors among sub-groups, considering the graduated secondary school variable, Tamhane test has been chosen from among the post-hoc analysis techniques; because of Analyticity and CCTDI-R Scale group variance are not homogeny according to the Levene's test ( $L=6.193$ ,  $L=6.320$ ,  $p<.05$ ), LSD test has been chosen from among the post-hoc analysis techniques; because of Inquisitiveness factor group variance is homogeny according to the Levene's test ( $L=2.440$ ,  $p>.05$ ). As a result of this test it has been stated that, graduated general high school and Anatolian high school students' score are significantly lower than graduated others (special, super, technical) high schools students' score for Analyticity, Inquisitiveness and CCTDI-R Scale total score.

As a result of one-way analysis of variance (ANOVA) which is done in order to determine whether the scores taken from the MUSOPCP factors show a significant difference according to the graduated secondary school variable; for both scale and factors scores the difference between the arithmetic average of the group has been found to be insignificant statistically.

Sub-Problem 3. Is there a connection between critical thinking dispositions and operational chemistry and physics problems solving skills of Engineering Faculty students?

As a result of Pearson Multiplication Momentum Correlation Analysis, conducted to define the relations between the MUSOPCP factors and CCTDI-R scale; MUSOPCP 1st Factor score and CCTDI-R scale Open-Mindedness, Inquisitiveness, Self-Confidence, Truth-Seeking and CCTDI-R scale total score have a significant negative, MUSOPCP 2st Factor score and CCTDI-R scale Analyticity and CCTDI-R scale total score have a significant positive (Table 5).

Table 5. Pearson Multiplication Momentum Correlation Analysis Results conducted to define relations of the scales and factors.

## 5.Results

When evaluated in terms of scores obtained from Mathematics usage scale in Operational Physics and Chemistry Problems scale the first factor Mathematics Anxiety in Operational Physics and Chemistry Problems factor and the second factor Conceptual knowledge and Mathematics Knowledge Relation in Operational

Physics and Chemistry, the students are conscious of Conceptual knowledge and Mathematics Knowledge Relation in Operational Physics and Chemistry but they have higher Mathematics anxiety than expected while solving operational Physics and Chemistry problems. In the literature, there are studies showing success in science of high anxiety lowers (Czerniak & Chiarelott, 1984; Yücel, 2008; Eddy, 2000). Researches can be found related to the necessity of operational problems and concept knowledge (Erdemir, 2009; Zhang & Watkins, 2001).

For the second factor of MUSOPCP the level is significantly higher for the female students in comparison with the male students. The study held among the students of Chemical Engineering, Electric-Electronic Engineering and Chemistry Department shows, that the first factor of MUSOPCP has a significant difference according to the department variable. According to the results, Chemistry engineering students was found to be significantly higher scores in comparison with the students of Electric-Electronics Engineering and Chemistry Department. This situation shows the differences between methods and perspectives of those disciplines. The score averages of MUSOPCP factors of the students don't significantly differentiate according to the graduated secondary school variance.

For Analyticity and Inquisitiveness factors, critical thinking dispositions of students were found to be higher compared to other factors. Analyticity, to find rational solutions to the problems and Inquisitiveness, trend learning new things of the people reflects (Kökdemir, 2003). Inquisitiveness factor results of our study were parallel with Facione, Giancarlo, Facione & Gainen (1995).

When the results analyzed according to gender; Analyticity, Self-Confidence, Truth-Seeking factor scores the difference between the arithmetic average of the groups have been found statistically significant. Female students' score average is significantly higher than the Male students. Similarly, according to Rudd, Baker & Hoover (2000), Yıldırım (2005), Gülveren (2007), Zayıf (2008), Beşoluk & Önder (2010), Çetinkaya (2011); gender, for critical thinking disposition is a variable that makes a significant difference.

Students of Chemical Engineering, Electric-Electronic Engineering and Chemistry Department, for Open-Mindedness factor of CCTDI-R scale have a significant difference according to the department variable.

When the results analyzed according to graduated secondary school; CCTDI-R total score and Analyticity, Inquisitiveness factors scores the difference between the arithmetic averages of the group has been found statistically significant. According to this, graduated general high school and Anatolian high school students' scores are significantly lower than graduated others (special, super, technical) high schools students' score for Analyticity, Inquisitiveness and CCTDI-R Scale total score. Results of our study were parallel with Beşoluk & Önder (2010).

The between Mathematics Anxiety in Operational Physics and Chemistry Problems factor average scores which is the first factor of Mathematics Usage Scale in Operational Physics with Chemistry Problems and CCTDI-R scale Open-Mindedness, Inquisitiveness, Self-Confidence, Truth-Seeking and CCTDI-R scale total score have a significant negative, the between Mathematics Anxiety in Operational Physics and Chemistry Problems factor average scores which is the second factor of Conceptual knowledge and Mathematics Knowledge Relation in Operational Physics and Chemistry and CCTDI-R scale Analyticity and CCTDI-R scale total score have a significant positive.

## Abstract

The purpose of this research was to examine the relationship between attachment to God and identity styles with psychological well-being in married teachers. The research method is descriptive and correlation type. The population of the current study includes all married teachers of Mashhad city in year 2013 who were studying in Farhangian university of Khorasan Razavi. 330 people were selected as the sample by using the simple random sampling method. In the current study, the three Ryff psychological wellbeing, ISI identity styles and Sim and Loh attachment to God questionnaires were used. The data were analyzed in descriptive such as frequency, average, standard deviation and inference statistic like Pearson correlation with SPSS-20 statistic program. The results indicate that attachment to God has a positive significant relationship with psychological well-being and all its 6 dimensions involving self Acceptance, positive Relations with others, autonomy, environmental mastery, purpose in life, and personal growth ( $P < 0/01$ ). Also, the informational identity style has a positive significant relationship with psychological wellbeing and its 6 dimensions ( $P < 0/01$ ). Nevertheless, the normative and avoidant/diffusive identity styles have negative significant relationship with psychological wellbeing and its 6 dimensions ( $P < 0/01$ ).

## Introduction:

The effort to understand well-being and its causes is not new but it is an issue that throughout history has always raised interest (McMahon, 2006). In some sense, all medical and psychological interventions, as well as political, social and economic ones, aims at increasing people's quality of life as one of their main objectives (Vazquez, 2009b). As a matter of fact, we make many of our everyday decisions by weighing up the degree of happiness to be reached by us ourselves or by our loved ones (Gilbert, 2006). However, due to reasons related to the sociology of science and with the professional development of scientific disciplines, the focus of intervention for health related areas has historically more often been on the reduction of pain, suffering and deficiencies rather than on development of individual and collective abilities (Vazquez, 2009b). In field of psychology, the emphasis on positive psychological states taken as factors protective of physical and mental health, and especially the relation that exists between these positive psychological states and its repercussions on the development of illnesses has only started to be studied over the last two decades (Taylor, Kemeny, Reed, Bower & Gruenewald, 2000). Except for some rare attempts such as the one by Jahoda (1958), positive theories and models are generally recent (Deci & Ryan, 2000; Keyes & Waterman, 2003; Ryff, 1989; Ryff & Keyes, 1995; Seligman, 2002), especially if we compare them with the long historical development of models explaining mental disorders. In recent years, the pathological view to the human health study has been criticized by some psychologists and pundits and paying attention to positive aspects of health has increased. In the reviewers' view, lack of mental diseases symptoms is not a criterion for health. But, adjustment, happiness, self-confidence and

positive features like this are indicators of health. After emerging these criticisms and new perspectives, a group of psychologists use psychological well-being instead of the term of mental health. Because they believe that, this term injects more positive dimensions to mind (Ryff, 1998). Psychological well-being refers to positive mental health (Edwards, 2005). Research has shown that psychological well-being is a diverse multidimensional concept (MacLeod & Moore, 2000; Ryff, 1989; Wissing & Van Eeden, 2002) which develops through a combination of emotional regulation, personality characteristics; identity and life experience (Helson & Srivastava, 2001). Psychological well-being can increase with age, education, extraversion, and consciousness and decreases with neuroticism (Keyes et al., 2002). Ryff model is accounted as one of the most important models in psychological well-being field. Ryff (1989) takes psychological wellbeing as an attempt to realize the potential abilities of an individual, or in other words progress of the potential and real talents of every person. He states 6 components for psychological well-being involving: 1- self acceptance: means positive attitude to one self and accept the diverse aspects of own self like bad and good traits and have positive feeling about the past life. 2- Positive relations with others: have a sense of satisfaction and intimacy in one's relations with others and comprehend the importance of these dependencies. 3- Autonomy: sense of having independency and impression in life events and the active role in behaviors. 4- Environmental mastering: means sense of mastery on environment, control the outer activities and take benefit of surrounding opportunities. 5- Purpose in life: having a goal in life and believing that there is a meaning in the past and present life. 6- Personal growth: feeling of having continuing growth and achieving the novel experiences as a creator with potential talents (Ryff, Singer, 1998; quoted by Khajeh, 2012).

One of the factors that its effect and relationship with psychological well-being is mentioned in diverse researches is the identity issue, especially the identity styles (Bersonsky, 1990; Vleioras & Bosma, 2005; Shokri and et.al, 2007; Siahpoosh and et.al, 2007). There are three different identity styles in Berzonsky's socio-cognitive identity model: information-oriented, norm oriented and diffuse-oriented identity styles. Information oriented individuals are keen to details, confident and respect their own thoughts in problem solving and decision making. This style is quite similar to Moratorium and Achieved Identity statuses proposed by Marcia (1966). Information oriented identity has a positive relationship with internal locus of control and negative relationship with authoritarianism. In this identity style the individual explores alternatives and decides on whatever is considered proper. They are aware of their individual emotions and believe that they are open to new horizons and experiences. They have liberal values, intellectual curiosity and intuition, in addition to complex cognitive schemata and consciousness. Norm-oriented individuals try to adapt to the norms of reference persons. This identity style is equivalent to the Foreclosure identity status reported by Marcia (1966). Norm-oriented individuals do not actively search for proper information to solve a problem. They use information valued by prestigious models. Their schemata are constructed by individualized norms. These kinds of schemata lead to biased commitments and thought processes. Norm-oriented style and social identity are intertwined. It depends on internalized social expectancies and tendencies. Diffuse/avoidant-oriented individuals are characterized by their defensive manners. They are reluctant to face problems and usually procrastinate stated wishes. External locus of control is dominant. They do not search for the best solution and proper information to solve a problem and rarely make long-term plans. They are sensitive, depressive, and have neurotic personal characteristics. These socio-cognitive identity styles are the outcomes of psycho-social intersections. Each helps a person to develop specific perspectives.

Previous researches pertaining to the subject area of religiosity and psychological well-being, eloquently speak volumes of, and provide sound evidence to support the positive association between religiosity and psychological well-being. One of the concepts which religion has been examined with it is attachment to God. Attachment theory is widely accepted as a broad encompassing model of psychosocial and emotional development. Recent work (Granqvist, 1998; Kirkpatrick & Shaver, 1990; TenElshof & Furrow, 2000) has suggested that attachment theory may be an appropriate framework for a believer's relationship with a God figure. Bowlby (1969, 1973, 1980) theorized that the early attachment bond formed internal working models through repeated daily experiences with caregivers and that these working models serve as a guideline for future social interactions throughout the lifespan. Some of the hallmarks of the attachment relationship are believed to be visible in behaviors toward the attachment figure seeking and maintaining proximity, serving as a secure base of explorative behavior, providing a haven of safety, and experiencing anxiety when separated (Ainsworth, 1985). Kirkpatrick (1999) cited evidence for the existence of these hallmark attachment behaviors in relationship with God. Generally, attachment to God can be defined in this way: the quality of affective, cognitive, and behavioural bond with God which is the underlying of many religious and spiritual behaviours and emotions (Miner and Ghobaribonab, 2011). One of the basic and influential parts in every society is the educational system of that society and teachers are among the most important pillars of this educational system. Therefore, carrying out surveys about this population in the society is so crucial and could resolve many problems. It is

obvious that existing a series of traits in teachers of a society like, balanced development, having strong identity, having positive and acceptable relationship with God, progress, vitality, mental happiness and high psychological wellbeing, could have considerable effects on personality aspects, personal and social development, emerging competent behaviours, nurturing more talented people and decreasing the personality and behavioural abnormalities of the people of that society. So conducting investigations about psychological wellbeing, identity styles and attachment to God in teachers not only help to develop and increase the quality of life level of the teachers but also leads to more growth and progress of the whole society.

Now with respect to what has been stated the purpose of this study was to examine the Relationship between Attachment to God and Identity Styles with Psychological Well-Being in Married Teachers.

### **Methodology:**

The research method of this study is descriptive and from the correlational type. The statistical population of the research included all man and women married teachers of Mashhad city who were teaching in the academic year of 2012-2013 in the elementary and secondary levels and simultaneously they were studying in different campuses of the Farhangian University of Khorasan Razavi. To reach the study goals, among the population with the size of approximately 2000 people, Krejcie and Morgan table suggested choosing 330 people as the sample. 330 people with the age average and standard deviation of 36.58 and 6.44 were selected as the sample by using the simple random sampling method. Thus, first of all a list of all members of the research population were taken from the Farhangian University of Khorasan Razavi and then the names were encoded and afterwards the sampling was done by using the random- number table and with the help of computer.

#### **Research tools:**

In this study, three Ryff psychological wellbeing, ISI identity styles and Sim and Loh attachment to God questionnaires were used.

#### **Ryff psychological well-being scale:**

This scale was developed by Ryff (1989) in the Wiskansin University of the United States of America and was revised in year 2000. The mentioned scale has 84 items which assess the 6 components of self-acceptance, positive relations with others, autonomy, mastery on environment, life with purpose and personal growth. The method of scoring in this scale is Likert type (1=completely disagree to 6= completely agree). It has 47 direct and 37 reverse items for scoring and the range of the total score of each person in this scale in all six components could fluctuate from 14 to 84. The reliability and validity of this scale has been reported in different studies. Ryff (1989) for examining the reliability of this scale calculated its relationship with the personality traits scales which at the same time are the psychological wellbeing criteria (like: Bradbourne affective balance scale, Newgorton life satisfaction and Rosenberg self-respect). The results of Ryff scale correlation with each of the mentioned scales were acceptable. Therefore, this scale is accounted reliable. For assessing the validity of this scale, Ryff (1989) used the Cronbach's alpha coefficient and acquired the following coefficients: self-acceptance 0.91, positive relations with others 0.84, autonomy 0.83, environmental mastery 0.86, purpose in life 0.88, personal growth 0.85 and the total psychological wellbeing 0.87. In Iran Shokri and et.al (2007) calculated Cronbach's alpha coefficients: self-acceptance 0.78, positive relations with others 0.74, autonomy 0.60, environmental mastery 0.77, purpose in life 0.75, personal growth 0.73 and the total psychological wellbeing 0.72. In the present study the Cronbach's alpha coefficients were achieved: self-acceptance 0.86, positive relations with others 0.84, autonomy 0.75, environmental mastery 0.81, purpose in life 0.85, personal growth 0.84 and the total psychological wellbeing 0.96.

#### **ISI identity styles scale:**

This scale was developed by Bersonsky for the first time and after that it was twice reviewed. The mentioned scale involves 11 items for informational style, 9 items for normative style and 10 items for diffusive/avoidant style and 10 other items for commitment scale which is used for secondary analysis and are not accounted as an identity style. Scoring method in this scale is Likert type (1= completely disagree to 5= completely agree). The minimum and maximum score in the informational style is in order 11 and 55, in normative style 9 and 45 and in diffusive/avoidant style is 10 and 50. For examining the reliability of this scale, White and et.al (1992) evaluated the people's responses in the three identity styles with the factor analysis method by using the varimax rotation with the main component. The correlation coefficient of each factor with the whole test for the first factor was 0.79, for the second factor was 0.81 and for the third factor was 0.84 that all of the amounts are high. In Iran, Farsinejad (2004) probe in the construct reliability with the factor analysis

method which the sampling adequacy was 0.75. For examining the validity of mentioned scale, Bersonsky (1992) in the last reviewed version, reported the Cronbach's alpha coefficient for the informational subscale 0.62, normative subscale 0.66 and for diffusive/ avoidant subscale 0.73. In Iran, Khosroshahi and Aliloo (2012) acquired the Cronbach's alpha coefficient for informational subscale 0.78, normative subscale 0.71 and for diffusive/ avoidant subscale 0.70. In this study, the Cronbach's alpha coefficient was calculated 0.81 for informational style, 0.81 for normative style and 0.88 for diffusive/ avoidant style.

Sim and Loh attachment to God scale:

This scale includes 16 items which evaluate the attachment to God in four dimensions of: God as a safety haven, God as a secure base, seek close relationship with God and detachment from God. The scoring method of this test is Likert type (1= completely disagree to 6= completely agree) and the range of total score for each person in this scale could fluctuate from 16 to 96. Jouis (2007) well described the reliability of this scale in a way that in a research, he calculated the correlation coefficient of this scale with the religious beliefs and religious activities orderly 0.83 and 0.85. For assessing the validity of this scale, Jouis (2007) in a study acquired Cronbach's alpha coefficient: 0.96 for safety haven, 0.97 for secure base, 0.96 for closeness and 0.97 for detachment and totally 0.99. According to this, attachment to God can be considered as a single construct which can be expressed in four different ways. In Iran, Nayeri and et.al achieved the amount of Cronbach's alpha coefficient for this scale equals to 0.96. In this research the Cronbach's alpha coefficient was also acquired 0.93.

## Results:

Descriptive results related to research variables can be observed in table number 1.

Table 1: the summary of the descriptive criteria calculations of psychological wellbeing, identity styles and attachment to God

	Attachment to God	psychological wellbeing	informational style	normative style	diffusive/avoidant style
N	330	330	330	330	330
Mean	90.47	365.06	40.13	30.17	26.19
Std. Deviation	7.72	57.82	7.24	7.22	9.62

**Research hypothesis:** there is a significant relationship between Attachment to God and Identity Styles with Psychological Well-Being in Married Teachers.

For examining the hypothesis of the research, Pearson correlation test were used and the results can be seen in table 2.

Table 2: the results of Pearson correlation test for examining the relationship between research variables

	Attachment to God	psychological wellbeing	informational style	normative style	diffusive/avoidant style
Attachment to God	1				
psychological wellbeing	.605**	1			
informational style	.604**	.707**	1		
normative style	-.392**	-.552**	-.423**	1	
diffusive/avoidant style	-.558**	-.772**	-.565**	.662**	1

\*\* . Correlation is significant at the 0.01 level (2-tailed).

As seen in the second table, all the research variables have significant relationship with each other in the 0/01 level.

## Conclusion and discussion:

This research was done to examine the relationship between Attachment to God and Identity Styles with

Psychological Well-Being in Married Teachers. From the acquired results it can be supposed that people with higher scores in attachment to God presumably are in better psychological well-being state and also those who placed in the informational identity style category, might achieve higher scores in psychological well-being scale. People with better attachment to God scores may be located in the informational identity styles category, in contrast those with less attachment to God scores are likely to be placed in normative or diffusive identity style category. For justifying these results, it can be said that those who are attached to God have beliefs such as expecting pleasant events, seeking meaning in unpleasant events, being patient by expecting rewards, and having the chance to compensate through repenting, are highly likely to have features like positive attitude to one's self and that capability to accept all aspects of one's self, feeling of satisfaction and intimacy about relationship with others especially with God and perception of the importance of these attachments, feeling of independency and having influence on life events, having active role in behaviors, having purpose in life and believe that life is meaningful in the past and the present, and feeling of continuous and strong development and achieving the new experiences as a creature with the potential talents, which all these features refers to the concept of psychological well-being. On the other hand, one the features of secured attached people to God is that they can explore and evaluate their environment more relaxed, and persons with informational identity styles are active, explore and evaluate more and constantly are seeking to achieve proper information to form their identity. Therefore it can be expected that people with secure attachment to God due to having the mentioned features, are highly likely to have the informational identity style.

## Abstract

The main purpose of this research is to examine the relationship of knowledge conversion abilities and academic performance. Knowledge conversion abilities comprise of four dimensions, namely, socialization, externalization, combination and internalization. Using the survey research method involving 263 respondents from the Faculty of Information Management, Universiti Teknologi MARA, the four independent variables are found to have a significant relationship with academic performance. Further analysis showed that the four independent variables are significant predictors of academic performance. The present study provides both a theoretical and practical contributions to understanding the predictors of academic performance and should be of interest to both researchers and practitioners.

## Introduction

Students are most essential asset for any educational institute as the social and economic development of the country is directly linked to students' academic performance (Mushtaq & Khan, 2012). According to Alfian & Othman (2005), students' performance in universities attracts the concern of corporations which are often said to be the "end user" in the supply chain of graduates for the labor market. Realizing the importance of students' academic performance, scholars and researchers have developed various models and frameworks portraying the determinants or predictors of academic success. However, due to the on-going change that is taking place in the university landscape and the technology surrounding students' personal lives, the available models and frameworks for academic performance requires updates and revisions. According to Uyar & Gungormus (2011), determining the factors that affect the student performance is important because primarily institutions and lecturers have to find out ways to increase student performance and to motivate students for better performance. Various factors have been identified by researchers and scholars as determinants of academic performance. Among the mostly researched factors are gender, previous academic performance, living place and income level of family, social environment, the type and quality of the high school graduated, the high school grade point average, the score obtained from nationwide university entrance exam (OSS), time spend in studying, learning ability and living place during the university life (Erdem, *et al.*, 2007). Very few researchers have attempted to explore the role of knowledge conversion abilities of the students' academic success. Based on Nonaka's (1990) knowledge spiral theory, several researchers have conceptualized knowledge conversion abilities as the combination of socialization, externalization, combination and internalization. All of these factors are apparently consistent with the Theory of Educational Productivity developed by Walberg (1981) that suggest three groups of factors that influence students' academic performance, namely, affective, cognitive and behavioral. A good of Academic Institution's is depending on their student academic performance (Chow, 2003; Ali *et al.*, 2009). Although most academic or higher learning institutions in Malaysia have adopted knowledge management approach in their learning system, it is still uncertain to what extent it has been practiced in order to get a better performance result (Daud *et al.*, 2008). Likewise, a research on how the conversion of knowledge took place in an academic setting among students is still lacking.

Given the aforementioned background, this study is aimed at investigating the influence of knowledge conversion abilities on students' academic performance. Specifically, this study will examine the influence of the four dimensions of knowledge conversion which are socialization, externalization, combination and internalization on students' academic performance. In addition, it is aimed to identify which dimension is the strongest predictor of students' academic performance.

## Literature Review

### 1. Students Academic Performance

Academic performance refers to how students deal with their studies and how they cope with or accomplish different tasks given to them by their teachers. In addition, it is also described as the ability to study and remember facts and being able to communicate knowledge verbally or down on paper (Ervina & Othman, 2005). Kuncel *et al.* (2004) noted that academic performance in the classroom is the end product of much other behavior. For example, obtaining a good grade after answering examination items is the result of effective performance, studying, managing goal conflicts, coordinating work with classmates, seeking additional information, negotiating with peers and faculty, avoiding counterproductive behaviors (e.g., drugs and alcohol), handling finances, and structuring effective communications (Kuncel *et al.*, 2004).

Presently, the standards of academic performance have been established in order to measure the students' achievement. Its' usually calculated with a grading system set up by the academic intuition. Grading systems came into existence in America in the late Victorian period, and were initially criticized due to high subjectivity (Kuncel *et al.*, 2004). The famously known of the grading system used by numerous higher learning today in measuring their student achievement is via grade point average (GPA) and cumulative grade point average (CGPA) i.e. a number which is the average mark received for all the courses a student takes and shows how well the student is doing. In Malaysia, most universities measure their student performance based on CGPA (Ervina & Othman, 2005; Ali, *et al.*, 2009).

In line with the Theory of Educational Productivity (Walberg, 1981) various factors associated with the students' affective (Olani, 2009; Richardson *et al.*, 2012), cognitive (Harb & El-Shaarawi, 2006; Olani, 2009; Uyar & Gungormus, 2011; Ren & Hagerdon, 2012), and behavioral abilities (Harb & El-Shaarawi, 2006; Olani, 2009; Uyar & Gungormus, 2011; Mushtaq & Khan, 2012; Richardson *et al.*, 2012) have been identified as the predictors of academic performance. Besides that, other demographic factors such as age and gender (Erdem, 2007; Olani, 2009; Ebuma-Okoh, 2010; Ren & Hagerdon, 2012); and other external factors such as the number of sisters/brothers in school, education level of parents, and expression of family expectations about the school (Erdem, 2007; Ebuma-Okoh, 2010; Mushtaq & Khan, 2012) have also been found to have a profound effect on students' academic performance.

### 2. Knowledge Conversion Abilities

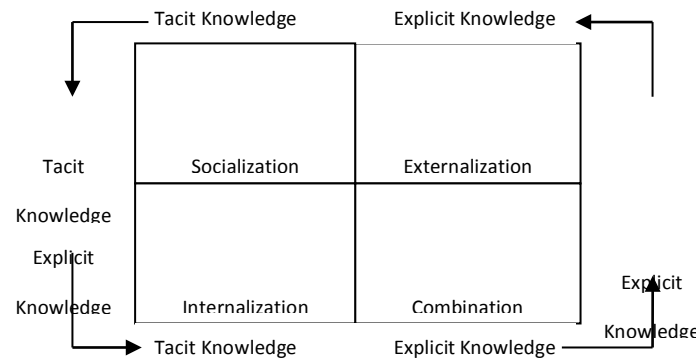

Marwick (2001) defined knowledge as an individual's experience and understanding. Davenport & Prusak (1998) defined knowledge as "a fluid mix of framed experience, values, contextual information, and expert insight that provides a framework for evaluating and incorporating new experiences and information". Nonaka & Takeuchi (1995) classified knowledge into explicit and tacit. Tacit knowledge is linked to personal perspectives, intuition, emotions, beliefs, know-how, experiences and values. Tacit knowledge is intangible and not easy to articulate, making it difficult to share with others (Nonaka & Takeuchi, 1995). In comparison, explicit knowledge has a tangible dimension that can be more easily captured, codified and communicated. Knowledge creation refers to the ability of an individual or organization to develop novel and useful ideas and solutions.

Through the famous SECI (*socialization, externalization, combination and internalization*) model as shown in Figure 1, Nonaka & Takeuchi (1995) explained the term knowledge conversion. According to them, the process of knowledge conversion (the dynamic interrelationship between tacit and explicit knowledge) lies at the heart of knowledge creation which involves an interaction between socialization (tacit to tacit), externalization (tacit to explicit), combination (explicit to explicit), and internalization (explicit to tacit/implicit). Choo (2006) stated that the role of knowledge conversion process is to develop the conditions that would be enabled the creation of knowledge at the individual, group, organizational or inter-organizational levels. The elaborations of these SECI model are as follows:

- *Socialization* is the process of converting *tacit knowledge into tacit knowledge* through shared experiences, such as observation, imitation, and practice. Socialization typically occurs in a traditional apprenticeship, where apprentices learn the tacit knowledge needed in their craft through hands-on experience. Socialization also may occur in informal social meetings outside the workplace, where tacit knowledge, such as world-views, mental models and mutual trust can be created and shared.
- *Externalization* is the process of articulating *tacit knowledge into explicit knowledge* and involves the interchange of tacit knowledge to explicit knowledge. When tacit knowledge is made explicit, knowledge is crystallized, which allows it to be shared by others, and it becomes the basis of new knowledge. The tools of this conversion use different metaphors, analogues, concepts, hypotheses and models.
- *Combination* is the process of converting explicit knowledge into more complex and systematic sets of explicit knowledge (*explicit knowledge into explicit knowledge*). Explicit knowledge can be accumulated from inside or outside the firm and then combined, edited or processed to form new explicit knowledge.

Through presentations or meetings, this new explicit knowledge can be directly disseminated among the members of the organization.

- *Internalization* is the process of embodying *explicit knowledge into tacit knowledge* and may be embodied in actions and practice, so that the individual acquiring the knowledge can re-experience what others go through. Some of the means through which individuals may acquire knowledge through the internalization processes are learning by doing, learning by observing, face-to-face meetings, and on-the-job training.

### Research Framework

Fig.1 Modes of knowledge conversion (Nonaka & Takeuchi, 1995)

Figure 2 showcases the research framework used in the study. Theory on Educational Productivity (Walberg, 1981) and Theory on Knowledge Conversion (Nonaka, 1984) were used as the main theory for the development of the framework. In Nonaka's SECI model of knowledge conversion process, the interaction between the knowledge conversion patterns, i.e., socialization (from tacit to tacit), externalization (tacit to explicit), combination (from explicit to explicit) and internalization (from explicit to tacit); and this continuing process can generate a new knowledge between individual, team, organizational to inter organizational level. The SECI model suggests that the knowledge conversion processes, i.e. the four knowledge conversion abilities will encourage the process of knowledge creation to generate better outcomes (Huang & Wang, 2002). Daud *et al.* (2008) described that the four knowledge conversion abilities as active learning processes that will give an impact on innovation in academic performance. Ali *et al.* (2009) found that students who actively engaged in the learning process and involved in extracurricular activities obtained greater cumulative grade point average (CGPA). Based on this premise, the following hypotheses are established:

- H1 – Socialization is a significant predictor of a student's academic performance*  
*H2 – Externalization is a significant predictor of a student's academic performance*  
*H3 – Combination is a significant predictor of a student's academic performance*  
*H4 – Internalization is a significant predictor of a student's academic performance*

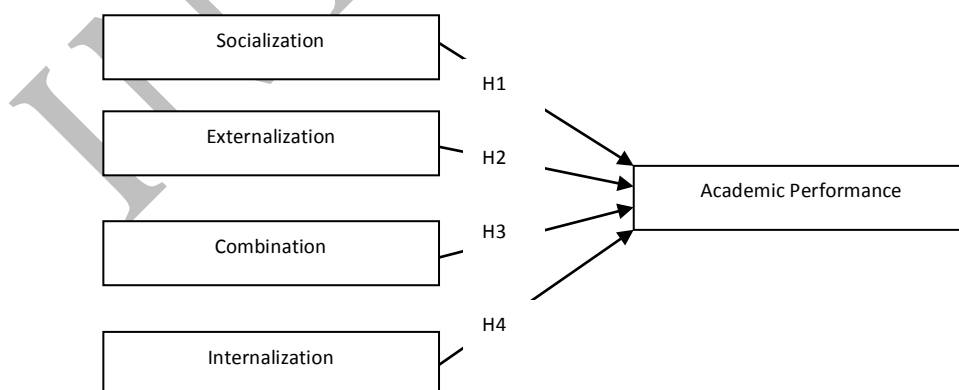

Fig. 2 Research Framework

### Research Methodology

The study used a survey method with questionnaire as the instrument for data collection. The questionnaire was developed based on the instruments used by a previous study by Huang & Wang (2002). Perceptual measures in the form of statements were developed for measuring each variable. For each statement or items, a corresponding Likert scale anchored as 1 for "Strongly Disagree"; 2 for "Disagree"; 3 for "Neither Agree Nor

Disagree”; 4 for “Agree” and 5 for “Strongly Agree” were also prepared. The questionnaire was pre-tested with several experts and prospective respondents. Subsequently, it was pilot tested with 30 students. The results of the pilot test are illustrated in Table 1 showed that the Cronbach Alpha for all variables were well above 0.7, indicating that the questionnaire was acceptably reliable.

The population of the study was students of Faculty of Information Management, Universiti Teknologi MARA Shah Alam. A total of 450 (i.e. 20% of the population of 2231) questionnaires were sent to the targeted students. The number is considered appropriate and in line with the suggestion of Sekaran (2003) that at least 15% of the total population must participate in the study. After the duration of the data collection was over, a total of 351 questionnaires were returned, yielding to 78.0% response rate. However, 88 were found to be unusable for further analysis as they were incomplete. The remaining 263 were analyzed using IBM SPSS. The statistical analyses carried out were frequency analysis; descriptive analysis focusing mean and standard deviation; factor analysis (EFA) for assessing common method bias; correlation analysis for looking into the relationship between variables; and multiple regression for testing research hypotheses.

Table 1. Sources of measurements of variables and results of pilot test

Variable	No of items	Sources of measurement	Cronbach Alpha of pilot test
Socialization	7	Huang & Wang (2002);	0.917
Externalization	7	Huang & Wang (2003);	0.824
Combination	6		0.879
Internalization	5		0.906

## Findings

Table 2 displays the demographic information of the respondents. Out of 263 respondents, 76.8% were female while the remaining 23.2% were male. In terms semester, the majority indicated to be in semester five (38.8%) while the minority indicated to be in semester seven (0.4%). Full time students contributed 85.2%, while the remaining were part-time (6.8%) and distance learners (8.0%). Students enrolled in BSc Library Science were also found to be the largest participants (31.2%). In comparison, students registered for BsC Records Management were the least (3.8%).

Table 2. Demographic Profile

		Frequency	Percent
Gender	Male	61	23.2
	Female	202	76.8
Semester	Part 1	2	0.8
	Part 2	13	4.9
	Part 3	60	22.8
	Part 4	36	13.7
	Part 5	102	38.8
	Part 6	49	18.6
	Part 7	1	0.4
Mode	Full-time	224	85.2
	Part-time	18	6.8
	FLP	21	8.0
Program	BSc Library Science	82	31.2
	BSc Information Management Systems	54	20.5
	BSc Resource Centre Management	48	18.3
	BSc Records Management	10	3.8
	Master of Information Management	40	15.2
	Master of Knowledge Management	11	4.2
	Masters in Library Science	18	6.8

In order to ascertain whether common method bias is a threat to the research data, Harman’s single factor test was executed. All items from all constructs under study were entered for analysis and constrained to only a single factor. The results showed that the single factor explained only 34.40%, less than the benchmark value of 50% of the total variance, implying that the collected data is free from the problem of common method variance. Accordingly reliability analysis was also performed and the results indicate that the Cronbach Alpha values are

well above the cutoff value of 0.7. The recorded Cronbach Alpha values are between 0.727 and 0.798 implying that the instrument used in this study is acceptably reliable.

The mean scores of all variable are well above the mid value (i.e. The middle value of the Likert scale is 3), suggesting that in general, the respondents of the study skewed to practice with the listed knowledge conversion practices, i.e. socialization, externalization, combination and internalization (refer Table 3). In comparison, the results of the correlation analysis suggest that, all independent variables have a moderate relationship with academic performance (CGPA). This finding denotes that each independent variable by itself, has some influence with academic performance. The strongest relationship is for variable combination ( $r = 0.396$ ,  $p < 0.01$ ), followed by externalization ( $r = 0.394$ ,  $p < 0.01$ ).

Table 3. Mean, Standard Deviation and Correlation Analysis

	Cronbach Alpha	Mean	Std. Deviation	[1]	[2]	[3]	[4]	[5]
[1] Socialization	0.798	3.9913	0.452	1.000				
[2] Externalization	0.748	3.6616	0.438	0.526**	1.000			
[3] Combination	0.749	3.7123	0.468	0.565**	0.587**	1.000		
[4] Internalization	0.727	3.8821	0.477	0.449**	0.516**	0.512**	1.000	
[5] CGPA	NA	3.279	0.4344	0.387**	0.394**	0.396**	0.362**	1.000

Regression analysis was performed to test the proposed hypotheses and the results are displayed in Table 4 and Figure 3. The F statistics produced ( $F = 19.284$ ,  $p < 0.01$ ), thus confirming the fitness for the regression model. The coefficient of determination,  $R^2$  was 0.23 which suggests that the four factors can significantly account for 23.0% in academic performance. Based on this result, all established hypotheses H1, H2, H3 and H4 are fully supported.

Table 4. Results of Regression Analysis

Independent variables	Dependent variable – CGPA Standardized beta
<i>Socialization</i>	0.165*
<i>Externalization</i>	0.153*
<i>Combination</i>	0.145*
<i>Internalization</i>	0.135*
$R^2$	0.230
Adjusted $R^2$	0.218
F value	19.284*
Notes: * $< 0.01$	

Fig. 3 Path Analysis

## Discussion

The present study provides both a theoretical and practical contributions to understanding the role of knowledge conversion abilities towards academic achievements. All the four dimensions of knowledge conversion abilities are found to have a significant relationship with students' academic performance. The combination of the four dimension accounts for 23.5 variances in students' academic performance. Out of the four dimensions, socialization turned out to be the strongest predictor ( $\beta = 0.165$ ,  $p < 0.01$ ). This result indicates the importance of socialization in shaping students' academic success. This result is almost consistent with that of Mushtaq & Khan (2012) who found that communication as a significant predictor of academic success.

Socialization requires an individual to heavily involve in various modes of communications. Being university's students, communications with lecturers, supervisors, colleagues and others is definitely inevitable. The implication of this study is that, the educators of the university should encourage their students to improve not only their communication skills, but also their intensity of communications with people of all ranks.

The second strongest predictor discovered in this study is the externalization ( $\beta = 0.153$ ,  $p < 0.01$ ). The finding suggests that the higher is the engagement of externalization, the better would be the performance of the student. According to Nonaka & Takeuchi (1995), externalization involves the converting tacit knowledge to explicit knowledge and the tools that can be used for the conversion include analogues, concepts, hypotheses and models. All these various conversion tools are no alien to the students as they are used to engaging them in their learning process. Nonetheless, this finding signals the need for educators to continuously engage students to visualize their tacit knowledge in the form of models or diagrams. This approach will enable other students to also learn and at the same time promotes knowledge sharing.

The third strongest predictor of students' academic performance is combination, which involves the conversion of explicit knowledge to explicit knowledge ( $\beta = 0.145$ ,  $p < 0.01$ ). The results suggest that, in the absence of combination, students' academic performance will be greatly impacted. Knowledge acquired from the class lecture combined with the knowledge obtained from fieldwork research among the student will definitely produce new explicit knowledge. As advocated by Nonaka & Takeuchi (1995), this new form of knowledge can be shared with others through the medium of presentations and meetings. This finding further stresses the significance of doing fieldwork research as it will further enrich the students' knowledge, which in turn improves their academic performance. Educators should respond to this finding by giving more exercise that will require the students to do fieldwork research.

The last significant predictor discovered in this study is internalization ( $\beta = 0.135$ ,  $p < 0.01$ ). Internalization involves the conversion of tacit knowledge into explicit knowledge. As suggested by Nonaka & Takeuchi (1995), activities such as learning by doing, learning by observing, face-to-face meetings, and on-the-job training are examples of which the internalization can occur. All these activities are very common for students because the nature of their learning process will require them to engage in these activities. Given this result, academics and educators should further intensify the activities as outlined by Nonaka & Takeuchi (1995), because by doing so, will further improve students' academic performance.

## Conclusion

The purpose of this article has been to examine the influence of knowledge conversion abilities which consists of four dimensions which are socialization, externalization, combination and internalization on students' academic performance. Drawing upon Nonaka & Takeuchi's (1995) model of knowledge conversion, this study developed an empirical based framework which connects the dimensions of knowledge conversion to students' academic performance. The results of the analyses suggest that all the four dimensions are significantly correlated with students' academic performance. Further analysis proves that socialization, externalization, combination and internalization are truly significant predictors.

While this study has achieved its objectives, it is still subject to several limitations. Firstly, this study collected data from one university only. Future researchers should consider testing the developed model in a bigger scope of the population. Secondly, this study collected data based on perceptual measures. Future studies can further extend this research by integrating the objective measurement or evidence-based measures.

## Acknowledgements

The researcher would like to extend our thanks to the students of Faculty of Information Management, Universiti Teknologi MARA, Puncak Perdana Campus Shah Alam who had willingly participated in this study. Special thanks are also owed to the Accounting Research Institute, Universiti Teknologi MARA for providing all the necessary resources required for the completion of the study.
